The wind blew the bodies against one another so that they swung backwards and forwards; and he thought, "If I am cold here below by the fire, how must they freeze above!" So his compassion was excited, and, contriving a ladder, he mounted, and, unloosening them one after another, he brought down all seven. Then he poked and blew the fire, and set them round that they might warm themselves; but as they sat still without moving, their clothing caught fire. So he said, "Take care of yourselves, or I will hang all of you up again." The dead heard not, and silently allowed their rags to burn. This made him so angry that he said, "If you will not hear I cannot help you; but I will not burn with you." So he hung them up again in a row, and sitting down by the fire, he soon went to sleep.

The next morning the man came, expecting to receive his fifty dollars, and asked, "Now, do you know what shivering means?"

"No," he answered; "how should I know? Those fellows up there have not opened their mouths, and were so stupid that they let the old rags on their bodies be burnt."

Then the man saw that he should not carry away the fifty dollars that day, so he went away saying, "I never met with such a one before."

The boy also went on his way, and began again to say, "Ah, if only I could but shiver—if I could but shiver!"

A wagoner walking behind overheard him, and asked, "Who are you?"

"I do not know," answered the boy.

"The wagoner asked again, "What do you here?"

"I know not."

"Who is your father?"

"I dare not say."

"What is it you are continually grumbling about?"

"Oh," replied the youth, "I wish to learn what shivering is, but nobody can teach me."

"Cease your silly talk," said the wagoner. "Come with me, and I will see what I can do for you."

So the boy went with the wagoner, and about evening-time they arrived at the inn where they put up for the night, and while they were going into the parlor he said, quite loud, "Oh, if I could but shiver—if I could but shiver!"

The host overheard him, and said, laughingly, "Oh, if that is all you wish, you shall soon have the opportunity."

"Hold your tongue," said his wife; "so many imprudent people have already lost their lives: it were a shame and sin to such beautiful eyes that they should not see the light again."

But the youth said, "If it were ever so difficult I would at once learn it; for that reason I left home." And he never let the host have any peace till he told him that not far off stood an enchanted castle, where any one might soon learn to shiver if he would watch there three nights. The King had promised his daughter in marriage to whomsoever would venture; and she was the most beautiful young lady that the sun ever shone upon. And he further told him that inside the castle there was an immense amount of treasure guarded by evil spirits,—enough to make any one free, and turn a poor man into a very rich one. Many had, he added, already ventured into this castle, but no one had ever come out again.

The next morning this youth went to the King, and said, "If you will allow me, I wish to watch three nights in the enchanted castle."

The King looked at him, and because his appearance pleased him, he said, "You may make three requests, but they must be inanimate things you ask for, and such as you can take with you into the castle." So the youth asked for a fire, a lathe and a cutting-board.

The King let him take these things by day into the castle, and when it was evening the youth went in and made himself a bright fire in one of the rooms, and, placing his cutting-board and knife near it, he sat down upon his lathe. "Ah, if I could but shiver!" said he. "But even here I shall never learn."

At midnight he got up to stir the fire, and as he poked it there shrieked suddenly in one corner, "Miau, miau! how cold I am!" "You simpleton!" he exclaimed; "what are you shrieking for? If you are so cold, come and sit down by the fire and warm yourself!" As he was speaking two great black cats sprang up to him with an immense jump, and sat down, one on each side, looking at him quite wildly with their fiery eyes. When they had warmed themselves for a little while, they said, "Comrade, shall we have a game of cards?" "Certainly," he replied; "but let me see your paws first." So they stretched out their claws; and he said, "Ah, what long nails you have got. Wait a bit, I must cut them off first;" and so saying, he caught them up by the necks, and put them on his board, and screwed their feet down. "Since I have seen what you are about, I have lost my relish for a game at cards," said he; and instantly killing them, threw them away into the water.

But no sooner had he quieted these two, and thought of sitting down again by his fire, than there came out of every hole and corner black cats and black dogs with glowing chains, continually more and more, so that he could not hide himself. They howled fearfully, and jumped upon his fire, and scattered it about as if they would extinguish it. He looked on quietly for some time, but at last getting angry, he took up his knife and called out, "Away with you, you vagabonds!" and chasing them about, a part ran off, and the rest he killed and threw into the pond. As soon as he returned he blew up the sparks of his fire again, and warmed himself; and while he sat his eyes began to feel very heavy, and he wished to go to sleep. So looking round, he saw a great bed in one corner, in which he lay down; but no sooner had he closed his eyes, than the bed began to move of itself, and traveled all round the castle. "Just so," said he, "only better still;" whereupon the bed galloped away as if six horses pulled it up and down steps and stairs, until at last all at once it overset bottom upwards, and lay upon him like a mountain; but up he got, threw pillows and mattresses into the air, and saying, "Now, he who wishes may travel," laid himself down by the fire and slept till day broke.

In the morning the King came, and seeing the youth lying on the ground, he thought that the spectres had killed him, and that he was dead; so he said, "It is a great misfortune that the finest men are thus killed." But the youth, hearing this, sprang up, saying, "It is not come to that with me yet!" The King was much astonished, but still very glad, and asked him how he had fared. "Very well," replied he, "as one night has passed, so also may the other two." Soon after he met his landlord, who opened his eyes when he saw him. "I never thought to see you alive again," said he: "have you learnt now what shivering means? "No," said he, "it is all of no use. Oh, if any one would but tell me!"

The second night he went up again into the castle, and sitting down by the fire, began his old song, "If I could but shiver!" When midnight came, a ringing and a rattling noise was heard, gentle at first, and louder and louder by degrees; then there was a pause, and presently with a loud outcry half a man's body came down the chimney and fell at his feet. "Holloa!" he exclaimed; "only half a man answered that ringing: that is too little." Then the ringing began afresh, and a roaring and howling was heard, and the other half fell down. "Wait a bit," said he; "I will poke up the fire first." When he had done so, and looked round again, the two pieces had joined themselves together, and an ugly man was sitting in his place. "I did not bargain for that," said the youth: "the bench is mine." The man tried to push him away, but the youth would not let him, and giving him a violent push, sat himself down in his old place. Presently more men fell down the chimney, one after the other, who brought nine thigh-bones and two skulls, which they set up, and then they began to play at ninepins. At this the youth wished also to play, so he asked whether he might join them. "Yes, if you have money." "Money enough," he replied. "But your balls are not quite round;" so saying, he took up the skulls, and placing them on the lathe, turned them round. "Ah, now you will roll well," said he. "Holloa! now we will go at it merrily." So he played with them and lost some of his money, but as it struck twelve everything disappeared. Then he laid down and went to sleep quietly. On the morrow the King came for news, and asked him how he fared this time. "I have been playing ninepins," he replied, "and lost a couple of dollars." "Have you not shivered?" "No! I have enjoyed myself very much, but I wish some one would teach me that!"

On the third night he sat down again on his bench, saying in great vexation, "Oh, if I could only shiver!" When it grew late, six tall men came in bearing a coffin between them. "Ah, ah!" said he, "that is surely my little cousin who died two days ago;" and beckoning with his finger, he called, "Come, little cousin, come!" The men set down the coffin upon the ground, and he went up and took off the lid, and there lay a dead man within, and as he felt the face it was as cold as ice. "Stop a moment," he cried, "I will warm it in a thrice;" and stepping up to the fire, he warmed his hands, and then laid them upon the face, but it remained cold. So he took up the body, and sitting down by the fire he laid it on his lap and rubbed the arms, that the blood might circulate again. But all this was of no avail, and he thought to himself, if two lie in a bed together they warm each other; so he put the body in the bed, and covering it up, laid himself down by its side. After a little while the body became warm, and began to move about. "See, my cousin!" he exclaimed, "have I not warmed you?" But the body got up and exclaimed, "Now I will strangle you!" "Is that your gratitude?" cried the youth. "Then you shall get into your coffin again." And taking it up, he threw the body in, and made the lid fast. Then the six men came in again and bore it away. "Oh dear me!" said he, "I shall never be able to shiver if I stop here all my lifetime!" At these words in came a man who was taller than all the others, and looked more horrible; but he was very old, and had a long white beard. "Oh, thou wretch!" he exclaimed; "now thou shalt learn what shivering means, for thou shalt die!"

"Not so quick," answered the youth; "if I die, I must be brought to it first."

"I will quickly seize you," replied the ugly one.

"Softly, softly! be not too sure. I am as strong as you, and perhaps stronger."

"That we will see," said the ugly man. "If you are stronger than I, I will let you go; come, let us try;" and he led him away through a dark passage to a smith's forge. Then taking up an axe, he cut through the anvil at one blow down to the ground. "I can do that still better," said the youth, and went to another anvil, while the old man followed him and watched him with his long beard hanging down. Then the youth took up an axe, and, splitting the anvil at one blow, wedged the old man's beard in it. "Now I have you! now death comes upon you!" and, taking up an iron bar, he beat the old man until he groaned and begged him to stop, and he would give him great riches. So the youth drew out the axe, and let him loose. Then the old man, leading him back into the castle, showed him three chests full of gold in a cellar. "One share of this," said he, "belongs to the poor, another to the King, and a third to yourself." And just then it struck twelve, and the old man vanished, leaving the youth in the dark. "I must help myself out of here," said he, and groping round, he found his way back to his room, and went to sleep by the fire.

The next morning the King came and inquired, "Now have you learnt to shiver?" "No," replied the youth; "what is it? My dead cousin came here, and a bearded man, who showed me a lot of gold down below; but what shivering means no one has showed me!" Then the King said, "You have won the castle, and shall marry my daughter."

"That is all very fine," replied the youth, "but still I don't know what shivering means."

So the gold was fetched, and the wedding was celebrated; but the young Prince (for the youth was a Prince), notwithstanding his love for his bride and his great contentment, was still continually crying, "If I could but shiver! if I could but shiver!" At last it fell out in this wise: one of the chambermaids said to the Princess: "Let me bring in my aid to teach him what shivering is." So she went to the brook which flowed through the garden, and drew up a pail of water, full of little fish; and, at night, when the young Prince was asleep, his bride drew away the covering and poured the pail of cold water and the little fishes over him, so that they slipped all about him. Then the Prince woke up directly, calling out, "Oh! that makes me shiver! dear wife, that makes me shiver! Yes, now I know what shivering means!" GRIMM.

Sabbath Reading.

TWO ROBBERS.

F. W. BOURDILLON.

When Death from some fair face
Is stealing life away,
All weep, save she, the grace
That earth shall lose to-day.

When Time from some fair face
Steals beauty, year by year,
For her slow, fading grace
Who sheds, save she, a tear?

And Death not often dares
To wake the world's distress;
While Time, the cunning, mars
Surely all loveliness.

Yet though by breath and breath
Fades all our fairest prime,
Men shrink from cruel Death,
But honor crafty Time.

A HAPPY SUNDAY.

"I AM so busy just now," wrote Luther once, "that I cannot get along without at least two hours a day for prayer." The epigram points American Christians to the true doctrine of Sunday observance. We are so busy as a nation, that we need to guard more jealously than ever one day in the week for spiritual and intellectual refreshment, replenishing and rest.

There is a difficulty of old habit which is a great hindrance to a right and joyful acceptance of the Lord's day. From our youth up, unless we have been educated under exceptional auspices, it has been presented to our view by our religious teachers as a day of prohibitions. "Thou shalt not" has been the motto of the Sabbath: and we have been accustomed to feel that the keeping it holy consisted rather in the putting away of our ordinary occupations than in the energetic taking up of others. This is specially true in regard to children. "You must not play to-day," says the father or mother, glad to rest and read half drowsily the religious paper; forgetting that the time for weariness or for reflection has not yet come to these little bodies and minds, and that inactivity is the sorest trial to a healthy child. "I must not plow or sow to-day," says the Christian farmer to himself; nor does he desire to do so; but in lieu of this his wonted occupation, he does not quite know how to fill up the time not devoted to public religious exercises or private devotions, and gradually he seeks to know what is permissible; how near he may come to his week-day life without overstepping the Sunday-line. The necessary cares of his farm are sometimes a relief from this fear of transgression and uncertainty of thought; and much of the sleepiness of which workingmen complain on Sunday may be traced to the inactivity of mind and body to which they compel themselves by voluntarily turning away from their accustomed work and thoughts.

Hence it comes about that, except with the majority of reverent but not mentally active people, there is a constant striving to come as near the forbidden ground as possible, as if all delights except those exclusively religious were contained in the six days' lawful occupations, and the seventh was to be a time of privation and self-denial. Hence come all those questionings as to reading, walking, visiting, writing letters, etc., which trouble the consciences of Christians, and lead either to an overstrict line of conduct, or to indulgence, under some pretext of health or expediency, in that which conscience disallows. Hence comes the habit of which we have spoken, of making the family cares a sort of parenthetic relief to religious duties; and also a secret dread of the Sunday, and an undefined gladness when it is over.

REPENTANCE is a flower that grows not in nature's garden.

PERSONAL ITEMS.

B. Funnie is the name of a San Francisco undertaker.

The entire number (seven) comprising the Memphis "Sisterhood of Mercy," have died of yellow fever.

It was Artemus Ward who said of the Mormons: "Their religion is singular, but their wives are plural."

Mr. Edison has taken out one hundred and fifty patents. He only considers twenty of them of much importance.

Pierre Soule, grandson of the famous Louisianian, died last week in New Orleans, aged 19. The family name is now extinguished.

Alexandra Louise Olga Victoria is the name of the Duchess of Edinburgh's last baby, the twenty-sixth of the Queen's grandchildren.

Mr. Burchard Hayes, eldest son of the President, has completed his law studies and intends to open an office in Toledo this fall.

Eugene A. Cronin, who enjoyed some notoriety during the presidential count, and who had a very red nose, died at Portland, Or., last Saturday night week.

The report current that Senator Thurman has had an attack of paralysis is untrue. His illness was occasioned by a severe billious attack, from which he is fast recovering.

Commodore Cornelius K. Garrison of New York, aged sixty and worth several millions, has bought a wife—Miss Letitia Willett Randall of St. Louis. She is about twenty-five.

Count Von Bismarck, nephew of Prince Bismarck, the German chancellor, committed suicide at Venice, Italy, the other day with a revolver, on account of physical suffering.

Garibaldi will perhaps be a man of comfortable fortune, after all. He has sold to a company the privilege of quarrying granite on the island of Caprera to pave the streets of Rome.

M. Gambetta is the impersonation of self-poised resolution. He has a large, short, square figure, with a fine head, a Hebrew nose, one defective eye, yet a bright and inquiring face.

Mrs. General Sherman is quoted as saying that her husband first aroused her admiration when at the early age of ten years—"because he caught rabbits better than any of the other boys."

Edison is still going around inventing things. There doesn't appear to be anything he can't invent. People go to him with their troubles and Edison immediately gets up something that fills the bill.

It is said that Peter Mankins, of Washington county, Ark., aged 108 years, eats fat bacon twice a day, has a splendid set of teeth, and is as active as most men of fifty. This looks like an attempt to "bull" the pork market.

Blanton Duncan of Louisville, Ky., who is a Greenback candidate for Governor, travels about his district with a wagon equipped as his desk, a small cannon and some locomotive headlights. When he reaches a place where he wishes to speak, he fires off his gun, lights up and opens the ball.

Ida Greeley, the daughter of the lamented Horace, has a son. The father's name is Smith—Nicholas Smith. But the boy is not to be called Smith. He has been called Horace Greely, jr., and the Smith will not bo added unless the boy takes it into his head to be known as his father's son.

Sir Garnet Wolseley, the English Governor of Great Britain's latest acquisition, the island of Cyprus, who was roundly censured by good churchmen for having the Greek priests perform the religious ceremonies at the cession of Cyprus, has been celebrating the Turkish feast of the Warram.

The son of the Khedive of Egypt has not been permitted to find a royal road to learning. He has lived in London for two years, preparing for the Woolwich examination. Not only was the young man obliged to give himself up altogether to study, but every member of his suite was made to do the same.

The late Colonel Kinloch Falconer, Secretary of State for Mississippi, went from Jackson to Holly Springs, his native town, to help his friends and family in their hour of trouble. His father died, and then his brother, and then he himself was stricken. He served in the Confederate army on the staff of General Joseph E. Johnston.

Among those who have been converted in Great Britain to the Roman Catholic Church during the present generation, are a son of Dr. Arnold of Rugby, a niece of the historian Froude, a sister of Gladstone, a nephew of Whately, a granddaughter of Sir Walter Scott, a grandson of Paley, and a son of Wilberforce and more than a hundred members of noble families.

Bishop Williams used to tell an amusing story of the late Dr. Berrien, rector of Trinity parish, New York. On one baptismal occasion, in answer to the ritual request, "Name this child," the mother who lisped, said, "Luthy, thir." "Lucifer!" exclaimed the indignant doctor, "that is no name for a Christain child; I shall call him John"—and Lucy was duly christened John.

John B. Gough, who is lecturing in England, gets this high compliment from a correspondent of the Liverpool Mercury; "Mr. Gough's oratory is more like a raging fire than a tiny spark. He rushed along through pathos and fun, exhortation and declamation, now shouting, now whisporing, but always suiting his action to his theme dramatically, until he almost took away one's breath. The audience was completely at his mercy. He might before he had finished have said what he pleased to it, so ready was it to respond to him."

S. Augier Chace, one of the Fall River defaulters, while being interviewed recently, was told of the developments in Stickney case. His reply was substantially as follws: "Yes; I expected it. I was strongly urged at my trial to make a full statement, but I remembered a statement of Daniel Webster's, which was that he never shoveled off his walks until it had done snowing. Gentleman it has not yet done snowing."

Dr. Erasmus Wilson, who furnished the money which took Cleopatra's Needle to England, is the son of a Scotchman. His mother was a Norwegian. He is white-haired and pale, and he is a great authority on skin diseases. He says in opposition to some other authorities: "I think good food, properly assimilated, of course, one of the most potent safeguards against diseases of all kinds, and particularly of the skin. Children suffer terribly in this way for the want of being properly fed. Against common diseases I distinctly recommend high feeding.

The Emperor of China has the power of conferring the oldest decoration mentioned in history. This is the Yellow Tunic, which is made of yellow silk and has on the back a dragon, the arms of the Chintse Empire, embroidered in gold and black silk. It is the most distinguished order in China, and is conferred only on extraordinary occasions. Only two Europeans have ever received it—the Englishman, Colonel Gordon, who rendered great service to the Chinese Government during the Taeping rebellion, and the French engineer, Cignel, who built a military arsenal in Northern China,

Garibaldi has a liking for writing letters, and concerning this taste there is told a pleasant little story. Several years ago a poor man came to Caprera, with the intention of settling down there, so as to be near his hero while gaining a livelihood. He asked Garibaldi's advice as to what he should do, as he was somewhat too old for agriculture. The General reflected a few minutes, then said:—"The paper and ink sold on the island are detestable; import from Livorna some smooth paper, some good ink and some fine pens." The man followed the advice and, though no one on the island bought his merchandise except Garibaldi, he got enough by that to live on. Soon after Victor Hugo heard this story and ordered his writing materials from this same man, who is said to be now in very comfortable circumstances.

Trees, Seeds, Plants, &c.

KAKI or Japanese Persimmon
A new and delicious Fruit.

SPECIALTIES: Magnolias, Japanese Maples, Rhododendrons, Hardy and Chinese Azaleas, Roses and Camellias.

An immense collection of Fruits and Ornamental Trees and Shrubs. All THE VERY LATEST NOVELTIES. Price-List FREE. Descriptive Catalogue, 10 cts.

Implements and Machinery.

THE SILVER & DEMING FEED CUTTER
HAS NO SUPERIOR IN THE MARKET.

Celebrated for its great capacity, ease of running, and its adaptability to all kinds of work. Our Power Cutters are fitted with an Improved Safety Fly Wheel, and in the event of iron or other hard substances getting into the feed, the Fly Wheel revolves, but the knives stop, thereby securing safety to the machine and to the operator. Send for Circular giving Prices and full Particulars.
SILVER & DEMING MF'G CO., Salem, O.

THE SILVER & DEMING
Endless Chain Horse Powers

For 1, 2 and 3 horses are the best made. They have steel track rods, wrought-iron links, and for strength and durability are unsurpassed. Our improved Governor regulates the speed perfectly. We also manufacture Draw and Circular Sawing Machines. Send for Circular.
SILVER & DEMING MF'G CO., Salem, Ohio.

OSBORN'S PATENT
GRAIN AND SEED SEPARATOR.

We guarantee this machine to Clean, Separate and Grade, Wheat, Barley, Oats, Rye, Timothy, Clover and Flax Seed. These machines have invariably taken the First Premium at every Town, County & State Fair wherever exhibited, including the St. Louis Fairs of 1874 and '75, and were awarded the Grand Gold Medal at the great Kansas City Exp'n in 1875, for the best Invention in Agricultural Implements.

Keystone Wringer

Has Greater Capacity, Is More Durable, and is better finished
Than any other wringer now made
THE ROLLS
Are made of White Rubber clear to the shaft. No twine or wire or fibrous material, or anything else but rubber being used. The rubber is *vulcanized upon the shaft and cannot be taken off except by cutting it off*. They are more elastic than other rolls because there is nothing but rubber on the shaft, and more durable because there is no twine or fibrous material to rot out or wire to cut the rubber. They are greatly superior to any other kind of roll now known.

AN EARLY CROP?

Well-Toned Systems.

Systems toned and renovated with Hostetter's Stomach Bitters are most effectually defended from disease. That supreme invigorant soon overcomes that distressing feebleness consequent upon ailments which impoverish the blood and relax the muscles. Vigor, appetite, sleep return to the wasted frame, and every physical faculty gains greater activity through its benign influence. Nor is this all, for the Bitters have a most genial and cheering effect upon the mind of the despondent invalid, which is the natural effect of the increased bodily vitality which they produce. Nervous symptoms disappear in consequence of the use of this medicine, and the evil consequences sure to result from a premature decay of the physical energies are averted. Dyspepsia, liver complaints, rheumatic ailments, urinary and uterine irregularities, malarial diseases, and many other disordered conditions of the system, are remedied by the Bitters.

PIANOS AND ORGANS AT FACTORY PRICES. Great Reduction to close out present stock of 300 New and Second-hand Instruments of first-class makers, fully warranted, and at prices that DEFY COMPETITION, for cash or installments. "Pearl" or "Egyptian" Millet. The New Fodder Plant. From a single Seed. Drawn from Life.

Field Crops.

NOTES FROM RURAL GROUNDS

"EGYPTIAN" OR "PEARL" MILLET.

See 1st page illustration, also opposite page for section of seed spike.

We have already stated that a large quantity of this seed was planted at the farm last spring. But it was sown too early and rotted in the ground. Later a few rows were planted here. Though the seed germinated readily, and the plants grew to the hight of a few inches—there they remained so long that while we were in doubt whether they would make any further growth or not, it seemed evident that "Pearl" Millet was a failure, at least with us.

The advent of steady hot weather rapidly changed this state of things, as our first-page illustration will show. This plant grew from a single seed, and is as true to life as our artist could make it. Many of the stems were nearly the same hight, the highest being 10 feet, 1 inch. Three feet from the ground, the circumference of the plant was 13 feet, 9 inches. The weight of the highest stalk, leaves and flower spikes was one pound, two ounces. There were, in all, small and large, 52 stalks, the weight of which was 42¼ lbs.

Several plants were cut down August 1st. The average weight of the subsequent growth was nine pounds per plant. Our first frost, which was very light, occurred while the seed was in the milk. A few seeds upon a few spikes have ripened. As the season has been unusually favorable for the ripening of the seeds, it may be concluded that seeds will never mature in this climate. This, however, is of little moment, since an abundant supply could be obtained from the South.

While, on the one hand, we are naturally desirous not to convey impressions which may lead our readers to waste time and labor upon worthless plants—on the other, we are naturally in haste to introduce to them any "novelty" that, having tried ourselves, we think may be advantageously cultivated. We are arranging to make seeds of this plant one of the set to be offered in our free-seed distribution, though, as even to send a small packet to each applicant would require us to secure a large quantity, we cannot as yet make any definite promise to do so. In case we do, however, all may try it next year upon a small scale, and estimate its value for themselves.

TEOSINTE.—(SEE ILLUSTRATION P. 695.)

Among novelties sent out by Vilmorin & Co., of Paris (France) last year was Teosinte (Reana luxuriana), a fodder plant resembling corn in its stalk and leaf. The accompanying engraving correctly shows the entire plant. Our seed was sown May 15. It was, like the Pearl Millet, slow to germinate and slow to grow until late in summer when the rate of growth was very like that of corn. Oct. 12, after the leaves had been somewhat withered by frost, one of the largest plants was cut and found to weigh ten pounds. It measured five feet in hight and consisted of seventeen stalks. These stalks were thicker, softer, the juice sweeter than those of corn. There were more leaves also and they were broader and more tender. It is a perennial plant in its native home, Central America, where the stalks are cut off and fed to cattle, new shoots again growing from the roots. Those plants which we cut back, made very little growth afterwards. The very large, tender leaves the heavy succulent stalks and their sweet juice and the luxuriant growth of the plant during hot weather, might warrant a trial of Teosinte in our more Southern States.

MILLETS AND THEIR ALLIES.

PROFESSOR W. J. BEAL.

KINDS OF MILLET.

The term "Millet" is applied alone or in connection with some adjective to a great variety of grasses. The word is about as indefinite as the term bilious, or smut, or mold, or pigweed. Sorghum vulgare and its varieties are known as Indian millet, Durra, Doura, Guinea corn, Sweet sorghum, Chinese sugar-cane, Imphee, broom-corn, etc. It is called Dana in India, where it is used for horses, swine and poultry.

The name "Millet," when used alone in this country, has mostly been applied to two species of Panicum, viz: miliaceum and miliare. Panicum miliaceum, or common millet, is a native of Southern Asia. In India it is called Warree and Cheena. Both it and P. miliare are considerably cultivated in Southern Europe and in various parts of the United States, where there are at least two prominent varieties; one known as brown and the other as yellow millet.

USE AND CULTIVATION OF MILLET.

The millets are raised both for their grains and for their foliage. For fodder they should be cut as soon as they are found in blossom and cured in the same manner as hay. In this country millet is mostly raised as a forage or fodder plant. All of the millets and the like, are annuals, and prefer a rich, warm, mellow soil. The seeds, like those of Indian corn, will not grow well in cool weather, but require considerable heat. For this reason millets are not of much use in England. There is no use in sowing the seeds till the ground is well warmed up by the spring sun.

Millet is an exhaustive crop, but with a good season and suitable soil, the yield is often enormous, running up to four or five tons, or more, to the acre. On poor or unfavorable soil it is certainly an unprofitable crop. The seed is usually sown broadcast from twelve to thirty-two quarts to the acre, usually about twenty quarts. It is harrowed in with a light implement. It may be sown with a drill, if it is made to run shallow. The seeds are much smaller than those of wheat, oats or barley; hence they will not bear sowing so deep as will those grains. The tops of Panicum miliaceum, or common millet, are open, spreading and nodding, much like the tops of broom-corn or heavy panicles of oats.

ALLIES OF MILLET.

The genus Panicum is a very large one. Panicum pilosum is cultivated in India as Bhadee, also Panicum frumentaceum which is called Shamoola in the Deccan.

Several of our grassy weeds belong to this genus, as Panicum sanguinale, crab-grass or finger-grass; also Panicum glabrum, or smooth crab-grass, is met with in the Southern States. Panicum capillare is often sold as an ornamental grass, under several different names, such as hair-grass, old-witch grass, etc. It is a common though not a very bad weed all over the Northern States. The tops, when ripe, break off and are blown over and over along the ground for long distances. In this way the seeds are scattered. One of our most prominent and weedy annual grasses abounding everywhere is Panicum Crus-galli,

BARNYARD GRASS, OR COCK'S-FOOT.

This is exceedingly variable in size, color, length of awns, etc. The tops are green, purple, or reddish. The plant appears so different under different circumstances that it is often mistaken by very good botanists as belonging to several species or even to different genera. It grows very fast and becomes large and rank on sandy soil which is moist and well manured. I have often seen horses, cattle and sheep eat it as though they liked it. I have sometimes cut it for hay or to feed when partially cured, always to find that all kinds of grazing animals devoured it with avidity. So far as I know, barnyard grass is always treated with abuse as a weed, an unwelcome plant, an invader. It is a self-seeder, and, in favorable soils, springs up with astonishing rapidity. This thick seeding, abuse and neglect probably tend to make the stalks small and the seeds small and few in number. If I mistake not, here is a grass worthy of some care and thought. It looks as though it was very sensitive to good treatment and would soon turn out to be valuable, if it had good culture and if seeds of the best were annually selected. Who will try it?

Closely related to the genus Panicum and sometimes included as a section of it, is Setaria. There are two of these common all over our country, in fields and gardens, where they are known as pigeon-grass, bottle-grass, fox-tail, wild-timothy etc. These are Setaria glauca and Setaria viridis and more rarely Setaria verticillata. These three are all treated as weeds, though, when young, cattle are fond of them either when green or dried. Setaria viridis looks much like a small specimen of

HUNGARIAN GRASS.

The latter is Setaria Italica or Setaria Germanica. Besides the common name of Hungarian grass, it is also often called Golden millet, Cat-tail millet, Italian millet, Bengal grass, Mammoth millet. The latter name is likely to be applied to specimens which grow in favored localities. In such cases the spikes often grow fifteen or more inches in length. Setaria Italica is a native of Southern Asia and is raised to a considerable extent in India where it is called Kala, Kangnee or Kora Kang. This, like the other millets, grows rapidly and likes the heat. In many cases, the spikes are cylindrical and, at a little distance away, appear to be unbranched On large specimens, the thick branches are more apparent. Some specimens have long, tapering and drooping spikes, others are shorter, broader and club-shaped. A club-shaped spike, reduced about one-third, is shown in figure 2, see p. 697.

Once in a while some lucky man succeeds in producing some sort of millet of extraordinary size; then perhaps he advertises it under a new name, or sells the stock to some seedsman. The Department of Agriculture at Washington sometimes distributes the seeds. This species has sported into many varieties and no doubt by constant selection and care these would soon be as distinct and unlike each other as are our varieties of Indian corn, which now appear as Dent corn, Flint corn, Sweet corn, and Pop corn in numerous varieties. Setaria Italica is more popular in the West than in the East where the soils are generally not so deep or rich. The treatment, uses, quality of seed, and vegetation, as well as the yield, are much the same as in the case of common millet.

Setaria Italica in its numerous forms, has from time to time, in the South and West, had a great run with varying results. Some people like to raise it and have continued its use for years, while others try it one year only to reject it ever afterwards. In 1859 or earlier "American Weeds and Useful Plants" was revised. With reference to this species, the author says that it was "some years ago introduced into Pennsylvania, but it was soon found not to be as valuable as the usual fallow crop of oats or barley. The cultivation soon declined and is now generally abandoned." It is still raised in many places in the West and South.

For reasons which I do not fully understand, the seeds of all millets are usually considered dangerous for horses and cattle. Perhaps it is because the animals swallow so much of the fine seeds without crushing them, in which case they do not digest well. Some men praise millet as safe for all animals. If ground and fed judiciously, I have no doubt it is a wholesome and valuable food for all kinds of live stock. We learn of some who have tried it as human food. They like it, give several recipes for cooking it, and say it much resembles hominy.

ELUSINE CORACANA.

is a sort of crab-grass for which I know no definite common name. Some five years ago, I received seeds from the Kew Gardens. It has grown at the Michigan Agricultural College in small quantity ever since. It grows about two feet or a little more in hight and is quite uniform in appearance. The vegetation is not large, but it seeds profusely. It has matured seed well every year in this frosty country with short seasons, and has had time to spare. It ripens quite evenly.

Figure 3, see cut, page 697, shows the top in fruit, natural size. The seeds closely resemble those of millet in size, color, and taste. The plant is raised in India where it goes by the name of Natchnee, Naglarageo or Mand. It is there raised for the grain and is considered of great value, especially when the crop of rice is cut short.

Agricultural College, Lansing Mich.

GOLDEN vs. COMMON MILLET.

COL. F. D. CURTIS.

We shall be under obligations to the Rural for telling us all about millet. "Experience is a good teacher," so the old proverb says; but, then, it is costly oftentimes. We have found this to be so twice in growing Golden millet. In both cases it was sowed too late and did not ripen the seed before frost came. This year it was put in the same day with the barley—the first of June—and it barely escaped the frost the last of September. We have found out that Golden millet requires, in our latitude, not a day less than three and a-half months to ripen the seed. We are satisfied it will yield nearly double the amount of seed when well ripened over the common millet, or Hungarian grass. When the seed is an important item in the calculation, Golden millet is the best, provided there is time to ripen the crop, and provided the ground is *rich*. If these necessary conditions cannot be met, then the common millet is the most profitable. The latter will mature in two months and a-half and ripen the seed perfectly. The seed is just as good for feeding, but there is not so much of it. It will produce a full crop on poorer land, as the corn-like blades of the Golden and the large, bunchy heads must be fed with a strong soil. This crop is necessarily more exhaustive. Common millet will make as good fodder when cut green, but the Golden, on very rich land, will yield more tons to the acre. If both crops are allowed to ripen before cutting, the golden would be the more desirable for hay. The common would resemble straw and the Golden would be more like a dry cornstalk.

Common millet is a *handy* crop, as it may be sown on patches where other crops have failed, or on spots in meadows where the grass is run out, in which case it can be harvested with the other grass. It is "handy" to supplement a short grass crop any time, and may be sown after an early spring crop has been gathered, and, with its prompt and rapid growth, produce a good yield of forage. Our cattle like the millet, even after it has been killed by the frost while growing, and in this condition it is almost worthless in comparison with that which has been cut green and nicely cured. We have a somewhat shiftless practice of throwing a bundle of millet down on the barn floor and letting the hens pick it out for themselves. This saves the labor of thrashing, furnishes amusement for the chickens and keeps them out of mischief.

The seed of millet is excellent feed for poultry, and when ground and mixed with bran or meal is healthful for stock and will give them the glossy look which oil meal does when animals are fed on it.

Kirby Homestead, Oct. 9, 1878.

EXPERIENCE WITH PEARL MILLET.

Mr. P. W. Hollingsworth, of Los Angeles Co., Cal., writes us that he sowed some Pearl Millet seed sent him by the Rural, in February, and some in April. The former did not come up on account of the cool evenings, he thinks; while the latter came up well, and has made a strong growth. He irrigated a part of it, and that part has seeded well, but the part he failed to water, didn't fill. He thinks, with us, that had he planted it on land having an ordinary amount of moisture, it would all have done well without irrigation. As every farmer should do with all new and promising plants, he intends to make further experiments with it next year. The corn crop, he says, is above an average in most of the county, while the barley is below an average on account of late rains last spring. The fruit crop is good, with the exception of apples, which this year seem to have fared badly even in "the finest climate of the world, Sir," as most Californians claim theirs to be. The Monarch of the West Strawberry, is *the* Strawberry for California, in his opinion, and it could not well have gone farther west to show itself worthy of its name.

THE CHINESE YAM.

S. D. PECK,

Some thirty years ago this esculent, with an additional foreign name, came upon the stage and was planted and experimented upon and joked over as growing down through the earth and clinched on the other side in China—hence its name. [This Yam—the Dioscorea batatas—has a better claim to the prefix, Chinese, than that humorously assigned to it here by Mr. Peck; for it was cultivated in China and Japan long before its introduction to Europe, about 1848, by the French consul at Shanghai. Soon after that it was brought to this country and excited considerable interest for a time.—Eds.] The plant and its culture soon died out for the want of patronage. Some ten years since it was partially resurrected and was advertised by a nurseryman in Indiana, but he claims that it did not pay to raise it for market seed purposes.

In "The Farmer's Book," by C. W. Dickerman, published in 1870, is a particular description of the plant and the best methods of its culture accredited to the "Canada Farmer," from which I make a few quotations:

"It is destined to supersede the tropical and unreliable potato in all northern climates. It is a native of the northern limits of the temperate zone—will endure everywhere the winters in the open ground—produces abundant crops from the fragments left in the ground—will flourish best in the now useless sandy lands—will succeed in any soil except a stiff clay—from tubers which grow among the foliage, the roots attain 10 or 12 inches in length—it is more palatable than the best Mercer potato—much more nutritious than wheat or any other grain—the only vegetable which combines with its other ingredients an ample portion of azote."

Others state that it continues to grow from year to year, and increase in size without any diminution of quality and may be harvested at any season of the year as wanted, that it is not injured by any frosts, that the vines may be trained on stakes or left to trail on the ground.

In the spring of 1877 I was presented with a small Yam freshly dug. It was planted in sections of one to two inches in length, in sandy soil unmanured. After I had given up the idea of ever seeing anything more of the pieces, the young vines peeped through the ground about June, and were provided with eight-foot stakes which they clung to affectionately and were soon at the top looking for a chance to climb higher. This fall, 1878, I essayed to test the growth and edibility of the tubers. The first effort was unsuccessful; I only found a piece of a Yam or root, chipped off by the spade, some 18 inches down. A few days afterwards I attacked another specimen, determined to probe to the bet-if there were any bottom. At the depth of about a foot the stem seemed to detach itself, and by its side was a bud evidently designed for another year's growth. At the base of this were the first branching rootlets, and about a foot further down I came upon the stem of the tuber, averaging half an inch in diameter, and slightly tapering. Below this was the yam, nearly a foot in length, and about two inches in diameter, tapering at each end. Below the upper stem the whole tuber was very tender, and could hardly be exhumed whole.

So much with regard to the growth of this oriental Yam; now with regard to its taste. Well, after baking it, we found it in no way objectionable; the dyspeptic members of the family ate it without fear or protest. *I* said it was like arrow-root and rice, that it needed extra flavoring, and suggested cranberry sauce or currant jelly, and hinted that it should be used instead of potato in making bread. On the whole, I think it worthy of cultivation on light soils. Suppose a vigorous man, living at a distance from market, has company to dinner in the month of June, and his wife tells him that she is without the indispensable potato, just think of the glow of pleasure with which he remarks, as he doffs his coat and seizes his spade, "Well, my dear, luckily there is a substitute always within reach of a good digger."

Muskegon Co., Mich.

The chief use of the Chinese Yam has not been mentioned here by our friend, Mr. Peck; for as our readers know from our references to it on many former occasions, it is far more deserving of cultivation for ornamental than for culinary purposes. The vines run from 10 to 20 feet and have rich, dark-green heart-shaped leaves in the axils of which are produced bulblets smaller than an ordinary pea, from which, as well as from cuttings of the upper portion of the root, the plant is propagated.

Horticultural.

THE STRUCTURE AND FUNCTION OF FLOWERS.

BYRON D. HALSTEAD.

ANCIENT AND MODERN IDEAS OF FLOWERS.

THERE are perhaps no objects in nature which have received more attention than flowers. They are the emblems of purity and beauty, which cheer the sick, gladden the hearts of the sad, give the last touches of charm and beauty to the bride, and fall as the fitting tribute of love upon the coffin at the open grave. The part flowers play in the culture and expression of the finer nature of man we all know full well, and we must not pause to dwell upon a subject which has been the theme of admiration and poetic praise since the world began.

If we could present the ideas of the nature of flowers, which have been held by great scientific men in the successive ages of the past, we would have one of the best illustrations of progress in human investigation and evolution in human thought. Not long ago flowers were considered as parts of plants for decoration only. Even Linnæus, the great Swedish naturalist and the acknowledged Father of Botany, of whom it has been well said: "He was one of that handful of men whose appearance in all ages of the world has marked an era in philosophy—one of those human land-marks whose personal history is the history of science"—even he, living only a century ago, held to the idea that the calyx of the flower was the outer bark, the corolla the inner bark, the stamens the wood, and the pistils the pith of a floral stem.

In this transformation of parts we see the first glimpse of that idea which was soon to dawn as bright and clear as a cloudless morning in June. This was the advent of the full conception of *Morphology*, born of one of Germany's greatest poets, Goethe, and set forth at length in his immortal work, "The Metamorphoses of Plants." Goethe reduced all parts of plants to *leaf* and *axis*, and showed that all organs, whatever they may be, are but these shaped and adapted to the functions they are called upon to perform. It was not until nearly a century later, upon the publication of Darwin's work on the "Origin of Species," in 1859, that the law of morphology came boldly to the front, and was so clearly and thoroughly presented that it at once commanded and received the attention of scientific men. Before this, the students of nature had been toiling for ages in accummulating facts, and now a theory was given founded on those facts as viewed in the light of the law of morphology

—the key, by means of which every variation of form, however remarkable, every deviation from type, however wide, every abnormality, however apparently capricious, may be referred to a common and well-known elementary standard by contrast with which its deviations may be measured and its abnormality explained.

It is in the comparison of parts and a careful study of the relations which they bear to each

other, and the special purpose which each modification subserves, that the most interesting and ennobling study lies. With these principles before us let us consider

THE FLOWER IN A STRUCTURAL POINT OF VIEW.

In a complete and perfect flower, like that of the Lily, Apple or common flax (Fig. 1), we have an outer whorl, with its separate or united parts, as the case may be, doing the duty of supporting or protecting the parts within. It is often of a green color, and thus shares with the ordinary foliage the important work of assimilating food for the growth of the plant. Next within is the *corolla*, with its usually conspicuous *petals* or *lobes*. Within the corolla is the next whorl of organs, the *andrœcium*, made up of the stamens, the male organs of the plant. At the center, surrounded by the calyx, corolla and andrœcium, is the *gynœcium*, consisting of one or more pistils, the female parts. These four parts, which are shown in section in a flax flower, in fig. 1, make up what the child as well as the botanist recognizes at once as a flower. But what is the nature of these strangely-formed and highly-colored parts? If all parts of plants are reduced to leaf and axis, our flower must be one or the other, or a combination of these two. In an ordinary stem, as any which we might cut from an apple or willow tree, we find there is an axis—the stem, with certain expansions upon it—the leaves. The axis may be long and the leaves widely separated upon it, as in a twining hop vine; or it may be reduced to the shortest possible length, and hid from view by the numerous closely-packed leaves upon it, as in the house leek, lily bulb, or any stem while it is in the bud condition. In every flower there is an axis, however short, upon which the floral organs are borne. It remains to be seen that these organs are leaves. There is no doubt about the calyx; in general it is leaf-like in shape and function. The petals are "the leaves of the flower," but are usually of other than a green color. But many true leaves have bright colors, as those of the Coleus, Poinsettia and many other common greenhouse plants. The true leaves of the Pitcher-plant and Venus's Fly Trap, are more curious in shape than almost any petals.

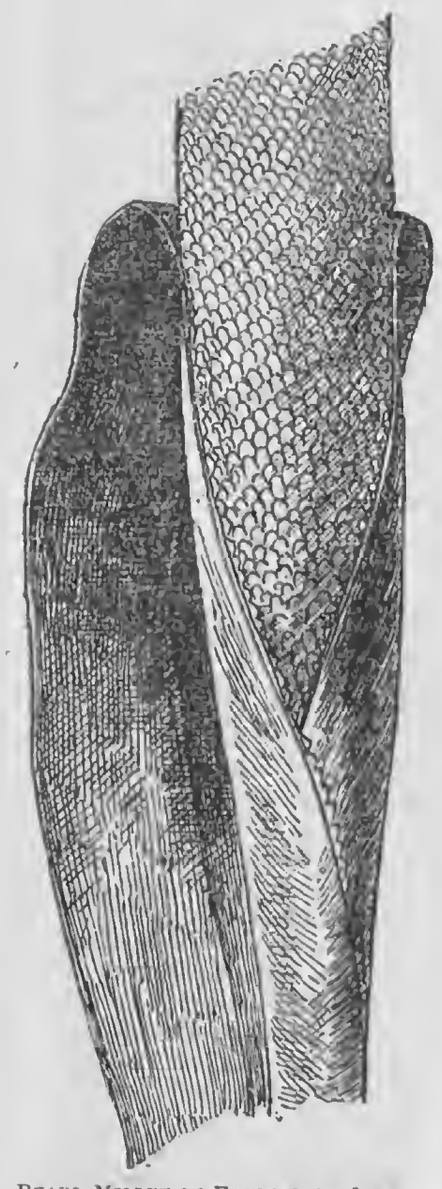
The sepals and petals are leaves; but how as regards the stamens? The cases are numerous where we find all gradations between petals and these male organs of the flower. The white Water-lily illustrates this in nearly every one of its large, showy flowers. (Fig. 2, a). Under cultivation many species "double"—as the gardeners say—and this is done by stamens changing back into petals. The Fuchsias often give fine illustrations of the plasticity of these organs as they are molded by the hands of man. Stamens are but changed petals, and petals are leaves. In the same way we can see that pistils are also leaves. Fig. 3 represents two regular leaves *a*. and *d*. and two simple pistils *b*. and *c*., and it is scarcely necessary to add that a leaf with its edges folded in and united, makes the ordinary female organ of the flower. Monstrosities are often found where, from some unknown cause, ordinary leaves have taken the place of pistils, showing that the pistils have reverted to the simple element from which they had been differentiated. We thus arrive at the structural nature of a flower through the study of comparative morphology, and express our result in the following terms: A flower is a metamorphosed axis, with its metamorphosed leaves.

We now come to a consideration of the

FUNCTION WHICH THE FLOWER FULFILLS

in the economy of the plant. Functionally a flower is a structure by means of which one plant individual acts upon another for the production of a third. In the elaboration of this theme we must see, in the first place, what is understood by the term individual, as used among plants. Among the higher animals the conception of an individual is clear and well defined. With lower animals such is not the case, where, as in the corals, many individuals remain attached to each other through life, and exist as a community of individuals. Among plants the unit is often still more difficult to determine, and upon this point some difference of opinion is still held. Some have considered all that results from a single seed as a single individual, but this would make all our Weeping Willows an individual, because they are propagated entirely by cuttings in this country. Likewise each variety of fruit which is propagated in like manner, is but a single individual, though there may be millions and millions of trees. Another view, and the one generally accepted is, *that a plant unit is that smallest part which, in general, will live and grow when separated from its former place in a plant community, and given the fitting conditions for growth by itself.* To such a plant individual the term "phyton" has been given, and it consists of a node with its leaf and bud and internode. A cion is often such an individual. The gardener divides his young branches of Verbena, etc., into these phytons, and places them in moist sand, where they begin an independent existence. With this view, a tree or shrub is a community of individuals, each one of which is joined to, and in great measure dependent upon, those around it, and often assigned some particular office in the combined labors of the community.

It is not difficult for us to carry our idea of a plant individual to the flower which we have previously seen to consist of simply stem and leaves—a stamen with its portion of the stem is an individual and the same with the pistil. Fig. 4 represents the division of a plant into its

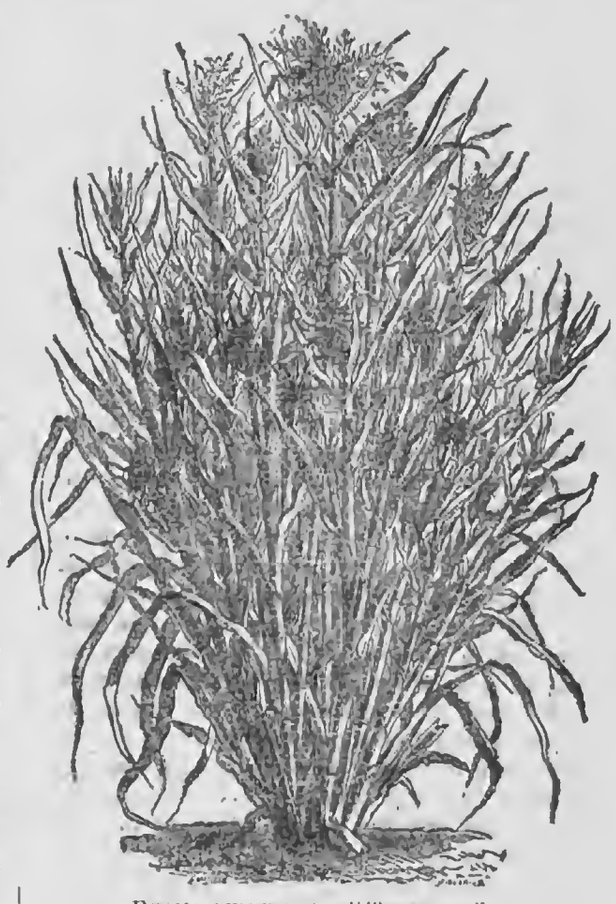


PEARL MILLET IN FRUIT FROM LIFE.

phytons, the upper ones of which are floral individuals. We have said one individual in the flower acted upon another for the production of a third. The staminate leaf is one such individual—the male—which acts upon the pistillate leaf—the female—to produce a new individual—the seed.

HOW THE SEED IS PRODUCED

is the question for us now to consider. The stamen has a work to do widely different from that of exposing a large surface of green to the air and sunshine; so that the cells beneath the epidermis of the anther, in place of containing chlorophyl grains—those bodies which give the green color to vegetation—have pollen



REANA LUXURIANS—"TEOSINTE."

grains. Figure 2 shows a part of an ordinary leaf above and a portion of anther below. These pollen grains represent the male element in flowering plants and consist of small roundish masses of protoplasm (Fig. 2, *c*, *d*, *e* and *f*,) provided with two protecting coats of cellulose, the outer often beautifully marked with bands and spines. This pollen is the "fertilizing dust" of flowers, and, when mature, escapes into the air through a rupture in the anther sacs. The production of these pollen grains is the aim and end of all stamens, and when this is done, they wither away and soon cease to be.

The pistil is a specialized organ also, consisting, when of a simple form, of a single leaf, with its edges folded in and united, thus forming an inclosed space called the ovary, above which the leaf is prolonged into the style and terminates in the stigma. Along the infolded edges of that portion of the leaf which makes the ovary, small bodies are produced which have received the name of ovules. Each ovule is an outgrowth from the leaf-edges, and consists of two coats of cellular tissue, not quite inclosing a mass of cells, within the central one of which is the *embryo sac*, which contains a little globule of protoplasm, the *embryonal vesicle*. (See Fig. 5.) This is the female element of flowering plants. Pollen grains and embryonal vesicles are thus the sexual elements. The pollen grains are small masses of highly endowed protoplasm, formed from the central cells of staminate leaves, which, by the breaking away of the surrounding membrane, are *set at liberty* from the male phyton which has produced them. The embryonal vesicles are also peculiarly vitalized masses of protoplasmic matter borne in the center of protecting layers of cellular tissue, and are *not* set free from the female individual which produces them.

SEXUAL ACTION IN FLOWERING PLANTS

consists in the union of the contents of a pollen grain with that of an embryonal vesicle, and is called *fertilization*, and is brought about, first by transfer of the pollen from the anther where it is produced to the sticky, receptive surface of the stigma—pollenation—secondly, in the growth of a tube from the pollen grain, down through the style to the embryo sac, where the contents of the grain—by means of the tube—pass by osmose, or membrane diffusion, into the female cell. It is, then, through this portable mass of protoplasm that one plant individual acts upon another for the production of a third. This third and new individual is the embryo plantlet which develops from the embryonal vesicle which has been stimulated into new growth by the pollen grain, whose contents have mingled with its own, and when the proper time comes the little individual, provided with food and protection, is thrown off from the parent community to begin a new colony and thus continue the species. The end of the flower is the seed; and the essential organs in the production of the seed are the stamens and pistils. The end of the seed is the beginning of a new community of plant individuals, all working together for the same common end—the production of new seeds.

And thus seed time and harvest do not fail, and the cycles of life move constantly forward.

The Apiarian.

HINTS TO INEXPERIENCED BEE-KEEPERS.

O. O. GEORGESON.

THE honey-gathering season is past, and the surplus honey sold or stored away for future use. So far the inexperienced bee-keeper may have met with but few difficulties in the management of his stock, and encountered little or no loss.

The most perplexing problem that now presents itself to him for solution is how safely to winter his bees, so that in the spring they may come out healthy and strong, ready for another season's work. This is a question that often proves a stumbling-block to the inexperienced, and one in which a mistake will be most severely felt. Yet, it is not at all a difficult matter if a few necessary precautions are observed, and of these I will first mention the necessity of keeping the colonies strong.

Strong colonies are to be preferred at all times, in the honey season as well as during the winter. It is from these that a good yield of honey is expected, and, other circumstances being equal, they endure best the inroads of robbers, disease and injudicious treatment. Weak colonies stand but a small chance of passing safely through a severe winter. The bees are few in number, and if the temperature should sink rather low, they are more likely to suffer than those in a strong colony, especially if they have not been breeding as late as the beginning of October. Late breeding is of importance; it not only indicates the prolificness of the queen and the general vigor of the colony, but as bees live but from three to seven or eight months, according to the season, it supplies the colony with active bees for spring work.

If for any reason there should be several weak colonies in the apiary, it is better to unite two or more into one colony, before preparing them for winter, than to run the risk of losing all before spring. This may be safely accomplished by daily bringing the hives a few feet nearer to each other, till they stand side by side. Then, on a pleasant day, find the queens of both hives, remove the poorest one, and empty her bees into the other hive by taking each frame and holding it over the colony whose strength it is desired to increase; give it a sharp jerk so that the bees fall off, and with a brush remove the few that still adhere to the comb. They may perhaps fight a little at first, but by smoking them with rags or rotten wood, with a few pieces of onion added to the fuel in the smoker, the hostility will soon subside.

In preparing for winter, which may be done now on any pleasant day during October, give to each colony thirty pounds of good capped honey; on a less amount they will be in danger of starvation, while more than this will be superfluous. Pack the frames rather close together in the hive, and to facilitate communication from frame to frame, make a hole of about half an inch in diameter in the middle of each comb. Put a division-board next to the frames; cover with a piece of quilt or thick cloth, ready for the purpose, and fill the vacant space in the hive, if any, with clean straw. Thus prepared the hives can remain at their places till cold weather sets in, when they should be brought to their winter-quarters.

Any dark, quiet room or cellar, free from dampness, and where a temperature of between 35° and 45° to 50° can be maintained, forms suitable winter quarters. It may not always be possible to command such a room, but the nearer these conditions can be approached, the better. Here, store the colonies as closely together as convenient, and if they continue healthy through the winter, let them remain undisturbed till the warm days of spring again call them into activity. *Do not let the temperature rise above 50° F.* if possible to prevent it. Above this temperature the bees become restless, eat more than they otherwise would, and are very liable to get dysentery. The presence of this disease may be known by a continual loud hum and noise in the hive, and, after a while (mostly when it is too far gone to be cured), a repugnant smell on opening the hive. If this disease should set in, choose the first warm and pleasant day in which to remove them to their old places in the apiary, that they may enjoy a cleansing flight, and of course, bring them back again at night. On the other hand, if the temperature should sink much below freezing, ice may be formed on the comb and prevent the bees from getting to the honey, and they may die from the combined cold and starvation.

In lieu of such a wintering place as that above-mentioned, other methods may be resorted to. Each hive may remain at its place, and a box, about two feet longer each way than the hive, nailed together of rough boards and supplied with a movable, slanting cover, may be placed around it. Then pack the space between the hive and box with chaff or straw, and secure the cover from blowing off. To permit flight when desired, let a wooden tube lead from the entrance of the hive to the outside. This method has been successfully employed here at the college; and if the colonies are strong and the place somewhat sheltered from the fierce winds, as the apiary always should be, such covering will be sufficient in all ordinary winters.

Another method, which has also been successfully tried here, is to bury them in the ground. To this end, dig a hole in a dry, sandy spot, about three feet deep, and of such lateral dimensions as the case may require. Put some straw in the bottom, on which place the hives close together, and pack with clean straw all around the sides and top. For the admittance of air, let a small tile lead from the hives to the top of the heap. Cover all with a layer of dirt sufficiently thick to exclude the frost, and they will remain safe till spring. For obvious reasons it is of importance that the place should be dry and the ground sandy, so as to allow free passage to any moisture that might gather from atmospheric precipitations. The hives should not reach above the level of the ground, nor should they be placed on top of each other, as the bees in the upper ones may get too warm, suffer from dysentery, and die.

During the winter, mice are sometimes troublesome guests in the apiary, especially if the hives are surrounded by straw in which they can harbor. The best preventive is to have the hives so tight that they can gain no admittance. For the sake of ventilation, it is not well, however, to have the entrance closed air-tight. Therefore, fasten a piece of wire gauze over the entrance of the hives that may be in the cellar or that are buried in the ground; this will exclude mice and admit air; and over the entrance of hives, that are covered with boxes, as mentioned above, fasten a piece of tin about a quarter of an inch above the bottom board, so that the bees can just pass under the edge of it, while the mice are excluded. The ordinary dangers, then, to which bees are exposed during the winter, are starvation, mice, too much cold, too much warmth, or, as in the case of weak colonies, they may die a natural death, and from sheer lack of young bees the hives may in the spring be void of life. But if the inexperienced bee-keeper will follow the above hints, he need not despair of wintering his bees successfully.

Michigan State Agricultural College.

The Garden.

CALIFORNIA SMALL FRUIT REPORT.

THE STRAWBERRY.

OF all the small fruits none is more popular with the masses in California than the strawberry. The season just passed has been a beautiful one and very productive. The crop of strawberries was unusually large, and at all times brought remunerative prices.

In the strawberry there have been more improvements made perhaps both in regard to quality and size than in any other kind of fruit. Our growers are beginning to realize this, and during the past season have more or less extensively experimented with the newer and greatly improved varieties. These experiments have pointed out most distinctly that varieties which are most successful in one locality are entirely worthless in another, making an imperative necessity for local selections. Another lesson which the observing grower has learned is, that varieties from one locality do much better than the same varieties from another section; thus, a plant of Monarch of the West from Southern Ohio, will grow more luxuriantly and bear earlier and more abundantly than a plant of the same variety from northern or middle New York. It would be well for intending growers to experiment in this way in order to learn from what section to get their supplies. As to

VARIETIES,

I can only report those which have proved worthy of culture in El Dorado County.

THE PROLIFIC is the standard variety throughout the State. Where irrigated and well cultivated, it produces abundance of large, rich fruit. In my grounds it commenced ripening in May.

THE MONARCH OF THE WEST is one of the most promising varieties here. It bears large, rich fruit in abundance; bears for a long season, not as constant as Prolific.

THE PROUTY'S SEEDLING will doubtless be in a few years a leading variety. It produces well, bearing abundantly large, rich berries. When irrigated, it bears from May to November. The fruit is a bright red, delicious in flavor, of good size and a fine shipper. One thing that is absolutely necessary in a good strawberry is, that it should be firm and sound in order to insure good shipping. This quality the variety under consideration seems to possess in a high degree.

BOYDEN No. 30 is a very fine variety, bearing abundantly, but not as constantly as Prouty's. The fruit is of good color, size and shape, moderately firm and a tolerable shipper. We have many other varieties, including the Colonel Cheney, Great American, and other highly recommended sorts, but I cannot as yet speak of their desirability for our section. If I were planting an acre of Strawberries, two-thirds would be occupied with Prolific and Prouty's Seedling.

The Poultry Yard.

POULTRY NOTES.

FOR the past eleven years I have been interested in everything I have seen printed about poultry, as I have been anxious to learn the best method of keeping fowls, and whether a farmer could make any profit from a stock of 100 or 200 hens. I have come to the conclusion that, according to the nearly unanimous verdict of different writers, there are few things from which a farmer can derive so large a profit with so small an outlay, as from a flock of fowls of the right breed, properly treated. I have kept from 25 to 60 birds in order to ascertain by experiment which breed was the best and would yield the largest profit. My conclusion is that farmers can do much better with good common hens, with some good-blooded cock, than with a flock of fancy fowls. A good cross among poultry is as valuable as among stock. One of the most profitable kinds for a farmer is a cross between the Leghorn hen and a Poland or Brahma cock. Their progeny are good layers, nice for the table and profitable for market. The White Leghorn is the most profitable breed for eggs; they need a little more care than some other sorts, but care of poultry pays.

In order to secure a profit from fowls, however, a few conditions are essential. First, every farmer who keeps hens should build a hennery for them, so arranged that it can easily be kept clean and well ventilated. In winter the temperature in it should be warm enough to prevent it from freezing—say from 45 to 60 Fah. A supply of fresh water therein is of great importance; hens drink often if they can get water. Ground feed is best when eggs are wanted. Corn and wheat middlings form an excellent combination for food; but meat should be given them, by way of a change, once or twice a week, if not oftener. With a large flock of fowls this is essential. Nests should be made of bright straw instead of hay. Hens are pleased with a neat place for depositing their eggs, and appreciate good care. Hens receiving proper attention will give a net profit of $1.50 to $2.00 a year each until they are four years old. Clam shells are excellent for making egg shells. They should be burnt, pulverized and kept in the hennery at all times, especially in winter.

Miscellaneous.

GARDEN TALKS AND WALKS.

RENOCLAF.

THE BEECHES, Mass., Oct. 14th, 1878.

COLD-FRAMES.

MOST people know what these are and how easily and cheaply they can be made, how readily they may be moved about as desired, and the many precious plants we can winter in them better than elsewhere. Plants suitable for cold-frames should be planted out rather than kept in pots, and in this way they will grow more stocky and robust, flower longer, and need less care as regards watering and covering up. Sashes should be used to cover the frames, and in the event of severe weather, Russia mats, straw mats, wooden shutters, or loose straw may be placed over the sashes as additional protection. Snow is a first-rate protection, but should never be left on the sashes after it begins to thaw.

WHAT TO PLANT IN FRAMES

is now in order. First throw out some of the old soil, and fill up to within ten inches or a foot from the sashes with fresh loam, some very old manure, and leaf soil, if to be had; and if that be not free and open enough, add some sharp sand. Then plant Pansies, Violets and Daisies to blossom in winter and spring, Christmas Roses for January, Alpine Cyclamens for February, Anemones and Polyanthuses for spring, and such other early-flowering beauties as we can conveniently get and find room for. Besides, we want frame winter protection for a number of biennials for next summer's flower garden: for instance, Snapdragons, Wallflowers, Canterbury Bells, Centranthus ruber, etc. And, again, there is a number of unreliably hardy perennials that are better wintered in frames and transposed to the open garden in spring: for example, Plumbago Larpentæ, Verbena venosa, Liatris elegans, Vernonia Lindheimera, and many others. True, in many places these are quite hardy, too, and in some seasons and under some circumstances they may survive the winters unscathed in localities where, were they growing under different circumstances, they would be winter-killed. Many hardy plants, as Winter Aconites, Jonquils, Blue Squills, and the like, are often grown in frames, but when these are perfectly hardy out-of-doors, I cannot see the economy of such tender nursing. How to take

CARE OF PLANTS IN FRAMES

is of great importance. Do not let heavy rains and snow fall on your Pansies, Violets and other plants you have set out for spring-blooming, but at the same time be careful to ventilate freely, day and night, on fine weather; remove the sashes altogether in fine days, replacing and tilting them up at night. As regards the annuals, biennials, and perennials planted in frames merely to carry them through the winter, let them have a good deal of rough weather and frost from now till Christmas. Protect them from heavy rains, but at the same time tilt up the sashes or cover at back and front. Do not protect them from slight frosts, either by day or night; in fact, for a couple of months to come they may remain perfectly exposed, unless a severe frosty snap or two will come, when, of course, protection should be given.

LEAVENWORTH'S ERYNGO.

Talking of grasses and everlastings for winter bouquets, in a late number of the RURAL, I see there is no mention of this beautiful plant It is a Texas annual. We treat it like stocks or Asters, and now, when almost all other hardy plants have done blooming, its branches are laden with brilliant deep-purple flower-heads and involucral bracts, and the stems, too, have changed to the same color. But their great merit is their "everlasting" nature. Cut now, they retain their beautiful coloring all winter long, and their branchy habit and odd-like flowers being so distinct from the ordinary winter-bouquet stuff, they are quite a desideratum. Besides, like rosy cheeks, they are nature's coloring, that no dye can imitate. I do dislike dyed grasses or flowers. They are deceit. Give us nature and purity.

[We are in hopes to be able to offer this as one of the varieties of our Free Seed Distribution to be announced next week.—EDS.]

COOKING.

MRS. V. F. K., p. 656, Oct. 12, asks some of the RURAL ladies to furnish a good reliable recipe for Boston Brown Bread. Well, I am not a lady, but for the love I bear the blessed creatures, perhaps they will pardon me if I report from headquarters. Every Sunday morning, in true Boston style, we have brown bread and baked beans; we cook them at home, and as follows is just how we make our

BOSTON BROWN BREAD.

Use one quart of Indian meal, half quart rye meal, and quarter quart of wheaten flour; add a little salt, and barely a cupful of molasses. Raise it over night with yeast. Mix it soft with warm water in cool weather and cold water in summer time. Add a little saleratus in the morning before baking. Bake in an earthen pot or tin pan—most people use the earthen pots. Bake slowly.

Our women folks say you will not be likely to succeed well till after two or three attempts. I never cared much for brown bread, but I do like what we call

FRENCH TOAST.

Cut some white bread into one-half or one-third inch slices, then beat up some eggs with a little milk and sugar added, dip both sides of the bread in this, and dust on some powdered cinnamon. Then fry the slices till slightly browned' taking care to have the frying-pan hot and well larded before putting the bread into it.

These are not book recipes, but written to practical dictation.

THE TRUTH ABOUT IT.

[UNDER this heading, a number of articles have been prepared by able writers. These will appear from time to time. Their object is not at all to deal with "humbugs"—but with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

POPULAR ERROR ABOUT CHESS OR CHEAT.

THERE is rarely a generally popular delusion that has not some truth at the bottom of it, or some truth has been the seed from which it has sprung. One of the most popular delusions of the agricultural mind is that wheat or other small grains change their character under some circumstances, the former producing chess or cheat; and oats, among the latter, producing barley. Recently, as might have been expected from the constant wheat-growing in California, chess has begun to abound everywhere, and this weed is so prevalent as to give occasion to considerable popular excitement. The old idea has revived, and has gained such strength that men who seem to be otherwise well-informed, are insisting that the prevalent chess is degenerated wheat. Now, it is useless to argue with men who will believe that one plant, by reason of untoward circumstances, will change into another as different from it in its structure as an apple tree from a rosebush or a blackberry; or as different in character as a sheep and a goat. But the idea has become fixed in men's minds because the growth of a plant from a seed is something that is invisible to them in some cases, and they do not realize that no living thing exists that has not been derived from a seed, an egg, or some other similar source of

germination. There are men who believe very firmly that weeds are *natural* to the soil and grow spontaneously; and others, that potato beetles and other insect pests *are sent* and come and go by some mysterious dispensation. Now, as regards *cheat*, the origin of the delusion seems to be that the true cheat is merely an abortive or degenerate grain produced by plants diseased and stunted by the attacks of an animalcule known as Vibrio tritici. Instead of the plump grain expected, a shriveled, chaffy abortion, called "drips" by some, is gathered and this has been known as *cheat* for centuries past in England. Here is the basis from which the prevalent error has sprung, and anything that has had the appearance of the blasted grain, has come to be called cheat or chess, which are synonymous. To look into the origin and nature of things is necessary to the discovery of error, and if farmers could only study a little of the botanical character of the grasses, they would easily discover the truth of this matter.

H. S.

INFECTIOUS ROOMS.

Our correspondent, Mr. S. Rufus Mason, writes us that he is just recovering from a very dangerous attack of typhoid fever, and a knowledge of the way in which the disease was contracted may be a warning to others against exposing themselves to infection in places where the air is vitiated by the germs of putrefaction, whose presence is often indicated by offensive odors.

COMMON MILLET, (PANICUM MILIACEUM) AFTER FLINT.—(See page 694.)

In the latter part of August Mr. Mason was called to an old friend and neighbor to write his will. He was dying from an abscess in his side, of a most offensive character, which had already commenced to mortify. The stench was intolerable. He was in a tight room, only six by eight feet, with no ventilation, while the thermometer was at 84°. For two hours the visitor was shut up with him, and nearly fainted before he got through, but afterwards he thought no more of it. On the first of September, however, he was stricken down with the fever, confined to his bed for over three weeks, and, as stated above, is now slowly recovering.

WHAT OTHERS SAY.

TO RELIEVE CHOKED COWS.—In the always interesting proceedings of the Elmira Farmers' Club, as efficiently reported in the Husbandman, we find the following:—"My way is to open the mouth of the choked animal and insert a clevis wide enough to keep the jaws distended, and give space for the passage of a boy's hand. I hold the clevis in place, while my boy passes his hand through and picks out the apple or other obstruction. Any boy whose hand is small enough to pass without crowding, can easily remove the trouble with entire safety. I have tried to do it myself but my hand is too large. There is no difficulty or danger if the clevis is firmly held in position."

Another member said that an easy way to bring relief is to cause the choked animal to jump over bars as high as may be leaped with considerable exertion. It never fails to eject the offending substance or cause it to pass downward. He had tried it many times, always with success.

FIG. 3. ELUSINE CORACANA, (FROM LIFE.)

PROGRESS OF THE PHOSPHATES.—Professor Caldwell remarks on this subject, in the Weekly Tribune, that Mr. Lawes, whose name is as familiar a household word among English and American farmers as Liebig's, was the first to manufacture superphosphate on a large scale, and offer it in the markets as an article of trade. In 1858 he made 12,000 tons, procuring the raw material from beds of mineral phosphate in England owned by himself, from Norway and Sweden, and from bones imported from America and Germany. In 1870 the product of his manufactories amounted to 40,000 tons. In 1872 he retired from the business, and his extensive works were purchased by a company with a capital of about $3,000,000.

In another part of the article he says that Georgia is now the banner State of the Union with respect to the consumption of commercial fertilizers; and the State Government has set an example that might well be followed by other States in the older parts of the country, in the enactment of laws for the protection of consumers from fraud, and—what is often quite as important as the enactment of laws—in making liberal appropriations for carrying them into effect.

FARMING IN ENGLAND.—"Our local weekly papers teem with advertisement of sales by auction of live and dead farming stock, and it is interesting to read the "why and wherefore" of such and such sale. Some are relinquishing business, some going to a far-off country, others declining farming, and others speak of their tenancy expiring; and some we know of, have failed in their business, broken their covenants, and, if reports be correct, have not paid their last year's rent yet. It is no manner of use people going into farming if they have not got capital at their back. The tight-screw principle or make-shift system will not pay. We have before our eyes two fields of turnips very near to each other on the same side of the road we travel along; one is tenanted by a well-to-do farmer, who has mucked and worked his land well before sowing, and there is a good crop. The other belongs to a poor farmer, who cannot afford to buy manure, and is very nipping with labor, and consequently has only half a crop."—*London Ag. Gazette.*

ORIGIN OF THE JERUSALEM OR SUN-FLOWER ARTICHOKE.—A correspondent, J. J. Miller, Kansas, U. S., in the RURAL NEW-YORKER, writes:—"I am not wise enough to decide who invented the Jerusalem Artichoke, but this I can say, and vouch for, that it is found growing wild in abundance on the banks of the streams in this section, where none has ever been planted, where the virgin soil has never been touched by plow or any instrument or implement. They were here when the first white man arrived."

The Town and Country Journal, of Sydney, Australia, commenting on the above, says:—"The plant is indigenous to Brazil. How can Mr. Miller prove that it was found or existed before the advent of Europeans? He cannot have studied geographic botany."

[The editor of the above journal is mistaken. The Jerusalem Artichoke did not come from Brazil, but probably *did* originate in the Mississippi Valley from a species of Sunflower, Helianthus doronicoides, which there grows wild.—EDS.]

AN INTERESTING HYBRID CONIFER.—In his private garden at Verrieres, says the London Chronicle, M. Henry Vilmorin has, among other choice coniferous trees, an interesting and very handsome hybrid Conifer, obtained from a cross between Picea Pinsapo and P. Cephalonica. We do not remember at the moment which was the seed-bearing parent, but whichever it may have been, a dozen cones were fertilized. Of these, only one "set," and in this there was only one fully developed seed, which gave birth to the plant in question. The specimen, which measures eight feet in hight and as much in diameter of branches near the ground, is thickly furnished, differs from both its parents in the arrangement of its leaves, and promises to make a distinct and noble-looking tree.

"IMPORTATION OF AMERICAN CHEESE," the London Gazette states, "is growing, and appears to grow in spite of our low prices, which alone, however, can be trusted to check it. The pinch thus given us will be felt more and more. Let us hope that it will stimulate us to a greater attention, carefulness, and skill at home. In the contest of qualities those which are good will obtain a sale, and the inferior sorts will be more and more absolutely refused as the quantity of the latter increases in the market.

If our English dairies would, as they might, turn out the higher qualities alone, the American importation would be nowhere in competition, and we should be saved."

PERSONAL GENEROSITY, says the Town and Country (Australia), needs undoubtedly to be exercised judiciously, but when so exercised it is worth all the other generosities in the world. The man or woman who will take a fellow-creature by the hand and assist him to rise out of the mire into which he may have fallen, or stands by the sick and suffering, and with tender care and loving words softens their anguish, performs an angel's part. Would there were more who did this! There would be little need for big institutions and their long lists of subscribers who never, from year's end to year's end, enter the building they maintain.

FULTZ WHEAT.—The American Miller thinks this is the best variety now in the market, and if properly farmed, it will yield on an average equal to any wheat in the country. Many farmers claim 40 bushels per acre this season. It has a stiff straw, and does not lose any grain in handling, and when cut, will lie compact and take up less barn room than any other variety of wheat. It will weigh 64 lbs. per bushel, if clean; it always sells readily for the highest price, and the flour manufactured from it has no superior.

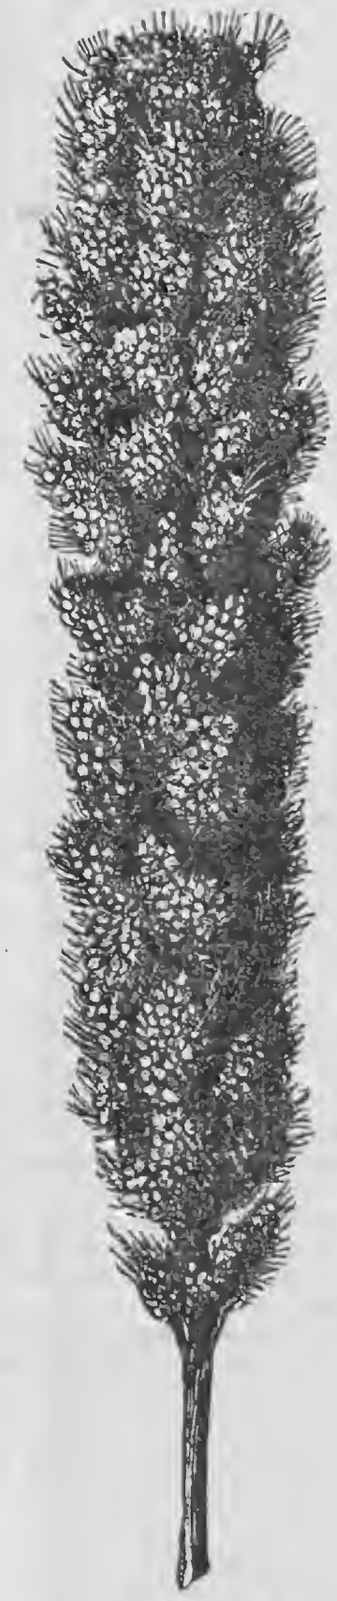

FIG. 2. HUNGARIAN GRASS. (SETARIA ITALICA) FROM LIFE.—(See page 694.)

POUNDS TO THE BUSHEL.—Blue Grass, 14; Oats, 32; Hemp Seed, 44; Timothy Seed, 45; Castor Beans, 46; Barley, 48; Flaxseed, 56; Rye, 56; Shelled Corn, 56; Onions, 57; Wheat, 60; Clover Seed, 60; Salt, 75; Corn on the Cob, 75.

"UNLESS prices take a turn before another season, many makers of second-class English cheese will turn their attention to something else."—*London Farmer.*

THE Western Rural says that the game the lightning-rod men play is, "Heads I win—tails you lose."

Dairy Husbandry.

FARMERS "BEARING" THEIR OWN MARKET.

T. H. HOSKINS, M. D.

FARMERS have complained bitterly of the effect of the oleomargarine manufacture upon the price of butter, and there is no doubt in regard to the fact that oleomargarine has killed the market for cheap grades of dairy butter. It is, in fact, a *sin* to convert good milk into poor butter or cheese, and we should all be glad when any sin becomes plainly unprofitable. The thing to be done now is to learn how to make good butter, and *make it*, or quit dairying for some business requiring less skill, care and neatness. "Scrub-farming," of all sorts, is getting very unprofitable in this new era of small margins, and the result will be such improvement in agriculture as comes from the pressure of dire necessity—a force of far greater potency than the persuasive voice of the agricultural editor, charm he never so wisely. The "root-hog-or-die" principle is being applied to a good many of us in these days, and as necessity is the reputed mother of invention, it is possible that a good many owners of cows will come to the conclusion that there *is* a difference between good keep and poor keep, between clean milking and dirty milking, between a careful and a slovenly handling of milk and making of butter, between a "good-enough" not seen by the buyer and the "first quality" that is sufficiently evident to be recognized in the market.

There is no doubt at all that the market for dairy products is, in the language of Wall Street, "beared"—that is, depressed, by the very large quantity of inferior goods forced upon the public over and above the natural demand. This demand is indeed now well supplied by oleomargarine, which takes the place of, and is generally preferred to, the cheaper grades of dairy butter.

Yet this is not the "bearing" of the butter market which I had in mind when writing the heading of this article. I wish to call the attention of dairymen to a depression of the market for even first-class butter, wrought by the product of cows that do not pay their way. In almost every herd there are cows that never make butter enough to pay for their keep. In not a few of our dairies 25 per cent. of the cows are of this class. I have known whole herds that, with the keep given, did not yield a dollar of profit to the owner; and perhaps would not with any keep.

Now, let us suppose that one-fifth of the cows kept for making butter in this country are of this class—cows that do not make enough butter to pay expenses. This butter goes into market at cost, or less than cost, even when well made and bringing the top of the market. The farmer has the care of them and the labor of manufacturing and handling their butter, yet without profit. If at an actual loss as, in many cases, this loss must be deducted from the small profit yielded by the rest of the herd. *And yet this butter comes upon the market in competition with that of paying cows*, and must depress the price of their product.

It is said that Vanderbilt objects to competing in freight tariffs with bankrupt railroads that do not pretend to pay any dividends. In this Vanderbilt shows the shrewd common sense of a trained business man—a common sense which is quite as useful to the farmer as to the man who carries the products of the farm to market. Are not the farmers who are running twenty-five "bankrupt" cows in competition with seventy-five that pay dividends, lacking in business sense? Are they not filling the market with goods upon which no profit is possible, and thus weakening the price of those goods on which they must make what gain they have to depend upon for a living? Are they not plainly "bearing" their own market; thoughtlessly, stupidly hurting their own trade far worse than the oleomargarine makers, who only compete with a class of goods that never should be made at all?

I put these questions squarely to the intelligent dairymen who read the RURAL and are farming for profit: "Had you not better at once, if you have not done so already, begin a thorough testing of each and every cow in your herd, with the purpose of ascertaining whether she makes butter enough to pay you for keeping her? And if you find that she does not, does not your interest, as a dairyman, demand that all such cows shall at once cease to make any butter at all?"

If the cows now producing butter at a loss were all put into beef this fall, the supply would be reduced and prices must rise. Thus the dairyman will make a double gain. He ceases to lose on the poor cows, and makes more money on his good ones. He stiffens his market instead of weakening it. He puts his feed and his labor where they will do the most good. He shows business sense, and if this view of the question could be brought home effectively to the minds of the dairymen of this country this very fall, the profits of dairying would be raised fifty per cent. next year, even though the price of butter did not advance at all. But if, as we might justly expect, a short supply was followed by an advance in price, dairying would have a still [illegible] it. And it needs it.

Farm Topics.

SANITARY ARRANGEMENTS FOR THE HOMESTEAD.

BY A JERSEY FARMER.

NO. 2. THE KITCHEN.

The kitchen is the workshop of the house. The female portion of the family spend therein the greater portion of their lives. That it should be conveniently arranged is necessary for ease and economy of working, and, in fact, for the saving of time and labor; that it should be kept clean and free from any infection from decaying wastes of the house, which are there disposed of, is imperative for the health of the inmates. It may be an easy matter to throw slops out of a handy window upon a pile of rubbish gathered there; or into a convenient pool at the door-step, but many a fatal case of fever or diphtheria has occurred from such a state of things—unfortunately too frequent—and the pet of the household has many a time fallen a victim to the ignorance or carelessness through which that sort of thing has been permitted. It is a question, which of the two, a well-constructed sink or a set of stationary wash-tubs, with proper drains connected with them, is the more important. The sink perhaps is the more needful, but the wash-tubs are indispensable, once their usefulness is known.

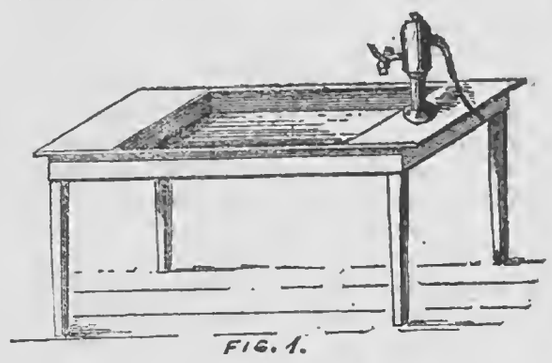

FIG. 1.

THE KITCHEN SINK

is generally a nest of foulness, even in some so-supposed well-ordered houses. It is usually closed up below, and a hiding place is there found for pots, pot rags and any rubbish that must be put out of sight. Here is the first thing that requires to be remedied. *No sink should be closed in.* From the nature of the thing, there cannot help but gather about it something disagreeable and unclean, and this becomes a pest in hot weather; for it is a breeding-place for flies and other vermin, if for nothing else. Wherever there is such a sink, the first work of the careful housekeeper should be to open it to day-light to the floor; where there is no sink one should be made without delay. There are cast-iron sinks which can be procured for a few dollars, furnished with legs so that they can be set in a corner or against a wall; but where there is a man handy with tools about the house, a very good sink can be made of wood, and painted, which will answer every purpose. A good-sized sink should be 36 inches long by 18 wide, and four inches deep. A plain cast-iron one of this size costs $3 50. A small table, at the right, should have a pump connecting with a well or cistern, and another, at the left, should be large enough to hold a tray of dishes. The arrangement complete of a home-made sink is shown at Fig. 1. The whole should be made of good fine timber, the joints put together with white-lead, and three coats of paint should be given to it. The pipe from the sink should be covered with perforated zinc, to prevent it from becoming choked, and there should be an air-trap in it; or the air-trap may be made in the drain-pipe, described further on.

FIG. 2.

STATIONARY WASH-TUBS

are such a convenience and so helpful to the housewife that a set may very well be considered as worth several years of life saved by thus avoiding the injurious results of heavy lifting of tubs and of water in and out of the house on the weekly washing day. In this sense, as well as in others, stationary tubs are a sanitary provision. These tubs are considered indispensable in a city house, and are equally so in a country house. The cost is trifling It is not necessary that they should be connected with a supply of water, although that would be convenient; it is their connection with the drain for the escape of the fouled water that is the most important point. At the same time a water supply may be had without much difficulty, as will be shown hereafter.

HOW THE TUBS ARE MADE.

The tubs should be made of clear pine, an inch-and-a-half thick. A section of the tub, showing the shape and the slope of the front is given at Fig. 2. It is 21 inches wide at the bottom; 25 inches wide at the top; 15 inches deep, and 30 inches long. This makes a tub of the largest size used in any private house. A set may consist of two or three. It is very little more trouble to make three than to make two, and the third is a great convenience.

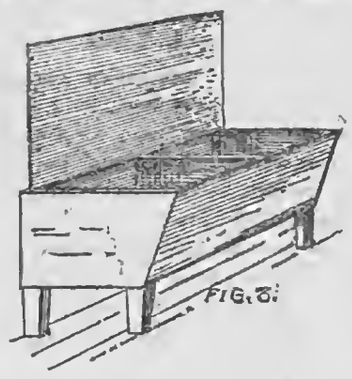

FIG. 3.

At Fig. 3 is shown a set of two tubs complete. A wringer can be fastened on to the partition between the two. The tubs are fastened to the wall of the kitchen at such a hight that the top is 30 inches above the floor; and they are also supported at each end on legs, as shown. The planks of which they are made are accurately jointed, and the joints are put together with white-lead and securely nailed with large nails. The outside is to be painted, but not the inside. Lead pipes are fitted to the bottoms, which should be strapped with S-straps and connected with the drains. Plugs secured by small chains are generally used, but wooden plugs will answer the purpose when the tubs are home-made. The lead pipe may be spread and flattened down, and fastened with nails around the hole in the bottom and the joint is made tight with white-lead.

THE WATER SUPPLY

of a house may be very conveniently made and at a small expense by arranging a suitable pump and a few pipes. For instance, the pump shown on the sink at Fig. 1, represents one made expressly for domestic convenience, and is well entitled The Universal Pump. It is a lift and force pump, and may be used in deep or shallow wells. It is made so that the handle may be behind the spout or work at right angles with it on either side. It has two openings from the spout so that by turning a "two-way" cock the water may be made to flow into the sink or through a pipe leading to an upper story into a tank, or across the kitchen into the wash-tubs. Then, again, if pipes from the pump are connected with a cistern and a well, by turning taps properly placed, water may be drawn from either at will. Further, by screwing a hose to the spout, the water may be forced to the stables or the barn, or by using a nozzle on the hose, windows may be washed or the garden and lawn sprinkled. All these conveniences make a pump of this kind very desirable and convenient and indispensable for a sink and wash-tubs.

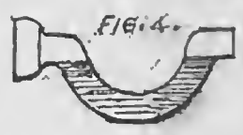

FIG. 4.

THE DRAINS

from a house are of the most serious importance; in fact, these are really a matter of life and death in many instances, if not always, and everywhere. Where waste animal and vegetable matters decay upon the ground, poisonous germs are given off, which are capable of generating the most deadly diseases. When, by ill-arranged circumstances, these germs are washed by percolating or surface water into wells, and are introduced from thence into the stomach of any person, typhoid fevers or dysentery of the worst types are occasioned, so that where fevers of any kind, diphtheria, summer complaints or dysentery occur, want of proper drainage, or the absence of any at all, may almost certainly be inferred. A drain should be perfectly well made and should have an outlet into a well-built and tightly-covered cess-pool, or what is preferable, should discharge into a liquid-manure tank, where the contents are disinfected with plaster or copperas, and are regularly removed for fertilizing purposes. The best drain is made of glazed stone-ware; the next best is made of round drain-tile; and next is a wooden pipe. If glazed stone-ware is employed, a trap (Fig. 4) should be used near the house. This prevents the back flow of foul-smelling gas through the pipes into the house. This sewer-gas is a deadly poison. If common drain tile or a wooden pipe is used, a trap made of a wooden

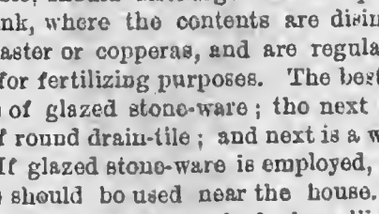

FIG. 5.

box (Fig. 5) will be effective. It is readily seen that at every flushing of the drain some water is left in the trap, which prevents any return of air from the outlet to the house. An occasional use of a pailful of water in which a pound of copperas has been dissolved, will keep a drain sweet.

A USE FOR SEWAGE.

House sewage is a valuable fertilizer. It contains much decomposed animal matter derived from the soiled clothes which are saturated with the constant insensible, as well as sensible, perspiration from the skin, which contains much nitrogen or ammonia; also potash from the soap and other matter from dish-washings. In a state of decomposition this waste has a more powerful odor than barnyard manure. No other fertilizer is more valuable for flowers, a grass-plot, shrubbery, vegetables, or as a mixture for the fields. The smallest house will supply a garden with manure in this way. To collect it, a barrel, large cask or box may be sunk in the ground in a secluded place and the drains may discharge into it; or a pit may be made in the form shown in Fig. 6, backed up with a few stones to keep the earth from falling down. All the solid waste of the house; garbage of all kinds; ashes; waste of the garden and all sorts of absorbents may be thrown into this pit and soak up the liquids from the drains. In this way a wagon load of rich manure may soon be procured. Otherwise the liquids will flow into the barrel or cask. It may be dipped out from this weekly, diluted with water and used to moisten the beds in which flowers or vegetables

FIG. 6.

are planted. Wonderful growth will thus be produced and a large sum may be realized in a year from this use of the house waste, besides the comfortable knowledge that by the sanitary precautions used, one's own health is not recklessly endangered, nor are the lives of the children—more precious than one's own—risked by avoidable dangers.

Everywhere.

NOTES FROM CENTRAL ILLINOIS.

BY AN OLD SUBSCRIBER.

WHEAT SOWING.

The largest breadth of wheat ever put out here, is now very nearly all sown. Continued dry weather has held many back, waiting for rain, and some will not sow till it does rain, if it fails to do so until the 10th of October. The excitement in favor of Fultz wheat has just reached this locality, several farmers having secured seed of that variety at considerable trouble rather than sow any other sort. I probably have the only Clawson in the county, having sown three and a half bushel of seed from an Ohio crop yielding forty-two and a half bushels per acre. The grain has the finest appearance of any I have ever seen. I have sown Fultz, Gold Medal, Sanford, Amber, Clawson, Silver Chaff, and a "common" red wheat, and expect to sow several sorts of spring wheat. Going to extremes? Yes, I like to do so occasionally. When I began with Strawberries I bought 25 varieties, and I got the right sorts for my soil by trying so many.

FRUIT NOTES.

I had a number of seedling-peach trees, which I cut or headed back regularly; I supplied them with abundance of potash, and gave them good treatment in every way. They were selected promiscuously from the lot, without reference to quality, really being no better than the rest. This season all bore, and the trees properly treated bore peaches eight and nine inches in circumference; and a common remark of observers was that I "had some fine budded Peaches among my seedlings." I thinned my Peaches and got better fruit and more of it.

I know of Ben. Davis apple trees that last year bore a large crop of fruit—too large a crop, indeed. This year they struggled and bore half a bushel of apples each; but they were the largest I ever saw of that sort. Now, if those trees were mine, by judicious pruning, and by thinning out the fruit severely in the year when they bear the heavy crop, I could make them bear a good crop the next year, when apples are usually scarce and command a high price.

A HANDY SUPPLY OF SUPPORTING POLES.

Broom corn has become a staple farm product in this part of the State. One of the difficulties encountered in raising it is to get the poles necessary to save the crop. I know of farmers who have been growing this crop for six or eight years, at a distance of five, eight and ten miles from timber, and who have no timber of their own when they get to the woods. In August scores of teams are perambulating all through the timbered districts, hunting for poles. Sometimes the hunt lasts a whole day before any one who will sell poles is hit upon, and not infrequently the hunters go home without any, and next day start off ten miles in another direction to repeat their search. Now, suppose ten or even only five years ago, they had set apart one or two acres of low, wet land on their farms, for a maple or willow grove. This grove would not only make the farm look better, but it would soon furnish abundance of poles, while the "laps" would make the summer's cooking wood. Moreover, it would furnish shelter for stock both in summer and winter, and all the labor of hauling poles long distances would be saved. But it was not done. It can yet be done however. For fifty cents a "timber boy" in June would gather a pick of maple seed on the banks of any of our water-courses, and if planted immediately, they will come up as readily as beans, grow two to three feet the first year, and reach a hight of from 25 to 40 feet in five years.

INTERCHANGING IDEAS.

Hog cholera has ruined many of our Western farmers, and will continue to do so till we profit by the example of our Eastern friends, and feed our hogs more roots, their natural food. They must have less corn, and what they get should be Mammoth, or Stowell's sugar corn. Of these varieties as much can be grown per acre, as of many sorts we now plant. The great need is to put the agricultural class into weekly communication with each other's successes, reverses, plans, theories and practices, and the only as well as the cheapest plan I know for doing this, is for the farmer to take agricultural papers, and through them give his own ideas to his brother farmers, at least occasionally. In this way we can all reap the benefit of each other's acquired knowledge, and sometimes learn in half a column's reading, how to accomplish successfully what we might have spent hard-earned dollars in trying to do, and then fail.

NOTES FROM ARKANSAS.

The Rural New-Yorker gives to the tillers of the soil valuable instructions in all the various branches of agriculture and horticulture, so that the farmer that reads the Rural need hardly make a mistake in planting or cultivating the earth, but in the Rural's columns I see no information to the thousands that are seeking new locations for their future homes. [Surely, our friend has not looked.—Eds.] The emigration this year from the East and North to the Far West is immense and nine-tenths of it is going to localities where nature has bestowed a fertile soil, it is true, but only at a distance of from 1,000 to 1,500 miles from a market, even when the country is all settled. There the hard-fisted sons of toil may raise wheat for 40 to 60 cents per bushel; beef and pork correspondingly low, while other cereals as well as vegetables, fruits, and market truck are not worth transportation. Building and fencing lumber there costs from $30 to $35 per M., while fuel is scarce and high.

I have spent many years in exploring for our most valuable minerals, coal, iron, manganese, zinc, etc., in the States of Pennsylvania, Ohio, Indiana, Illinois, Missouri, Arkansas and Texas, and I have been a close observer of the different sections as to their advantages for the production of grains, fruits, vegetables and stock, and the wealth that nature, in some of the localities, has stored away for those that may be so lucky as to inherit a portion of the soil that is underlaid with them. During my explorations in Arkansas and Texas, in the years 1876, '77 and '78, I found Arkansas to be a nearly unknown State as to her vast deposits of valuable minerals. The day, however, is in the near future, when she will produce iron, spelter, zinc, lead, crockery, queensware, cotton and woolen goods more cheaply than any State in the Union—much more cheaply than the old Eastern and Northern States.

My reasons for so predicting are: First, the coal territory of the Arkansas Valley embraces about 12,000 square miles of a pure, valuable coal, semi-anthracite, containing 80 per cent. of fixed carbon and less than three-fourths of one per cent. of sulphur. The iron ores are of the purest quality, and in abundant supply. They assay 50 to 65 per cent. of metallic iron, with no trace of phosphorus or sulphur.

Zinc ores are in abundant supply, and of as high quality as those found anywhere else in the United States.

Marl or phosphates for fertilizing purposes equal to those of South Carolina, are found here in a deposit 31 feet thick, that will yield per acre 41,000 tons, and at a royalty of but 10 cents per ton, will give $4,000 per acre.

The State of Arkansas is principally timber, one-tenth or one-twelfth only being prairie. The timber is of great variety and exceedingly well adapted to all farm uses. Good yellow pine boards can be had for $6 to $10 per M.

Peaches, Apples, Pears, Plums, Strawberries, Blackberries, and nearly all the fruits that grow in the Eastern States are produced to perfection in the fruit belt in Arkansas, and scarcely miss a crop any year; only two failures of the peach crop have occurred in 88 years.

James Watson.

RURAL SPECIAL REPORTS.

Warren Co., N. C., Oct. 16, 1878.

No frost yet. Cotton-picking is the principal farm operation about these days—yield an average one, and acreage somewhat greater than usual; present price, three cents per pound in the seed. Cow peas are below the average, on a less acreage than usual. Seed was scarce and high this year, which deterred many from planting. Oats and rye sown in August cover the ground and will furnish fine pasturage during the winter. But little wheat has been sown yet. Our farmers think cotton-seed the best fertilizer for wheat, 40 bushels per acre making a vast improvement in the crop, and costing from eight to ten cents per bushel at the gin. There are no mills hereabouts for extracting the oil;

consequently we can make no other use of the surplus over the small amount required for next year's planting. Fruit-growers are preparing to plant more Peaches; the fair crops and good prices of the two last seasons have encouraged them. The Early Beatrice seems to be the most popular sort just now, though some condemn it for the small size of the fruit. Alexander is preferred by some, but has not been sufficiently disseminated as yet, to allow of a competent decision as to its merits for this locality. M. B. P.

BELLEFONTAINE, Logan Co., Ohio, Oct. 18.

THIS has been a remarkably productive year in this section of the State, and truly the farmer has no just reason for complaint; for he has been amply paid for his labors, notwithstanding the low price of produce.

We have not had such a yield of wheat within my recollection. Very little of the crop is below 20 bushels to the acre, and some of it is as high as 45 bushels per acre. Corn, which is now being gathered, is heavy, and of a good quality. The yield of oats is good; perhaps the only crop that has fallen below an average is potatoes. The apple crop is enormous, and the price realized per bushel scarcely pays for gathering and marketing. Plums, pears, peaches and all small fruits are good.

A large crop of wheat has been sown, and the timely rains and warm weather are giving it a a good start for the winter.

Stock is doing well, and will go into winter-quarters in good condition. Our pastures are good, as there has not been frost enough to check or stop growth. A few more weeks of good weather and our fall work will be done, and then we shall want about "*two* RURALS *a week*."

G. A. H.

BEWDLEY, Northumberland Co., Canada, Oct 19.

ON the 4th of July our crops had a splendid appearance, but two weeks before harvest the prospect changed. The spring wheat will not, I think, average, in this township, over eight bushels per acre. Fall wheat is very good; that is, Clawson and Silver Chaff; Soule's is badly shrunk. Barley is a fair crop; oats, good; peas, fair; potatoes, none where the bugs were allowed to take them; where they were attended to, they are a fair crop; they are worth 60 cts. per bushel, and will be scarce. Hay is plentiful; of clover a great quantity has been left for seed; but it will not yield one-third of a crop, and that of poor quality. I sowed one pound of Pringle's Defiance wheat last spring, and I have fifty pounds from it, though I had considerable oss in harvesting it. It grows strong straw and large ears, but it has shrunk. J. F.

HUMBOLDT, Tenn., Oct. 19, '78.

THIS morning we have the first killing frost, and a little ice. Therm. 31°. Thank GOD, we now feel safe, and a new lease for life. A strict quarantine has doubtless protected our town from yellow fever and its awful ravages. From Memphis to Paris on the Louisville R.R., through West Tennessee, very few towns or stations have escaped entirely. Brownsville has been very badly afflicted. The weather is favorable for plowing and gathering crops—only a fair average with us. No late fruits, winter apples bear a good price. Oct. 20, another splendid frost.

E. F. T.

SUNSHINE, Boulder Co., Col., Oct. 15.

WE have a Cherry here, a native of the mountains, that is worth cultivating. We also have three or four varieties of Currants and red Raspberries but I do not think they are worth cultivation. The currants are large but they have an unpleasant flavor; the raspberries are fine but the vines will not bear cultivation here though they might do so East. The June or Serviceberry grows here, but it is a more shrub, often not more than from one to three feet high; but the berries are far superior to any I have ever seen in the East. A. C. S.

MENDON, St. Joseph's Co., Mich., Oct. 20.

WE have hereabouts a good soil devoted to a great variety of products. The past season wheat and oats yielded largely. Corn is a medium crop. Beans, of which a great quantity is raised here, were a fair crop. They are worth $1 per bushel; wheat, 75c. to 80c.; corn, 35c.; oats, 23c.; Irish potatoes, 40c.; sweet potatoes, $1; hogs, $2.50; farm labor, 75c. per day.

G. A. A.

NEWPORT, Vt., Oct. 21.

OUR crops have been good in Vermont, except potatoes, and we have had a good season for getting them in. Prices are low for everything except potatoes which are now bringing 65c. per bushel, with a prospect of a considerable advance. Already our local papers are begging the farmers to keep back at least enough for home consumption. T. H. H.

ROANOKE, Huntingdon Co., Ind., Oct. 22.

OUR crops hereabouts are light. Wheat yields from 12 to 15 bushels per acre; corn 25 bushels; clover seed 1½ bushel per acre. Prices are good. Farmers are all feeding hogs for November market. P. H. S.

BLOWING ROCK, Watauga Co., N. C., Oct. 19.

LAST night we had a slight fall of snow, and this morning the air is crisp and cold, while the snow contrasts strangely with the green, yellow and brown shades of the autumnal foliage, for the trees have not yet shed their leaves.

J. A. B.

NEW MARKET, Shenandoah Co., Va., Oct. 22.

WEATHER fine for seeding. Farmers have nearly all finished sowing hereabouts. Wheat, 90c.; corn, 50c.; butter, 15c. P. S. W.

RACINE, Wis., Oct. 22.

WE had quite a severe storm this morning, and it has grown quite cold. C. L. H.

WINONA, Minn., Oct. 19, 1878.

CROPS hereabouts are poor this year.

P. A. B.

The Querist.

ANSWERS TO CORRESPONDENTS.

ABOUT BONES.—1. *Relative Value of Nitrogen and Phosphoric Acid in Superphosphates.* 2 *Ground Bone and Farmyard Manure*—3. *The Organic and Inorganic Materials of Bones*—4. *Manner of Manufacturing Superphosphate.*

E. R. Walmsley, Flint Co., Mich., says:—1. What is the money value of the nitrogen and phosphoric acid in superphosphate, and what is their relative fertilizing value? 2. What is the comparative value, as fertilizers, of ground bone and farm-yard manure? 3. As bones contain organic and inorganic materials, is there any easy way of obtaining these separately; and, if so, what? and what is the function of each of these constituents? 4. Give some idea of how Superphosphate is made at the factories.

ANS.—1. There is only from two to four per cent. of nitrogen in raw-bone superphosphate—little or none when the article is made of burnt or steamed bones, and none at all in mineral superphosphate. The nitrogen in the superphosphate is worth 20 cents a pound, so that in every 100 pounds of raw-bone superphosphate there is from 40 to 80 cents' worth of nitrogen. The amount of phosphoric acid in superphosphate varies, but a good article should contain at least from 15 to 18 per cent., and some manufacturers guarantee as much as 20 per cent. The acid in that combination is worth 12½ cents a pound, so that in a hundred pounds of the superphosphate averaging 20 per cent. of phosphoric acid, $2.50 worth of that article is contained, and $1.87½ cents' worth in 100 pounds of superphosphate averaging only 15 per cent. of phosphoric acid. The comparative fertilizing value of nitrogen and phosphoric acid depends upon the amount of each in the soil and the kind of crops to which they are to be applied—nitrogenous manures being of a forcing nature, and phosphate manures being grain- or seed-forming.

2. According to the experience of good farmers in England, where bone-dust has been much more extensively used than here, and where its effects have been more carefully noted, the total action of a cwt. of finely pulverized bones is estimated to be equivalent to that of from 25 to 30 cwt. of barn-yard manure. Bone-dust resembles, in its chief constituents, the solid excrements of animals as well as straw, differing from them chiefly by being much richer in the more valuable parts of manure, as will be seen by the following comparison, taken from a high English authority:—

Constituents.	1000 lbs. of bone dust.	1000 lbs of fresh cow or horse dung.	1000 lbs of straw.
Nitrogen.....	50	4	4
Phosphoric Acid	240	3	2
Lime.....	330	4	4

Thus it will be seen, by this approximate exhibit, that bone-dust contains about twelve times more of ammonia-forming or forcing substances, and from 80 to 100 more grain-forming materials than dry straw or the solid excrements of animals.

3. Yes. If a bone be steeped in diluted muriatic or nitric acid—generally obtainable at the nearest drug-store—the inorganic or earthy matter is dissolved out, and the organic substance remains, retaining the original size and shape of bone, and capable of being easily bent. Then, again, if the bone be subjected to a strong heat, the organic or animal part is burned out and the earthy part remains, retaining its form, but ready to crumble to pieces at the slightest touch. To the earthy part, which consists chiefly of phosphate and carbonate of lime, the bone owes its hardness, density, rigidness and white color; to the animal part, principally cartilage, or some form of gelatine, it owes its strength and cohesion. In childhood the animal matter forms nearly half the bone, accounting for its greater flexibility then, and its less liability to fracture; whereas in the old, the earthy matter in the bones amounts to about 84 per cent., which explains the great brittleness of bones in aged persons.

4. The phosphatic materials, either bones or phosphatic minerals, are first ground to a very fine powder by mill-stones; the powder is then carried up, by means of elevators, and discharged continuously into a long iron cylinder having agitators revolving within it with great speed. A constant stream of sulphuric acid, having a specific gravity of 1.66, enters the cylinder at the same time as the dry powder, and the mixture of the two flows out at the other end in the form of thick mud, having taken from three to five minutes in passing through the machine. The quantity which such a machine can turn out daily is about 100 tons. The semi-fluid mass runs into covered pits 10 or 12 feet deep, each of sufficient size to hold the produce of one day's work. In a few hours it becomes tolerably solid, but retains a high temperature for weeks or even months if left undisturbed.

About Song Birds.

Fred. Offier, Miami Co., Kansas, asks whether there is in this city a bird store kept by a party whose name he gives; the names of some works treating of the best methods of raising song birds; whether we know of any one who breeds mocking-birds or thrushes in cages; a description of the nightingale, so that he could recognize it on sight.

ANS.—We cannot find the firm named, but Our Own Birds ($1.25), The American Bird Fancier (30c.) and Canary Birds (50c.) are books that deal largely with young birds. These can be had through this office. There is a gentleman, we are told, in this city, who attempts to breed mocking-birds in cages, but he has met with nothing but failure so far. He does it in an amateur way, professional bird-raisers deeming the occupation impracticable. The nightingale resembles somewhat some of the smaller thrushes in form and color as well as in the character of its song. It is very plainly colored; the upper parts being a rich brown, with a reddish tinge on the back and tail; below it is a grayish-brown with the throat and abdomen whitish; its length is 6¾ inches; the spread of wings, 10½ inches with the first quill one-third the length of the second and the third the longest; the length of the bill is about ½ an inch. The tail is moderate, and rounded at the sides; the toes are very long and slender, the outer being longer than the inner and united at the base: the hind toe is long with a curved claw. The female is like the male in color, and is nearly of the same size. The males only sing, and like other migratory birds, never during the winter in cages, and not until after the spring molt. In captivity they are very short-lived, from being kept too warm and from improper food. From this, or indeed from any other description, it would be no easy task for our friend to recognize a nightingale in Kansas; for among the multitudinous advantages of that State the presence of this bird cannot be counted; but then in this respect it's no worse off than than the rest of the U. S; inasmuch as the nightingale is strictly an "Old Country" warbler.

Destroying Borers.

R. C. K., Marietta, Ga., writes that the borers are killing the trees all through that part of the country, and asks, 1. How the pests can be destroyed? 2. The price per dozen of the Sharpless Strawberries? 3. Where can the seed of Alfalfa be bought, and how much does it cost per bushel?

ANS.—1. Offensive washes will, to some extent, prevent the insects from depositing their eggs upon the bark. When the eggs hatch, the grubs bore small holes in the tree which may be detected by the particles of wood thrown out. A wire may then be used to punch the pests to death. The wash we use consists of lime, soot, salt, sulphur, tobacco, etc., colored with lampblack and red mineral paint mixed with water. The consistency should be that of white-wash. The quantity of the tobacco, salt, etc., is not material.

2. Inquire of those who have advertised in the RURAL. See Strawberry number.

3. Any prominent seedsman. The price is about 30 cents per pound.

Treatment of Raspberries.

A. A. M., Auburn, N. Y., cultivates some red and orange Raspberries and has been in the habit of treating them to a variety of food in the shape of hen manure, autumn leaves, chip dirt from the wood-shed, clean sawdust, &c. Having a large heap of rotten apples our friend asks whether it would be beneficial to place them around the raspberry vines in the hope of stimulating them to a more bountiful yield by good treatment.

ANS.—All the information asked by our friend was given in detail in our Raspberry number, Oct. 12. It would be better to rot the apples in a compost heap before using them. Plow the ground deeply. Manure according to the richness of the soil with home manures, or if naturally rich, a thorough working of the soil will suffice. If planted this fall, cover the earth about the canes with fine manure. The richness will find its way to the roots and stimulate an early, vigorous growth in the spring. Should the Raspberries be some of the semi-hardy sorts, it would be necessary to lay down the canes and cover them with earth or something else.

Bermuda Grass.

A. B. Cooper asks where is Bermuda-grass indigenous; is it so in the Bermudas, as its name seems to indicate, and can seed be obtained from those islands?

ANS.—Bermuda-grass — Cynodon dactylon—is indigenous to British India, and was first brought to the Bermuda Islands in order that its tenacious growth might check the attrition of water which was wearing away the projecting mountain tops, which those islands really are. It was first introduced into the United States at St. Mary's, Ga., and about the same time into South Carolina. It does not seed in any part of the United States, or indeed outside the tropics, according to the best authorities. It is, therefore, a naturalized, not an indigenous product of the Bermudas, as it has become in many parts of this country.

Muhlenbergia Mexicana.

James B. McKinnon, Logan Co, Ohio, asks for the botanical and common name of a species of grass, a sample of which he sends us. It grows thickly in his orchard which he plowed in April and planted with corn, potatoes and other vegetables.

ANS.—This grass is Muhlenbergia Mexicana. It has no common name, except a general one—Drop-seed. There are several others in this country. It often thrives in open woods. It is in no way related to Quack-grass. It is of poor quality, as the stems become hard, and the leaves and tops are very light. A little persevering work, especially in dry weather, we think will kill it, if the land is properly drained.

Cement Walks.

E. S. M., Montreal, Va., wants to get some idea of the cost of a cement walk; the amount of material required to make it, and how to use the cement. The grade of the walk is such that every rain washes the gravel off.

ANS.—From our experience, we do not recommend cement walks. To do them properly the earth must be dug out at least two feet in depth and filled in with small stones. Then the cement should be used in the proportion of one part of cement to two of coarse sand. One barrel of cement would answer for about ten feet of walk three feet wide.

Self-Binders.

W F. Walsh, Chippawa, Welland Co., Canada, asks where the self-binding machine is made.

ANS.—We suppose self-binding harvesters are referred to. If so, one is made by the W. A. Wood, M. & R. Mach. Co., Hoosic Falls, N. Y. and another by the Johnston Harvester Co., Brockport, N. Y. The former uses wire; the latter, string.

Miscellaneous.

Thos. McBride, Corunna, Mich., asks what would be the price of a well-matched team of heavy draught horses in the New York market.

ANS.—In such a case as this, so much depends on the age, get, condition, appearance, temper and action of the horses, that on the above data even an approximate estimate would be extremely hazardous. The best answer we can give, under the circumstances, is from $300 to $1000 according to age, goodness and style.

J. P. McC., Jamestown, Pa., sends specimen of grass the name of which he wishes to learn as well as its value for pasture grass.

ANS.—It is Meadow Soft Grass, Velvet Grass, (Holcus lanatus). Cattle are not fond of it, and it is therefore of little value for pasture or hay. Except on poor, moist soils, it is not worth cultivating.

L. Wilbur, La Fayetteville, N. Y., asks whether he could get a small Alden Fruit Dryer, just large enough to dry the fruit on a small farm.

ANS.—The Alden Fruit Dryer is not designed for small operations. A dryer that would suit our friend's purpose better, we think, is made by the American Dryer Co., Chambersburg, Pa.

J. M. N., Boonton, N. J., asks the best way to keep through the winter a collection of hen manure swept up from time to time from under the roosts.

ANS.—See Brevities, editorial page.

Mrs. Haynes Lord, West Brighton, Staten Island, asks where is the depot for the sale of the Cleveland Rubber Paint.

ANS.—The N. Y. office is at 506 West St.

P. P. M., asks the name of some periodical suitable for a boy just learning to read.

ANS.—"The Nursery." Boston, Mass.

J. T., Albion, Ill., asks where can he get a set of tools for engraving wood-cuts.

ANS.—C. E. Little, 57 Fulton St., N. Y. City.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY NOV. 2, 1878.

We offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

THE RURAL NEW-YORKER.

Many of our readers who have become familiar through association with the old title-heading of this journal, will best appreciate the new design that graces the first page of the present issue. While the lettering of the name has been preserved, the details have been so changed that the complete result will bear the closest critical scrutiny, inviting attention because of its suggestiveness.

The home grounds in the lower right-hand corner are typical of the refined country home, such an one as every well-to-do farmer *might* possess, thereby increasing the attractions of the homestead by simple and natural arts that create surroundings so pleasant that the young people would be loath to exchange them for the coarser allurements of city life. The foliage is true to nature, being drawn from life. All may recognize among the trees the Beech, Elm, Norway Spruce, Juniper, Hemlock, Magnolia, etc.

The bouquet over the "Y" is composed of some of our native flowers, which the artist has faithfully portrayed from life-specimens. Jack-in-the-Pulpit, Bog-arum and the Dog-tooth Violet, are in graceful juxtaposition with the Anemone, Violets and other modest flowerets.

Next, to the left, under "The," is a group of fruit and vegetables,—an exact copy of their prototypes in the field and garden; while the Blackberries, Raspberries, Grapes and Grasses further along, make a graceful and fitting border to the picture. Prominent among the industrial symbols are the bees and farm tools. The same minute attention to detail and artistic effect characterizes this group. Each implement is a model, accurate in all its parts. The vignette of the Short-horn bull is after Forbes, perhaps the most distinguished cattle artist in the country.

The complete design is intended to be a study, and its thoughtful consideration will, we believe, repay the reader. It is the work of seven gentleman, who have been unsparing of their patient labor. Under the superintendence of Mr. H. A. Jackson, the general design was made by Mr. L. Bauhahn. The cattle are from the pencil of Mr. R. Ankele, while the landscape is from Mr. E. White's sketches from nature. Mr. Wilhelme was engaged exclusively on the farm implements, leaving the hen, chickens, and several minor parts to Mr. T. Fleming. The mechanical labor of preparing the artists' work for its final place under the cylinder of the press is credited to Mr. J. C. Moss,—all of this city.

We have only now to express the hope that our readers will accept the new title-heading as an indication that Rural's promises of improvement are made to be fulfilled, and that increase of years will bring more of beauty as well as of wisdom.

SUAVITY OR AGREEABLENESS.

In that portion of the brain lying a little on each side of the upper part of the forehead, phrenologists locate the organ suavity, or agreeableness. As this is large or deficient depends, in a great degree, the natural politeness of its possessor. Some men are so organized that it is only with difficulty they can even force an appearance of politeness. Without intending it, their manner is repellent, and if they have a fair share of combativeness, antagonistic to such an extent as to make their society unsought and disagreeable. They receive favors ungraciously, and grant them in such a manner as makes the recipient regret having asked them. Of this kind was the young lady in the rail car, who took a seat offered her by a gentleman old enough to be her father, without remark. Perceiving that he stood by her side longer than she thought nesessary, she asked rudely what he was waiting for? "Merely to hear you say thank you," he replied, much to her annoyance and to the merriment of those sufficiently near to hear the remarks.

Sometimes a person really possesses a desire to be polite, the result of the action of other organs, as benevolence, reverence, &c., but lacks the power of expressing it by acts or words. Such are unfortunate, and are constant sufferers in consequence. Their questions are often put in such manner and word as to give unintentional offense, and their replies are shot out bluntly, and without the respect the circumstances demand. We know of more than one really kind-hearted and affectionate man, who impress a large majority of merely business acquaintances with the idea that they are ugly, unsocial disagreeable individuals, whose company is to be avoided.

On the other hand there are those whose brain is so largely developed and active in that region as to make them so desirous of appearing polite and agreeable that they often sacrifice truth itself in the endeavor. Of this class are those who treat you as if they desired to make you their dearest and most confidential friend; parting with you with an appearance of great sorrow, only to meet the next moment another person with the same expressions of affectionate regard. Their desire to please is so great, that their words are not always measured by the strict rule of fact, but expand or contract therefrom as it seems to them will best please the listener. Nor can those people be called really hypocrites or deliberate falsifiers. They act out their natures as inheritance and circumstances have made them.

But between these two unhappy extremes are various gradations tending to the happy mean. We occasionally meet men, (would it were oftener), whose every look and action have attractions, and whose words, not studied, are as agreeable as possible, who can say unpleasant things in such a way as to deprive them of half their bitterness, and even decline a request in such a way as makes a friend of the applicant. We cannot all attain this degree of perfection, but "character is not writ in marble," and it is left for each of us by care, attention and cultivation to make ourselves better or worse than nature leaves us.

There is no place where true politeness is worth more—is productive of better results than at home. And by this we do not mean the house and family circle merely, but everywhere about—on the farm, in the garden, among the animals. What, be polite to animals, do you ask? Most certainly, we say. And we leave it for your own observation to discover how much gentle words, pleasant tones, and kind looks can accomplish. The best cattle trainers we know have learned by experience it is not necessary to scold and abuse oxen to render them obedient; and a horse soon comes to love a gentle master. Try it with your farm hands. A request pleasantly preferred is complied with quite as readily and with a better spirit than a mandatory order. "Please" is an entering wedge to a man's good nature, and often opens the way through which the sentence following passes without friction, where otherwise it would chafe and rub.

Capt. Gardner, an old friend of ours, was a student of human nature, and knew men, their ways and their weaknesses, and their deserving too. After one of his long trips he called on us. In a conversation he said he believed, since he saw us before, he had done what no other man ever did. He had sailed a ship around the world without using an oath or striking a blow. He believed it was possible to be kind and agreeable to his sailors and still maintain their respect and obedience. He determined to try it, and proved by practice what he inferred from theory.

There are many rough places in life's journey. We cannot make them too few, try how we may; but most of us can, by a little self-control and will-power, keep back a disagreeable expression, and replace it with one not only more polite and quite as effective, but which is less a stumbling-block in the way of our neighbor.

A REQUEST.

We ask our farmers, who are not already possessed of the information, to read carefully—to study and to understand, in fact—the botany article under its appropriate department head. There is nothing new or especially interesting about it, but it explains, in simple language, what *every* farmer ought to know. What is a pistil, a stamen, an ovary, etc.? What relations do they hold to each other? Such elementary botanical knowledge is of itself of practical value, and when once gained—at least with many—leads to further investigation. At a fair held in Bergen Co., N. J., a few weeks ago, a fig tree was placarded thus: "A tree that bears fruit but never bears flowers." It seemed rather strange to us that neither the directors nor hundreds of visitors vouchsafed an explanation. All appeared to take for granted that the statement was true, and that it was, indeed, a remarkable tree. Any botany would have informed them that the flowers of the fig are inclosed within the receptacle, and that they might have been discovered by cutting open one of the young figs upon the tree in question.

There are many ways in which a knowledge of the beautiful and simple study of elementary botany might be rendered useful in the farmer's daily avocations, and we know of no other which, when fairly begun, so incites the inquirer to further research.

OUR PROMISING FUTURE.

When the owner of a farm or a workshop is producing and selling more than he is buying and is accumulating a balance at his bank, or is enlarging his good and sound credits, or his stock-in-trade, or the means of future production, he is prosperous; otherwise he is not. If two men or two thousand or two million, or the whole nation in the aggregate, are doing this, they or the nation are prospering, however much they may be practising economy, saving expenses or paying off previous debts. This must be evident. But yet there are persons who would have us believe differently; at least so far as the nation is concerned. A nation is only an aggregate of individuals, and what is true of one is true of every one together in combination.

While we are yet doubting whether, as a nation, we are in the way of prosperity or not, it might be well to consider what we are doing in business. Last year the exports from this country amounted to $728,617,425. Of this amount over $400,000,000 represented the products of manufactories of all kinds; including cotton cloths, jewelry, watches, tools, machinery, hardware, bells, locomotives, coffins, carriages, cars, statuary, paintings, books, wines, pianos, carpets, soap, boots, glass, stoves, scales, leather, ink, pins, marble, scientific instruments, agricultural machinery, and a vast assortment of other products of handicraft. These paid for all our imports, very nearly; leaving our cotton, corn, wheat, provisions and other farm products to be paid for in cash, which means gold; for that alone is accounted as money in this our best business.

Now, what an agreeable view is this for the farmer: what a home market is here opened for his produce at his doors! How much better this, than to have all these artisans working as farmers, growing pork and wheat to send to foreign countries in exchange for such things as they now make at home in their shops. Prices of produce are low enough at this time, but what would they be if the producers were doubled and the markets the same as they now are? On the whole, the figures of our rapidly increasing business with the world should be very satisfactory to every farmer, and should be a source of great hopefulness for the future, as proving beyond a doubt that our progress is sound and solid, and contains the elements of a greatly increased prosperity in the future.

Exaggerated Estimates.—Many of our agricultural writers estimate the possible yield of an acre of corn or wheat from the yield of a very small plot highly cultivated, or even from that of a single favored plant. Such reasoning excites hopes which never can be realized, though, it is true, that endeavors to realize them may, in some cases, do good. Suppose we were to reason in that way, taking our Pearl Millet plant presented on the first page, as a basis for our calculation. As it measured nearly 14 feet in circumference, suppose we allow 16 square feet to each plant. There are 43,560 square feet in an acre. This would give 2722 plants, which, at 42¼ lbs. to the plant, would be over 57 tons to the acre! The fact is, whenever anything new is offered to the public with a grand flourish, it is purchased at a high price, and given ten times the care that ordinary crops are given. The results are published as if they were due only to the merits of the new variety of plant—the extra culture is ignored.

BREVITIES.

Gather the leaves.

Plant all hardy fruits.

Be gentle and kind unto your colts.

Clear up stones, stumps and rubbish.

Harvest the sugar beets and mangels—leave the parsnips and salsify.

What is the use of talking about *new* fodder plants, if of less value than corn?

It seems that 29 bushels to the acre are the average wheat yield of England for 1878.

Keep a barrel in the hen-yard. Clean the hen-houses weekly, and throw manure into the barrel—then cover with a layer of dry soil or muck.

The students of our agricultural colleges should bear in mind that their studies there are but preparatory steps to enable them more quickly, more thoroughly, to understand in what successful farm management consists.

The English papers say that they have never before known so many farms of the better class in the market. They say that if any man will take a pen and correct the prices of any former year's balance-sheet by the prices of to-day, he will find sufficient cause for apprehension.

Many farmers will buy seeds because they are *cheap*, and run the risk of half of them being worthless. In many cases they should know that pure live seeds can not be raised, gathered and sold for such prices. Thus a bid is offered for dishonest practices, and the buyer is as culpable as the seller.

Pres. Hayes remarked in a speech last week: "Great changes have occurred during these five years of financial depression. The agricultural interests always suffer less by such depression, for in good and "flush" times the farmer is usually the last to branch out, run into debt and go beyond his means. He certainly is caught with less debt than the manufacturer or commercial man. When prosperity comes back the farmer leads off with good crops, and this makes business for railroads, steamboats and canals. It quickens and increases the products of the factory and the shop."

Skim-Milk Adulteration is justly denounced by a correspondent of ours from Circleville in this State. Although mixing skim-milk with new milk, and selling the mixture as pure new milk is probably the least hurtful form of adulteration practised by the dishonest milk-dealers who supply large and small cities with the lacteal fluid, yet no upright man will be guilty of this species of swindling; for it is not only an injustice to the purchaser, who pays an honest price for a fraudulent article, but it is also an injury to conscientious dealers, by begetting suspicions of their product and by "bearing" the milk market."

Literary Miscellany.

THE OLD PASTOR'S DISMISSAL.

ELIZABETH CUMINGS.

"We need a younger man to stir the people,
And lead them to the fold."
The deacons said: "We ask your resignation,
Because you're growing old."

The pastor bowed his deacons out in silence,
And tenderly the gloom
Of twilight hid him and his bitter anguish
Within his lonely room.

Above the violet hills the sunlight's glory
Hung like a crown of gold,
And from the great church spire the bell's sweet anthem
Adown the stillness rolled.

Assembled were the people for worship;
But in his study chair
The pastor sat unheeding, while the south wind
Caressed his snow-white hair.

A smile lay on his lips. His was the secret
Of sorrow's glad surcease,
Upon his forehead shone the benediction
Of everlasting peace.

"The ways of Providence are most mysterious,"
The deacons gravely said.
As wondering-eyed, and scared, the people crowded
About their pastor—dead.

"We loved him," wrote the people on the coffin,
In words of shining gold:
And 'bove the broken heart they set a statue
Of marble, white and cold.

EVERLASTING FLOWERS IN VASES AND BASKETS FOR ROOM DECORATION.

JULIUS J. HEINRICH.

SECOND PAPER.

DRIED Grasses, Everlasting Flowers, Pressed Ferns and Autumn Leaves can be arranged in many hundreds of beautiful designs.

Fig. 1—drawn from nature by Mr. L. F. Graether—represents a wall-pocket,—basket, filled with flowers, grasses and ferns. It makes a very effective and charming ornament for hanging against the wall. Fig. 2 is a Swiss moss-basket filled with grasses and flowers. It can be placed on the table or on the mantel in the parlor or sitting-room. Fig. 3 is one of the neatest and at the same time one of the easiest designs to make. Glue a piece of bark on a cardboard 12x14 inches, so as to represent a log of wood; then run the ferns in behind the bark and fill out with grasses and flowers. A Swiss moss-basket may be used, cut in two lengthwise. Glue this on the cardboard instead of the bark. After the basket has become dry, fill up with moss and then put the ferns and grasses in it. This can be framed, with or without glass, and looks very pretty.

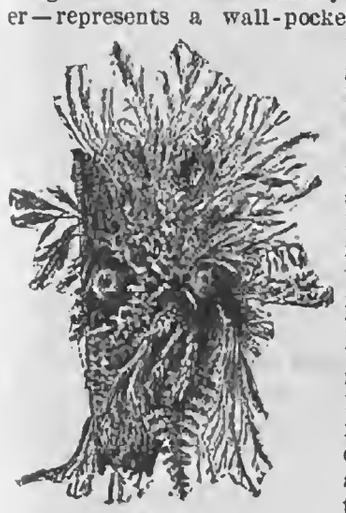

Fig. 1.

Fig. 2.

Fig. 4 is a bouquet made of grasses only. Fig. 6 is a bouquet made of flowers and grasses. These designs are popular, as they form beautiful ornaments for filling vases and they retain their shape and beauty for years. They can be made of all natural grasses, or the grasses may be dyed according to directions given in a previous article. In arranging the bouquet it is essential to use Stipa pennata to give it the graceful look which otherwise is lost, and which gives the beauty and shape to the bouquet, as shown in Fig. 4. Bouquets of domestic grasses can, however, be made without the Stipa, but they do not look as well as those with it. Before using the grasses, it is best to hold them over a kettle of boiling hot water and let the steam rise up among the grasses; this will expand them and also soften them, which will be found to make them easier to work with.

Fig. 3.

The hanging basket (Fig. 5) is made of Everlasting flowers and grasses. This design is very hard to make, as each flower is wired on fine hair wire, then twisted over fine pieces of moss, and lastly fastened to one long piece of wire which runs from the inside of the basket to the end of the branch; this is called branching. After the branches are made, the rest of the basket can be easily arranged. This will make a beautiful ornament for a bay-window or chandelier. It will last for years and needs but little care. If dust settles on any of them, they need only be well shaken and all the dust will be shaken off. Besides these, designs can be made in the shapo of wreaths, crosses, anchors, stars, and in many other styles. The straw baskets so much used by florists are especially adapted for this work. An article on Straw Baskets (illustrated) will appear in the RURAL in the course of a few weeks.

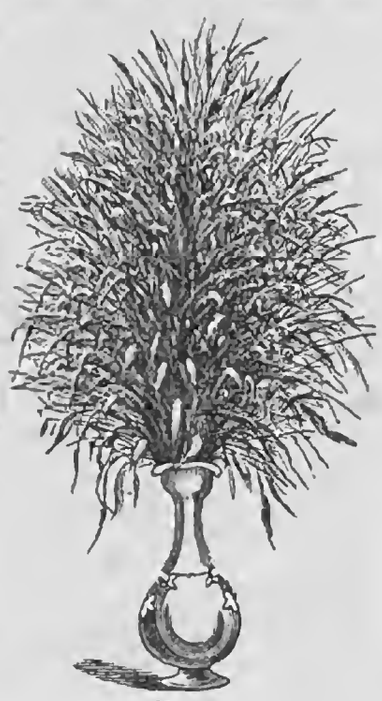

FIG. 4.

WEAKER THAN A WOMAN.

CHAPTER III.—(Continued.)

The question seemed to him almost decisive. She would not have asked it had she meant to refuse him. He could hardly answer her calmly, but he boat back his emotion. "She is so easily startled," he said to himself—"I must be very cautious what I say to her." He answered—

"Yes; and many of the boautiful things that Captain Henderson bought are thero now. To my mind it is the prettiest house in Lilford; and, my darling, I have a vision of you standing in that pretty entrance-hall, waiting for me when business hours are over. I can see the light from the stained-glass window falling on your golden hair. I can see the sunlight lying outside on the flowers. I can see my wife's sweet face grow brighter for my coming. I can see your hand stretched out to welcome mo. I can also see the years pass on, and life grow brighter and more beautiful. Do you like the picture, Violet? Will you make it real?"

His great, passionate love, shining in his eyes, trembling on his lips, touched her. Her beautiful face grew pale. She was woman enough to feel the beauty of the future he had painted for her—woman enough to appreciate the deep, honest, true love offered to her.

"I would rather not promise," she said; "but I will think of it, Felix."

"You do not refuse, Violet?"

"No, I do not refuse," she answered.

"Why, then," he cried, "the victory is won. You will be my wife. My darling, I love you all the better for your shy, sweet reserve. How could I be so foolish as to fear that I should not marry my sweet girl-love Violet? See, darling, I have been keeping this for you ever since I came home from London, last year." He drew a little morocco-case from his pocket, and, opening it, took out a pretty ring. It was of gold, set with pearls. "You will let me put this on your finger, Violet. This is your betrothal ring. You will never part with it—promise me."

She looked at the pretty jewel shining on her finger.

"No, I will never part with it," she said; "but remember, Felix, I have not quite promised."

"Not quite," he returned, with a happy laugh. "You will let me go back to the Limes with you, Violet, and tell Mr. Haye what I have asked you?"

"Must you tell them now so soon?" she asked. "It will be almost the same thing as being married if you tell them."

"It will be only the foreshadowing of a happy future, my Violet. Yes, I must tell them to-night. It would not be honorable to keep silence; besides, I am so proud of the treasure I have won that I could not be silent if I would."

They went back to the Limes; tea was ready in one of the sunny little rooms that looked into the garden, and Mrs. Haye sat waiting for her daughter. She smiled as the beautiful girl entered with her lover.

"I am not surprised," she said. "I thought it was so. Violet is two hours later than she intended to be, and then does not return alone. That is like Violet."

Later on in the evening Felix told his love-story to Violet's parents, who were pleased with it—pleased but not elated. Violet was very lovely; she belonged to the gentry. Her beauty ought to have done much for her; still Felix would certainly one day be the leading lawyer in Lilford, and the legacy had quite altered matters. But for that and the partnership, Mr. Haye would not have been willing for his daughter to engage herself to Felix Lonsdale; however, in that country spot he was now a good match. They talked for some time about the prospects of business, about the cottage *orne*, about Lilford, and then Felix knew that it was time for him to go.

Violet went with him to the garden-gate. How many times he had blessed that garden-gate! A great lilac-bush shaded it, and some of the happiest hours of his life had been spent there. The moon was shining and the flowers were steeped in glittering dew as the lovers walked through the garden. It was a long good night. They stood under the sweet-smelling lilac, and the moonlight seemed to soften Violet's heart just as it softened the beauty of her marvelous face.

"Violet," said her lover, "will you give me one kiss? It is customary at all betrothals, and this has been our betrothal-day."

She raised her fair face to his in the moonlight, and he kissed the sweet lips.

"Remember" she told him, "I have not quite promised."

"I have been thinking of your wedding-dress, Violet," he said; "it shall be of white silk. My darling, you will be such a beautiful bride that every one who sees you will want to take you from me."

The lilac-leaves were wet with dew, and the lovers laughed as the dew-drops fell over them. They laughed as the night-wind swept over the sleeping flowers—as the great boughs swayed and murmured. All the world seemed so fair. Then Felix found that it was growing late. It was hard to shorten this the happiest hour of his life, but it must be done.

"Violet, I could stand here saying good night until morning dawned; but that must not be. Good night."

Once more he kissed the beautiful face, and whispered to her that she was dearest, sweetest, truest, that the world had no other jewel so rare, that he loved her with his whole soul; but she, when her fair face was resting on his breast and his strong loving arm enfolded her, whispered—

"I have not quite promised. Felix, do not forget that."

"I shall remember it only to love you the more," he answered as he left her; and he smiled to himself each time that he thought of the words.

"You have brought good news home, Felix," said Mrs. Lonsdale, when she saw the happy light shining in his dark eyes.

"Yes, *madre*, good news," he replied. "I have seen Violet, and she was more beautiful and charming than I have ever seen her yet."

"And she promised," began Mrs. Lonsdale—and then she stopped suddenly, thinking to herself that after all she had no right to put the interrogatory that was on her lips. Felix looked at her with a bright smile. "She ill be my wife, *madre*. Mr. and Mrs. Haye are both willing. She has not exactly promised; but she will marry me when I have a house ready for her."

Love and youth were strong within him; the mighty passion stirred his heart; he could not breathe within the narrow compass of four walls. He went out into the moonlight; he could think of it all—realize it all—better there. He had won Violet. She was his own, the beautiful girl whom every one loved and admired—his own, to love him and bless him, to crown his life.

The union was a settled thing. Both families met and talked it over. It was a certainty; and a few days after Felix had placed the little pearl ring on Violet's finger he went to make inquiries about the cottage *orne*, while Mrs. Lonsdale said to herself more than once, "I do not know how it is, but I wish that he had choosen Evelyn Lester."

CHAPTER IV.

THE news of an engagement was always well received in Lilford; it was something to discuss, to think of—something in which both maids and matrons took a lively interest; and it was certain that no engagement ever courted so much discussion as this. How intensely the young farmers in the neighborhood detested Felix Lonsdale for having won beautiful Violet! Each one made up his mind that Felix Lonsdale should do no more business for him, and wondered why she preferred a lawyer to a farmer. All the old people thought it a most suitable alliance. Felix and Violet, they said, were equal in position, and marriages of that kind were the best. Mothers who had daughters of their own to marry were thankful that beautiful Violet could rival them no longer. The girls thought that Violet had won a prize, for there was certainly no one in all the country-side like Felix.

Fig. 5.

There was one pure, gentle heart to whom the news of the engagement came like a terrible blow, although it had long been expected. Evelyn Lester had never even owned to herself that she loved Felix Lonsdale, yet when she heard the news, it seemed to her that the bright face of heaven was hidden from her by a dark funereal pall. They had all been children together, and in their childish quarrels it was always Evelyn who defended Felix. He could do no wrong in her eyes; in her opinion the wide world held no other so brave, so handsome, or so noble; and the childish love had unconsciously grown with her—she called it friendship, and believed it to be nothing else. Felix had a real friendship for her, a real admiration, a great esteem, but nothing like love. He lent her books, he frequently asked Mrs. Lonsdale to invite her to the house; but it was all because he was sorry for her, and thought her life lonely and sad. Evelyn was an orphan, left to the tender mercies of a strong-minded aunt, Jane Lester, mistress of the pretty little farm known as the Outlands. Miss Lester would say of herself, "I am nothing if I am not strong-minded;" and therein she spoke the truth.

Fig. 6.

She looked like a strong-minded woman. She was thin and angular; she had what she called a useful complexion—the sun did not darken it, nor did the wind ever freshen it into deeper bloom; her gray hair was braided in most severely uncompromising style; her dress was of plain, rich material. In writing the word "woman" she always used a capital "W," and a capital "H" in "humanity." Of men as a whole she had the poorest possible opinion; she had the profoundest contempt for all their sentiments, principles, and inventions. She went to extreme lengths in her views about the rights of women. Where there was a man, she was accustomed to say, there was mischief. "If you want anything done well, do it yourself," she counseled; "do not leave it to men." She had a certain conviction that if the world were governed by women it would be quite another place. She did not dislike men, she had simply a superb contempt for them—a lofty pity and compassion that were infinitely amusing even to the objects of them.

It was the puzzle of the whole neighborhood how so sweet a girl as Eve Lester could have grown up under the charge of one like her aunt Jane. Eve was not beautiful. She was the perfect type of an English girl—graceful, healthy, with a rounded figure, a clear complexion, fair brown hair, red, ripe lips, a face that one would call sweet rather than beautiful; the dark-gray eyes were clear and tender, long lashes shading them—a frank, noble soul spoke from her eyes; her lips were firm and sensitive, with sweet and gracious curves about them. Of a hundred men perhaps ninety-nine would have passed Eve by and thought but little of her; the hundredth would have considered her face one of the sweetest and dearest. There was a quiet dignity about her, a graceful ease and self-possession that delighted her aunt. Evelyn had a small fortune entirely at her own command, but her aunt was always at hand to see that there was no undue expense.

The Outlands was a pretty farm not more than half a mile from Lilford, and Miss Lester was supposed to have made money. She, with her niece, belonged to the gentry, but, owing to the elder woman's peculiarities, the two ladies visited but seldom and seldom received any visitors.

If there was one man in Jane Lester's eyes less contemptible than another, it was certainly Felix Lonsdale. "The boy has a beautiful face," she was accustomed to say of him, "and beauty is a woman's gift." So because he had a "woman's gift" Miss Lester looked more kindly on him. She liked to see him at the Outlands. She gave him any amount of good advice; she was pleased that he should be a friend of Evelyn's.

No one was more delighed than Jane Lester to hear of the legacy, but the engagement did not please her so well. Love and marriage were folly in her eyes.

"I am disappointed in you, Felix Lonsdale," she said, sharply. "I thought you had a little more sense than the generality of men. Pray expect no congratulations from me—I have none to give."

But Eve smiled at him with her clear tender eyes.

"I am very pleased," she said, "for I know that you love Violet dearly."

"We shall always be friends," he told her.

And she answered him with a happy smile on her sweet face—"Always."

They would always be friends; for she desired nothing better in life than the friendship of Felix Lonsdale.

Miss was perhaps a trifle more disagreeable than usual for the next two or three days, and and then, to all outward appearance, everything went on as usual at the Outlands; but to Eve Lester life was never quite the same again. She was innocently unconscious of her love. If any one had suddenly taxed her with it, she would most indignantly have denied it. She hardly knew that the love of the woman differed from the love of the child. She did not know why the smiling earth and the fair heavens had so suddenly grown dark to her. She did not know why the spring of her life had left her.

* * * * * * *

Darcy Lonsdale had taken Vale House; he had for once in his lifetime the pleasure of ordering new carpets and pretty furniture. Mrs. Lonsdale was delighted. She had engaged a treasure of a nursery-governess, and prepared herself to enjoy life in real earnest. The deed of partnership had been drawn up, and the firm was known now as Lonsdale & Son. Every one agreed that Darcy had done a very wise thing in making his clever, bright, intellectual son a partner. Felix had taken the pretty cottage *orne*, and his spare time was devoted to preparing it for his beautiful bride. He had seen some fine photographs one day that he fancied would look well framed and hung upon the walls. He had asked Violet to look at them; but he could not get her to speak freely upon anything. The photographs were beautiful—with the most charming of smiles she condescended to say so; that was all. She was evidently in an amiable humor, and Felix resolved to make the most of it.

"Violet, do come and see the house?" he begged. "You say that you never visited it while the Hendersons lived there. You cannot tell how pretty the rooms are; do come and see them."

It was a brilliantly beautiful day in July; the sun shone on lilies and roses, on flowers of every hue; the earth lay in the warm heat and brilliant haze—there was a hush and sweet, brooding silence over all. Violet could not refuse; putting aside all other thoughts, it would be pleasant to see the interior of a pretty house. Mrs. Lonsdale offered to go also, and the three started together. But Mrs. Lonsdale had been in love herself, and she had pity on her stepson. When they had admired the beautiful grounds and gardens, she said laughingly—

"The kitchen will not interest you; it does me. I will go and inspect it."

Then Felix showed Violet the pretty rooms he had planned for her.

"The charm of them," he said, "is that they are full of light and brightness; from every window you see flowers and trees, through every door comes a breath of perfumed air. Oh, my Violet, we can be so happy here!"

"Is that jessamine growing yonder?" she asked. "Do gather a few sprays, Felix. I think I am fonder of jessamine than I am of any flower that blows."

He went in compliance with her wish. What request of hers could he have refused? And Violet Haye stood alone in the home that her lover sought to make hers. She stood there, dainty and bewitching; she looked round. The rooms were very pretty; she tried to imagine herself mistress there; she tried to picture herself living there, going in and out, waiting for Felix, giving orders. She tried to realize what life would be like when she was married and lived there. There would be no future to look forward to, no sweet, bright possibilities. "I should know all my life then," she thought, "it would hold nothing brighter than this;" and the dainty little foot tapped the floor. "Here it would all begin and end; there would be no more dreaming"—and she had dreamed wildly of a different life from this. Still she loved Felix.

"I wonder," said the dainty young beauty to herself, "in what I differ from other girls. I know not one but many who would gladly change their fate for mine, who would marry Felix Lonsdale and be happy in his love, who would think this pretty house a palace, and who would find the contentment of a lifetime within its walls; why cannot I do the same? What is it I am always looking for, hoping for, expecting? What more do I want? I cannot understand myself—and I am sure no one else can understand me."

The violet eyes glanced wistfully round the pretty rooms; why was she not content?

"I love Felix," she told herself; "and it seems to me that if I made an effort I could be happy and contented here. What is the effort that I have to make? I love Felix; nothing on earth can make me alter that fact." Yet she did not feel quite at ease. There was a vague shadowy feeling of something wanting that she had not yet found.

Felix amused her with his raptures when he returned. It was so novel, so delightful to see her there; and the day was never forgotten by him, because she had been gracious to him upon it.

CHAPTER V.

The inhabitants of Lilford were pleased at Darcy Lonsdale's good fortune. He deserved it, they said; his honest, honorable, industrious life had been spent amongst them; they had known him as boy and man; they had been interested in his marriage, in his children, in his business; he was one of themselves; they had been interested in his joys and sorrows and in his welfare, and now they were pleased at his good fortune.

With this sudden and unexpected gleam of prosperity came other gleams; his business increased—and Darcy Lonsdale owned to himself that he was a most fortunate man. He removed with his household to Vale House; and Felix began to think that he might induce Violet to marry him before the end of the year. He did not often speak to her of their marriage, for it was a difficult task; she would evade the question in a hundred different ways; she would laugh, yet look charming—do anything, in fact, but reply to his inquiry as to when they should be married.

He went to the Limes one lovely summer evening, quite resolved upon not coming away without a definite answer. Violet was looking even more charming than usual; she wore a white dress with blush roses, and her fair girlish face was like a sweet flower. He persuaded her to come out with him, beguiling her on the lawn under the pretext of showing her the gorgeous western sky.

"I do not care for sunsets, Felix," she said. "I cannot go into raptures over them. I see the sun set in some fashion or other every evening."

But he was so determined that she thought it less trouble to accede to his wish. The sight of the glorious sky made her thoughtful; then, when she was in a frame of mind proper for listening, he turned to her. How dazzlingly beautiful her face was in the sunlight!

"Violet," he said, "I want to quote a couple of lines from a familiar ballad to you. Can you guess what it is?"

"No, I cannot; I do not care for familiar ballads," she replied. "What is it?"

"You know 'My pretty Jane,'" he said. "The lines I want to quote you are these—

> 'Name the day, the wedding-day,
> And I will buy the ring.'

Now, sweet Violet, that is just what I want you to do—tell me when that happy day will dawn for me. Do not let the summer sunshine and the summer flowers all die before you are my wife."

She turned her startled face to his.

"You are cruel, Felix," she said. "You always spoil these lovely sunny days by talking about marriage."

"My heart is full of it," he replied—"at least it is full of you. I do not wish to startle you, Violet, but give me one kind word to dream about now. I am always wondering, 'When will our marriage take place? When will my darling consent? When will the end come to all my uncertainties, doubts, and fears? When shall I say to myself—On such a day I shall bring home my wife?'"

She answered half impatiently.

"You make so terribly sure of everything, Felix."

"Have I not the right to do so in this case?" he asked, laughing half sadly at her.

"I did not quite promise, you know, Felix."

"Perhaps not in so many words, Violet, but in honor you are bound to be my wife."

"I am willing to be your wife, Felix, but let me enjoy my youth a little longer. I am only nineteen—there is no hurry."

"You forget," he interrupted, "how dearly I love you to be with me. If I thought you did not love me, Violet, I would not urge my request—I would go far away, and occupy my life as well as I could—nay, I would rather die than make you unhappy. If you do not love me I will not hold you pledged to me, Violet."

"But I do love you," she said, looking up at him with sweet perplexed eyes; "still, Felix, it seems so sudden—"

"Hardly sudden, darling," he interrupted, "when I have loved you since you were seven years old. You will be just as happy when you are my wife as you are now—will you not?"

"I cannot tell," she replied. If she had spoken the real truth, she would have told him that she was unwilling to lay down her sovereignty—that the homage and admiration she received were very precious to her—that she liked to know she was the queen of the country-side. All that of course would end when she was married. The married ladies she knew led dull lives—or dull they seemed to her—spent in the routine of duty. They superintended their households, nursed their children, directed their servants. It seemed dreary work to her—a life that held little. She had hoped for more than this; her brilliant beauty ought to bring her a brighter fate than that which these plain-faced matrons had met.

While she sat musing with these bright thoughts plainly written on her fair face, Felix was looking earnestly at her.

"Let me say September, Violet," he pleaded; "that is a glorious month, and the house will be quite ready. My darling, gladden my heart with one word."

But he was never quite sure whether she had spoken that word or not; her eyes were dim with tears, and she murmured something to the effect that she loved him—had always loved him; while something of remorse seemed to tinge her manner. Her fingers thrilled him with their soft touch; her lovely lips quivered as she talked to him—but he could never tell whether she had whispered the word he wanted.

That evening, when he reached home, Evelyn Lester was there, and a sense of rest came over him at the first glance at her sweet face. She went up to him with the gentle grace and dignity that characterized her.

"Felix, I have heard good news—you are favored in fortune and in love. Is it all true?"

"Yes"—he told her it was all true; he had been spending the evening at the Limes—he had just left Violet.

He walked home with Evelyn, and he was struck with the strange sense of rest that came over him. She was not beautiful, but the sweet face was very fair and very tender, her voice musical and full of sympathy; she spoke so kindly of beautiful Violet, she praised her so generously and warmly, she spoke with such real enthusiasm of her loveliness, of the admiration she excited, of her brilliancy, that his heart warmed to her. She listened with such sweet sympathy to all that he had to say—to his history of the cottage, and of the pretty furniture and pictures he hoped to place therein; she was interested in it all. He said to himself that it was strange what perfect rest he found with her, a something which he could not describe, a sense of deep tranquillity and repose.

"I think, Evelyn," he said, as he stood at the hall door of the Outlands, "that no man was ever so blessed. I have the truest and fairest of loves, and the truest and warmest of friends."

The moon was shining brightly, and Eve stood in silence for a few minutes, watching him.

"You will need a friend," she thought—"and, when you do, you shall not fail to find one."—[To be continued.

COFFEE-HOUSES AGAINST RUM-SHOPS.

We sincerely hope the admirable suggestions contained in the following article (which we extract from Popular Science Monthly for November) will commend themselves to the serious attention of all who are interested in the temperance cause—more especially those whose work lies in the larger towns and cities.

The blessings of cold water may be expatiated upon until doomsday and yet the masses of working people (who furnish the largest quota of confirmed drunkards) cannot be persuaded to drink their solitary cup of cold water amid the squalor and misery that are the usual accompaniments of home-life in tenement houses, when the liquor-saloon offers the attractions of society, cards, music and a beverage which, for the time at least, cheers and exhilarates them.

It is very many years since total abstinence was first agitated, and after all these years of effort, intemperance is on the increase; this the temperance leaders themselves admit. Can their methods of combating the evil be at fault?

"A large party has been striving for half a century to eradicate the evils of intemperance by proclaiming certain great inflexible principles and insisting upon their being uncompromisingly carried out. Immense evils result from the use of alcoholic drinks as beverages, and it has been thought to extirpate these evils by reprobating the use of anything alcoholic under any circumstances, and by outlawing the commerce in these beverages. The rum-shops have been denounced, and the politicians have been called upon to suppress them. Much good may have been done; but drinking habits are still prevalent, and rum-shops still abound. The temperance reform, from this point of view, has been a failure, if by success we understand the eradication of the evils of intemperance. This failure has been, we think, at least partially due to the refusal of the master-minds of the movement to study the various ways in which partial advantages may be gained. Those who view the subject practically maintain, for example, that much benefit to the community would result if the weaker liquors could be generally substituted for the stronger, as wine and beer for distilled spirits; but this notion has been sternly resisted by the great mass of ardent temperance reformers as sacrificing first principles. All alcoholic liquors, they maintain, are poisonous, baneful, and to be equally condemned, unless, indeed, the weakest are not the most dangerous. To which the reply is, that these extreme views are self-defeating; that they have been preached until the community is wearied with it, while the liquor traffic still flourishes, and that it is the part of wisdom to check, diminish and circumscribe an evil where it cannot be wholly removed.

"Of one thing there can be little doubt, that to substitute the use of tea, coffee and cocoa, for spirituous liquors, would be a great gain. In the literature of teetotalism thus far there has been but one dietetical alterative to alcohol, and that is water. With curses upon alcoholic drinks, the temperance lecturer has interspersed copious praises of 'clear, cold, sparkling water.' In practice the abandonment of alcoholic stimulation has been often accompanied by a resort to the stimulations of opium and tobacco—a change which has in it but few elements of reform. As an ultimate fact of man's nature, he is so constituted that he seeks stimulus of some kind—some method of breaking the monotony of the feelings and getting contrasts in the psychical life. This may be wrong, and water may be the drink that should be exclusively patronized by everybody; but that consummation, whether desirable or not, is undoubtedly remote, very remote indeed. Meantime, there would unquestionably be a great gain in substituting tea, coffee, chocolate and cocoa for alcoholic liquors.

"Accordingly we are glad to see that a vigorous movement has been set on foot to fight rum-shops with coffee-houses. We have received a very interesting tract from Mr. Charles Collins, describing the results of experiments made chiefly in Liverpool, to maintain a system of 'public coffee-houses' and 'cocoa-rooms' for the use of English laboring men. There is a society in Liverpool for the promotion of this object, and the pamphlet before us is made up from its reports.

"It appears that twenty-nine places under the denomination of 'cocoa-rooms' have been opened in Liverpool under the auspices of this society, by the employment of a subscribed capital of $100,000. So successful has been the enterprise, not only in its favorable influence upon the habits of the people, but also pecuniarily, that ten per cent. profit on the investment was distributed to the stockholders last year, and it is now proposed to increase the capital of the association to $200,000, in order to still further extend its operations.

"The rooms are open to all at five in the morning, so that men may call on their way to work, as the early morning cup of hot cocoa, coffee or tea, is found to be of immense advantage. It is said that many by this means have been saved entirely from the use of other stimulants. The cocoa, coffee and tea are of good quality, and are furnished hot at the following prices: two cents per large mug and one cent per small mug of cocoa and coffee; tea, two cents per cup. The large mug contains a pint, the small mug and the cup contain each a gill. Newspapers are provided for reading, smoking is allowed for those who wish to indulge in it, and separate rooms for women are said to have been much appreciated. All the arrangements have been placed on a business footing, and with an eye to profit.

"There is an association in London for the promotion of a similar object, and in their circular, entitled 'The Coffee Public-house: how to establish and manage it,' they say:

"'Give the workingman a public-house, where he may meet his friends, and talk and smoke, and play games with all the freedom to which he has been accustomed, and where good coffee and tea—with stimulus and nourishment in them—take the place of beer and gin, and you set before him for the first time, plainly, the choice between sobriety and comfort on the one hand, and dissipation and wretchedness on the other. If it is proposed to carry on mission-work, it is better that this should be done in adjoining premises, rather than in the coffee public-house itself.

"'The rooms should be airy and pleasant, full of light and color. It is better to avoid giving to the coffee public-house a distinctively class designation, or one which might appear to connect the house with any particular social or philanthropic movement.

"'The plan of partitioning off portions of the ground-floor, or setting apart rooms for reading, smoking or other purposes, though occasionally useful, does not always work well. Men like being in a crowd; isolation is not to their taste; and an arrangement of this kind is apt to lead to overcrowding of particular rooms while others may be almost unoccupied. The only other exception to the foregoing rule is where a room can be set apart for the accommodation of women and children, or for youths. Wherever a room especially for women has been opened, as in some of the Liverpool houses, the boon has been highly appreciated. It should be understood that men accompanied by their wives may use the women's room, and every encouragement should be given to men who may be disposed to bring their wives and children to the coffee public-house. Women should be encouraged to avail themselves of the public rooms when no other accommodation has been provided for them.'

"There is everything to commend and nothing to condemn in this mode of promoting the work of temperance. It proceeds upon the assumption that there is no use in trying to shut up dram shops until something else has been provided to take their places. Various causes lead to the formation of intemperate habits, but perhaps the most powerful are social influences. Men are gregarious, and as they are cultivated they become more social and crave companionship. They meet together, and wine favors geniality and conviviality. If men are to be delivered from this temptation, they must be furnished with a substantial equivalent, or places where they can come together and have *some* social enjoyment without the temptation of intoxicating drinks. Reform here begins at the right end. Its spirit is not ascetic, but sympathetic, and it cannot fail to be well received by large numbers who would not be influenced by bare moral inculcations.

"It is to be hoped that the experiment that has proved so successful in Liverpool will be tried in New York and other American cities, under such modifications as the changed circumstances may call for. The desirableness of some systematic movement of the kind is undoubted; and if it will do positive good, and pay its expenses and yield a liberal profit, there ought to be no difficulty in getting capital for it, whatever may be the difficulty in finding competent and trustworthy managers, who will not steal the funds."

The Princess of Wales took lessons on the zither last year, and all the daughters of the nobility, and all who can afford to ape aristocracy, are now waking weird strains from that instrument. And now—horrible thought!—suppose Mrs. Wales were to take lessons on the accordion this year. The result would be too dreadful to contemplate! This country would be overrun with English accordion refugees, and millions of dollars would have to be raised for the sufferers at home. If there is one thing in this world worse than the yellow-fever scourge, it is an accordion epidemic. We shall send the Princess a copy of the Herald with this paragraph marked.—[*Norristown Herald.*

RECENT LITERATURE.

Hand-Book of Punctuation. With Instructions for Capitalization, Letter-Writing and Proof-Reading. By W. G. Cocker, A.M.: A. S. Barnes & Co., New York. Price 50 cents.

The author of this very excellent manual truly says, "Very little attention is paid in schools to punctuation, and the rules usually given in English Composition are either disregarded or not properly understood. The evils of bad punctuation are really more serious than the evils of bad spelling, and no student can be said to have learned to read well, much less write well, who has not studied punctuation intelligently." Many people who are in the main intelligent and fairly educated, cannot punctuate or capitalize even a short note correctly. Among Rural readers, how many would write the following address in the way it is here given?

Rev. E. O. Haven, D.D., LL.D.,
Chancellor of University,
Syracuse,
N. Y.

Why should there not be a period after the first of the two L's as there is in case of the D's? Which is correct, Yours affectionately or Yours Affectionately? Why is not the "d" capitalized in the following address: My dear Friend? Shall we say Dickens' Works or Dickens's Works?

For answers to these questions, and for very much other useful information, we refer those interested to the book under notice. It is written in a clear style, very few technicalities are introduced, and it is not cumbered with rules. The work merits a wide circulation, and its low price puts it within the means of all.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

THE WOMAN'S CLUB.

A POOR ECONOMY.

THERE seems to be a current opinion among our friends of the "Club" that if a woman hires help to wash her "greasy dishes" she should in some way supplement the family income so as to make up the "loss." Now, I think it would be just as reasonable to say that if she used flour in her housekeeping, she ought to sit up nights and do sewing work to pay for it. The "help" in a household where there is a baby to care for ought to be set down as one of the regular expenses as much as the family flour. And it *can be* even on a very small income. I know this from twenty years' experience. During the war, on as small an income as a professional man often gets, I kept both a nurse and a kitchen girl, and *paid them, too*. It takes self-denial in other things, but if that cannot be compassed in any other way, it becomes a moral duty to make these self-denials for the sake of securing the help. A young mother's health both of body and mind (which latter is so little thought of), is worth more than fine clothing, or rich table fare or more acres, or more stock or high-priced farm implements. I would ring it in the ears of every young householder, with a family of little ones growing up about him, "Keep help if you would keep your young wife from turning into a broken-down, snarling old woman in her early prime, or save her from the stony walls of a retreat for the insane." Man's inhumanity in this line calls loudly for another Mr. Bergh.

Sometimes it is a woman's fault. She can't "put up" with such help as she can get, and would rather slave along alone. Dear, working sister, it is a poor, short-sighted policy. Save yourself, now, while your children are small, train them to be helpful, and by and by you can enjoy the luxury of doing your own work in your own way, and having your whole house to yourself, with no cross Bridget to mar its harmony. I have "put up" with help for twenty years, and have enjoyed for one year the luxury of doing without, when I found that it could be done with the children, and I felt a little as "a man and a brother" might after the Emancipation Proclamation went into effect. The children, too, felt as if they had moved into new quarters, now that they had the freedom of the kitchen, a luxury the older ones had never known. "Don't ever keep a girl again," is the universal sentiment, though "Horatio" still looks upon it as an experiment."

Keep help of some sort when your health or labor require it, even if you can get only a hired boy to clean your steps and draw the baby out in his wagon. Whenever you economize do not save out of your life blood, or that saving will in the end gnaw like a viper at your heart.

RUTH.

RECREATIVE HOUSEKEEPING.

MISS RIPLEY:—With your permission, I have a few ideas to offer in response to some of the ladies who have joined the Club with matters of importance for discussion.

Naturally, the acme of my ambition would be above the very ordinary piece of labor termed dish-washing, but since such work always has been done, and always will have to be done by some one, and as "Sufferer" enters complaint, I wish to offer a crumb of comfort. She does not state whether "Horatio" has only the book and cigar to be entertained with, or whether there are any children to wash dishes for, or whether very often a goodly number of uncles and aunts, interspersed with troops of little cousins—not to mention other friends—come to dine as well as visit, thereby subjecting at least *one* member of the family to the care of dish-washing. But in any case she is not like my humble self if she is able or inclined to "rush" and "grapple" the soiled pile, with the soiled cloth, immediately after eating a satisfactory meal. At least, I for one, do not find such a proceeding agreeable, and the laws of health prohibit any exercise within a given time after eating.

A few moments, if not a whole half hour, for the strong and weak, can be profitably employed by matters of interest in book or paper, or in the inspection of house plants; or a stroll in the flower garden might prove beneficial. Allow yourself pencil and paper, and make a copy of any object or of any landscape before you which may please your fancy, though you are not an adept in the art of penciling. Choose a retired corner for fear of intruders upon your pastime; tax well your memory with the rules, and when complete, lay away on some out-of-the-way top shelf, and when you have forgotten your own perplexities, and have looked to some one for entertainment and help, perhaps they may possibly be as well amused by your productions of of pen and pencil, and wonder who has brought out so fine a picture of the old brick smoke-house, or of the oldest pear tree in the home place, with its dead branches represented so faithfully. Then when you've thus diverted your mind from the dreaded task, you've fresh ambition to "grapple" the cloth without a "rush" and forget the task, apparently, by allowing a more absorbing and agreeable subject to color your thoughts.

You can, if you choose, tie a cloth to a stick to save those pretty hands of yours, and then to be sure to have a supply of that valuable article, "Glycerine;" and the *only specific* known, is offered you until there's a machine invented, or a substitute in your place takes the burden from you. You cannot have a natural love for the womanly ways which all *married women* should possess, if you do not really like to see the pretty things which are so important in the partaking of "a satisfactory dinner." It is true, too much time can be spent in the cooking department, but there are circumstances which render the "dish-washing" an *absolute luxury*.

But your circumstances, individually, may be truly trying, so I will close by saying that Margaret Harvey, in another department of the RURAL, has said *all* in her article, "Small Courtesies at Home," and her letter has tempted me to make my particular grievances known; but as I have been a sufferer many years, I cannot very well enter complaint to a young housekeeper, nor ask advice of her; but truly it is one's privilege to make one's-self nobly happy, even in an humble way, and with little expenditure. Perhaps there's policy in being patient in well doing, because if, like children, we tire of the toys given us, we can easily shut the door on such stern realities as "dish-washing," and have a picnic in the woods and partake of some berries from bass-wood leaves, fish from a piece of birch bark, and nuts from off a clean piece of rock after the sandwiches from a dinner-basket brought from home; and of course "a sufferer" would not enjoy such cheap pleasure without "Horatio's" book and cigar.

Respectfully, "A TIRED HOUSEKEEPER."

OUGHT WE TO BE GLOOMY AT FORTY?

DEAR——, what shall I say? To "dear" a whole club of women is rather too comprehensive. There's the editor. I might have lavished my tenderness on her, but I forgot. For the nonce I'll let my "dear" stand solus. I suppose I ought to start out by stating how charmed I am with the idea of us women being permitted an opportunity to appear on the RURAL stage; how delightful I have always found the editor, and how from my youth up I've doted on the RURAL,—I believe that's the regulation way of introducing one's-self; but I want to do a bit of growling, and, like the deacon who complained that the only trouble he had about praying was his inability to to "switch off," I'm afraid if once I started on the amiability tack I'd never get to the growl.

My grievance is the following poem, which I clipped from a paper the other day. I think the last two lines deserve special condemnation:

AT FORTY YEARS.

Flying, flying fast—
Ah, whither have they fled?
Velvet cheek, and dewey lip,
And golden head,
Rose, and bloom, and blush,
Star-eyes, and bird-song's gush—
A cloud on airs Elysian
Flying, flying past;
Ah, lovely, fleeting vision,
Too lovely to last!

Drearily the waves
Of the Dark River flow,
Sad their under-tone on all
The winds that blow,
Rose, and bloom and blush,
Star-eyes, and bird-song's gush—
When lids are full of tears
The heart no longer craves:
For, after forty years,
We only tread through graves!

What a preposterous idea to doom those of us who are forty and over to perpetual graveyard pedestrianism. All the joy of life, it would appear, is in youth's morning and after the "rose, and bloom and blush" have fled, there is no future in this world for us! After that, all is to be suggestive of buried hopes, dead loves, lost friends and charnel houses generally—both mental and material. Certainly, a most cheering and winsome prospect for middle life and old age.

It's absolutely wicked to write such stuff. Think of all there is that is beautiful and grand in life, of all the enjoyable experiences one can have with friends, books, art, science and nature. Is the delight these afford us dependent on our being under forty? Does not every bird, flower, and fruit, every bit of lovely scenery, every ray of sunlight, and each and all of the thousand delights which crowd into the humblest life, bid us "rejoice and be exceeding glad" that it is our privilege to enjoy such blessings? And what right have we to indulge in never-ending grief and to keep our "lids" in a chronic state of tearfulness? It's an insult to the good God who made us.

The heart should know no growing old, for to the last moment of the longest life one can be happy, negatively so at least, if he but will it.

Out upon the doctrine which would condemn us after the brief season of youth to sit on the banks of the Dark River and listen to its dreary moanings, and by way of variety, permit us the luxury of graveyard meanderings.

LINDA BROWN.

CANCER CURE.

I HEARTILY approve of the "Woman's Club." Anything which has for its object the education, or advancement of the mothers, and sisters of our country should find a full indorsement, from every patriotic citizen, whether man or woman. There is such pressing need to arouse in woman a desire for higher development physically, morally and intellectually, that whoever engages in the good work, should receive the gratitude of womankind. There is scarcely a woman in the land, but what is possessed of some invaluable knowledge, which might prove of great benefit to others if she would but make it known. It is frequently more lack of confidence in herself than lack of ability to put it in proper shape, that prevents many from writing.

And now as a first contribution to the Club: Four years ago, I learned a remedy for cancer, which I have never known to fail in effecting a cure. It came to my knowledge in this manner. A lady, at whose house I was stopping, had a sister whose face was terribly disfigured, the nose being almost entirely gone, and the throat so much eaten away that the girl could not speak in a way intelligible to any but those accustomed to her. The sores were all healed, and had been for years, and there was now no appearance of eruptions or any other impurities of the blood. She was so disfigured that it would almost have seemed a mercy not to have saved her life, but she was an example of what the medicine could effect. While I was at this lady's house, I met a gentleman who, I happened to know, had been afflicted with a cancer, which had caused him much anxiety. He had recently spent some time in New York under the treatment of a celebrated cancer doctor, but without obtaining relief. I informed the lady of these facts, and she gave him this recipe. This was four years ago. I saw the gentleman a few months since and inquired about his. The reply was, "Oh, it gives me no trouble; if I have any fear about it, I take a little of Mrs. S.'s medicine, and it is all right."

I have an aunt between 50 and 60 years old, who has had an internal cancerous tumor, causing her much suffering, and rendering her for much of the time, unable to work. She has been treated by many eminent physicians, and has spent hundreds of dollars, but all to little purpose. For the last few months she has been taking this medicine, and says she has not been so well for years

I might mention other cases, but perhaps these will be sufficient. I have never known it to fail in a single instance to cure impurities of the blood, whether cancerous or otherwise. I wish I could inspire in others the same confidence which I feel, for I am certain it would mitigate a vast amount of suffering.

Cancer Cure.

Two ounces of Sulphur; ½ ounce of Quicksilver; 1 ounce of Cream-of-Tartar; ½ ounce of Saltpeter. Put into a pint of molasses, stir, take a tablespoonful before going to bed.

For outside application: 1 bottle of British oil; 1 ounce of Red precipitate.

The sulphur and quicksilver must be thoroughly mixed for a long time in a druggist's mortar, and then the other ingredients added.

I wish this could be published in every paper in the land, and that in after years I could have the satisfaction of knowing that many had been saved from horrible suffering and death by its use. Faithfully yours,

MRS. W. C. G.

THOSE DISHES.

I HAVE been reading the "Woman's Club" for October with great interest. I am sure I sympathize with "A Sufferer" over her dish-washing, but I am afraid society has not progressed sufficiently far, as yet, to allow of our dispensing with that needful ceremony, however handy a nice, crisp leaf might be as a substitute for a dinner-plate.

But if we cannot abolish dish-washing, the next best thing is to put science into it and expedite it all we can. "Sufferer" does not want energy, we feel sure, or Horatio would never have been disturbed by the clatter of the plates. Now let her add to this energy the best system she can possibly invent for putting the work along rapidly and successfully, and she will feel that she has achieved something worth doing. Let her have an eye to the finished result, as she goes along, and it will be quite a help. Wax-fruit making is a very dirty, sticky business, but the beautiful results more than pay one. A shelf filled with shining china and sparkling glassware, is a pleasant sight in the eyes of any housekeeper, and it will not detract from their beauty to feel that they owe their shine to your industry.

Of course, everybody knows her own business best, but if I have dishes to wash I like to get the worst over first. The baking pans and kettles I take first in nice, clean suds, and dry them about the stove. Then I pour out the water and take a fresh panful for the glass, the silver; then the cups, plates and vegetable dishes. Two good dish-pans, plenty of nice, soft water, soap and clean tea-towels are the main essentials of good dish-washing. It can be done very quickly, with proper dispatch and a good, stout determination. Without the latter all work will drag. I often think, in view of disagreeable duties, of the remark of the old Indian who was asked about a dry crust he was eating, "Do you like that?" He answered, stolidly, "He's my victuals, and I will like him." We have need of a little of this spirit if we would get along smoothly with life's trials. We can cultivate our likes and dislikes to any extent, if a man can learn to like the taste of tobacco. So, dear "Sufferer," even you may learn to like dish-washing. It seems incredible, does it not? but people have. Time yourself by the clock and see how quickly you can finish the unpleasant work. That will serve as a stimulus and keep the work from dragging on your hands. "Dragging" is what makes work particularly "hateful." Still, the main ingredient to make the cup palatable is a willing mind. Nothing is a task which we do willingly. Time and custom also make many things easy and even pleasant that once were very distasteful.

Your loving AUNT FANNY.

THE "BRIGHT SIDE" VIEW RECOMMENDED.

EDS. RURAL:—In looking over the RURAL of a few weeks ago, I noticed several excellent suggestions in the columns devoted to women, especially "Talks with Children," but was sorry to see so much discontent in regard to housekeeping.

Wherever our lot may be cast, we should try to make the best of it and, if possible, look at the bright side of the picture. If we are obliged to be "housemaid, nurse, dressmaker, mother and hostess,"—cook and dishwasher, I may add—why not try and arrange our work in such a way that it will be as little as possible distasteful to us?

There are other enemies to conquer besides the weeds that grow up among our fruits and flowers. If one has a time and place for everything and everything in its place, it sometimes seems remarkable in how short a time one can prepare a meal or wash a set of dishes. As to the dish-cloth being "slimy," that need not of necessity be so, for if it is well washed with soft water and good soap, and dried in the sun after every dish-washing, it will not become slimy.

It is a pleasure to me to serve a well-prepared meal, to see that the remains are not wasted, and to wash the dishes after it is over, with a *clean* cloth. I would much prefer cooking or dish-washing in a nice, clean kitchen, to pulling weeds in the garden on a warm summer day.

Let us be content with whatever we have to do, and do all in the best possible way, and it will lighten our burdens considerably.

When I began to write I only intended to write a few words, but my epistle has lengthed considerably. I hope the Editor will give me a place in the Women's Column, and if acceptable, I will occasionally contribute "one thing and another."

SARAH E. R. SHEPHERD.

"THE WAIL AND THE PROTEST."

IN striking contrast are the letters published in the RURAL of October 5th.

First. There is the happy mortal who has no dishes to wash, and also has no milk, no chickens, no fruit, no eggs to feast upon, if we except the feasting with the eyes, which it must be acknowledged, is not altogether unsatisfactory. Then, added to all this, the unsatisfied cravings of the inner man—there is that culminating misery of beholding a duplicate of one's love of a hat upon the head of the village Amaryllis (It's an ill wind that blows nobody good; the rustic beauty is, doubtless, happy)

Mrs. Price pays twenty dollars per week for that peculiar nectar and ambrosia which only the country yields, but alas! the gods *i. e.* the landladies are unpropitious and brew neither nectar nor ambrosia for her delectation. So much for the "Wail," now for the "Protest," which comes from the happy mortal who breakfasts on aromatic coffee, sweet, light rolls, tender juicy steak, or at least I suppose she does, for she is mistress of her kitchen, but all these advantages she counts as nothing compared with that "unmitagated horror," dish-washing.

The question seems to resolve itself into a conundrum—"which is better, to starve—(board) and have no dishes to wash, or to have feasting and dish-washing?" If we believe as our ancestors taught, that there is no rose without a thorn, I would prefer the dish-washing thorn to the starvation thorn.

I have no remedy to propose, as I wish I had, except the one—patient endurance. I heard a lady say last summer, that it need not follow because we wash dishes, our thoughts must be concentrated upon them. My poetry-loving sisters might learn an indefinite amount of poems by having them fastened on the wall before their eyes while their hands were grappling with the "slimy dish-cloth." Poor Horatio, with the pots and kettles to wash! the next protest will come from him.

SANS SOUCI.

THE HEAD TO THE NORTH.

IN order to have more convenient access to a case that has been opened frequently of late while pursuing certain investigations, the writer moved his bed with the head to the West. It continued to have this direction for two weeks, and during that time he had not a night of his usually unbroken sleep. A vague uneasiness tormented him, and half of his customary eight hours of repose was wretchedly spent in restless attempts to slumber. No particular ailment could be detected that might account for it; the day's experience was much as usual, only for the morning's soreness and heaviness, resulting from broken and insufficient sleep. A newspaper paragraph on the advantages of lying in the line of the magnetic meridian or near it, so that the body may be favorably enveloped by the currents that are excited by changes of temperature, reminded me that I had met with a similar direction fifty years ago, only that the advantages of lying in a north and south direction were not attributed to electric currents, about which little or nothing was then known. I had generally acted on this advice from an indoctrinated sense of its value, but losing sight of the reason, I allowed a different reason to turn me east and west, with the effect above related. At any rate, I turned back to north, a little west (for I live where the magnetic needle points about four degrees west of north) and my usual soundness of sleep immediately returned and has continued. One swallow does not make a summer, nor does it do to generalize from a single occurrence, but I give my experience in the belief that it may add to the ease of some others who, in the decline of life, find slight straws sufficient to rob them of rest.

W.

DEAR SISTERS.—It looks very much to me as though the "Club" was going to be given up to housework: can't those of us who are interested in art and in literature have a chance to air our hobbies before the club? Will some of the sisters tell me what is the best and newest text-book of the Russian language? Also what is the best authority on Harmony and Thorough Bass.

JESSIE CAMERON.

SEVERAL club letters arrived too late for publication. They will appear in "December Club."

Domestic Economy.

CONDUCTED BY EMILY MAPLE

FRESH SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

A Substitute for Rag-Carpets.

THE article on rag-carpets in our domestic department reminds me of my own troubles in the past with carpets in living-rooms, and how the difficulty was solved. An account of the method may be of benefit to other housekeepers. After years of suffering from dust and tacking with the inevitable wear and tear, we decided to lay a floor of hard wood and selected, as a bright and pretty contrast, ash and cherry. So the boys and papa went to the woods, cut down the trees and, without unloading them from their sleighs, took them to the saw-mill, where they were sawn into narrow boards, three inches wide by three-quarters of an inch thick. They were afterwards dressed, and when brought home, placed in the kitchen garret closely packed, *on edge*, and left to dry till spring. The carpenters were ordinary mechanics, and the floor was laid on top of the old one, care being taken, however, to insert wedges wherever it was uneven. It is now so firm that not a board creaks and with a slight oiling once a year, it retains its pretty markings, while the weekly washing is very easily done. In summer a rug and a bright piece of matting are placed where there is most walking, and in winter a couple of sheep-skin mats and a larger rug, produce an additional warmth, and those things are very easily taken up to be shaken, while the floor gathers no dust, and has a pleasant glow that a carpet cannot give. So we do not intend to make any more rag-carpets for our living-rooms, but to continue our polished floors to the kitchen at some future day.

Noise did you say? Then teach the children to *lift* their chairs and not to push them, and console yourself with the reflection that the little necessary noise is nothing in the way of annoyance in comparison with the dust that would irritate delicate lungs, covering and destroying every article of furniture in much-used, carpeted rooms.

MOP-HANDLE PAPERS.—No. 8.

SEVERAL years ago I was a boarder in Mrs. L——'s family, and roamed about the whole house much as I would at home. One morning she had sent the girls, her daughters, to the garden to pick currants for jelly, while she went to the milk-room to attend the butter and milk, leaving the breakfast dishes in the sink to await her return. Just as they had all got engaged in business, word came that several visitors would be there to dinner. The morning was already well advanced, and I had heard my landlady say that it was scrubbing and baking day.

Lina, the eldest daughter, was called in from the garden to attend to the fine arts of making cake, pies and puddings. I volunteered my services to attend to the dishes in the sink, while Mrs. L. finished working and packing butter, and then came in to clean the wood-work, and put things to rights all about the house. For there was not much system about the work, and things often seemed to be in a general commotion.

After having hunted all about the sink for the dish-towels, I found them both tucked down in the corner of the sink in a "mop," left so since the preceding night by the little girls who usually washed the dishes. Of course, they were soiled and sour. A large wooden bowl was used for a dish-pan, and this was so slimy with grease as to make it almost impossible to hold it for an instant in one's hand. The first thing to be done was to make use of plenty of soap and water in cleansing both cloths and the bowl. Then the dishes were soon put away in their accustomed places, with smooth, shining faces. Next came the iron-ware; and I began to look about the stove for the necessary cooking utensils. The kettles, large and small, were thoroughly cleansed and put away; only the "spider" or frying-pan remained; the inside of this was soon made clean, but the outside was—under the circumstances—beyond my control. How shall I describe its appearance? Apparently the iron was about four times as thick as was necessary; and the molding was certainly of peculiar workmanship. But its thickness was not all iron. Whatever of grease, milk, gravy, or juices of any articles cooked that had boiled over and drained down on the outside, during all the years it had been in use, remained there, burned on, resembling the warts, both great and small, upon a toad's back, only the protuberances were black instead of brown.

Had I been alone, I should have put that "spider" upon a bed of hot coals, and left it there till all that accumulation had burned off. As it was, I scraped off the rough portions as best I could, and thought what a blessing it would be if little girls could be taught *to do well* what their hands were often obliged to do. If iron-ware is thoroughly washed, every time it is used, there will be no accumulations though it be used for centuries. Then there will be no unsightly black rings or streaks of grease streaming down upon the wall where it hangs. And though children wash the dishes, the matron should *see* to it that the work is well done, each time, before the child leaves the apartment. If this were done, if the little daughter were taught to be neat and systematic about all her work, we should not find so many slatternly kitchens as we now do, even though many married at the too early age of sixteen, as is frequently the case at present. I sometimes think that cooking schools, with a department for washing dishes, should be organized in every district, and would be, in after life, of more importance than so many text-books.

MAY MAPLE.

DOMESTIC RECIPES.

Buckwheat Cakes.

As this is the beginning of the buckwheat cake season, I will give my experience for the benefit of those who have no buttermilk to put in them, to make them of that appetizing color so much desired; for, to have them good they must look well. To begin, I take one-half teacupful of good yeast and stir my cakes at night, adding a spoonful of molasses in the morning. Bake from two to four more than are eaten; while hot, pour boiling water on them and let stand until cool; then squeeze them fine and put in your pitcher, where there should be one teacupful of the batter. Add a cup of water, that it may not sour during the day, and set it in a cool place. If in danger of souring, pour off the water and add fresh when they are stirred the next evening. I think you will find no need of starting anew very often or using saleratus, unless you let them sour. One-fourth Indian meal improves them or, instead of meal, what we call wheat middlings—fry quickly. MAY.

Black and White Marble Cake.

The White:—Three cups of white sugar, the whites of eight eggs beaten to a froth, one cup of butter, one-half cup of sour cream, one teaspoonful of soda, and two of cream-of-tartar, one cup of sweet milk, one teaspoonful of lemon extract; flour enough to make it rise nicely.

The Black:—Two cups of brown sugar, one cup of molasses, one cup of butter, one-half cup of sour cream, yelks of eight eggs, one-half cup of sweet milk, one teaspoonful of soda, two tablespoonfuls of cinnamon, one teaspoonful of cloves, one teaspoonful of allspice, and one of black pepper. Put in a layer of the black and white alternately till it is all in. Draw a fork through it two or three times to mix it a little, or leave it as you put it in, if you like.

MRS. S. V. W. C.

Boston Brown Bread to be Baked in a Brick Oven.

TAKE a quart of rye-meal, and the same of fine Indian meal—if fresh, do not scald it; if not fresh, scalding will much improve it—also a pint or half-pint of white flour. Mix with warm water. Take also a gill of molasses or sirup, a small teaspoonful of soda, a large teaspoonful of salt, and half a gill of yeast. Such bread is improved by the addition of a gill of boiled pumpkin or winter squash. Make it as stiff as can easily be stirred with a spoon. Grease a deep brown pan, thickly, and put the bread in it, and dip your hand in water and smooth over the top. This will rise faster than other bread, and should not be made over night in the summer. The quantity can be doubled for two loaves. Bake long in brick oven—and long accordingly in stove. N. L. O.

Boston Brown Bread.

IN the "RURAL" of the 12th, Mrs. V. F. K., Oil City, Pa., asks some lady among the RURAL readers, to give her a recipe for Boston Brown Bread. Will not a recipe given by a RURAL bachelor do as well? I will give you my sweetheart's recipe: Four coffeecupfuls of sifted Indian meal; two cupfuls of coarse flour, either wheat or rye; one teaspoonful of salt; one teacupful of molasses, and boiling water enough to make as thick as griddle-cake batter. When nearly cool, add one-half cup of yeast, either home-made, or distillery. Put the mixture in an iron baking dish, cover tightly, let it stand in a warm place until it cracks over the top, (which should be smoothed over with wet hands before it is placed to rise.) Bake it five or six hours in a moderate oven which will not burn the crust to a cinder. F. B. H.

Jackson Co., Mo.

Steamed Brown Bread.

For a very small family, take half a pint of rye meal, not sifted, and a pint of sifted Indian meal, a tea-cupful of flour, a pint of sour milk, half a gill of molasses, a tea-spoonful of salt, and a small one of soda. Add soda last and stir the mixture well. Grease well a tin pan or pudding boiler with lid, and steam the mixture four hours. To serve it remove the lid, and dry the top a few moments in the stove oven; then it will turn out in perfect shape. N. L. O.

Boston Brown Bread.

Two teacupfuls each of Indian meal, Graham meal, rye meal, cold water and sour milk; one teacup of molasses; one heaping teaspoonful of soda; steam three hours, then bake one hour. EMILY.

Lowell, Mass.

SMALL LOAVES.—I wish the Domestic Economy department would preach the doctrine of making bread into small loaves. I believe the majority of housekeepers continue to mold their dough into loaves of old-fashioned bigness.

M. W. F.

News of the Week.

POLITICAL.

Monday, Oct. 28, 1878.

In this city the Tammany party has selected Augustus Schell, the grand sachem of the organization, as its candidate for mayor at the approaching election; while the anti-Tammany people have agreed upon Edward Cooper, a son of old Peter Cooper, as their candidate. Mr. Cooper is an old democrat and, in consideration of that nomination having been accorded to the anti-Tammany democrats, the nominations for city judge and district attorney were given to the republicans, while the German democratic association was allowed to name the candidate for coroner, these being the four principal municipal officers to be elected this year. Each party has also nominated candidates for Congress, the State legislature and the board of alderman, but the interest in the struggle for the mayoralty transcends that in all the others, inasmuch as the next mayor will have the appointment of the heads of the different municipal departments who control the vast and lucrative patronage of the City. At present each side professes to be confident of coming out ahead. Throughout the State the interest of the contest depends mainly on the elections of members of the legislature, for these will have to choose the United States Senator to succeed Mr. Conkling. At present the outlook is that he will be his own successor, having apparently succeeded in placating his chief opponents within his own party, while there does not seem to be much doubt but that the republicans will have a majority of the legislature, unless the greenbackers show unexpected strength and manage to elect members enough to hold the balance of power.

The report comes from Washington that the President has determined to conciliate the leaders of his party in order to strengthen and unite all elements for the great political conflict of 1880. To this end it is said Attorney-General Devens will retire from the Cabinet and take the vacant United States circuit judgeship for New England; Eugence Hale of Maine who has been lately defeated for re-election to congress by his greenback opponent, will then be made Secretary of the Navy, Thompson, the present Secretary taking Devens' place. Others say that Postmaster-General Key will also be provided for elsewhere in the public service so as to get rid of the democratic element in the Cabinet. This change is Hayes' policy is said to be the result of the intolerant spirit manifested by the democracy in some of the Southern States.

MISCELLANEOUS.

His Jersey City church has accepted the resignation of the Rev. Mr. Vosburgh, who was tried some months ago for poisoning his wife, but he was refused a "character" by a vote of 19 to 13.....The revenue yielded to Virginia during the past year by the bell-punch amounts to $850,000, which shows that they drink early and often in the Old Dominion.....Prairie fires have done immense damage in north-eastern Nebraska, besides burning to death nearly a dozen people.....During the week Edison has produced a new talking machine at Menlo Park, N. J.—in the shape of a fine twelve-pound boy. The Professor himself has been laid up with a severe attack of neuralgia, but is now considerably better. His invention of a means by which electricity can be used instead of gas, has caused considerable fall in gas stocks across the Atlantic, and much discussion as to its practicability here. The gas companies declare such a measure impossible, except at a much heavier cost than that for gas, and that for an inferior light, but Edison and his friends are confident of success and have organized a company with a capital of $300,000 to begin operations. It is said within a fortnight the town of Menlo Park, N. J., will be in this way brilliantly lighted up.

On the morning of the 21st a violent storm on its way north from the tropics, was signaled south of Florida; on the 22d it had reached Georgia; by midnight of the same day it had reached Hatteras, on the North Carolina coast; by midnight on the 23d, it had reached Baltimore and Philadelphia, and early on the morning of the 24th it struck this city. It was one of the severest hurricanes ever felt along the southern coast, and was extremely violent in Baltimore, and still more so in Philadelphia, where it unroofed over 40 churches, blew off the steeples of several or them, badly damaged a vast number of manufactories, depots, warehouses and dwellings, killed about a dozen persons and wounded many more by hurling falling *debris* upon them, and destroyed $3,000,000 worth of property. Everywhere its course was marked with ruin and disaster. Many shipwrecks are recorded, the most deplorable being those of the ship A. S. Davis and the steamer Maggie, 18 lives being lost on the former, and 20 on the latter.. ..Yellow fever is dying out all over the South, since the first frost. During the first part of the week, the number of deaths exceeded that of new cases, because, as stated here in advance, the cold spell always is injurious to those actually sick while a safeguard to those who have hitherto escaped; latterly, however, both the new cases and deaths have rapidly diminished everywhere. No more relief is required; indeed, it would seem that assistance has poured in so rapidly that the relief managers, here and there, will have a considerable surplus of money on hand after giving all necessary aid.

The October returns to the department of agriculture place the average condition of the corn crop at 96, an increase over the September average, which brings the figures up to those of August. New England and the Middle and Gulf States show a small decline. The south Atlantic States maintain their September condition. The State averages range from 77 in Pennsylvania to 116 in Maine. The average condition is three per cent. less than in October, 1877. The out-turn of the crop will not vary largely from 1,300,000,000 bushels. The October returns do not materially change the statistical aspects of the wheat crop. The New England and Middle States indicate a slight advance upon last year's yield. The Gulf States indicate a still more decided advance, owing to the very superior crop of Texas. The south Atlantic States and the southern islands show a very heavy decline, which, however, is more than compensated by the general increase in Mississippi valley and on the Pacific coast. The yield, on the whole, will be in advance of last year's, and from present indications will exceed 400,000,000 bushels. As to oats, a preliminary estimate based upon the October returns, indicates a yield somewhat larger than even the very fine crop of 1877. Nearly two-thirds of the crop are in 10 States from Ohio to Nebraska, occupying the northern portion of Mississippi valley. In these 10 States the aggregate net increase is about two per cent. Quite a number of counties in that region report an exceptionally fine quality, weighing in many cases 30 to 40 pounds per bushel. In the four southern inland States the season, so unpropitious to wheat, has been remarkably favorable to oats, raising the general condition to 110; in all other sections the product has fallen off. The present statement is that the cotton crop of 1878 is the largest ever known in the country. Published details do not justify the assertion, but further facts may show it to be sound. The number of bales is put at 5,500,000.

Gen. Sheridan has received additional reports of lawlessness in New Mexico. The cut-throats who are terrorizing parts of that State are mainly from Texas, and are known as "wrestlers." They recently killed three citizens near old Fort Sumner. Two were shot and one hanged. All the inhabitants for miles around have fled to the mountains....The California Chamber of Commerce, on Tuesday, considered the question of the proposed new treaty with France, and passed a resolution opposing any reduction of the tariff on French wines and liquors.....The hostile Cheyennes are reported to have escaped pursuit, and to be rapidly on their way to join Sitting Bull in Canada. It seems that they left their reservation to avoid starvation, as Gen. Miles reports an enormous deficiency of supplies at the Reno agency; so that all the deaths and destruction of property during the recent Indian raid are due to the dishonesty, inefficiency and mismanagement of Indian agents.

President Hayes has certainly shown more interest in agriculture than any of our former presidents, judging by the number of fairs he and many of his Cabinet attend. On Thursday, he received an enthusiastic reception from the farmers of Maryland, at the State Fair at Cumberland. He was introduced by Gov. Carroll, delivered a rose-colored speech, and aided materially to make the show a success.....Lately the Roman Catholic Church has suffered seriously by the death of several of her most prominent ecclesiastical dignitaries. Quick upon the death of Monseigneur Dupanloup, bishop of Orleans in France, at the age of 77, comes that of Cardinal Cullen, Archbishop of Dublin, Ireland, which occurred last Thursday afternoon, at the age of 75, while here, in America, Bishop Rosecrans' death has been caused by over-exertion at the dedication of a new Roman Catholic cathedral, on yesterday week.

FOREIGN.

The swindling directors of the City of Glasgow Bank have been arrested and are in jail awaiting trial. They were all "uncoo" good, saintly men, ranging from 60 to 75 years old, and very liberal to churches and to charities the names of whose contributors appeared in print, but with one exception they all owed money to the bank they were mismanaging, their indebtedness to it ranging from $150,000 up to $1,650,000. An assessment of £500 on every share worth originally only £100 has already been made on the stockholders, and bankrupted most of them. There have been numerous other failures, too. Business is exceedingly dull especially in Lancashire, the seat of cotton and woolen manufacture. Actual hostilities with the Ameer of Cabul will probably be deferred until spring; meanwhile preparations are being pushed vigorously forward.

The Emperor William of Germany has determined not to resume control of affairs until December. He became sovereign by the abdication of his brother and probably pride alone prevents him from following the fraternal example at his advanced age of 82. Wherever he goes the utmost precautions are taken against any further attempts on his life. The members of the families of Bismarck and Moltke are also reported to be in dire terror for the safety of these eminent men. In Berlin the Emperor's life is in jeopardy outside the walls of the palace; the Crown Princess is constantly worried by apprehensions for the life of her husband. Bismarck always has a body of police about him and his residence is strictly guarded; Von Moltke, whose life has been frequently threatened, takes things coolly, saying that the dead and the defeated only are happy, as success begets jealousy and enmity. Severe measures have already been adopted against socialism; between thirty and forty of its newspaper organs have been suppressed and a large number of its local organizations broken, still it is spreading secretly, it is feared. The fact is that Germany is fast becoming infidel. When the lower orders believed in future reward and punishment, they consoled

themselves for the present inequality in the conditions of the rich and poor by assigning heaven to the latter in the next world, and hell to the former; now, believing that this life ends all, they are determined to get as much as possible of the good things in it—and then the schoolmaster is everywhere abroad in the Fatherland, and education is apt to make one discontented with hardships and plot to evade them. Now that Bismarck has secured the passage of the Socialist bill it is announced that negotiations with the Vatican are useless, as no mutually satisfactory basis for an agreement can be hit upon.

In Russia assassinations by secret societies are reported to be very common, though the government tries to hide their frequency from the public in order to conceal the vast extent of popular discontent. Preparations are now being made for trying 300 Nihilists in different places, and hundreds, nay thousands of them, it is said, have already been condemned to Siberia. In view of possible complications with England or Turkey, the Czar has ordered military furloughs to be only granted for particularly urgent reasons and in any case not to extend them beyond February. There is a general feeling of uneasiness lest Russia should break through the treaty of Berlin and resume hostilities with Turkey. She has 80,000 infantry troops now in Eastern Roumelia. Another army corps is near Constantinople. There are 15,000 men at Adrianople. Baker Pasha is vigorously at work fortifying Constantinople, and Osman Pasha and other military authorities have been ordered to lend him every possible aid to complete the works within the next two months. To meet an issue of notes for 500,000,000 rubles during the war, the tariff in Russia is to be raised fifteen per cent. and an income tax introduced, while the people are earnestly exhorted to improve their methods of agriculture so as to be able to compete with this country. The tightness in money matters is probably the cause why Russia is likely to insist on Turkey paying her right-away a first installment of 300,000,000 rubles by way of war indemnity. It was supposed at Berlin that the territory conceded to the Czar would be taken by way of indemnity, but as this was not stipulated, the Muscovites insist that the treaty of Berlin did not supersede, but was merely supplementary to that of San Stefano, and that before they retire from Turkish territory, a private treaty will have to be concluded with them by the Porte. There is a report, however, that Count Schouvaloff is soon likely to succeed Prince Gortschakoff at the head of the foreign office in Russia, and such a change would be generally considered as an augury of a continuation of peace, as the Count is considered an advocate of a peaceable policy.

Several Powers have notified Servia that they will not acknowledge her independence till all civil rights are granted to Jews, in accordance with the provision to that effect in the treaty of Berlin. An autograph letter has been received at Bucharest, capital of Roumania, from President Hayes, recognizing the independence of that State and containing the stereotyped expressions of hope for her prosperity and for a continuance of cordial relations. On Tuesday last Roumania completed the surrender of Bessarabia to Russia, and with the latter's aid, she is about to occupy the Dobrudscha, which was assigned to her as a compensation....In Asia Minor reforms are under way. Mixed Christian and Mussulman police are to be commanded by English officers; an English assistant judge will be added to each Court of Appeal, and the governor and head taxgatherer will be appointed and dismissed according to English approval. These and some equally important clauses have been approved in principle by the Porte.

There are very severe floods in the north of Italy; crops over a large extent of territory along the river Borinda have been destroyed and many lives lost....The threatened disasters from an unusually high inundation of the Nile are now taking place in Egypt. The overflow from the Damietta branch of the river on Saturday last covered 120 square miles, had submerged 20 villages and drowned from 600 to 1,000 persons besides a vast amount of stock of all kinds. The government is loudly blamed for having taken no precaution whatever to guard against the calamity of which ample warning had been given....At Largentiere, France, on Monday last, the river Ligne rose 65 feet in an hour, flooding a great part of the town and destroying much property, but no lives....Several of the most successful American exhibitors at the Paris great show have been enrolled in the Legion of Honor. This numbers about 100,000. A majority are chevaliers, or knights; next in order are officers, then commanders, then grand officers, and lastly grand crosses—there are no American grand crosses....The ex-Sultan Murad V. still lives at the palace Tcheragan. His mental condition has improved, but he is still subject to attacks of the alienation that justified his dethronement and detention.

The late insurrection of negroes on the island of Santa Cruz has been followed by the execution of 100 of the insurgents already, while the loss of property due to it is estimated at upwards of $3,000,000....They have another of their frequent insurrections at St. Domingo, a rising having taken place at Azua in favor of the former president Baez....At Alzala, Mexico, a fanatical mob, incited, it is said, by a couple of priests, massacred 25 Protestants, and wounded many others on Sept. 20. At Puebla the Protestant missions are threatened by the rabble. Diaz says he will do all he can to protect all religious denominations. The soldiers of the Mexican army of the north have received no pay since July, and numbers of them are deserting from lack of subsistence. Escobedo has not been hanged yet, but is dangerously ill in prison. The other day 25 Indians crossed from Mexico into southwestern New Mexico, killed three ranchmen and an expressman, stole a lot of cattle and escaped, hotly pursued by citizens and troops.

HERMAN.

THE MARKETS.

PRODUCE AND PROVISIONS

NEW YORK, Saturday, Oct. 26, '78.

BEANS AND PEAS.—The supply of beans begins to show more general qualities, but what demand exists is directed to prime grades—the custom in new crops—and there are consequently few ranges of quotations. Old marrows rather firm at $1.55@1.60; new mediums, prime, $1 65@1 70; do., marrows, $1.70@1 75, delivered to vessel. Pea beans, $1 80@1 85; white kidney, $1 75@1 85. Red kidney weak, except for choice, $1 75@2 10; black beans, $1 50@1 95. Green peas, $1 25@1.35; Canadian field, do., lower, 74@75c., some western new competing, Southern B. E. peas, $2 60 per 2-bush. bag.

Receipts of beans for week, 7,900 bush.; exports, 618 bbls.

BUTTER.—Trade has been sluggish and otherwise unsatisfactory. Buyers of State are unwilling to accept the standard of fine, because our high grades of butter do not contain the usual excellence of fall churnings, and there is, consequently, a good deal of "shopping" before sales result. The weather has been severely against quality: it wants cool or cold temperature to bring out all the merit of stock on the trier. Dairies with tubs in are regarded fully valued at 20c.; and there is an abundance of good, useful stock, mostly firkins, quoted at 18@19c. Exportation is of little account. Western butter is in good demand for medium or market buyers, but the objection of late continues—lack of uniformity in dairy and factory packed.

Dairy pails, choice, 22@22c.; common to good, 14@18c.; half-tubs, choice, 21@22c.; fair to good, 14@18c.; Dairies, full, good to choice, 18@20c.; firkins, 15@18c.; Welsh, 17@18; Welsh tubs, choice, 20@21c.; other, 13@15c.; poor State, 10@13c.; creamery, choice, 25@2 c; other, 19@23c; sweet cream, 23@24c. Western creamery, 20@24c.; early packed, 18@19c; dairy, fine, 15@16c; other, 10@14c.; factory, ladle packed, 14@15c; good to fine, 9@12c.; poor to fair, including milled, 6@9c.

Receipts for week, 24,580 pkgs.

BEESWAX.—A light amount of trade is in progress on export account. Sales at 26½@27c. for Western and Southern.

BROOM CORN.—Offerings of new crop are light, and prices for the moderate amount of old offering are nominal. Quoted at for old choice green hurl, 6@7c.; medium hurl, 5@6c.; choice short green, 5½@6½c.; medium short green, 5@6c.; red stubby and crooked, 4@5c.

CHEESE.—Toward the close of the week the lull which had characterized the situation for several days gave way to rather more activity on export amount. Fancy factories have been most wanted and 9@9½ made, the latter for exceptional lots. Receipts have not been large, but of other than choice lots they have accumulated.

Quotations are 9@9½c. for fancy late made; 7½@8½c. for good and prime; 6@7½c. for fair to good; 5½@7c. for half-skimmed; 4@5½c. for skimmed. State, farm dairy at 8@9c. for good to choice, 6@7½c. for fair to good, and 3@5c. for poor skimmed. Wisconsin factory, fine to fancy, 8½@9½c.; do. good to prime, 7½@8½c.; do. fair to good, 6@7½c. Western factory, fine and fancy, 8½@9c.; good and prime 6½@7½c.; fair, 5½@6c.

CIDER.—Small packages 10@12c. per gallon.

COTTON has been usually depressed on the look of affairs abroad, selling down sharply, but closing with some reaction. Latest prices are for October, 9.61@9.62c.; November, 9.62@9.63c.; December, 9.69@9.70c.; January, 9.79@9.80c.; February, 9.89@9.90c.; March, 9.99@10.00c.; April, 10.09@10.10c.; May, 10.18@10.20c.; June, 10.27@10.29c.; July, 10.38@10.39c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade bove or below the grade quoted:

	Uplands.	*Alabama.*	*Texas.*

Good ordinary.. 7 15-16; Strict good ordinary. 8 7-16
Low middling.. 8 15-16; Middling..... 9 5-16

DRIED FRUITS.—Apples show a small export demand; choice, sliced, are moving but moderately well. Peeled peaches of choice grade are decidedly higher, as also pitted cherries and raspberries.

New blackberries are quoted at 5½c. Peaches—Peeled, new Georgia, at 6c. for poor; 8@9c. for fair to good; 10@10½c. for prime, choice North Carolina, 11@11½c.; good do., 8@9c.; unpeeled new halves, 3½c.; quarters, 3½@3½c. Pitted cherries, 17c.; southern plums, 12@13c. Apples—Old State quarters, 2½@2¾c.; do., sliced, prime, 4c.; do., good, 3@3½c. New apples 2¾@3c. for Southern quarters in bbls.; 4½@5¼c. for prime sliced, and 5@7c. for fancy. New raspberries, 25c.

Exports, past week, 422 bbls. dried apples.

EGGS.—Receipts for the week, 7,143 bbls.; do. last week, 7,264 do. Receipts show the effect of accumulation at the West. Really fresh true counting stock would bring better rates than are current for the present supply. Near by, 23@24c.; State and Penn., 21@21½c.; Canadian fresh 0c.; Western, 20c.; poor are held 18½@19c.; choice limed, 16@17c.; other, 13@15c., including Western.

FLOUR.—The supplies are liberal, especially of winter wheats, and prices have been declining. Export demand has been to a moderate extent only, and the local trade have been buying reservedly.

Latest prices are: $3.10@3.50 for very inferior to choice superfine State; $3.50@3.75 for poor to good extra do., odd lots and lines; $3.75@4.25 for good to very choice do., strictly choice and fancy lots above this; $2.90@3.50 for very inferior to choice superfine Indiana, Iowa, Michigan, &c.; $3.50@3.85 for very inferior to good shipping extra do. and $3.85@4.25 for good to choice extra do.; common to about choice white wheat extras, $3.85@4.75; choice to strictly fancy do. at $4.85@5.75; red and amber winter wheat, inferior to very choice trade and family at $3.75@5.50; round hoop Ohio at $3.65@4.10, and trade and family brands of do. at $4.10@5.50, the latter rate for very choice; St. Louis, $3.85@4.50 for very poor to good extra, and $4.50@5.75 for good to very choice; Minnesota clear, very inferior to fancy, at $3.50@5.50; Minnesota "straight," very inferior to very choice at $4.50@6 00; and patent fair to very fancy at $5.25@8.50; unsound stock at from $2@4.75; city mill extra at $4 75@5.00 for West Indies (the latter rate for strictly choice in new packages); do. for England, $3.65@3.75; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.50 for fair to very choice; No. 2 at $2.50@2.90 for very inferior to choice.

BUCKWHEAT FLOUR comes in slowly and is wanted at $1.85@2.25, the latter for choice lots.

CORN MEAL.—Sales at $2.15@2.75 for yellow Western, and $2.85@2 90 for Brandywine.

FRESH FRUITS.—There is some improvement in apples but it does not extend beyond fancy fall stock, and these are cheap at quotations. Winter fruit is very quiet and easy; the weather prevents storing. Selected fall, $1.62@1.75 ₱ bbl.; good mixed do., $1.37@1.50; best winter, $1.25; mixed do., $1@1.12; common, 50@75c The stock of cranberries press somewhat upon the market, but fine, hard, high-colored Capes will bring, singly, $8 ₱ bbl.; other Eastern bbls., $5@7.50; N. J. do., $4@6; crates, choice, $2; poor to good, $1.25@1.75. Quinces are higher; selected apple, $8@10 ₱ bbl.; other, $5@6.50. Grapes in fair supply from the interior; near-by lots about used up. Catawbas, in any package, 7@7½c.; Isabella, Diana and Iona, 5½@7c. Cal fornia 40-lb cases, Tokay, $7@8; Muscat, $6; Black Morocco, $6.50; hothouse grapes, 50c. ₱ ℔. Few table pears left; best trade supplied by California boxes. Near-by Duchess, bbls., $7@9 for prime; common, $5@6; Vicar of Winkfield, $4@6; cooking, $2.50@3; California Vicars, $3@3.50; Glout Morceau and Winter Nelis, $3.50@4. Latest car of California arrived in bad order. New peanuts are not of good grade; ranging at $1.15@1.35, or about the opening rates. Chestnuts, $3.50@3.75; a few fancy, $4 25. Hickory nuts, $2@2.25 for clean shellbarks; no others wanted.

GRAIN.—Wheat has varied considerably, as the advices from the other side have been variable or otherwise; export demand has not been to a satisfactory extent. Latest sales are, of No. 2 red, at $1@1 01½; No. 1 red, at $1 02@; white Canada, in bond, at 98c.; ungraded white at 98c.@$1 06; No. 2 white at $1 01¾; No. 3 white at $1; No. 1 white at $1 03¼@1 04; extra white at $1 06@1 08; white State at $1 03@1 03¼ for ungraded; ungraded red at 95c.@1 02; No. 2 amber at 98c.@$1, mainly at 99½c.@$1; ungraded amber at 98c.@$1 02; No. 3 spring, part to arrive, at 83@81c.; No. 2 red, October option, at $1 01; do., November option, at $1 01¼@1 02; do., December option at $1 03¾; No. 1 white, October option, at $1 04; No. 2 amber, October option, at 99½c.@$1; do., November option, at $1; do., December option, at $1 01¾; New York No. 2 spring, October option, at 91½c; do., November option, at 92c.; No. 2 Northwest spring, November option, at 90c. Rye at 60@61c. for State, and 57@58c. for Western. Corn has been very slow and lower; sales of steamer mixed at 43c.; New York No. 2, at 46@46¼c.; ungraded mixed western at 44@46¾c.; western yellow at 48c.; New York No. 3 at 41c; New York No. 2, October option at 46¼c.; do., November option, at 46¾@47c.; do., December option, at 47⅞@47¾c.; steamer mixed, October option, at 46c.; do., November option, at 46¾c.; do., December option, at 47c. Oats have been higher, but closed easy. Sales of white State at 28½@35c.; mixed State at 25@31c.; white western, 28@34½c.; mixed do. at 27@30½c.; New York No. 1 at 30@30½c.; No. 1 white at 34c.; No. 2 at 28¾@28¾c.; No. 2 white at 30@30½c.; No. 3 at 25¾@27½c.; No. 3 white at 28¾@28¾c.; rejected at 26½@26½c.; No. 2 Chicago at 29@30¾c.

HAY AND STRAW.—A more active trade is noted, and prices generally steady.

Latest sales are at 40@45c. for shipping, and 65@75c. for retail qualities. Straw quoted at 35@45c. for long rye; 30@35c. for short rye.

Exports past week, light, 175 bales.

HOPS.—Emmet Wells, in his circular, says, "The market keeps up remarkably well in the absence of a demand from Europe, but how long it will hold to the present price is beginning to be a matter of some considerable doubt. Exporters claim that there is really nothing to warrant higher prices now than ruled at this time last year, taking into account the fact that London is loaded down with our old hops, and the general trade in Europe is becoming paralyzed by late financial and political disturbances. Holders, on the other hand, knowing our crop to be some 100,000 bales less than last year's, and of a more varied quality, think they ought to have more money for their hops. The law of supply and demand must and will settle this whole question. No combination of growers or dealers can fix a price to suit themselves. We still hold to the opinion that without a liberal foreign call the price cannot advance; and until the question is determined whether or not England must have our hops we must remain in the dark as to the future course of the trade.

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, low to fair, 8@10; Eastern, new crop, 10@13; Wisconsin, new crop, 10@12; Yearlings, growth 1877 (nominal) 5@8: Olds, all growth, 2@4.

HONEY.—City buyers will not stock up much while the weather is warm; many grocers wait until store cleaning is over before they add delicate supplies. Nominal rates: Single comb, clover, 15@16c.; two comb, do., 13@14c.; buckwheat, 10@12c.; strained, 6@12c, as to quality.

LEATHER.—Sales at 19½@20c. for light hemlock; 20@21½c. for middle do.; 20@22c. for heavy do.

OIL-CAKE is at $28.50@$30 for Western.

POULTRY AND GAME.—Live poultry has declined and is not likely to revive again to long prices, as dressed will soon be the feature.

Best fowls and chickens, 10@11½c.; State and Penn., 10@11c.; Western, 8@9c. Turkeys—N. J. and State, 10@11c.; Western, 8@10c. Ducks, common to prime, 40c.@$1 pair; Geese, do., $1@1 62. Pigeons, 30c.

Dressed poultry cannot count upon more than two active days in the week at this season. Latterly the weather has favored it and prices are much steadier than they were at our last when very warm weather prevailed.

Dry picked turkeys, 14@15c.; fair to good 10@13c. Chickens, dry picked, 15@16c.; N. J., 12@14c.; State and Western, 10@13c. Fowls, dry picked, 13@14c.; N. J., 12@13c.; State and Western, 10@12c.; poor stock, 9c. Ducks, choice, 16@17c.; fair to good, 12@15c. Geese, extra, 13@14c.; other, 8@12c.

Supplies have as a rule arrived in unmerchantable order. Good game has had a fair demand and sell readily at the close at the extreme.

Pinned grouse, 75c.@$1 pair. Partridges, 75c.@$1. Woodcock, 40@60c. English snipe $1.25 doz.; Plover, $1.50. Stall-fed pigeons doz., $2; flight, $1.40@$1 50. Canvas back ducks pair, $1.50; Red Head, 75c.; Mallard, 65c.; Teal, 40@50; common, 30@35c. Venison, saddles, short, 16@18c.; long, 13@15c. Whole Deer, 11@12c.

PROVISIONS—Have suffered a sharp decline on the large arrivals of hogs at the West. Mess pork quoted at $8.05 for October and November deliveries, and $8.15 for December. Bacon at 5¾c. for long clear and 5¾c. for short clear. Lard at $6 40 for western steam on the spot; $6 37½@6 40 for November and December, and $6 45 for January. Shearine at 6¾c. for prime western. Beef Hams at $15.50@16. Tallow at 6¼c. for prime.

SEEDS.—Clover quoted at 7@7½ for prime, and 7¼@7½ for choice. Timothy at $1 15@1 20. Flaxseed at $1 40@1 42.

TOBACCO.—Export demand is fair, and home trade good, especially in Seedleaf; prices are not showing important change.

VEGETABLES.—Potatoes are out of the reach of shippers, unless they will use very common styles. The trade, however, is not sought for, as dealers think the local demand will use up the scant crop at good figures. Choice Eastern Rose, $3 bbl., with $3 12 threatened; State, $2.25@2.75, fair to choice; Peerless, $1.75@2.50. Sweet potatoes have worked out of their low position, Va. now quoted, $1.50@$1.75; Md., $1.50@2. Onions steady; Ohio is adding to the supply, other vegetables steady with the advanced season. Onions, white, $1.25@1.50 bbl.; yellow, $1 25@1.50; red, $1@1.25. Hubbard squash, $1.75@2; Marrow do., $1.25@1.50. ℔. Turnips and Beets, 75c. Cauliflower, 75c.@$2. Cabbages, 100, $3@4 Egg plants, doz., $2@3.50; Pumpkins, do., $3@6. Celery, doz., 75@87c.

Exports for the week, 3,272 bbls. potatoes; onions, 200 do.

WOOL.—There has not been much activity; manufacturers buy close to actual needs, while there are free sellers, yet prices are generally steady.

Quotations are—Ohio, Pennsylvania and West Virginia—XXX and picklock, 38@40c.; XX, 35@37; X, 33@36; No. 1, 30@33c.; No. 2, 33@36c; coarse, 30@31c. combing, 40@42c.

New York, Michigan, and Wisconsin, XX, 30@35c.; X, 30@33c.; No. 1, 31@33c.; No. 2, 30@31c.; coarse, 27@30c.; combing, 38@40c.

Indiana, Kentucky and Tennessee—XX, 31@35c.; X, 30@34c.; No. 1, 33@35c.; No. 2, 31@34c.; coarse 27@30c.; combing, 33@42c.; unwashed combing, 28@33c.

Illinois, Iowa and Minnesota—XX, 3 @31c.; X, 32@34c.; No. 1, 32@34c.; No. 2, 28@31c.; coarse, 25@27c.

Georgia, Alabama, Mississippi and Louisiana.—Fine unwashed, 25@28c.; medium unwashed, 26@29c.; coarse unwashed, 18@21c.; burry, 11@16c.

LIVE STOCK MARKETS.

Saturday, Oct 26 1878.

BEEVES.—Receipts for the week, 11,602 head do. last week, 11,955 do. It is generally conceded that the past week has been the best "buyer's week" since the second year of the war. This would certainly seem so when a look could be had at the fine, showy Ohio steers that sold at 10c., to dress, 57 lbs., while there were other buyers almost equally fortunate who obtained a splendid grade of native stock at 9¾c., to dress, 56 lbs. The general quality of the drovers was much above the usual average, having few Texas or Colorado, and quotations have consequently a deepened shade, not apparent to those absent from the collection. Arrivals were irregular at the close, and buyers obtained some advantage from that course. Wednesday's market was ¼c. higher than the closing one. We quote extra, 9¾@10c. Strictly prime, by the car-load, 9¼@9½c.; good to prime, 8½@9c; fair to good, 7¾@8¼c.; common to medium, 7@7½c.

COWS AND CALVES.—During the week five carloads sold at $35@75 per head.

VEAL CALVES.—Market quiet at 5¾@7¼c. for milk fed; 2½@3c. for grassers, and 3½@4½c. for fed.

SHEEP AND LAMBS.—Receipts for the week, 29,129 head; do. last week, 29,647 do. The demand was fair, but buyers insisted upon easy figures as the retail markets are well supplied with a general stock of meats. Sheep sold at $3.85@5 per 100. Lambs, 4@5¾c Some poor sheep at 3c.

SWINE.—Market dull; there were sales at the close at $3.55@3.62½ per 100; good Ohio's held at 4½c. without an offer. N. J. dressed pork, 5½@6¾c. for heavy, to pig.

SPECIAL NOTICES.

Electric Belts, &c., are manufactured by the PULVERMACHER GALVANIC CO., Cincinnati, O.

Also the celebrated Union Horse-Power.

THE YOUTH'S COMPANION
A WEEKLY PAPER FOR
YOUNG PEOPLE AND THE FAMILY

It aims to be a favorite in every family—looked for eagerly by the young folks, and read with interest by the older. Its purpose is to interest while it amuses; to be judicious, practical, sensible, and to have really permanent worth, while it attracts for the hour.

It is handsomely illustrated, and has for contributors some of the most attractive writers in the country. Among these are:

J. T. Trowbridge, Dinah Muloch Craik,
James T. Fields, J. G. Whittier,
Rebecca H. Davis, Louise C. Moulton,
Charlotte Mary Yonge, C. A. Stephens,
Edward Everett Hale, Harriet P. Spofford,
Rose Terry Cooke, A. D. T. Whitney,
Louisa M. Alcott.

Its reading is adapted to the old and young; is very comprehensive in its character. It gives

Stories of Adventure, Stories of Home and School Life,
Letters of Travel, Tales, Poetry,
Editorials upon Current Topics, Selections for Declamation,
Articles on Health, Anecdotes, Puzzles,
Biograph'l Sketches, Sports and Pastimes.
Religious Articles,

Subscription Price, $1.75. Specimen copies sent free. Please mention in what paper you read this advertisement.

PERRY MASON & CO.,
41 Temple Place, Boston.

THIS NEW
ELASTIC TRUSS
Has a Pad differing from all others, in cup-shape, with Self-Adjusting Ball in center, adapts itself to all positions of the body, while the BALL in the cup PRESSES BACK the INTESTINES JUST AS A PERSON WOULD WITH THE FINGER. With light pressure the Hernia is held securely day and night, and a radical cure certain. It is easy, durable and cheap. Sent by mail. Circulars free.
Eggleston Truss Co., Chicago, Ill.,

Halladay Standard.

The only Wind Mill awarded
TWO MEDALS
and
TWO DIPLOMAS
by the
CENTENNIAL JUDGES.

Every machine warranted to be well made of good material; to do good work in any kind of wind; to be perfectly self regulating; to possess more power and to be more reliable than any other Wind Mill made.

Each piece is fitted and numbered so that a stranger can put the Mill up, using our drawings and printed instructions for a guide.

Send for Catalogue "B" and Price List.

AGENTS WANTED for WATERS' SUPERIOR REED ORGANS and PIANOS. Illustrated Catalogues Mailed. HORACE WATERS & SONS, Manufacturers and Dealers, 40 East 14th-st., N. Y. Also General Agts. for SHONINGERS' Celebrated ORGANS.

Reading for the Young.

DOLLY'S CHRISTENING.

ELEANOR KIRK.

"I'LL be the goodest little girl
Tha ever you did see,
If you'll let me take my dolly
To church with you and me.
It's too dreff'ul bad to leave her,
When we's all gone away;
Oh! Casette will be so lonesome
To stay at home all day."

'Twas such a pleading pair of eyes,
And winsome little face,
That mamma couldn't well refuse,
Tho' church was not the place;
For dolls or play-things she well knew.
Still mamma's little maid
Was always so obedient,
She didn't feel afraid.

And tho' Casette came straight from France
She really was quite small,
And could be carried very well
Right under mamma's shawl.
So when they reached the great stone church,
And sat inside the pew,
Cosette was placed in Mabel's arms—
Both of them dressed in blue.

No mouse was ever half so still
As this sweet little lass,
Until the sermon was quite through—
Then this did come to pass:
A dozen babies (more or less,)
Dressed in long robes of white,
Were brought before the altar-rail—
A flash of heaven's own light.

Then Mabel stood upon the seat,
With dolly held out straight,
And this is what the darling said:
"O min'ster, pease to wait,
And wash my dolly up like that—
Her name it is Casette."
The "min'ster" smiled and bowed his head;
But mamma blushes yet.

LETTERS FROM BOYS AND GIRLS.

For the Little Folks.

LISTEN, little children, while I tell you about a hog that got drunk on cider. No doubt you have seen a great many drunken men, but perhaps never a drunken dumb animal—they usually having too much self-respect to get drunk like some men. And even this one of which I am about to tell you, would undoubtedly have scorned the idea, had he known beforehand the evil effects of taking "a drop too much."

It was a great many years ago, when nearly every farm had a large orchard, and after storing away what apples were necessary for family use, the remainder were manufactured into cider, which was afterwards converted into brandy and the most of it consumed on the premises during the year. I was a boy then, and we lived about half a mile from an uncle of mine where the affair happened, the relation of which, by my aunt, caused no little merriment among us children.

Previous to making cider, it was necessary to clean the barrels of all the old cider and settlings which might remain in them from the previous year's supply, and in doing this, my uncle thought it would be a matter of economy to turn it out where it would run down into the hog yard, where was confined a large old sow with some ten or a dozen pigs of about three or four weeks old, so that they might drink it and nothing would be wasted. Accordingly, barrel after barrel was brought out and the contents emptied before the old sow who stood ready to receive them, and as each new lot came, she grew more and more excited over it; her eyes glistened and she would fairly dance for joy, while she seemed mentally ejaculating, "A little more cider for Miss Dinah," until finally, she began to show evident signs of intoxication. She would cut up all sorts of hoggish capers—she would run, and squeal, and tumble down; then she would scramble up and try to walk on two legs, but she would make about as much headway as some other two-legged creatures do when drunk. But there was one thing noticeable about her, she was perfectly good-natured about it; she didn't offer to fight, or even to bet on how much she was worth, but kept on cutting up silly capers and ludicrous faces, till at length, yielding to the force of circumstances, she gave over her vagaries, and stretching herself at full length upon the ground, was soon lost in a state of *beastly* intoxication. The little pigs, which till now had stood back apparently wondering what had befallen their mother, now came forward to examine her as she lay insensible on the ground. They would ply their little noses to her to see if they couldn't rouse her from her stupor; failing in this, they would start in a string one after another and run her over from head to tail and back again; crying meantime most piteously, as though their hearts would break over the supposed death of their mother. This was continued for a long time, till finally the old lady, having in a measure slept off the effects of her debauch, with much difficulty, regained her feet, and looking around as if to ascertain her locality, sneaked off to her nest out of sight; nor did she show herself again until she was sure she was entirely sober

Whether she signed the pledge or not I never learned, but certain it was she was cured of drinking; for while she lived she was never known to taste of another drop of intoxicating drinks; which is more than can be said for a great many two-legged beasts.

You will agree with me that by getting drunk the mother was setting a very bad example before the little ones, but I think the whole family were heartily ashamed of it, since I never knew one of them afterwards to get any worse for liquor; though we can't tell what might have happened had they lived a good many years, and mingled in society; but they all died young, which was fortunate for them after all, if it saved them from drunkenness. Don't you think so?

A. H. M.

"Mississippi" Makes His First Appearance.

DEAR COUSINS:—I am a new cousin claiming a hearing, if Uncle True thinks this worthy of insertion. I like the letters from the cousins, and, as I have not seen a letter from this State, I thought I would tell you all something about this part of the world. I live in what is known as the "Prairie Belt;" of course this prairie is not to be compared with the prairies of Texas, it being only about fifty miles long, and not half so wide. This is very fine land, and most of it is now under cultivation; however, there is one place in it, just as it was when the Indians used to hunt deer here before Mississippi was settled. This prairie land gets very muddy in the winter, and the mud sticks so fast that some say it will pull the soles off of your shoes. I have never had it pull my soles off, but I have had it pull my shoes off leaving me to make my way as best I could without them. If one does not like the mud, he can go to the hills, and there he will find a rich sandy soil. Our bottom lands are also fine.

Our farmers devote their time to raising corn and cotton. Cotton is the chief product, but our lands will grow as fine small grain as the best lands in the West, and a few farmers do grow small grains and grasses.

I expect some of the cousins never saw a cotton plantation (for I have seen grown people who never had seen one) and for their benefit I will tell how one looks. It grows, on an average, about waist high, and is very pretty while growing; everything looks green, and the white and red blooms give it the appearance of a large flower-garden. A field of three hundred acres presents a grand sight in the fall when it has opened. Then everything is so white that it looks as if it had snowed. Cotton is picked with the fingers, and we boys have lots of fun picking cotton, we all run races and see who can pick the most. I never was a good picker, because I was always too lazy to stoop so much. A good picker can get out as much as three hundred pounds per day. I would like to tell you all more, but I am afraid I have already said too much for the first time. I hope the boys will be better hereafter, but the girls need not stop because the boys won't write. If Uncle True takes this, you may hear from me again. I won't say how old I am, but I am a good-sized boy.

Aug. 20th, 1878. MISSISSIPPI.

A Very Early Snow-Drop.

DEAR UNCLE TRUE:—Oh, Cousins, where are ye? I haven't seen a letter for a long time, and my spirits have decended three degrees and a tenth. The young people's column is nothing without the boys' and girls' letters. Why don't you write? I am stricken with grief at such tardiness. Where is Storm? Perhaps some of you remember his letter in the RURAL of October 28, 1876. I don't think I have seen one from him since. Why doesn't he write? We want such letters as his and those of Madcap Mollie, Bell, E. F., Adele W., Yound Ed, and Wild-fire. Come, cousins, wake up! and have a regular exciting time, even a pitched battle would be preferable to this continued silence. I defy the boys to beat the girls! Slayerofconceit, my lad, where art thou? Hast thou, too, deserted? or art thou waiting until the girls get cooled off somewhat? Solomon, some more of thy wisdom; we poor creatures are sadly in need of it; let us behold some of the productions of thy pen ere long. Cousins *all*, will you not heed my request, and write? I want to see the young people's page full of letters next week. If, when I take the RURAL in my hand and eagerly turn its leaves until my gaze rests upon *the* page, I find none, I shall be bowed to the earth in dire distress. I have another request to make: Will Rocky Mountain Joe, if he be still in existence, please step forward and tell me where, in the Rocky Mountains he lives, and what the place is like? Now, his hair needn't rise for fear of a girl's being after him, and I will dispel his fears at once, and inform him that it is merely for information regarding the country round there, that I ask him so to exert himself. Will he tell me what I wish to know? Sir Editor! Did you deem the cousin's letters that were sent you lately—if there have been any—unworthy of publication, and so filled the waste-basket to overflowing with them? Oh! I entreat you with uplifted hands and streaming eyes, to let this, my touching appeal, come forth in your paper, thereby sending a cheering ray to my saddened heart. Cousins, adieu. Yours, sorrowfully,

Norfolk, Co., Va. SNOW-DROP.

A Trip to the Falls.

DEAR COUSINS:—Good for Madcap Mollie! Now there will be some letters—or a fuss. And, Mollie, I would suggest that you tell us in your very first letter what you have been doing this summer. Have you been on a pleasure trip, or have you, like myself, been quietly baking at home? And I think after all, if one must bake, home is about the best place to bake in. I am sitting just now in my favorite nook in an old pear tree. Sometime I will describe it. I will only say now that it is in the middle of a large orchard, just a little way from my home. I came here with a pocketful—as the boys elegantly put it—"chock full" of plums. Delicious, little, sweet plums, but alas, they are rapidly disappearing. Now, just wait till I get another one and I will tell you of what was about the only pleasure trip I took last summer. It was an excursion to Niagara. We started quite early, going on the cars, and arrived there in due season. Then, after walking around a little in the Park, going down to Prospect Point, etc., we went down the Inclined Railway; some of the party went over in the ferry. I wanted to go very much, for I love the water, but the lady with whom I went to the Falls, being very timid, wouldn't hear of such a thing, so I was obliged to be content with land. When we came up to dry land again, for everything down there is washed with spray from the falls, we had our dinner in Prospect Park, which, (the dinner), wasn't the *least* pleasant part of the day I can assure you. After that we visited Goat Island and the Three Sisters, (I think the view from the Three Sisters is the finest I saw), and went a step into Canada, not more, for there was not time for any sight-seeing there; then to the depot. We had to run for the train as it was. But my plums are all gone and so I am sure is Uncle True's patience, so I must end this short (?) letter. Thanking Uncle True very much for the answers he gave to my questions last time, I remain,

LEONORA.

Query:—"Where is Jumping Jack?" Ans.—Dead Silence.

Her Introduction.

GOOD EVENING COUSINS.—May I come and swell your ranks? Methinks I hear your answer, yes. Why do they respond so readily? some one may ask. Because they think (judging by my name) that I am all animation, and will help to enliven their circle. Now cousins, I don't want you to be disappointed by inferring the opposite to what I may be. Perhaps my signature reminds you of Topsy, who took an active part in "Uncle Tom's Cabin," and that I will do the same in our circle. I don't propose to do any such thing, and why? for the simple reason—that I haven't the wit to do so. Perhaps I ought to have left my last remark unsaid, for some of the boys, as Slayerofconceit, Young Bach and several others I might mention, may regard me as of little consequence. And you know I wouldn't have them think that for anything, because I flatter myself that I am of a little importance if I am not humorous. I have some good common sense which is a great deal better. I am somewhat older than most of the cousins, I judge, and may be in your way; but as you have so kindly admitted me, I will promise not to tire you too often with my long, prosy letters. Trusting my admission has met the approval of UNCLE TRUE (for I suppose the invitation of new members must be sanctioned by him), I will close this introductory letter.

COUSIN TOPSY.

A Kiss for Uncle True.

DEAR UNCLE AND COUSINS.—Will you allow a little girl away off in Kentucky to enter your circle? I am a dear lover of the RURAL, and when it comes can hardly wait for mamma to sew and cut it, and being the only little girl in the family I generally get it first. Where shall I look first? Oh, turn to the pictures, what a treat! Little brother, four years old, crowds in to "shee" too. As soon as I get the paper all to myself I turn with eager delight to the letters. The names of Lily Lee, Wild Fern, Wild Rose, and many others are quite familiar to me. I am eight years old, have never been to school, but am learning at home. I have one little brother, Johnnie, and he is a true boy, full of mischief and fun. My papa has been taking the RURAL ever since I can recollect. I can't write much this time, not knowing if I shall be admitted. I have never seen a letter to the cousins from good old Kentucky, and if I am not counted in I will know I am not welcome; if kindly received, I will write again and tell you more about myself and my home. Love to all the cousins whether you claim me or not, and a kiss to dear Uncle True.

Todd Co., Ky. KATIE M. MOBLEY.

Not for Several Years.

DEAR RURAL COUSINS:—Although it has been several years since I have written to you, my dear unknown young friends of THE RURAL, still I hope you will give me a *hearty welcome* among you once more. I still read the letters, and hope that the writers will follow my example, and we will soon gain as much room in the paper as we ever possessed. We have been having quite a pleasant time this summer down here in our quiet little village of the Sunny South. There have been several picnics and we enjoyed ourselves greatly playing and fishing. The lady with whom I board has a great many flowers in bloom now, notwithstanding the dry weather and excessive heat of the last few months. I can send bouquets to my dear friends whenever I am so disposed, but sad to say, fate has not smiled on me as on most of my companions, for I have no sweetheart to love and cherish. I think it is best for the grown-up people to have lovers; and I abide by my own opinion.

Hoping my young friends will write oftener and long letters, I again subscribe myself your cousin, JOHN W. E.

Carrollton, Ala., Sept., 1878.

To the Front at Last.

DEAR UNCLE TRUE:—Will you please consider me one of the cousins. Some undefinable fear has prevented me from coming to the front and joining your number before. I would like to ask Uncle True if he considers it right for people to read novels? I have only taken your paper for about six months, yet I assure you I like it very much. Will some of the cousins please tell me how they fix their autumn leaves to keep them through the winter? Now, if Uncle True will please print this, he will greatly oblige,

A RURAL COUSIN.

PUZZLER ANSWERS.—Oct. 19.

CHARADE.—May-basket.

DOUBLE ACROSTIC.—Initials, Perch; finals, Trout.

TRANSPOSITION.—

Yet do not think I doubt thee;
I know thy truth remains;
I would not live without thee,
For all the world contains.

Sabbath Reading.

WHERE HAST THOU GLEANED TO-DAY

I.

AH, never true workman toiled in vain,
E'en though he watered his seed with tears;
Bright golden stalks and the full-eared grain
In God's "due season" for him appears!
Dear Christain worker, what sheaf for you
Stands safely bound in the twilight gray?
Thy soul drinks blessing midst falling due—
O, tell us, where hast thou gleaned to-day!

II.

Has some fallow ground sprung green at last—
Doth the stubble field its grace renew?
Where bramble shadows have long o'ercast
Doth rude fence-corner yield treasure too?
Where Sorrow's sickle, with edge so keen,
Left naught of promise in smiling May,
Humility's fragrant petals lean—
O, reaper, hast thou gleaned there to-day?

III.

Where Satan's briers the fingers wound
Have not your labors been all too brief?
Remember, where sharpest thorns are found
Stands richest blossom for Master's sheaf!
Yet there's precious grain in ev'ry field—
No scythe sweeps wholly, though swung for aye!
For thousands of sweets the harvest yield—
Say, Christian, where hast thou gleaned to-day?

IV.

E'en Job returned from the close-mown vale
More richly laden than joyful Ruth;
For him, where others thought crop would fail,
Flashed gems of wisdom and pearls of truth!
When in stubble field of affliction tried,
Like grand old Daniel, we'll often pray
The Angel of Mercy will walk beside,
And bend our sheaves at its closing day!

[Christian at Work.

MATERIALISM IN THE POPULAR FAITH.

MANY defenders of the faith are greatly alarmed, just now, by the spread of materialistic doctrines. It is feared that the belief of men in the truth of the gospel will be undermined by this movement; and a host of apologists under the able and confident leadership of Mr. Joseph Cook, are arming themselves with such arguments as they can command to meet this dangerous foe. The materialism which excites their alarm is that which appears in connection with the recent investigations in physical science—the materialism of Bain and Buechner and Carl Vogt; the alleged (but not acknowledged) materialism of Tyndall and Huxley and Spencer. From the teachings of these physicists and philosophers the danger to religion is supposed to come; and these are the names with which polemical pulpits are resounding, and the pages of quarterly reviews are plentifully besprinkled.

We are not inclined to belittle the perils confronted by the church on this side, nor to ridicule those who are trying to meet them; but it may be that materialism in other shapes is assailing our faith in another quarter. Sometimes it is true that the most dangerous foes of the church are in its own household. Sometimes the enemy outside the camp has a powerful ally within. We wish to suggest the inquiry whether it be not so in this case; whether there be not a very considerable materialistic element mingled through and through the popular faith; and whether this materialistic leaven, which is not the product of modern science, but which has been propagating itself in Christian thought all through the centuries be not, after all, more to be feared than scientific skepticism.

BIBLE ARITHMETIC.

ADDITION.—Add to your faith virtue; and to virtue, knowledge; and to knowlege temperance; and to temperance, patience; and to patience, godliness; and to godliness, brotherly kindness; and to brotherly kindness, charity. 2 Peter, 1: 5—7.

SUBTRACTION.—Laying aside all malice, and all guile, and hypocrisies, and envies, and all evil speakings—desire the sincere milk of the Word, that ye may grow thereby. 1 Peter, 2: 1, 2.

MULTIPLICATION.—Grace and peace be multiplied unto you through the knowledge of God and of Jesus our Lord. 2 Peter, 1: 2.

He that ministereth seed to the sower doth minister bread for your food, and increase the fruit of your righteousness. 2 Cor. 9: 10.

DIVISION.—Come out from among them, and be ye separate, saith the Lord, and touch not the unclean thing; and I will receive you, and will be a Father unto you, and ye shall be My sons and daughters, saith the Lord Almighty. 2 Cor. 6: 17, 18.

ONE of the religious journals expresses the hope that the Committee of Bible Revisers "will have honesty and grace enough to weigh with the utmost impartiality the authority for every passage in the Holy Word, and that wherever the evidence for an interpolation into God's Word overbalances by the slightest fraction that in favor of the passage, they will consign it to margin or brackets, or omit it altogether, as the evidence may require." To this the *Interior* seems to object. "Who," it asks, "shall certify to us the absolute accuracy of those balances? It was not nominated in the bond that they were to supply a new canon. If, however, the highly improbable supposition should prove true, that the Committee are thus amusing themselves, their work will fall so heavily from the press as to mash some of them. A steam derrick could not hoist an emasculated Bible into a single evangelical church." We do not quite get the force of this objection. It is true that the revisers were not expected to supply "a new canon;" and though the question of the canon was not settled by miracle, and cannot be regarded as beyond the pale of argument, yet we have heard no desire expressed that the Revision Committee take up that question.

PERSONAL ITEMS.

Dr. Carver's rifle brought him an income of $60,000 last year.

The Chinese Ambassador at Washington works from nine A. M. until six P. M.

Butler has one hundred and two Republic orators declaiming against him in the field, and still he is not happy.

Dean Stanley says that the Government buildings in Washington are among the grandest structures in the world.

Governor Bradley, the Democratic Governor of Nevada, is seventy-five years old, and is known among his people as "Old Broad Horns."

Mrs. Corbin of Elizabeth, N. J., sister of ex-President Grant, has taken the prize for the best home-made bread in that State at the State fair.

Christopher Mann, of Independence, Mo., has just celebrated the one hundred and fifth anniversary of his birth. He is the father of twenty-eight children.

Lord Salisbury, urged on, like a second Macbeth, by the ambition of his wife, is determined to be Lord Beaconsfield's successor as prime minister of England.

The Crown Princess of Prussia is a sensible woman. When she visits an exhibition she goes in a simple black silk gown, with a straw hat with black band and a veil.

The Duke of Edinburg, Queen Victoria's son, and husband of the Emperor of Russia's only daughter, will accompany the new Governor-General of Canada to America.

Emperor William of Germany has contributed $700 for the relief of the yellow fever sufferers, and United States Minister Noyes has sent $4,000 to Secretary Evarts from Paris for the same purpose.

The new preacher-Congressman, Rev. Gilbert de la Martyr, of Indiana, elected by the Nationals, is fifty-three years old, and very tall, spare and angular. He ran for prison inspector in New York in 1874.

This was Thomas Carlyle's estimate of Beaconsfield a good many years ago: "He's just a miserable mountebank, who does everything with the rattle of that tongue of his, and has no convictions whatsoever."

William B. Astor's country place on the Hudson, near Rhinebeck, contains about eight hundred acres, and gives employment to forty men during the whole year. He has one hundred and ten horses, of which thirty are road horses.

Ralph Waldo Emerson abhors the presence of a reporter, and Boston reporters all pay deference to his wishes, and do not cherish any antipathy. On one occasion he stopped in the middle of a lecture, and would not resume until he had assurances that the pencils should not follow him.

The intended husband of Fraulein Maggy Rothschild, a younger daughter of Baron Carl Rothschild, is not the Duc de Guise, as erroneously announced at Berlin on the 21st inst., but the Duc do Guicke, the eldest son of the Duc de Grammont.—It is a pleasure to correct a mistake about one's friends.

Prince Bismarck's big dog struck up quite a friendship with the Papal Nuncio. Mgr. Maselle, whom he followed everywhere, fawning on him and licking his hands. "Your dog seems to have taken a fancy to me," said the Nuncio one day. "He is not the only member of the family that has done so," said the Prince courteously.

The health of Mrs. Sherman, the wife of General Sherman, has received so severe a shock from her recent illness that she is too feeble to undergo the duties of society at Washington next winter, and for the purpose of recruiting her strength and of educating her two youngest children under her personal supervision, she will pass the winter season in Baltimore.

Lord Lytton, poetically known as Owen Meredith, Viceroy of India, is a genial man and a brilliant and delightful talker. His wife is a stately and graceful lady, and admirable hostess, most sweet and courteous. Their palace at Calcutta is a magnificent dwelling, and full of beauty and luxury. Lord Lytton's office is a very laborious one, but it has the compensation of power and splendor.

Senator Morton's son, John M., has just reached home from his lonely exile as United States revenue agent on one of the barren Alaska seal islands, but did not learn of his father's death, a year ago, until he reached San Francisco. About the time of the senator's fatal illness, John M. Morton was also thought to be at the point of death at the Alaska station, and was unable to return by that year's steamer, after which he became ice-bound and could not leave until the return of the steamer this fall.

The fine speeches of Lord Dufferin, which read as if they were delivered extemporaneously, are really prepared and committed to memory with the greatest care. He works out a speech generally in the morning, and dictates it to his shorthand writer, who then transcribes his notes upon large sheets of foolscap, writing on every second line, and leaving a margin of half the page. The extended manuscript is then returned to Lord Dufferin, who improves his composition until sometimes scarcely a word of the original conception remains. The amended copy is returned to the secretary, who makes a fresh transcription. This in turn undergoes revision, and a third, and often a fourth and a fifth, transcription will be ordered, until Lord Dufferin is satisfied. Then he reads and repeats his periods over slowly, walking up and down, and reciting paragraph by paragraph. A reply in Greek which he made to the professors of McGill University when he was given a degree, took him more than a week in its composition. It excited wonder and admiration in Canada and English learned circles as a piece of off-hand scholarship.

Trees, Seeds, Plants, &c.

The Simplest and Most Convenient
BURR STONE MILL
in the world. The best Mill in the market for grinding Corn, Feed, &c. Send for Price List.
C. B. OGLESBY & CO.,
41 So. Canal St., Chicago.

Portable Mulay Saw Mill,
With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power and is especially adapted to the engines used for threshing

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.

It makes smooth and even lumber, leaves no stubshot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc. to CHANDLER & TAYLOR Indianapolis, Ind.

Sold on trial and guaranteed cheaper, at its price, than any other Hay press as a gift or no sale. Don't be swindled by irresponsible manufacturers of infringing machines, as the purchaser is liable. It costs no more for a good press than an inferior or worthless one.
Address, P. K. DEDERICK & CO., Albany, N. Y

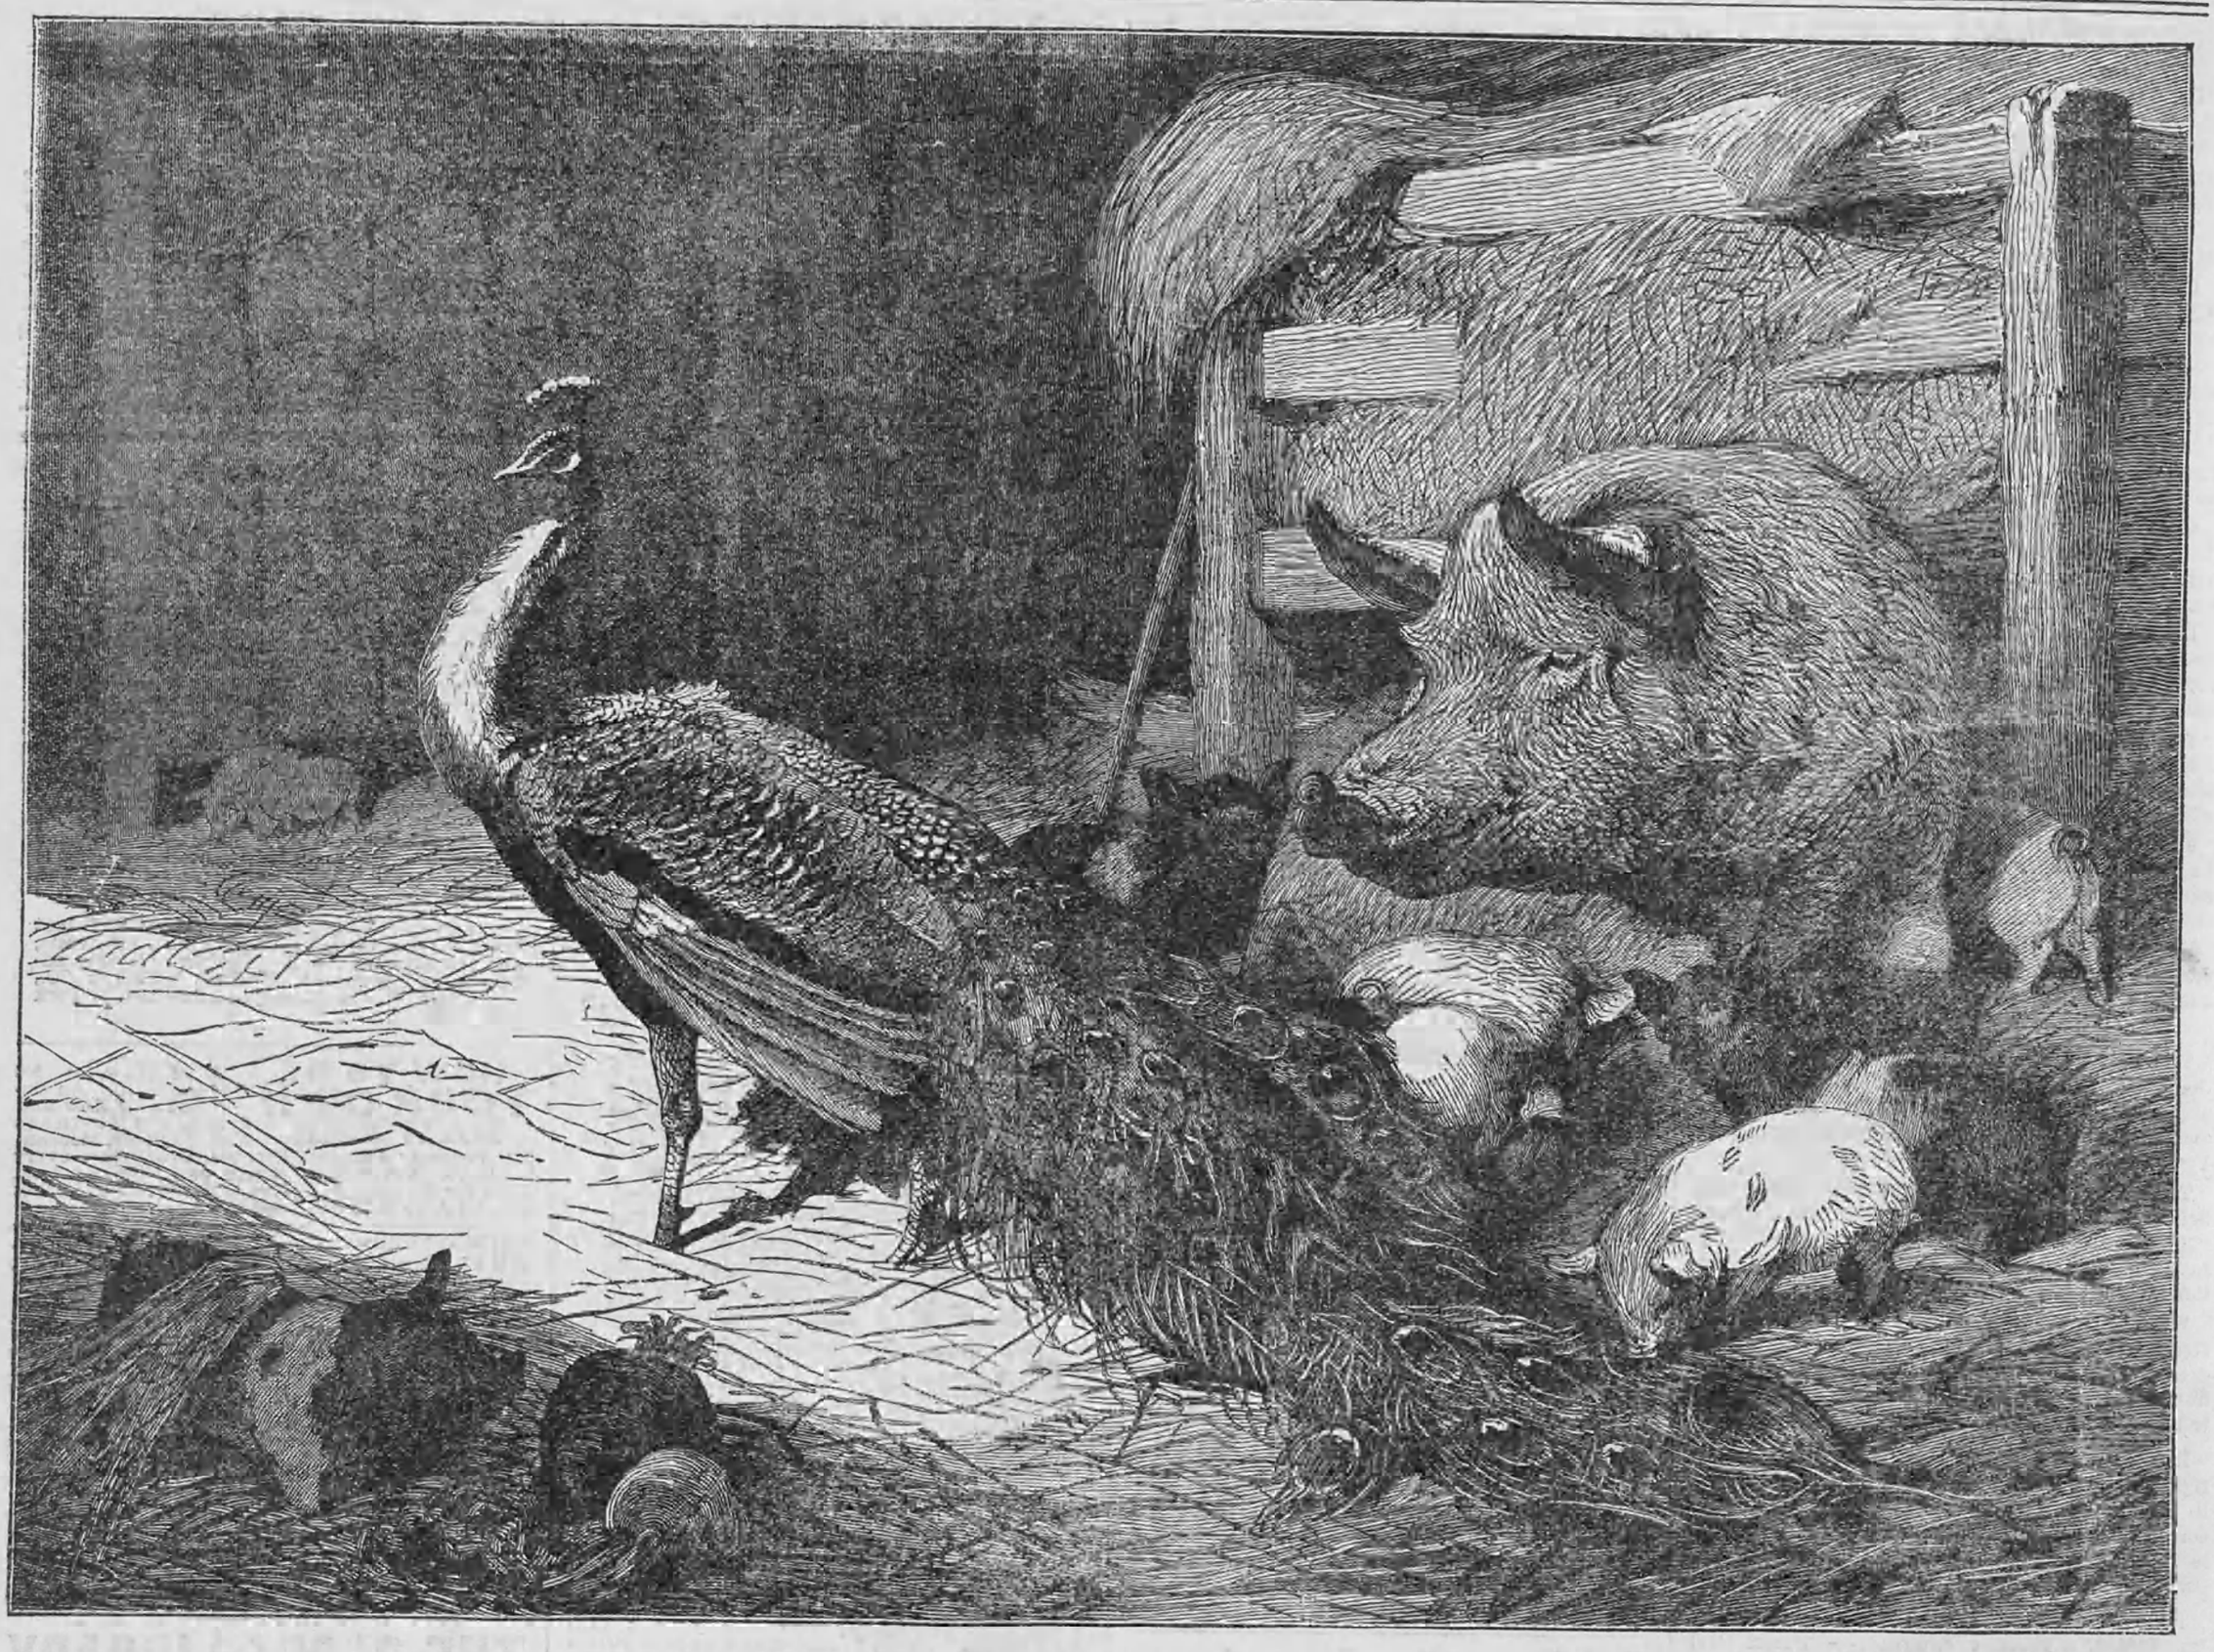
It is a mistake to suppose that any department of a paper may be slighted. The most important information is to be found, at times, under the guise of an advertisement; and it is agreeable to the advertiser and a courtesy to the publisher to mention the source of your information—in other words, to mention the paper.



BEAUTY AND THE BEAST.

Wit and Humor.

THE little girl rattled it off as if she knew it by heart: "Why do ducks put their heads in the water? For divers reasons. Why do they take them out? For sundry reasons. Why do they put them in again? To liquidate their little bills. Why do they take them out again? To make a run on the banks."—*N. Y. Graphic.*

A NEWLY married lady, who, as in duty bound, was very fond of her husband, notwithstanding his extreme ugliness of person, once said to a witty friend, "What do you think? My husband has laid out fifty guineas for a large baboon on purpose to please me!" "The dear little man!" cried the other. "Well, it's just like him."

"BEAUTIFUL, beautiful silken hair!" Philip murmured fondly, toying lovingly with one of her nut-brown tresses; "soft as the plumage on an eagle's wing, light as the thistledown that dances on the summer air! The summer of sunset, the glitter of yellow gold, the rich red-brown of autumnal forests blend in entrancing beauty in its ——." And just then it came off in his hands, and he forgot just what to say next. There was a moment of profound silence, and then Aurelia took it from him and went out of the room with it. When she came back he was gone. They meet now, but they meet as strangers, and the eyes that were wont to beam upon each other with the awakening love-light, now glare as though life was an eternal wash-day.

Though Shaking Like an Aspen Leaf

With the chills and fever, the victim of malaria may still recover by using the celebrated specific, Hostetter's Stomach Bitters, which not only breaks up the most aggravated attacks, but prevents their recurrence. It is infinitely preferable to quinine, not only because it does the business far more thoroughly, but also on account of its perfect wholesomeness and invigorating action upon the entire system. Testimony is concurrent, positive and ample showing the decisive nature of its effects, and that it is no mere palliative. Physicians concede its excellence, and there is a constant influx of communications from persons in every class of society avouching its merits, and bearing witness to its superiority over other remedies for malarial disease. It is especially popular throughout the West, wherever fever and ague prevails, as it does in many of the fairest and most fertile portions of that vast region.

THE ONLY PERFECT FAC-SIMILE OF THE REAL DIAMOND IN THE WORLD.

Pronounced by the Academy of France that *M. Lefevre has really obtained artificially the true diamond.* The basis of these gems are pure crystals found in the Sierra Nevadas, from whence they are exported to the Lefevre Laboratory in Paris, France, where they are submitted to a chemical and voltaic process, BY WHICH THEIR SURFACES ARE COVERED WITH A COATING OF PURE DIAMONDS, imparting to them all the BRILLIANCY, HARDNESS, and refractive qualities of the natural diamond, and making them as desirable for **Wear, Brilliancy,** and **Beauty,** as the veritable gems themselves. The Ring, Studs, and Ear Drops, as displayed in this announcement, are accurate engravings of SOLID GOLD MOUNTINGS, CONTAINING THE WONDERFUL LEFEVRE DIAMOND, warranted by certificate U. S. Mint assay.

ON RECEIPT OF ONE DOLLAR we will send free, by REGISTERED MAIL, to any address in America, either article as above represented. Our "Book on Diamonds," with illustrations of artistic Diamond Jewelry in solid (14 k.) gold, mailed free.

I have seen many imitations of diamonds, but never any that could equal the Lefevre Brilliant.—M. ELLROY, Stamford, Conn.
I am in receipt of a pair of the Wonderful Lefevre Ear Drops, for one dollar; to say that I am pleased with them hardly fills the bill, they are simply elegant.—ANDREW MORRIS, Hornellsville, N. Y.
The Wonderful Lefevre Diamond Ring, for one dollar, came to hand this morning. It is really elegant, giving entire satisfaction, and eliciting wonder and admiration from all who see it.—W. H. REEDY, Martinsburg, W. Va.
The Lefevre Diamonds, mounted in solid gold, are truly marvelous.—B. F. AVERY & SONS, Home and Farm, Louisville, Ky.
The eminently successful experiments of M. Lefevre silences all doubt of the artificial reproduction of the true diamond.—M. DU FRENOY, the great French Scientist.
The Lefevre Diamond most effectually disturbs the slumbers of the possessors of costly gems.—Journal of Science.

☞ We guarantee the Wonderful Lefevre Diamonds for **One Dollar** to be mounted in **Solid Gold,** and will cheerfully refund the money if found unsatisfactory. Address all orders to the

AMERICAN JEWELRY COMPANY, 5 Arcade, CINCINNATI, O.

EGYPTIAN,
OR
PEARL MILLET.

(See cut on first page.)

The value of this species of Millet, introduced by me last spring, has been well established by the past summer's trials. It produces enormous crops of fodder of which cows, horses and other farm stock are exceedingly fond.

Price of seed, by mail, prepaid, $1 per lb. (cleaned, heavy seed); 25 cts. per 2 oz. packet. Two pounds of seed will plant an acre. Circulars and Catalogues free on application to

WM. H. CARSON, Seedsman,
125 Chambers St., New York.

GIFFORD'S SWINGING STANCHION. Self-closing, self-fastening. First farm right in each town for 30 cts. in stamps. For Illustrated Circular, address W. C. GIFFORD, Jamestown, N. Y.

18 Chromo Cards, Shells, Mottoes, Cupids, etc., no 2 alike, with name, 10c. Dime Card Co. Nassau, N.Y.

THE "BOSS" Scroll Saw.

The Best and most Practical of its kind in use.

Simple, Cheap, Light Running and Durable.

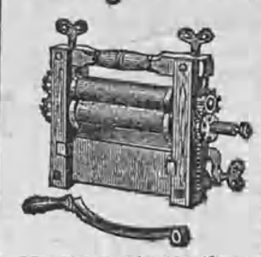
With adjustable table for inlaying work, it is especially adapted for ladies' use.

Every machine fully warranted. Send stamp for Circulars and full particulars. Address the manufacturers,

LEWIS MANUF'G CO.,
Seneca Falls, N. Y.

Every Man His Own Printer. THE EXCELSIOR **$3 Press** Prints labels, cards etc. (Self-inker $5) 9 Larger size For business, pleasure, young or old Catalogue of Presses, Type, Etc., for 2 stamps. KELSEY & Co. Meriden, Conn.

Keystone Wringer



Has Greater Capacity, Is More Durable, and Is better finished
Than any other wringer now made.

THE ROLLS

Are made of **White Rubber** clear to the shaft. No twine or wire or fibrous material, or anything else but rubber being used. The rubber is *vulcanized upon the shaft and cannot be taken off except by cutting it off.* They are more elastic than other rolls because there is nothing but rubber on the shaft, and more durable because there is no twine or fibrous material to rot out or wire to cut the rubber. They are greatly superior to any other kind of roll now known.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XXXVII. No. 45.
WHOLE No. 1502.

NEW YORK CITY, NOV. 9, 1878.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1878, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

ANNOUNCEMENT OF OUR FREE SEED DISTRIBUTION.

A Choice of ten from Nineteen Varieties of Farm, Vegetable and Flower Seeds, most of which cannot elsewhere be procured.

NOTES FROM THE RURAL EXPERIMENTAL GROUNDS.

Oct. 29, 1878.

DEFIANCE WHEAT.

We have made frequent reference to this variety of wheat which was produced by Mr. Pringle, of Vermont, a studious, hard-working botanist, by cross-fertilization. It was offered for sale last season for the first time, and at the absurdly high price of thirty dollars per bushel, a large aggregate amount—made up of small, trial quantities—was sold.* Of the five varieties of spring wheat which we tried at the farm last spring, this variety bore the heaviest straw and broadest leaf, and while some of the others were lodged by strong winds, this remained upright. The heads also matured the greatest number of grains, but owing to the hot weather and almost daily showers or, it may be, to the unsuitableness of the climate for this crop, they were much shriveled. We find, however, that the best we have been able to purchase for our subscribers is also shriveled. It is, nevertheless, true that in *some* localities, Defiance Wheat has yielded, under high cultivation, immense quantities, relatively to the area sown, and the grains have been both large and plump, as may be inferred from the size of our engraving, which is a correct portrait of a head selected from a prize collection. This was first presented in the RURAL of Sept. 14, and is now reproduced for the benefit of our many new friends.

From our own knowledge, we cannot say one positive word in favor of this Defiance Wheat, and we place it among the varieties of our free distribution, because it was originated by one whose earnest labors at least entitle him to valuable results, and also because, having been extensively advertised, the demand for it is far greater than the supply.

"PEARL MILLET."

The available stock of seeds of this "new" fodder plant is so inadequate to supply the demand that the price will this season be so high as to prevent farmers in general from purchasing it in other than experimental quantities. We have read a number of letters from those who have tried it during the past season, extolling it in the language of well-meant but probably unwarranted enthusiasm, and stating conclusions that extended trial will, very likely, modify.

From our own investigations we may state the gist of what was given in detail in the RURAL of Nov. 2, viz., that our *largest* plant weighed (without roots) 42¼ lbs.; that it was ten feet high and 14 feet in circumference; that our horses and cattle relish the leaves as much as those of corn. The stalks, however, are more slender, harder—more reed-like than those of corn.

THE BEAUTY OF HEBRON.

We do not know of any way in which an Agricultural paper can make itself of more value to its friends and readers than by testing new plants and presenting conscientious reports of the results when of enough importance to warrant such publicity. Years ago we paid three dollars for a pound of Early Rose potatoes and, though we have tried many new sorts since, we have until now deemed this kind in essential respects, as good as, if not better than, any of the hundreds of varieties that have since been offered, earliness, of course, being a first consideration in our estimate. Last spring we were shown the Beauty of Hebron potato and asked to give it a fair and a careful trial. We had confidence in those who made the request and were much pleased with its appearance, so that besides planting it ourselves, we sent a pound, or so, to a number of farmers requesting that they, too, would give it a careful trial. At this time we have space but for a few extracts from letters received: Mr. Peter T. Hewlett, of East Rockaway, L. I., says: "They are ten or twelve days earlier than Early Rose, of better quality and the yield is nearly double."

Mr. Jonathan Talcott says: "We planted them on fair soil of fine gravelly, sandy loam. The yield was about two bushels from samples (?) sent, of fine, smooth potatoes, *which I think will prove valuable in the future.*" (Italics are Mr. Talcott's.—Eds.) "I have never known but a single year, in more than 40 years, so disastrous to the potato crop in this section; and that was in 1857," etc.

E. L. Coy, of West Hebron, N. Y., reports: "I had at the rate of 295 bushels per acre of Beauty of Hebron, while the Snow-flake, planted beside them with the same culture, yielded but 185 bushels." John R. Willett, of West Hebron, says the yield was twice as great as that of any other kind he planted. Under common field-culture 15 hills yielded one bushel. They excel all others for table use.

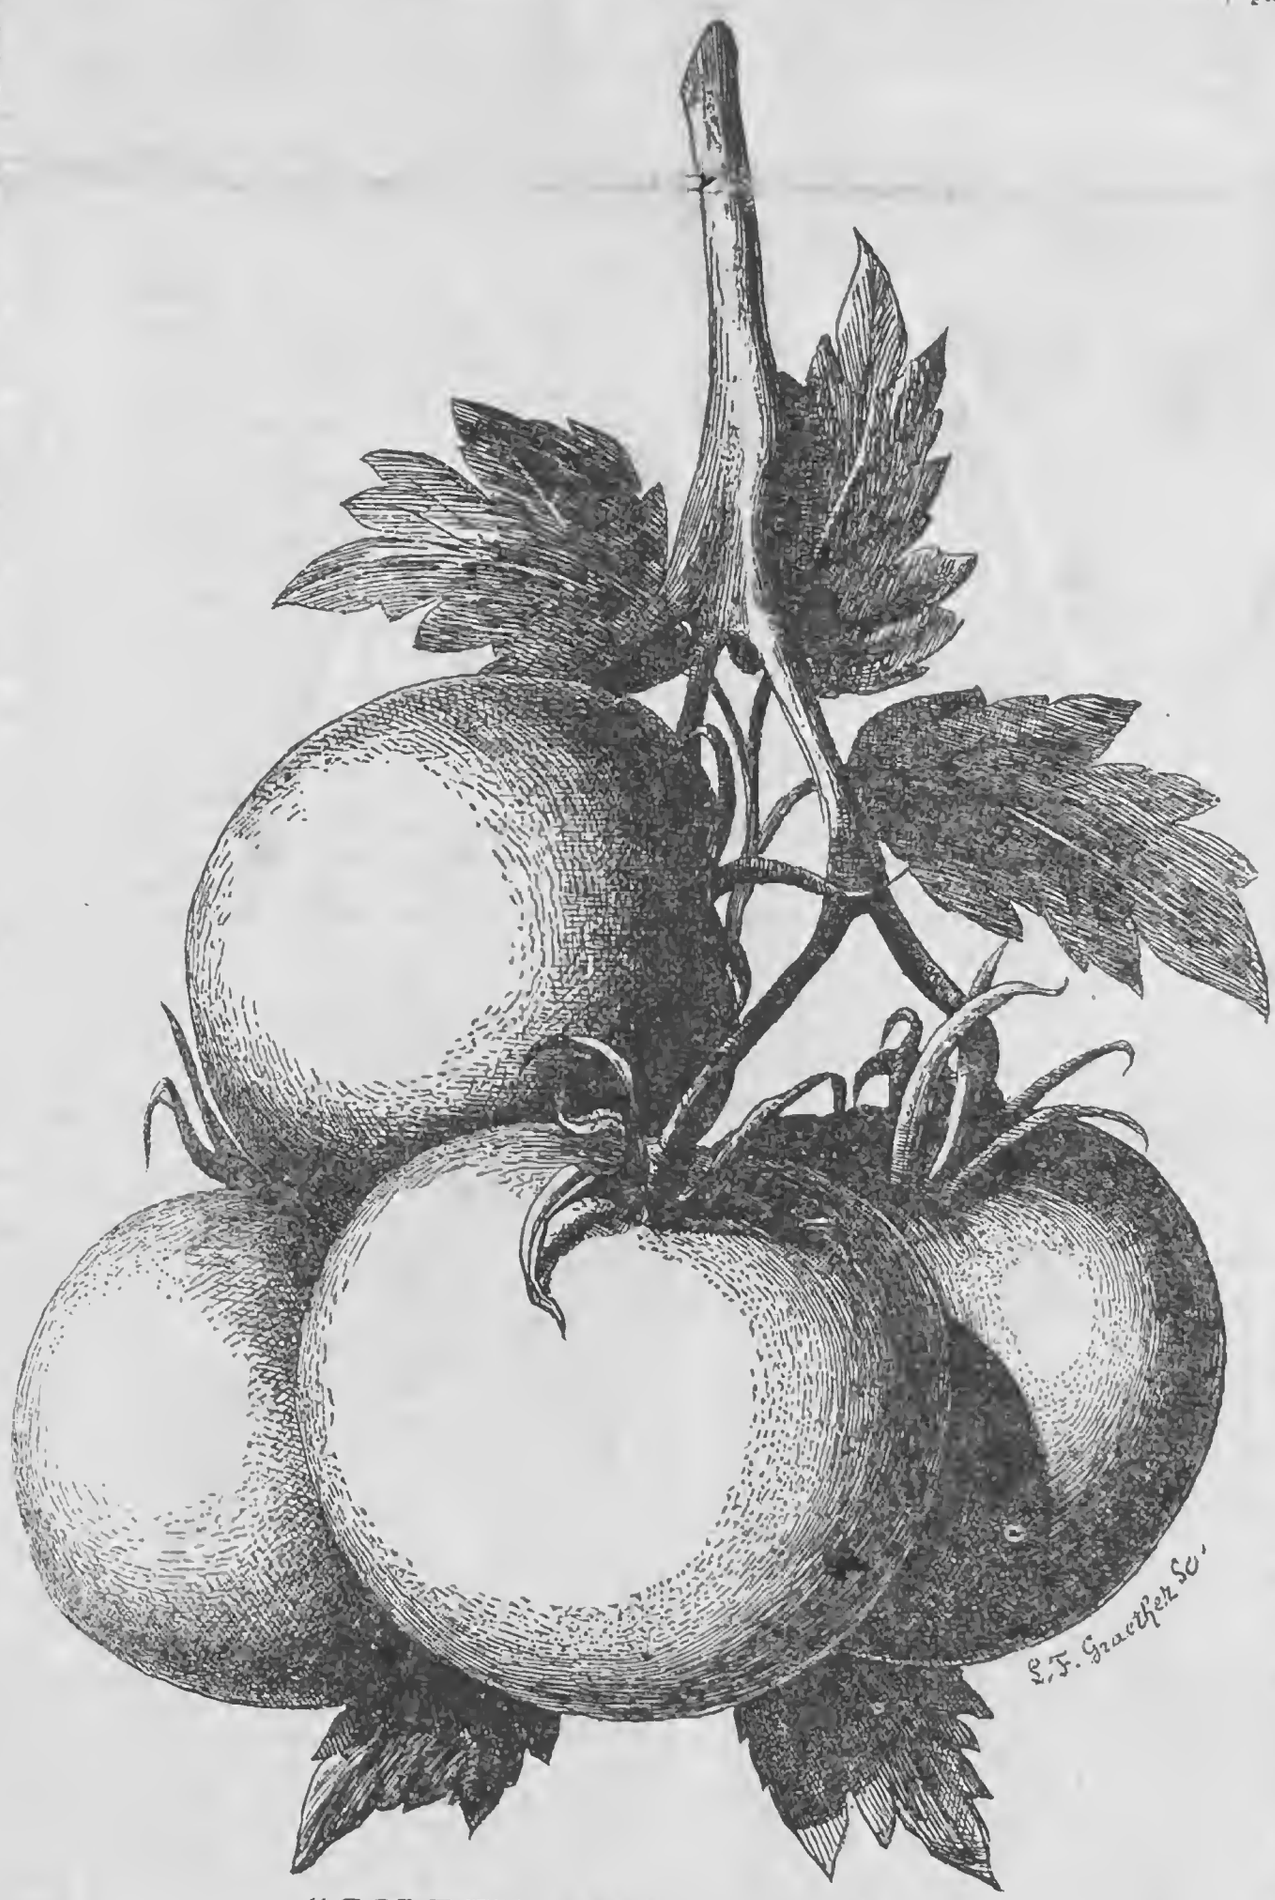
Mr. Coles Carman, of Hempstead, L. I., says: "Three small potatoes were planted in the garden. From these we got one bushel of very good size. I think they are about ten days earlier than the Early Rose. Tops of vine not so large as those of Rose."

Our own report is that they are ten days earlier than the Early Rose, that they will yield more potatoes in a given area treated in the same way, and that they are as good in quality.

The Beauty of Hebron originated in 1874 from seed-balls of the Chili-Red. The tubers are of medium size, very smooth, slightly tinged with pink about the eyes, but becoming white during the winter. They lie closely together in the hills, and the labor of digging them is consequently light. We propose to send a single potato to all of our subscribers who apply, until our own supply is exhausted, and we have contracted with J. M. Thorburn & Co. of this city who have brought this potato before the public, to supply any further demand.

THE VOORHIS WATERMELON.

Several years ago, one of our neighbors, Mr. Isaac Voorhis, saved seeds from either the Mountain Sweet or Black Spanish Watermelon which were planted together in his melon patch. These seeds produced an intermediate variety which he has since cultivated. Much pleased with this melon, we planted the seeds last year for our own use, and this year, with a view to placing them in the seed distribution, an acre was planted to them at the farm and as large a plot here as could be spared. Frost killed the vines at the farm. But Mr. Voorhis has obligingly collected all the seed from his crop for us, and so we are enabled to offer them to our readers as we had desired to do. The melon is longer than the Black Spanish and thicker than the Mountain Sweet, of a regular, thick, oval shape. It is obscurely ribbed and of a dark-green color, sometimes faintly streaked with a lighter shade. The flesh is remarkably solid, of a rosy-red color, lighter in the heart of the melon, extending in some melons, nearly to the rind itself. The seeds are of an ash-brown color speckled somewhat like Castor-oil "beans." The vines are wonderfully vigorous and productive, ripening fruit through a longer season than those of any other varieties which we have tried in these grounds.



"GOLDEN RURAL" TOMATO.

"GOLDEN RURAL" TOMATO.

THE Acme Tomato is said by many who have made Tomatoes a specialty, to be an improvement upon any other variety. Its superiority consists in its uniform size, its smoothness, its firmness, and in ripening perfectly about the stem. Comparing this with the "Golden Rural" as grown here, the latter is yet superior in several respects. It is nearly round, as our engraving will show; there are no lobes or irregularities whatever upon the surface; it is firm, ripens about the stem the same as in any other part, and is the earliest tomato we have ever cultivated. It is also the most fruitful throughout the entire season. It is the latest as well as the earliest, and is at this date (Oct. 27), of all the varieties cultivated the past season, only the kind of which we still have a supply. The variety grew from a seed of the Green Gage, the plant of which stood next to a Golden Trophy. Whether it is merely a self-seedling of the Green Gage, or a cross between the two, is merely a conjecture, of course; but the latter seems a plausible conjecture, inasmuch as several prominent characteristics of both seem blended in the new sort which, for want of a better name, we have called the "Golden Rural."

The color is a bright yellow. Our engraving is in every way true to life. We have also collected a large quantity of the seeds of the

ACME TOMATO,

which many may prefer, though this will, during 1879, be offered by most seedsmen.

OUR NEW BRONZE RICINUS.

This is a cross between R. communis Gibsonii and R. c. sanguineus, as we have already informed our friends. The cross was effected two years ago, an easy operation with these plants, since the male and female organs are borne by dif-

* Even this season, we understand, there is no likelihood of its being sold for less than twenty dollars per bushel.

ferent flowers though upon the same raceme. Seeds were planted across the entire garden and, here and there, about the beds and lawn. We have never grown plants which elicited more numerous or lively words of admiration. They grew to an average hight of nine feet, branching freely from the main stem, the effect of which is but imperfectly shown in our rather formal illustration. The leaves, main and secondary stems, as well as the fruit, pedunceles and pedicels, were of a rich violet-bronze hue, changing as viewed from different places or as moved by the wind. If our readers desire rich, luxuriant, "tropical" foliage, that will form a marked contrast with the bright green of other plants, or if it is desired to grow them as single specimens, we really do not know of a more imposing subject than this.

HIBISCUS MOSCHEUTOS.

We had intended to present our readers with a picture of this showy flower, but as its showiness rests in size and color rather than in the form, delicacy or markings of the petals, a few words of description may answer as well The Swamp Rose-Mallow grows wild in the brackish meadows along the Atlantic coast. The stems are annual, the roots hardy perennial. The stems in cultivated grounds grow about four to five feet high—the leaves are large, light-green, and not much lobed. The flowers resemble those of the better known H. coccineus, though instead of being crimson, they vary from deep-rose to pure white, with distinct eyes, varying from white to maroon. The flowers are immense, sometimes measuring twenty-seven inches in circumference. It is probable that cultivation might increase this size, and perhaps induce them to become double. Let our friends try, as we are trying, to bring about some such change. There is no trouble about raising the plants from seeds. They will thrive anywhere, and, to our way of thinking, will reward the cultivator for his pains.

The New Seedling Potato.—Beauty of Hebron.

CALLICARPA AMERICANA.

This is the French Mulberry and belongs to the natural order of Verbenaceæ or Vervains. It is hard to describe the beauty of this bush in a few words. The roots are hardy always, the tops are often killed by severe cold. But this is no objection, since by the first of July they will have again grown as large as desirable. The form is round, quite compact. The leaves resemble those of the peach tree in shape. The flowers are very small, of a rose color, in little umbels of four, each umbel bearing a dozen flowers axillary from every leaf. The umbels of fruit which succeed the flowers the last of September, are little berries of a rosy-purple color. As nearly every flower forms fruit, the bush is finally as full of fruit as it was of flowers and is then far more attractive. Each branch, indeed, becomes a wreath of clusters of rosy-purple beads which are more conspicuous than the leaves between. This lasts until frost. Our engraving, which is reduced to nearly half size to save space, will give some idea of this handsome shrub that deserves a place in every garden.

CHATER'S LEMON HOLLYHOCK.

We have before offered seeds of this strain to our readers and are induced to offer them again from the many letters we have received praising its "doubleness" and pure lemon color. A single extract from an esteemed contributor to our columns will suffice for all.

"I want to add a word about the Chater Hollyhock, the seeds of which came from the Rural office last year. The Hollyhock has been in bloom for some time and the blossoms are, in school-girl parlance, perfectly elegant. A pretty neighbor of mine finds them "lovely" for the toilet, placing one in her hair, another at the throat, one on each arm, and fastening them in the drapery of her skirts. They form the most exquisite rosettes—being perfectly double, triple and quadruple, and sextuple for that matter, and of a delicate straw-color—for toilette decoration that can be had, especially against a frock of black grenadine, or of pure white. They form plate bouquets of striking beauty, set in a background of dark, crimson Phlox." Mary Wager-Fisher.

CALLICARPA AMERICANA.

WEIGELA.

For a number of years we have much enjoyed raising this plant from seed. The seedlings are much inclined to vary, so that among every dozen plants one or two variegated specimens or golden-selfs may be looked for. Moreover, seedlings are far more vigorous and the leaves larger and fresher than those of old plants that have been propagated from cuttings. The flowers also vary from white to dark-red and are often blotched and striped. As with all of the other seeds we offer, they germinate freely, only needing a light loam, moderate moisture and plenty of sunlight. It need hardly be said that the Weigela (Diervilla, properly) is hardy and that it is one of the first to be thought of in planting new grounds.

DEUTZIA CRENATA, FL. PL.

The double-flowering Deutzia is everywhere acknowledged to be one of the best hardy shrubs in cultivation. It grows from four to six feet in hight, is of graceful form, blooms early and for a long time. The flowers are as "double" as they can be and so thickly set as half to conceal the foliage. From this variety, three years ago, we raised a large number of seedlings. In foliage there was no departure from the species, but the flowers, a large proportion of which were also double, were some of them pure white, while the others were more or less rose-color on the outside of the petals and white within. It is from this lot of seedlings that we have raised our seed for this distribution. The seed, though scarcely larger than those of Petunias, germinate very readily under usual care and the plants bloom the second year. Thus it may be seen that a dozen or more seedling plants of this beautiful hardy shrub may be obtained from a single packet of seeds, which will bloom as soon as those purchased of dealers at 50 cents each.

HIBISCUS MILITARIS

the Halberd Rose-Mallow bears sulphur-colored flowers with maroon eyes about five inches in diameter. The roots are hardy and send up heavy canes in the spring, forming by mid-summer formidable masses of foliage. It is a fine plant for clumps or thickets of shrubbery and makes a pleasing appearance upon the banks of lakes, though it thrives just as well in sandy soils.

ERYNGIUM LEAVENWORTHII.

This is a novelty in the way of annuals that attracts much attention. Our engraving will give the reader a very correct idea of the leaf and flowers, but it cannot show the brilliant purple color to which the leaves turn late in the season, or the intensely blue color of the innumerable stamens of the dense head of flowers. In the last issue of the Rural our sparkling floricultural correspondent, "Renoclaf "says of this beauty:

"It is a Texas annual. We treat it like stocks or Asters, and now, when almost all other hardy plants have done blooming, its branches are laden with brilliant deep-purple flower-heads and involucral bracts, and the stems, too, have changed to the same color. But their great merit is their "everlasting" nature. Cut now, they retain their beautiful coloring all winter long, and their branchy habit and odd-like flowers being so distinct from the ordinary winter-bouquet stuff, they are quite a desideratum. Besides, like rosy cheeks, they are nature's coloring, that no dye can imitate.

GERANIUM SANGUINEUM.

This is a true Geranium and *not* a Pelargonium. It is perfectly hardy and nearly evergreen. It forms a mat of foliage growing less than 18 inches in hight bearing purplish-red flowers over an inch in diameter. It blooms throughout the entire summer and autumn until freezing weather, and is one of the most desirable herbaceous bedding plants of which we have any knowledge. Removed to the house, it will continue to bloom through the winter. Our sketch was drawn from a piece cut off the 25th of October, after the plant had been exposed to three frosts. It is a native of Europe.

YUCCA FILAMENTOSA.

Because this is evergreen—because it is hardy—because it bears leaves which form a peculiar feature in the garden—because it bears hundreds of white, lily-like flowers—because it will grow in almost any situation or soil, it should be seen in every garden. Few people not specially interested in gardens, stop to think how easily a beautiful effect may be made at a trifle of expense or time. Every garden has a grass-plot; every farmer's wife, every man's wife needs one for laundry purposes at least. Suppose in the center a circle of grass be taken out and a sufficient quantity of good, mellow soil filled in. Here plant a Yucca or so, a Weigela, a Deutzia, a Rose-Mallow, a few Aquilegias, a French Mulberry—then we have a pretty little garden in itself, that, requiring but an occasional weeding, will last for ten years and yield flowers from spring until fall. We now furnish the

VITIS HETEROPHYLLA. (Variegated.)

VITIS HETEROPHYLLA.

This is a beautiful climber from Japan, with singularly variegated leaves and racemes of berries as large as peas. These wax-like berries, according to their stage of ripening, are light-blue, pink, white or green, speckled with tiny dots of brown, so that all of those colors may be shown in a single raceme. The roots are hardy, and the vines grow ten or a dozen feet in a season. It is rather singular that a majority of seedlings come variegated, though this variegation is not always permanent, unless the vines grow in partial shade. For low trellises, rocks or stumps, we know of no prettier vine than this variegated Ampelopsis, as it is called by some authorities. As the nodes are six inches or more apart, we could not spare the space to give a fair idea of its manner of growth without sacrificing the details of leaf and fruit.

RURAL HYBRID AQUILEGIAS.

All of our readers may know of the interest which the Columbine has excited of late years. Cærulea and Crysantha (see cut) are among the best acquisitions to our list of hardy herbaceous

Defiance Wheat.

plants. These, with others, have been planted together in these grounds and from the seeds collected, an infinite variety of curious markings may be looked for.

GRINDELIA SQUARROSA.

This belongs to the Composite family, somewhat resembling a Coreopsis in flower, though the stems are more leafy. The color of the flowers, which bloom in great profusion, is a dark brownish-red. As has already been stated in the Rural (Sept. 21), physicians are using the roots of this plant in the form of fluid extract for malarial fevers in place of quinine, with apparently excellent effect.

REMARKS AND EXPLANATIONS.

It will be seen we have announced nineteen plants, a small quantity of the seeds of any ten of which will be sent *free of charge* (except postage), to those subscribers whose names are, or may be, entered upon our books prior to May 1st, 1879, as yearly subscribers. Possibly a few other varieties (respecting which we are still in doubt as to whether we can collect a sufficient quantity of seed) may be added. Possibly also, we may run short of several varieties offered, in which case the best that we can *purchase* will be substituted. There is no doubt about it (in our minds at least) that this choice of seeds, many of which cannot elsewhere be procured, is worth more to

those who want them, than the new subscription price to the RURAL for a year, as each can ascertain for himself upon careful inquiry. Those who are pleased to view this offer in the light merely of a device to increase our circulation are respectfully solicited *not* to subscribe for the RURAL NEW-YORKER. This journal is now conducted with a fervent desire to *promote* the interests of agriculture and horticulture—*not* to harm those interests in promoting our own, and although we shall strive to place it in every respectable country or village home, a journal upon which less pains are bestowed, will doubtless answer the needs of those who look with distrust alike upon all motives whether benevolent or wholly mercenary.

Any ten of the following require a one-cent postage stamp:

The Voorhis Water-melon.
Golden Rural Tomato.
Acme Tomato.
New Bronze Ricinus.
Hibiscus moschentos.
Gaillcarpa Americana.
Chater's Lemon Hollyhock.
Weigela 5.
Deutzia crenata fl. pl.
Hibiscus solitarls.
Eryngium Leavenworthii.
Geranium sanguineum.
Yucca filamentosa.
Vitis heterophylla.
Rural hybrid Aquilegia.
Grindelia squarrosa.

When the Beauty of Hebron Potato is included, a two-cent extra stamp.

When both Pearl Millet and Defiance are included, a two-cent extra stamp.

FINALLY,

we have only to beg that our subscribers will write their addresses IN FULL and PLAINLY, and not *stick the stamps to their letters*. By so doing they will save us a deal of trouble and expense.

The Poultry Yard.

A FRENCH POULTRY FARM.

POPULARITY OF POULTRY IN FRANCE.

THE French excel in poultry breeding. There is something in their active, sanguine, vivacious temperament akin to the fussiness of fowls, and, as like seeks like, the French people raise more fowls and produce more eggs than any other nation. The export of eggs from France to England amounts in value to several million dollars' worth yearly, and the home consumption of poultry largely exceeds that of any other nation. Poultry in some shape or other, openly or disguised by their inimitable cookery, is upon the Frenchman's table every day, and the *omelette au confiture* or *au fines herbes* is a standard and delicious part of the usual meal. It would do an American farmer a real good to see how well and delicately a Frenchman lives on what the former either wastes or neglects. The fat, boiled pork usual in our farm houses, is there rarely seen, and where it is, it is brought up in such a form and of such a quality as to make it unobjectionable to the weakest stomach. Poultry and eggs are in reality the cheapest products of the farm under the best management, and we might well take a lesson from the French both in managing poultry while alive, and in using it to the best advantage after it is slaughtered.

We owe some of our most popular breeds of fowls to the French. The Houdan, the Crevecœur, and La Fleche, are purely French, and have been found so satisfactory that we have not as yet undertaken the usual American process of "improvement" with them. But to see French fowls in perfection one must see them in their native homes, for the best of us must admit that in their excellent methods of caring for their fowls we are far surpassed. Among other methods of management, that of colonizing is peculiarly French. A peasant woman who has but a dozen or two fowls will have her separate coops, each shaded by an apple tree or by a vine or plum tree; and the largest professional poultryman or amateur will still have his colonies. Here is a great advantage at the outset, because all the evils which come through crowding are avoided, and good health—a grand requisite to success—prevails.

We find in a French journal a description of

A FRENCH POULTRY ESTABLISHMENT,

that of M. Lemoine, of Crosne—Department Seine-et-Oise—who was awarded the "prize of honor" given for poultry, for his exhibit at the great Parisian show. This gentleman began to keep poultry in 1873. His first experience was one that is usual with all successful poultrymen. He began with the common farm fowls of mixed blood, but soon abandoned these for pure breeds, as being the only profitable kinds to be kept. Careful selections were made of perfect specimens of each breed, and these were bred with care and crossed with each other in such a way as soon to obtain superb birds. Twenty-seven different varieties of fowls are kept by him. These are kept in "parquets" of 80 to 100 square meters each—a trifle over as many American yards—in which they have freedom, and find grass, insects and gravel. Each yard has a garden or plot of green turf, shrubs, fruit trees and sanded paths. The low shrubs give cool shade and the earth beneath them absorbs and decomposes the droppings, and furnishes dusting places for the fowls. The young chicks early in the season are raised in a long building (Fig. 1) in which they have warmth and are conveniently attended to. As soon as the heat of the sun makes this house too warm, the chicks and breeding hens are removed to coops placed in the "parquets" under the shade of fruit trees. (Fig. 2.)

A PECULIARITY OF THE SYSTEM

followed by Mons. Lemoine, is to raise his chicks from large eggs and to produce the heaviest possible birds. The result has been that his fowls have always been awarded first prizes.

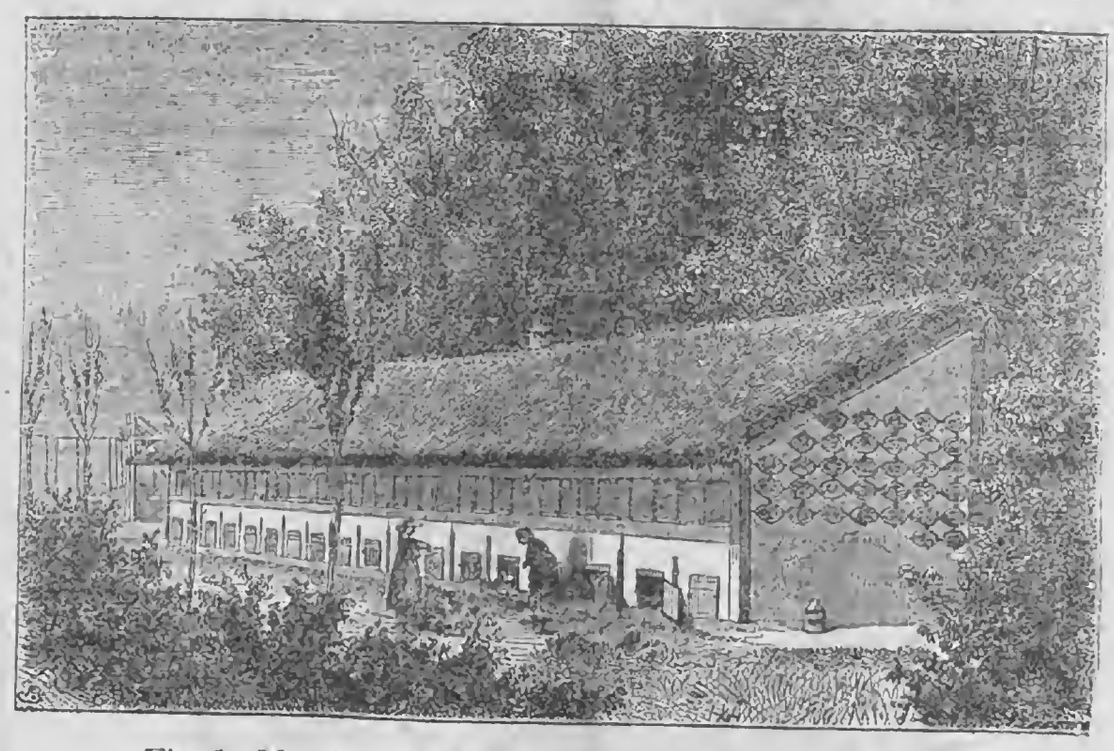


Fig. 1—Mr. Lemoine's Poultry Establishment, France.

He has found that a superior sire and an inferior dam produce a second-rate progeny, and that to procure the best offspring the dam must be the very best, while the sire may be of secondary character without injury. As to the scarcity of large eggs, M. Lemoine says: "This is not astonishing when we consider how frequently fowls are permitted to degenerate through negligence in killing off the hens indiscriminately, sacrificing those which lay large eggs equally with those which produce small ones." . . . "Those who know their best interests will guard carefully and keep for years the producers of large eggs and weed out their flocks, adding, by purchase of eggs of the best types, new blood through which the most profitable results may be obtained." In conclusion, Mr. Lemoine mourns over the extreme scarcity of the best quality of poultry in the French market, observing that "it is only by accident that one can find a satisfactory fowl offered for sale."

If this is said of the French markets, which are so far ahead of ours in this respect, what might be thought or said of ours, where to procure a decent fowl would be impossible without a long-continued search which, after all, might be unavailing? And yet it is not for want of willing purchasers who do not grumble at high prices so long as they can procure what they want.

Farm Topics.

NOTES FOR NOVEMBER.

PREPARING JOBS FOR WINTER COMPLETION.

THE days are rapidly growing shorter. The weather is becoming wet and cold. There are many things which cannot be safely delayed much longer. Work lively now if pleasant, and save cold fingers within the next thirty days. Some kinds of work may be prepared for completion during the winter. Wood, rails, stones, logs, may be got together for hauling when snow comes.

GOING TO MARKET.

It is a favorite time for marketing grain, apples, etc., if the prices are reasonable. In holding on for a higher price, the risk must be taken into consideration, also the interest on the money and the waste or shrinkage on the produce kept. The price should rise quite rapidly to keep up with all these drafts. After selling the produce, use the money to the best advantage. Pay debts if there are any, and invest the rest with judgment and discretion. Remember the needs of all the family and do not buy useless articles. Money spoils very quickly in the pockets of some persons: at least it will not keep well. It goes at once for something. In time of greatest need a man of this class has to "get trusted," borrow, or pay high interest. It is no small part of good farm management to learn to keep a little ready money. Nothing comes handier just when wanted to take advantage of some excellent opportunity to buy what is needed or certainly soon to be needed. It is rare to find a farmer who can carry money in his pocket or have it in a bank and not spend some or all of it foolishly. Farmers are not the only men in this large class of people.

STOCK.

Keep on the look-out for all kinds of stock; see that the fences are kept in good repair; cattle are likely to get uneasy in autumn, especially if the feed gets short. Get them up in cold weather, and do not neglect to give them feed as soon as they crave it. The spring pigs are fattening, ready to wintering in the barrel instead of in the pen. It is not often profitable to winter hogs to fatten the next season.

INDIAN CORN.

This is the most beautiful and one of the most valuable crops of the United States. Corn should all be cut and shocked before frost, except at the West and South where the practice does not seem to pay and is not "fashionable." Keep at the husking vigorously and get it in before freezing cold days. Take those shocks which have just tumbled down; bind the stalks well and set them up in large bunches where they may often be left till wanted for winter use. This saves another handling. They must not be stacked too early till well cured. The nicest sort of "binders" is made of basket-willow which is stout, light and always reliable. If you have not them already, get a few cuttings and start them near by in any wet place. Cut

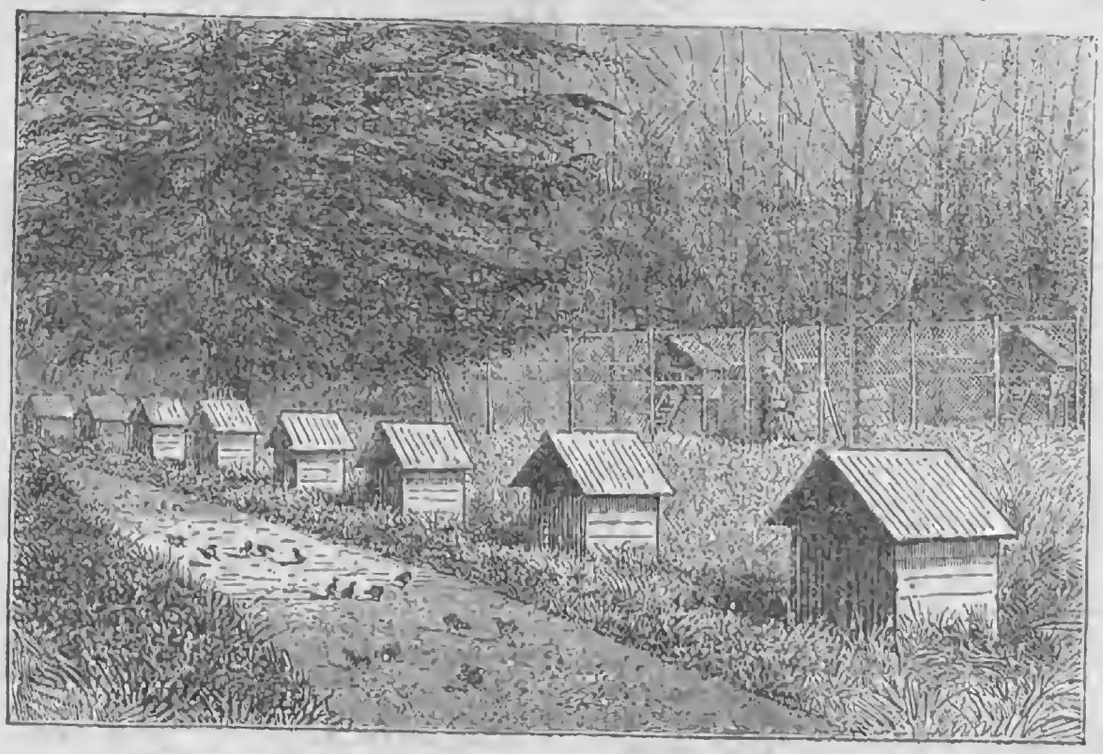

Fig 2—Mr. Lemoine's Poultry Establishment, France.

Clover seed must be harvested and saved. If there is time and the land is heavy, plowing at this time may advantageously be done for oats or corn in spring.

Fences can be laid over, ditches dug, tiles laid, wood cut, trees trimmed, and many other things can be done, if there is time and a willing hand to do them.

GOING TO MARKET.

It is a favorite time for marketing grain, apples, etc., if the prices are reasonable. In holding on for a higher price, the risk must be taken into consideration, also the interest on the money and the waste or shrinkage on the produce kept. The price should rise quite rapidly to keep up with all these drafts. After selling the produce, use the money to the best advantage. Pay debts if there are any, and invest the rest with judgment and discretion. Remember the needs of all the family and do not buy useless articles. Money spoils very quickly in the pockets of some persons: at least it will not keep well. It goes at once for something. They must not be stacked too early till well cured. The nicest sort of "binders" is made of basket-willow which is stout, light and always reliable. If you have not them already, get a few cuttings and start them near by in any wet place. Cut them back every year, to secure a vigorous growth of young wood.

VEGETABLES.

Potatoes must be dug and stored, the tops of asparagus cut and burned to kill the seeds which will otherwise grow and become a nuisance. Vegetables must be watched carefully. The cellar is kept closed on warm days and open when cold, to reduce the temperature and make it ready for storing fruits and vegetables in winter. Squashes must not be much exposed to the cold. As the ground freezes, potatoes and beets must be covered, a little at a time, to keep out the frost. A supply of nice sphagnum or moss in a good-sized box must be provided and well stored with beets, parsnips, carrots, salsify, turnips, a few cabbages, and a little celery for winter use. Some of the celery should be carefully taken up on a dry day, the roots set in mud in the bottom of a deep box, and the tops covered with damp sphagnum. Keep this cold, but not frozen. Apples are brought into the cellar or buried in the ground.

PICK UP.

It may be useless to mention the matter to the person who has left things "lying around handy" until this time of the year. But we must say again: pick up a little and make your farm and surroundings attractive, just once, at any rate, and see how it seems. Keep things in place; slick up; clean, brush out the fence corners; place the tools under the shed instead of leaving them sown broadcast along the road in front of the barn, or in the fields. If an implement is used up, burn the wood-work and sell the old iron before wintering it several years to allow it to decay and fall to pieces before your eyes.

A little time spent in keeping things tidy produces a good effect on the children, on visitors, on strangers who pass by and, above all, on the man who sees to the work.

WINTER WORK.

And now the summer is over and the harvest is ended. The tools are put away; the cattle are housed and fed; the evenings are getting long; look over the work of the past year and see what could have been better done. Look for the losses and see what was most profitable. Write up the books; read the valuable particulars about the different cattle, sheep and swine, that they may not be left to memory alone. Straighten up all old accounts; look over the list of papers; send for sample copies of those you see advertised and begin to make a good selection for the coming year. Buy some useful books each year; and do not forget to consult the tastes of your wife and the rest of the family. Join the Grange or Farmers' Club if you have not done so, or start a Club. Work, and learn; study, plan, and recruit for another summer.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

NECESSITY OF CLEAN MILKING PLACES.

WE consider ourselves fortunate in having a warm stable, well ventilated and roomy, in which to secure the cows at milking time, where we can milk in comfort with no concern for the rain which is drip, dripping outside. Cold storms may be expected at this season, and no more disagreeable job can be conceived than the milking of a dozen cows with no protection from the cold, drizzling storm. The yards are wet and muddy, the cattle uneasy, and it is next to impossible to so place the pail as to avoid the drippings from the animals' sides. Cleanliness is the first requisite—after the milking, of course—in successful butter-making. Disagreeable odors are readily taken and retained by the cream. Stables wherein cows are milked—and mine are confined in the stanchions at every milking—should be kept as cleanly as possible. A barrel of gypsum is kept in the stable all the time, and sprinkled about the floor after the stables are cleaned. It is an excellent deodorizer and a valuable absorbent of the liquid, the most valuable portion of the manure, yet that which most farmers lose entirely. If cattle are given plenty of salt, butter will be obtained much more easily than where it is given them only occasionally.

TIMELY HINTS ON CARE OF CATTLE.

Cows now do better if stabled at night, provided they are well-fed, than they would if allowed to remain in the field or yards. There is but little substance to grass after heavy frosts. Calves should receive much attention. They should have a little meal given them in their milk for some time. If they become poor in the fall and winter, it will be very difficult to make up the growth lost. Calves intended for the market when one or two years old, should be "crowded" from the time they are taken from the cow. The idea is to make a yearling as large and of as much value as an ordinary two-year-old. Those designed to be left on the farm as cows, should be kept only in fair condition. They do not then get their growth so young, yet they make better butter producers. To my mind it costs as much to winter a calf the first year as the second. It is as impossible to get them through in good condition, free from vermin, their growth unchecked, without grain of some description, as it is to have hens that will lay well through cold weather, with one feed of cold grain a day.

CHURNING BY POWER INSTEAD OF HAND.

Whoever keeps a dairy of even five cows, should either purchase or construct a power for

churning. I am a believer in woman's right not to be made a slave upon the farm or in the dairy and kitchen. While farmers, or the majority of them, are ready and anxious to procure all labor-saving appliances for their own share of the farm-work, the good housewife is, in many instances, forgotten, her comfort and often even her health entirely overlooked. While we see mowers, wheel rakes and hay-loaders in the field, in the kitchen we find the tired wife bending over the old fashioned wash-board, her hands worn by contact with its zinc surface until they bleed; her tired, care-worn face made old before its time by drudgery and incessant labor. While the farmer takes the world easy, his wife oftentimes is shown no more mercy than the cattle and horses, whereas, in many cases, to her efforts and advice may be attributed whatever measure of success has attended his career as a farmer. Two or three rainy days, well employed, are sufficient for anyone at all handy with tools to construct a durable and efficient power to be driven by dog, sheep or calf. I prefer sheep, as they are the most tractable. As a general thing, Carlo dislikes churning, and it is often difficult to find him when the cream is ready for the churn. Calves are not as cleanly as sheep, though some prefer them. A well built power, if housed, will last a number of years, and pay for its first cost many times.

POSTS IMMOVABLE BY FROSTS.

Mr. Barnard uses sawn fence-posts in preference to split ones. They are cut six inches square at the bottom and taper to two by six at the top. For what reason? The frost has no effect upon them. It is an error to suppose that deeply driven posts will not be thrown up by the action of the frost. They are not lifted from the bottom but at the surface of the ground. As the ground is frozen, it presses against the posts and raises them; when it thaws, the earth settles back but the posts do not. By having them sawn or cut tapering, this is avoided. The earth is pressed up the inclined surface and the posts remain firm. This is simply my idea of the matter. Mr. Barnard once called my attention to some gate-posts nearly a foot square, that he had set five feet deep. They had been lifted by frost nearly half the distance, while others close by but two feet deep, although set at the same time, were perfectly firm; but these had been sawn tapering.

SUGAR BEETS FOR STOCK.

Commissioner Le Duc sent me some sugar beet seed last spring. They received only ordinary culture, yet the yield promises to be enormous. Even if the manufacture of beet-sugar is destined to prove a failure in the United States, which I doubt, these beets can be raised to advantage as food for stock. All the animals on my farm eat them with apparent relish. Any good garden soil is capable of producing good crops.

Horticultural.

SOME NOTES FROM THE GARDEN.

GRAPES, with me, were almost minus this year, only three or four varieties of vines bearing, and these only a few clusters each. I have only a dozen vines of some half dozen varieties, some of which have not yet come into bearing. All of the vines have made a fair growth of wood, and appear well ripened off. My Rogers' No. 15, last year shed its leaves early, and this spring did not show any growth till quite late, and then not over half a dozen buds started from the last growth. Eventually, however, dormant buds on old wood started into growth, and the vine bore three or four small clusters of grapes which ripened. The vine has been set some five years, and kept short pruned in the fall.

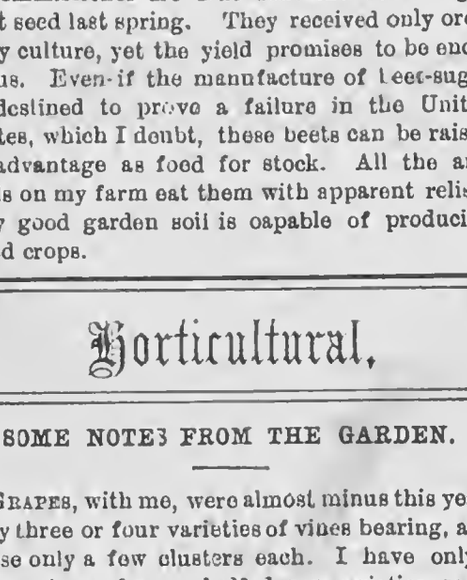

Fig. 1.

YOUNG PEAR TREES in my garden, which have not yet come into bearing, have made good healthy growth without any signs of blight, which I find is much less common about here this year than last, when in some orchards of 50 or more trees, more or less blight appeared on the principal part of them. The pear crop hereabouts was a light one where heretofore it was abundant.

STRAWBERRIES in my grounds were a medium o, lasting longer in bearing than oftentimes. The bed, however, must be renewed in whole, as it has been in part this fall. I grow only one or two varieties, just for my family use; but I like to have these good enough for eating without sugar.

HYDRANGEA PANICULATA GRANDIFLORA, after what has been said about it in the RURAL, deserves from me the report that the root planted out last fall came out this summer with eleven panicles of blossoms, some of which were larger than any before seen by my fellow townsmen. One panicle I measured was nine inches long, while its largest circumference was 28 inches, and that around the base 24 inches. Pretty

LEAVENWORTH'S ERYNGO.

good for the first season, I think. We have dried some two or three of the panicles, and intend them for dried bouquets.—[They are inclined to bloom larger the first year than afterwards.—EDS.]

GLADIOLI, on the whole, have given me satisfaction; for although of the eight named varieties planted by me this spring, two, Adaline Snedeker and Shakespeare, failed to grow at all, the others gave satisfactory blossoms—La Favorite particularly so.

TRITOMA UVARIA, which I thought dead, finally started, so that this fall we have a young root. Not having had any blossoms this summer, the root is taken into a box of earth and will be set in the cellar for the winter, for from what I can learn this plant will not endure our winters out-of-doors.—[Pure sand would be better. We have preserved the roots outside during severe winters by covering with straw and then placing sand over the straw.—EDS.]

ROSES I have only a few varieties of, but in their season there was a small rose show, the bushes seeming one mass of bloom. We have had less trouble than usual from insects, etc., on our roses this season. To-day, the 25th of October, I counted four roses on one bush, a hardy perpetual. Speaking of insect enemies of the Rose, I received a note from an amateur culturist in a different section of this State, inclosing a few rose leaves, part of which were beautifully skeletonized, which he stated was the work of a sort of thrip—a small white fly. Never having had experience of the sort can you or any of your readers give us information as to the insect and a preventive remedy?—[Syringing them with whale oil or tobacco solutions.—EDS.]

Worcester Co., Mass. W. H. WHITE.

ORIGIN OF THE HENRIETTA RASPBERRY.

WE have received a note on this subject from Mrs. E. Moreley, of Wetherfield, Conn. She denies that the Henrietta and Belle de Fontenay are identical, as stated by our correspondent Mr. Lovett, in our issue of October 12, and claims that the former variety originated in her own garden at the above town, in 1870. It was first found among the roots of a currant bush. There were no other Raspberries on the premises. The garden was contiguous to a gentleman's grounds, where there was a variety of fruits, among them several kinds of Raspberries of the latest and best varieties. It is supposed that the seed from which the Henrietta sprang was taken by a bird from this garden and dropped where the vine was found. The plant bore fruit the second year from its discovery. As it bade fair to be a fruit of some promise, she proposed that a neighboring firm of nurserymen should add it to their stock, and if it should prove worthy, give it a name and publicity. That such was the origin of the Henrietta Raspberry is a fact, she says, well known in that vicinity, and for which many trustworthy witnesses can be obtained.

Fig. 2.

Perhaps among the varieties of Raspberries in the gentleman's grounds from which the seed is supposed to have been taken, the Belle de Fontenay may have found a place. Mr. Lovett we know to be a careful, pains-taking, truthful gentleman, quite incapable of publishing a statement that he did not himself believe. Yet he may have been mistaken, although we find he is not alone in his opinion as to the identity of the Henrietta and the Belle de Fontenay.

NOTE FROM MR. DOWNING.

IN giving a description of the Lady Washington Grape in the last number of the RURAL, I am made to say that it is *hardy*, which is a mistake—not having said so, neither do I know if it is so or not, having only seen the vine during summer; but judging from the appearance of the wood and foliage, I would think it as much so as Isabella or any of its class. [We hold Mr. Ricketts for our use of the word *hardy* as applied by Mr. D. to this Grape.—EDS.]

Industrial Implements.

A SENSIBLE HORSE-SHOE.

A FEW weeks ago, there was sent to our office a new patented horse-shoe, differing radically from the ordinary shoe in design and construction. Following our custom, to test all new things that seem to be worthy of being tested, we procured a set and sent them to the Farm for trial. What in this instance we procured for trial, we have since purchased from choice. We think their merits entitle them to an illustration and description. The cuts here presented have been made to show the top of the shoe, (Fig. 1), the bottom or calks, (Fig. 2), and its position on the foot (Fig. 3.) Its merits seem to be due to its shape, presenting a wide bearing surface to the sole and wall of the hoof. It is, in fact and theory, a continuation of the foot in iron. The raised

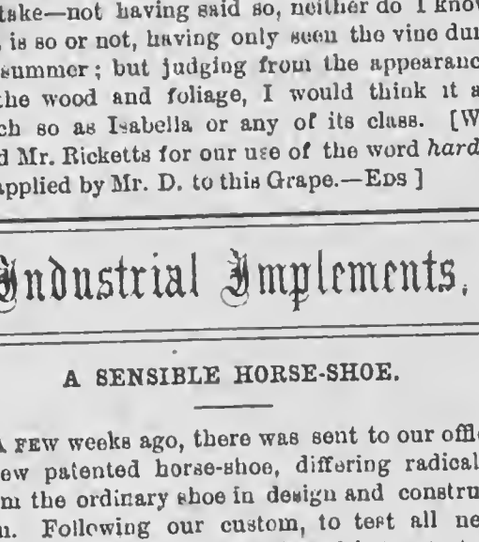

Fig. 3.

rim, or "clip," holds the horny crust of the hoof in position. The wide bearing surface supports, not only the wall but the sole of the hoof also, enabling the horse to stand firmly and naturally, with an evenly distributed pressure on all parts of the foot. But the conspicuous merit of the shoe lies in the fact that it follows the formation of the foot at the heel, where, as

will be seen, the "bars" have a natural, easy rest, obviating all compression of the hoof—an evil that is frequently produced by the ordinary shoes.

(Fig. 3) represents the foot closely fitted with the shoe, which is rendered transparent, showing what parts of the foot are supported and protected: *a, a, a*, the crust or wall of the hoof—perfectly represented by the continuous calk of the shoe, which, with its continuations, the bars, at the heels, sustains the whole weight of the horse: *b. b*, the bars supported and protected by the shoes: *c, c*, the heels, *perfectly* supported by the shoe: *d, d*, the situation of corns protected from injury: *e, e, e*, the sole, *f*, the frog. Instead of three prongs or "calks" for the horse to stand on, as if he were walking on stilts, the bottom of the shoe presents a continuous calk about a half inch in depth, which is worn off evenly, and always affords a square, solid foundation for the horse's weight, just as would be afforded by his hoof if he were unshod. Altogether, we are satisfied that this is a sensible, practical shoe that will correct some of the evils done by former faulty shoeing, and give nature an opportunity to keep the hoof in sound condition. These shoes are made by the JOHN D. BILLINGS' Patent Horse-Shoe Co., 265 Broadway, New York.

NICHOLS, SHEPHERD & Co., of Battle Creek, Michigan, have just erected a large addition to their already large factory. The new machine shop is 120x70 feet, built of brick, with power supplied by a new C. H. BROWN & Co., 50 horse-power engine. This shop is for the manufacture of portable steam-thrashing engines. The firm made and sold one hundred and twenty-three engines this season; and with increased facilities propose to turn out over three hundred next year.

Miscellaneous.

NOTES FROM NEBRASKA.

EX-GOV. R. W. FURNAS.

As the active agricultural and horticultural operations of the season are about closed, and a moment's leisure presents itself, I have an opportunity of letting readers of the RURAL know what we have been doing in this State.

THE SEASON has been remarkable for its advantageous characteristics in almost all respects. Plant growth has been all that could be desired, and as a natural result, products correspond. Our general farm products are unprecedented, even with us.

CORN, the great staple, is simply enormous. The great question is: "What shall we do with it?" We are in better condition to utilize this crop than ever before. Farmers have "catched up" as the saying goes, and have, or are able to purchase cattle and hogs to feed, and thus the crop can be condensed before transporting it. We raise anything we want, and as much of it as we want, out here. But the cost of transporting it in the raw, crude state, eats up the price of it before we can get it to you consumers in the East. But we are learning to put the corn product into beef and pork, and hand it to you in that shape.

OUR FRUIT CROP.

too, has been splendid this season, taken as an average.

APPLES, in quality and size this year, were very fine, but this is an "off year," and the crop is not as large as heretofore. Four Fallawater, or Tulpehocken, apples were on exhibition at our late State Fair, that weighed six and three-quarter pounds. The leading varieties of apples considered reliable with us, are Red June, Red Astrachan, Early Harvest, Maiden's Blush, Cooper's Early White, Rambo, Swaar, Rawle's, Genet, Winesap, Ben Davis, Jonathan, Domine, Fameuse, Willow Twig, Little Red Romanite, Baldwin, Ribston Pippin, Haas, Hubbardston's Nonsuch, Early Pennock, and Lowell. These have all been fruited with us successfully, for from eighteen to twenty years past, and thus established themselves as reliable. Very many other varieties are doing well as far as tried, and will doubtless in the end, prove valuable additions to our fruit list.

GRAPES of almost all the hardy varieties do well in this State. The Concord, Horace Greeley said, was "the grape for the million" you will remember: it is the leading variety with us.

PLUMS occasionally give us a good crop. The Curculio is the great plum obstacle. Wherever "eternal vigilance" has been practiced we have plums, however.

PEACHES were never better. The Agricultural Bureau Statistics, Washington, report us 121 in Peaches the highest of all the States in the Union, this year. We grow successfully the leading old and reliable varieties, such as Troth's, Hale's and Crawford's Early, Stump the World, Jacques' Rareripe, Crawford's Late, Newington, Heath Cling, Morris's White, Honest John, Old Mixon, George the Fourth and many others. The southeastern portion of Nebraska is particularly noted for its fine peach crop. Our native, or seedling peaches, particularly attracted the attention of non-resident fruit growers and pomologists at the

ANNUAL STATE HORTICULTURAL EXHIBIT.

held with the State Fair, at Lincoln during the last days of September. A very large attendance of prominent fruit men from the older States was present. Such men as Dr. Jno. A. Warder, Ohio, and Dr. Allen Furnas, Indiana, pronounced the exhibition the finest they ever saw. There were on exhibition over two thousand plates of apples three hundred of peaches, and one hundred of grapes and plums. These fruits were principally from the older counties in the State, bordering on the Missouri River. Richardson, Nemaha, Otoe, Cass, Douglas and Washington. There were some very excellent specimens, however, from the interior counties of Pawnee, Johnson, Saline, Lancaster and Buffalo. The latter county is in the heart of what has always been denominated the "Great American Desert" near Ft. Kearny, in the Platte Valley.

Nehama Co., Neb. Oct 29.

GERANIUM SANGUINEUM.—(See page 710.)

AQUILEGIA CRYSANTHA.—(See page 710.)

BOOKS RECEIVED.

PALLISER'S MODEL HOMES showing a variety of designs for model dwellings, also plans of a farm-barn and hennery combined, a stable and carriage house, a school house, masonic association building, bank and library, Town Hall and three churches, together with a large amount of miscellaneous matter. By Palliser, Palliser & Co., Architects, Bridgeport, Conn.

This is a very handsome volume of 83 pages octavo, elegantly bound in embossed dark-green cloth, costing only a dollar, and containing 27 illustrations of buildings erected by the firm in different parts of the country. Each illustration includes a front or side elevation, and a plan of the ground-floor together with a plan of the second floor whenever a full explanation of the structure of the house requires it. Each design is accompanied by a detailed information with regard to the construction and cost of the building; while a great deal of general information of value to all who contemplate building, is contained in three introductory chapters treating of Hints On Building and the Employment and Responsibility of Architects. The plans are all of a thoroughly practical nature, the instructions sound and economical, the designs handsome, convenient and wholly comfortable. In all cases they seem well adapted to the wants of those for whom they are intended, ranging from the neat cottage costing $500 to the elegant dwelling costing $4000 and upwards. The work is full of suggestiveness not only to all who are ambitious of owning tasteful, convenient homes, but also to the working builder who can derive many a useful hint from the skill and experience embodied in the plans and information here given. Of the various works on architecture which have come under our notice we do not know one which we can more heartily recommend to our readers.

SIXTEENTH ANNUAL REPORT of the Secretary of the Board of Agriculture of the State of Michigan for the year ending Sept. 30, 1877. This bulky volume of 732 pages is devoted to a statement of accounts of the Agricultural College, Reports of its various Professors on their respective departments, accounts of half a dozen Farmers' Institutes held in different towns in the State together with verbatim reports of the lectures delivered thereat, occupying altogether upwards of 300 pages. Then in succession come a collection of miscellaneous essays, a report of the State Board of Agriculture covering upwards of 200 pages, various reports from County Societies and finally a register of meteorological observations for 1877.

It is impossible for any one to look through such works without being impressed with the vast amount of worthless information they contain. This usually so far overlies what there is of value in them that one in search of the latter is very apt to overlook it and consign the work to its usual place—the waste paper heap or some unvisited shelf in the library. In case of the work before us, however, such a fate would be unjust to its merits, and a loss to the seeker for useful knowledge. It is not that it lacks an uninteresting mass of worthless information which no sane mortal will ever wade through; but the valuable instruction contained in it will amply repay careful perusal and study. This is comprised almost exclusively in the lectures delivered at the Farmers' Institutes, and to some parts of these we shall refer in future numbers of the RURAL. ROBERT G. BAIRD of Lansing, is the Secretary.

CATALOGUES, &c., RECEIVED.

L. L. POLK, Commissioner of Agriculture, Raleigh, N. C. Second Quarterly Report for year 1878.

DESCRIPTIVE CATALOGUE OF FRUIT TREES, HARDY GRAPE VINES, SMALL FRUITS, &c. Samuel Hape & Co., Hapewell, Ga.

VICK'S ILLUSTRATED MONTHLY.—We should write it "Vick's *Excellent* Illustrated Monthly." It is full of original and instructive matter, as usual. Rochester, N. Y.

CATALOGUE of the Ninth Annual Texas State Fair, to be held in the City of Houston, Tuesday, November 19, and continuing five days. James F. Dumble, Sec'y.

PRICE LIST and description of pure-bred Cotswold sheep and pure-bred Essex pigs raised and for sale by Joseph Harris "Moreton Farm," Rochester, N. Y.

BEECH GROVE FARM Catalogue of thoroughbred Jersey cattle, Berkshire swine and fancy poultry. Beech Grove Farm, the property of Messrs. CHURCHMAN and JACKSON is described and pedigree are given at length.

ADDRESS by Hon. Thomas F. Bayard of Delaware, at Pimlico Fair Grounds, near Baltimore, Md., before the Md. Ag. Assn., upon "The true Relation of Agriculture to Politics." Published by the Delaware Tribune, Wilmington, Del.

A. HANCE & SON, Red Bank, N. J. Catalogue of hardy fruit trees and small fruits, for market or garden; for pleasure or profit. The Rickett's El Dorado Grape. Also No. 1. AUTUMN OF 1878. CATALOGUE OF Hardy Fruit Trees and Small Fruits Free. A trustworthy establishment. Also Trade Price-list of Trees, Plants and Bulbs. Also, Trade Price-list of Fruit Trees and Small Fruits.

CATALOGUE OF SPRING BULBS AND HARDY HERBACEOUS PLANTS. J. M. Thorburn & Co., 15 John St., N. Y. Also Annual Descriptive Catalogue of Bulbs and other Flowering Roots, with directions for their management and culture. These catalogues are free to applicants.

H. & D. W. WATROUS, of this city have just sold the following A. J. C. C. Herd registered Jersey cattle, and they will be shipped on Tuesday, November 5th, to General J. W. BURKE of Jacksonville, Ala.: Maid of Amboy, Minnie of Orange, Delpha Weston, Rhoda of Merion, Carlatina, Olive Branch of Hillcrest, Io of Hillcrest, Lady Mildred of Hillcrest, Lady Alice of Hillcrest, Susette of Hillcrest, Salvadora of Hillcrest, Candace, Athalia Alabama, Maid of Perth, and bull Montgomery!

Everywhere.

TRADE AND AGRICULTURE IN ENGLAND.

PROFESSOR I. P. SHELDON,
OF THE ROYAL AGRICULTURAL COLLEGE, CIRENCESTER, ENGLAND.

For some time past things in general have been growing worse, gradually but not slowly worse, in these islands. The Franco-German war gave an extraordinary stimulus to trade, and through trade to agriculture, in Britain, and the country, for the time being, was almost gated with prosperity. But that prosperity was essentially fleeting and abnormal in character. Born of war and bloodshed, of tumult and anarchy; springing out of those convulsions which, wherever they occur, shake the foundations of society; coming to us because it was driven for the time away from other countries, this sudden and extra prosperity was fugitive and ephemeral. Commerce and manufactures were at a standstill, or next to a standstill in some of the finest and most industrious parts of Europe eight years ago, and they naturally gravitated to other parts where they could be carried on in peace. So the bulk of them came to England which, always excepting America, is the finest country on earth for refugees to flee to! But the war came to an end, as all wars must when men's evil passions have calmed down and their lust for blood is satiated; trade began at once to return to the places from which it had been exiled, and we in this country began to feel the effects of the inevitable reaction.

It is a law in mechanics that if you swing a pendulum violently in one direction it will, of its own accord, swing nearly as far in the opposite one, and that it will be some time before it again becomes settled. So it is with trade. Eight years ago we were very busy and very prosperous; our coal and iron industries had never before been so brisk; our ships were all profitably employed, and our insular trade and manufactures were in a state of the highest prosperity. As a matter of course, agriculture shared in the general welfare. Many of our people became in a sense intoxicated with success, and they thought their good fortune would continue forever—or at least they seemed to think so. These infatuated ones were found principally among the working classes, and there were strange scenes of wild extravagance amongst them. They were earning very high wages, and they squandered their earnings in reckless prodigality. Habits like these once acquired, are difficult to relinquish. But the time soon came when employers could no longer afford to pay such high wages, but sooner than submit to the reduction which was inevitable, the working classes struck work. Thus it was that our prosperity vanished like a dream—war drove it into our hands, our own folly drove it away again.

Thus it follows that we are suffering from long-sustained depression of trade, and agriculture is in a far from satisfactory state. The purchasing ability of our bread-winners is very much reduced, and they are learning habits of frugality—compulsory frugality. Our colliers no longer drink champagne themselves, or give legs of mutton to their dogs. They have to make one dollar go as far now as they made two or three go only a very few years ago. This, of course, is wholesome discipline, but it is diminishing the profits of our farmers. Bread, beef, mutton, cheese, butter—all are much lower in price than they were two years ago, nor are there any signs that the markets will improve very soon. Some people say they can detect symptoms of a revival in trade in some of its branches, but these speak their hopes rather than their convictions.

It is true, the country is wealthier now than it was ten years ago, but the wealth is less scattered than it was two years ago. When bad times come, money immediately begins to collect into the hands of a few people, just as ships hasten into port when stormy weather comes on at sea. The masses of our people are never frugal except when they are compelled to be, and they lay up no store against a rainy day. They are like the Esquimaux Indians, who grow fat in summer and in winter starve. Extravagance and its sister, improvidence—ugly twins, these—are the evil *genii* of the mass of our people, and the wise have to support the foolish when poverty comes.

Then, to make matters worse, we have a bellicose government in power who are taking the right way to increase the taxation of the country and to add to the national burdens. You are wisely paying off your national debt—we are augmenting ours. Lord BEACONSFIELD is squandering Mr. GLADSTONE'S savings, and with exquisite fatuity our people have hitherto encouraged him in it. The tide of popular favor is beginning to turn at last; we are now called on to pay for our swagger, our "spirited foreign policy," as it was vaingloriously termed. We are practically at war with Afghanistan, and it is quite possible we shall be at war with Russia before long, for our Government has done all it could to stir up ill blood between ourselves and the Russians; we should have been fighting them now but for Mr. GLADSTONE'S influence in favor of peace.

Meanwhile, the only thing that seems to be flourishing in this country at the present time, so far as agriculture is concerned, is the breeding of pedigree Shorthorns. The Duke of Devonshire sold off a portion of his surplus stock the other day, when thirty animals fetched close on £20,000! But it is only the longest pedigrees, the choicest strains of blood, and the most fashionable tribes that will fetch these high figures, and this because they are comparatively limited in numbers, and are all in the hands of wealthy men. Shorthorns of moderate purity of blood and limited pedigrees, but withal, sound and superior animals, can now be bought for moderate prices, within the reach of rent-paying farmers; they are, indeed, much lower than they were a short time ago; but this is owing not to depression in the agricultural world, but to the welcome and encouraging fact that the country is now full of well-bred stock; and the same remarks apply to sheep. Pigs we don't value so highly as you do in America.

The crops in England this year are, generally speaking, above an average—the hay crops especially. Wheat is about two shillings a bushel lower than it was a year ago—it is now worth about 5s. 3d. per bushel, or 42s. per quarter. Beef is lower; 4½ to 9d. per lb; mutton 5d. to 9d., prime; Southdown, 10½d. Cheese, inferior, 40s. to 50s.; middling, 50s. to 60s.; good, 60s. to 70s.; prime, 70s. to 80s. per cwt., and within these limits there are all kinds of qualities and prices. On the whole, cheese may be said to be 5s. to 10s. lower than it was a year ago.

NOTES FROM KENTUCKY.

WHEAT is growing finely. A few are yet sowing, but a large majority here, in Hunter's Bottom, finished during last month. We have taken more pains in preparing the ground than ever before. Many of us have planted on long fallows and, although the ground broke up cloddy, we are amply repaid for the extra rolling, harrowing, &c., by the thrift and evenness of the plants. We never before saw wheat look so beautiful at this time of the year. It seems as though each tried to have even the drills straighter than his neighbors', and so confident of victory are we that each has run his drill perpendicular to the road. It is gratifying to see such emulation, as it gives us a better prospect for an abundant harvest in 1879, than ever before.

POTATOES.—We are now, Oct. 20, in the hight of potato digging. We will not average more than forty barrels per acre, owing to the early and protracted drought and the rot; for these we find ready sale at our landing at forty cents per bushel. I dug 58 barrels on half an acre—variety, Scotch Nobles; soil, a dark alluvial, heavily manured in 1876 for celery in '77. I do not think the rot any worse on this plot than in my clover sod. My next neighbor has dug about 20 acres, and he has averaged 40 barrels of salable, 14 barrels of rotten and about five barrels of small potatoes per acre. No estimate is made of the tubers that were entirely destroyed; only those that were partly sound were picked up. These figures, I think, will closely approximate the average of this section.

APPLES have fallen badly and have rotted on the trees more extensively than for many years. They are worth from 40 to 60 cents per bushel.

STOCK.—Our cattle will go into winter quarters in better condition than for many years. Price 2½ to 3¼ per lb. on foot. Hogs are fattening finely. No cholera or other disease as yet. H.

RURAL SPECIAL REPORTS.

BERLIN, Hartford Co., Conn., Oct. 23, 1878.

EVERYTHING was in advance of ordinary seasons, nearly two weeks earlier. The hay crop was abundant, rye and oats good. Corn promised very well, but a dry spell came on about the time of its setting, and the ears are not filled out as well as expected, though there is some good corn. The "potato bugs" came on in force, and they, with the white grub, made the potato crop rather small. The grubs did not confine their attention to potatoes, but took strawberries, raspberries, and especially grass roots, killing, in the aggregate, many acres of grass. In some fields where they took the potatoes, the moles went through nearly every hill and took the grubs. It is a question whether the mole is not of greater benefit than harm to farmers. There is no doubt about its doing much apparent harm to meadow lands, but as it works for grubs, it very likely saves more than it destroys.

Pears were not very abundant, but the apple crop was too large for use. Besides this, the apples, ripening so much earlier than usual, promise to decay much earlier still. They are rotting very badly, and it is a question whether apples will not be scarce by mid-winter. They have been very low thus far, in some cases hardly paying for the trouble of picking and getting them to market. The grape crop was small, owing largely to the ravages of the "rose bugs." They took blossoms and leaves, too, especially on the Clinton. I have seen no rot or mildew worth naming, though the Dianas rotted most. IPSE.

HENRY CO., Ohio, Oct. 21.

WHEAT is a good crop—averaging 25 bushels to the acre. A larger amount has been sown this fall than ever before. It is looking finely now. The favorite varieties are Clawson and Blue-stem, which appear to do better here than any others. Potatoes are only half a crop. Apples are abundant, but the blight has injured pear trees so that pears are small and poor. Corn is a better crop than it has been for several years, being far better than was expected during the growing season. Rust has injured the fodder somewhat. Altogether the farmers are prosperous.

There is a cry here, as elsewhere, from a certain class, that they can't get work; but where work is to be done, it is difficult to secure hands at reasonable wages. In many cases laborers demand the same wages as before the general fall in prices. Crops often receive injury from the difficulty of securing laborers. One of my neighbors was obliged to do part of his harvesting with only himself and a single hired man to follow the reaper. Yet plenty of laborers (?) complain that they can't get work! V. J. EMERY.

AMHERST, Mass., Oct. 31, 1878.

OUR fall has been very dry and warm until the last two weeks during which we have had copious rains. No hard frost until the 26th. Apples are a glut in the market at 75cts, to $1. per barrel, and cider the same at $1.00 to 1.50. The crop of apples is the heaviest ever known in this valley, the trees fairly breaking down in many instances with their loads of fruit, which is of very fine quality, though not generally of large size. Potatoes are one-third or one-half a crop and are worth 75cts. to $1.00 per bush.; they are mostly of poor quality and were badly eaten by the white grubs of the May beetles which have increased rapidly within a few years and bid fair to become one of the worst pests the farmer has to contend with. Grapes were a failure, being 'nipped in the bud' by the late spring frosts. Corn a good crop. Tobacco a good crop and curing up finely and the growers are expecting good prices. L. W. G.

COVENTRY, Chenango Co., N. Y., Oct. 28th.

SPRING opened warm and dry. Potatoes, as a general thing, were planted in April, also some corn. May averaged dry; June cold and wet; July hot and dry up to about the 20th; after that light showers. Fall warm and dry up to about the 14th of October, when we had a cold rain with snow. Fall feed good; hay crop, unprecedentedly large; corn, good excepting on very wet pieces; oats a rather light crop, but quality good; buckwheat a good yield in this immediate vicinity. Potatoes were almost a total failure. Wheat, of which there is considerable raised hereabouts for a dairy region, was extra good, yielding about thirty bushels on an average. Spring wheat was hardly worth cutting. Corn is worth 50c.; buckwheat, 40c; rye, 75c.; wheat, $1.10@$1.25; oats, 30c.; butter, 18@22c.; pork, 5½c.; dressed beef, about the same by the side. J. H. M.

ST. CLAIR CO., Ills., Oct. 27.

THE wheat crop was very poor, averaging in this section about ten bushels to the acre. Nearly every one was disappointed, as the prospects before harvest were good for a heavy crop. The weevil damaged the wheat a great deal after it was stacked, and now quite a number of farmers are hauling it to market for fear it will be eaten up by this pest in the granaries. Corn and potatoes are not very good, the long, hot, dry summer having cut both crops short. There was considerably more wheat sown this year than last, but it was all a little late, as farmers were afraid to sow as early as usual on account of danger from the Hessian Fly; but considering the time when it was sown, it looks very well.

Land in this vicinity is considered worth from $20 to $60 per acre—$20 for unimproved timber land, and $60 for improved farms. N. J. SHEPHERD.

CORNING, Steuben Co., N. Y., Oct. 25, 1878.

GLORIOUS weather we are having for fall work, and most farmers are improving it. A large acreage is sown to wheat, but seeded very late, too late, I think. I have seen no appearance of the Fly on my own yet; dry weather has given it a small top, otherwise it is doing finely. I always cultivate my ground for wheat until it is as mellow as possible, Mr. Fowler to the contrary, notwithstanding. I am preparing to set a half acre of raspberries—a part this fall and a part in the spring. J. L.

HUGO, Ill., Oct. 24, 1878.

WE had considerable frost and some snow here from the 18th to 20th, and some ice formed. Oats, 12½c.; corn, 20c.; wheat, 75c.; hay, $8 per ton; labor, very low. Fine times generally. A larger area than usual has been planted to wheat. Apples are a light crop. Some orchardist who would come here and put out Ben. Davis, Rawle's, Genet or Gennetting, and work for annual crops, would do well. A. O. W.

ATTICA, N. Y., Oct. 30, 1878.

FIRST snow to whiten the ground fell here last Monday morning, Oct. 28th. The weather, however, is warmer since this snowfall. We had rain on Tuesday night and it is sprinkling to-day. Grape vines are green yet, with tips quite fresh. This is the latest fall weather we have had yet. Pasture is still fresh and good. S. F.

JACKSON, Mich., Oct. 27th, 1878.

IT has been snowing here all to-day and yesterday. The surrounding country is already buried beneath a spotless, white pall, and even the streets are covered with it, only that here and there, the mud shows its murky color through a rent in the texture. K.

CAMBRIDGE, Mass., Oct. 30, 1878.

A SHARP frost yesterday morning. Cannas, Morning-glories and other tender plants were spoiled. It rained all day to-day. The fall throughout has been unusually extended—mild and dry. F.

YORK, Neb., Oct. 28th, 1878.

VERY dry weather hereabouts. Grain turning out finely. Wheat worth 40 to 50c.; oats, 16 to 18c.; corn, 15c.; potatoes, 25c.; apples, $1 per bushel; hogs, $2 to $2.50 per 100 lbs.; wages, $1 per day. J. B. R.

DALLAS, Texas, Oct. 20, 1878.

WE had such a wet harvest that a deal of our wheat was spoiled; it is worth 50c. to 85c. a bushel, according to quality. Cotton, 8 to 9 cents. W. T.

The Querist.

ANSWERS TO CORRESPONDENTS.

Destroying Insects on Canary Birds.

W. H. W., Welland, Ont., Canada, asks for some way of destroying insects on canary birds.

ANS.—Powders warranted to kill parasitic insects are sold by all bird dealers. Quite a number of remedies are recommended, such as sprinkling a pinch of Scotch snuff under the wings, etc. One strongly recommended, from his own experience, by Rev. F. Smith, in his work on the Canary, is the following: Dissolve a couple of cents' worth of white precipitate powder in half a teacupful of warm water; dip the bird bodily into the solution, taking special care that none of the poisonous stuff gets into its beak or eyes; then dip it in a basin of warm water; then wrap it in a piece of flannel, lay it before the fire until partially dry; then put it in the cage, which should be kept before the fire until the bird is thoroughly comfortable. As preventives, a free use of the water and dust baths, thoroughly cleaning the nests and sifting the food well cannot be too strongly recommended.

Treatment of Smilax.

Mrs. E. N. C. is in trouble about her Smilax. About two weeks ago, unlike some other men, her husband managed to remember her order to bring the plant from the greenhouse. Since then, the young thing has been turning yellow and drooping, as if afflicted with the yellow fever or with regret at parting from its comrades. Like many other men, her husband forgot to ask all about how his new purchase should be treated, and accordingly she sends to the RURAL for information on this point.

ANS.—Take up the bulbs (it belongs to the Lily family) See that the drainage is perfect. Make the soil loose. Replant. After a rest, they will grow finely.

Miscellaneous.

W. H. W., Westborough, Mass., says that among some plants he received from the RURAL Grounds last fall was one whose name he could not make out. It has made only a small growth this season and seems to be a kind of vine or runner. He asks its habit, right name and use.

ANS.—It is Vitis heterophylla. For a condensed account of it, see RURAL columns this week under heading, Free Seed Distribution.

W. F. Mitchell, Perth Co., Canada, asks how to propogate White Thorn for hedges, by cuttings.

ANS.—If everything is favorable, it may grow out-of-doors from cuttings a foot long. It can also be grown by layers. A safe way is to grow it from cuttings of two or three eyes under glass.

We must again ask the indulgence of those whose questions are not yet answered.

THE RURAL NEW-YORKER

from now until Jan. 1st, 1880, for $2.

A Four Dollar Weekly Journal for Two Dollars.

TO ALL OF OUR SUBSCRIBERS WHO APPLY, A **FREE** SEED DISTRIBUTION EQUAL IN VALUE TO THE YEARLY SUBSCRIPTION PRICE.

ONLY SEEDS OF RARE OR **NEW** VARIETIES FOR THE FARM AND GARDEN OFFERED.

Experimental Grounds of 82 Acres.

A New Era in Horticultural and Farm Journalism.

A COUNTRY HOME PAPER FOR EVERY SECTION.

ORIGINAL ENGRAVINGS---THE BEST WRITERS OF THE LAND.

A JOURNAL THAT IS HONESTLY DEVOTED TO THE WELFARE OF ITS READERS.

No progressive Farmer, Fruit-Grower or Gardener can afford to do without the RURAL for 1879.

THE following are among a few of the recent notices of the press of the United States.

THE RURAL NEW-YORKER has been enlarged and improved, if that be possible. It stands at the head of the strictly agricultural and horticultural periodicals of the country.—*Philadelphia Germantown Telegraph.*

THE RURAL NEW-YORKER, so long and favorably known, seems determined to give its readers the benefit of whatever increased prosperity it secures. It has now, the best list of contributors of any weekly agricultural paper in the country, and is doing a noble work—*Boston Scientific Farmer.*

The editors of the RURAL NEW-YORKER now use a portion of their farm for experimental purposes in raising seeds for their subscribers. Their farm, which by the way is one of the best on the Island, is admirably adapted for such experiments. The RURAL is one of the best of agricultural papers.—*S. S. Observer, Long Island.*

THE RURAL NEW-YORKER.—We are glad to note by an increase of size in the RURAL NEW-YORKER, substantial signs of prosperity. The Agricultural Press of the country has severely suffered by the general depression of the last few years, and it is pleasant to note this first step in prosperity, especially as the Rural New-Yorker deserves all the success it seems to gain.—*Gardener's Monthly.*

THE trouble is that if you take it one year you will like it so well that you will take it every year.—*North Missourian.*

WE regard the Rural New-Yorker as the champion weekly paper of America, for the farm and family circle. While it is especially intended for Rural Homes, there is no fireside that will not be greatly benefited by the Rural New-Yorker's weekly visits. It gives you more for your money than any agricultural publication of which we have knowledge.—*Democrat, Coshocton, Ohio.*

WE are glad to receive assurances from headquarters that this excellent paper was never in such a promising condition as it is now, either financially or editorially, since its removal from Rochester. "It does not owe a dollar, and has half a million at its back." Good enough! but not better than it deserves.—*Buffalo Weekly Express.*

OF our agricultural exchanges none presents such a clear, crisp appearance, typographically, as the RURAL NEW-YORKER. Speaking of its contents, we are led to use the most emphatic language. It is edited with a precision unusual in agricultural journals, and a glance over its interesting "Questions and Answers" columns discloses with what painstaking it responds to requests for practical information. It is more comprehensive than papers of its class, also, embracing a literary department that is again subdivided into minor departments, which furnish excellent short and continued stories, fashions and cutpaper patterns for the ladies. Religious intelligence, the news of the week, and a cozy nook for the young people.

Its practical departments embrace articles by the foremost writers on agriculture, horticulture and kindred sciences, accompanied by illustrations that increase the interest of the text. In short, the Rural is just such a paper as our people should subscribe to. It is broad and national in its treatment of topics, and more than any other journal, serves the farming and fruit growing interests of the whole country.—*Dispatch, Live Oak, Florida.*

THE RURAL NEW-YORKER.—This old and well-established weekly is one of our best agricultural and horticultural exchanges.—*Phrenological Journal.*

THE RURAL NEW-YORKER.—One of the oldest, most reliable, and most welcome of farm and household journals published in America has been enlarged and otherwise improved. Its name has become a household word throughout the land, and we have yet to learn where the Rural is not welcomed by the family to whom it is sent.—*Journal, Flint, Mich.*

THE RURAL NEW-YORKER is the best and most prominent agricultural and home journal in the country.—*Democrat, Davenport, Iowa.*

On receiving The Rural New-Yorker, we scarcely recognized it, so greatly has it been changed, for the better.—*Observer, Bowmanville, Ont.*

THE RURAL NEW-YORKER has been enlarged to the size of Harper's Weekly, and otherwise greatly improved. It is one of the oldest and best agricultural weeklies in the country. Terms, $2.00 a year.—*Record, Yorkville, Ills.*

THE RURAL NEW-YORKER, one of the best family and agricultural papers in the land, has recently been enlarged, and its publishers claim that it has also been improved; but we can't see it, for the reason, we suppose, that our vision is clouded with the long and fixed notion that there was no chance for bettering it.—*Home and Farm, Louisville (Ky.)*

THE RURAL NEW-YORKER, once published at Rochester, but latterly at New York, has been the most widely circulated of the agricultural papers.—*Times, Hartford, Ct.*

RURAL NEW-YORKER.—That old reliable agricultural journal, The Rural New-Yorker, renews its youth every year, and steadily improves with age.—*Western Homestead, Kansas.*

THE RURAL NEW-YORKER has no peer as a family and farm paper.—*Commercial, Mitchell, Ind.*

THE RURAL NEW-YORKER has been enlarged and improved, and is now the best agricultural paper issued in the U. S. We cordially recommend it to our farmers.—*Times, Port Hope, Ont.*

THE RURAL NEW-YORKER, so long and favorably known as a guide and representative of the agricultural interests of the country, has been much improved in its typographical "get up." It would be hard to improve it otherwise. The Rural New-Yorker is a mine of information for farmers, wherever located, and amply repays perusal.—*Am. Mail and Express Journal.*

THE RURAL NEW-YORKER, published at 78 Duane street, New York, is now the best agricultural weekly we have any knowledge of.—*Spectator, Ohio.*

THE RURAL NEW-YORKER.—This popular agricultural journal has recently been enlarged and typographically improved, all of which will commend it still more, if such a thing were possible, to its vast army of readers in all the walks of life. The Rural New-Yorker is the most popular agricultural paper published, and we commend it as the best to all wanting a paper devoted to that department.—*Insurance Herald.*

THE RURAL NEW-YORKER has made another enlargement, which makes the Rural the largest agricultural weekly published in this country.—*Western Agriculturist.*

1878 Holiday Greeting! 1879

BEATTY

$1000 PIANO FOR $255

BEATTY PIANO Superb Extra Grand Square Style No. 2023. Magnificent Rosewood Case, new and valuable improvements, elegantly finished. Three Strings. Weight, when boxed, over 1,000 lbs. Seven one-third (7 1-3) octave, full agraffe scale, rosewood case, all round corners, beautiful curved legs and lyre, heavy serpentine and top mouldings all around the case, back finished same as front. All improvements with Beatty's very latest full iron frames, bars and extra braces, improved new scale, overstrung bass. French grand action, fret desk, carved pedal, solid rosewood mouldings, ivory key fronts, capped hammers, agraffe treble and every improvement which can in any way tend to the perfection of the instrument has been added. This instrument is a magnificent Pianoforte. Regular Retail Price asked by the Monopolists about.....$1000

I will sell this instrument direct during the HOLIDAYS, for only **$255**

No such offers as these were ever made before, but knowing that their introduction will repay me on future sales, I offer them to readers of this paper at these prices during the Holidays. **Order direct from this advertisement, which will not appear again,** and no further reductions can be made. Having met with unparalleled success within the past year and extended my sales over the world by an extended tour through the Continent of Europe, I have returned determined that no town or village in my native country shall be unrepresented by my instruments, and all energies, aided with ample capital, will be exerted to accomplish this object, hence the above offers, that can not be made by any other responsible house in America or the World. Don't miss these very valuable offers. **Order now.**

A fine two set of reed $300 Organ, new and as good as the best of this capacity, for only $65. Splendid $210 to $175 Organs, $95, $105 and $150. Sub-Bass and Octave Coupler, $350 to $400; Organs, $110 and $120. Elegant pipe top Organs. More and better styles of case and sweeter toned instruments than can be bought of any other house. Pianos new and perfect, rosewood outside and in, usual price $650, for only $150. Grand, Square and Upright Pianos from $125 to $275, usually sold at from $700 to $1,000. All instruments shipped on 5 to 15 day's test trial. Money refunded and freight paid both ways if unsatisfactory to the buyer. Warranted six years. More unsolicited testimonials now on file than any manufacturer in the world. **In ordering, state where you saw this advertisement.** Large Newspaper, containing much information in regard to cost of Pianos and Organs, free. Beware of irresponsible imitators. If you do not want one yourself, order one and make your friend a handsome Christmas or New Year's Present. Address, **DANIEL F. BEATTY, Washington, New Jersey, U. S. A.**

$375 Organ for $97

BEATTY ORGAN Style No. 2100. Magnificent Celtic Architecture. Height 7½ in.; depth, 26 in., length, 43 in. Three Sets of Reeds. Thirteen (13) stops. (1) Æolian; (2) Vox Celeste; (3) Echo; (4) Dulciana; (5) Violina; (6) Vox Humana; (7) Principal; (8) Hautboy; (9) Diapason; (10) Dulcet; (11) Grand Organ; (12) Principal Forte; (13) Flute. THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY NOV. 9, 1878.

Inasmuch as the income of THE RURAL NEW-YORKER, *during the present year, has considerably exceeded its expenditures — consistently with our statement often repeated, that our first aim is to benefit our subscribers—we shall furnish the* RURAL NEW-YORKER *from now until the first of January*, 1880, (fourteen months), *for Two dollars, and after the first of January at Two dollars per year, or* $1.10 *for six months.*

WE are glad to call attention to our paper from Professor SHELDON, upon Trade and Agriculture in England. Our readers may hope to hear from him again.

OUR Free Seed Distribution will remain open to all subscribers who may apply for them, until further notice.

OUR new Premium Lists, specimen copies and agents' outfits will now be forwarded free to all who apply.

THE RURAL NEW YORKER *is invariably discontinued at the end of the subscription term.*

THE TRUTH ABOUT IT.

WE presume to say, and we do so presume because we *know* it to be the truth, that our one object in conducting the RURAL NEW-YORKER is to benefit those who either from motives of pleasure, instruction, or as a means of livelihood, strive to know more of the soil—more of plant life—more of the relations of one to the other, and how to render them more serviceable to mankind. Our pleasure lies in these endeavors; our reward depends on their success.

We have had a very successful year, if the hearty approval of our readers and of the more liberal-minded part of the press of the country, as well as a considerable surplus of money beyond our business requirements, can be so construed. We propose to use this surplus in a way that shall be consistent with our professions, viz., first, in a free seed distribution among our subscribers, that, to all who are placed so as adequately to prize really choice seeds, shall equal in money-value the yearly subscription price of the RURAL NEW-YORKER;—second, by making the subscription price $2.00 TO ALL now and hereafter, whether singly or in clubs. Those who desire to get up clubs will be entitled, according to the size of their clubs, to the articles mentioned and fully described in our annual premium list, now nearly ready, or, if they prefer it, to a cash commission;—and, third, by improving the RURAL as much during 1879 as it has been improved during 1878—it is twaddle to assume that it cannot be improved.

We scarcely need request our friends to aid us in extending our circulation. If the RURAL NEW-YORKER is worthy of support; if our friends, from past experience, can confide in our ability and resolution to do what we declare we are earnestly striving to do; if they themselves desire to promote the interests of the rural home and the happiness of its inmates, they will, acting under the inspiration of their own impulses —— SPREAD THE NEWS!

FEEDING COWS IN FALL.

DAIRYING was formerly carried on generally in a very careless, slipshod way. A cow was a cow, and was supposed to give milk from some inherent power, regardless of the manner of keeping. Now, thanks to dairymen's associations and the more careful discussions in agricultural journals, dairymen are studying their speciality with much more care and attention to all its particulars. Few now believe that they can draw milk from the udder unless it first goes in at the month. They do not expect the cow to produce something from nothing, and they are inquiring anxiously about the best foods to produce milk, and the best methods of feeding. They study, not only the valuable characteristics of the different breeds, but the methods of perpetuating them.

This refers to the advanced dairymen; the great mass will have much to learn before they reach this point. Too many are careless about the feeding of their cows in fall. They think the season is past and that almost any thing will do them now. Having got through with the factory season, they pay little attention to the further yield of milk, drying off their cows without any thought of its effect upon the next season's yield. They do not sufficiently study the cow as a milk producer, and see that secreting milk is made a matter of habit; that if a cow is well fed and the flow of milk long kept up, this habit will continue year after year until she becomes almost a perpetual milking machine. Many dairymen are wont to extol the virtue of certain cows that yield a large flow of milk in the flush of the season, taking little note of how long this yield is kept up.

The value of a cow depends much more upon the length of the milking season, than upon the quantity of milk given for a few weeks. We have had cows that never gave more than 25 pounds of milk per day, and yet gave more milk during the season than others yielding even 40 pounds at the flush. The one class would average 20 pounds per day for 300 days, or 6,000 pounds per year; whilst the other would average only 20 pounds per day for 250 days, or 5,000 pounds per season. Now, the habit of holding out the milk was fixed in the first class at an early age, by good feeding through the whole season and careful milking. The second class had formed the habit of drying off at about eight months; and although yielding a large amount for a few days, they soon fell below the other class.

This habit of giving a pretty uniform quantity of milk is influenced very much by the uniformity of feeding and milking when the cow is young. If the cow gets a generous diet only when the grass is abundant and in a very succulent state, and no attempt is made to give a full ration when the grass is short, she falls off in her milk so decidedly and it continues so long as to become permanent, and cannot be recovered when grass again becomes abundant. The most important qualification in a cow, is to hold out her milk in a generally uniform quantity. This, to a great extent, is the result of proper treatment when the cow is young. If the heifer, with her first calf, is allowed to dry off at eight months, she will be very likely to do the same thing the next season. But if the young cow is to be established in a steady flow of milk, she must be fed uniformly a full ration during the whole season.

When the grass becomes short or dried, she must have other green food or grain to make up the deficiency. This extra food is the more important as the weather becomes cold, in the fall, and the grass becomes less nutritious from touches of frost. Then the dairyman must draw on his early-cut clover or late-sown corn. This being partly cured in shock, is sweet and nutritious and cows will eat it greedily in the stable at night and morning. If these are not sufficient to keep up the full flow of milk for the season, then a small grain ration of corn meal, oats, middlings, or bran, should be given also. Greater care should be taken in milking, for the milker should be sure that every drop is drawn from the udder. The cow yields her milk less readily at this season than when she gives a larger quantity. The cool weather renders the teats more sensitive to chafing in milking.

Too great stress cannot be laid upon the importance of a full milking season of ten months, but this full milking season must always be accompanied by a full and generous ration.

STEALING BY PROXY.

IN many parts of the country the fence-laws are now such that no one is obliged to fence against his neighbors' cattle or poultry. But in every community there are lawless individuals who will take advantage of the removal of fences—which is encouraged, and was designed to be encouraged, by this legislation—to turn out their cattle at night to depredate upon the property of the neighborhood. And it is astonishing what wonderful sympathy seems to exist between such people and their live stock, and what skill the latter develop in unlawful appropriation under the training they receive from their owners. Marks of their presence night after night, will be found next morning, especially if the nights be dark or rainy. But it is rarely that anything but a regular night-watch will catch the culprits, or trace their ownership. When, by chance or careful watching, their ownership is traced, the victim of the thievery is always assured that their escape from the inclosure of their owner was quite accidental, and the only instance during the season. Yet all surrounding circumstances may point to the fact that these animals get, and are expected to get, the most of their living by such plunder. The utmost severity of the law should, at all times, be visited upon men who practice this stealing by proxy.

How to Manage Bones in a Small Way.—A great deal of valuable fertilizing material is lost or wasted by reason of unacquaintance with cheap and handy ways of utilizing it. This is particularly true of bones, considerable quantities of which lie about and are accessible to farmers and gardeners, but are not used because no cheap way of making them available is known. Now, half a ton, or so, of bones may be easily reduced to a fine powder every winter by burning them, a few at a time, in the kitchen stove. Have a box or basket handy, and having collected a pile of bones and placed them where they will not be buried in snow or covered with ice, keep the box or basket filled with them in the shed. Put five or ten pounds in the stove with the wood during the day, and next morning when the ashes are taken up, the bones will be found mostly in a pulverulent condition. Any incompletely burned pieces may be left in the stove until the next day. This will quadruple the value of the ashes as a fertilizer, at no expense except that of a little trouble. The bone-ash thus produced is about half the weight of the raw-bones, and its commercial value is about $40 a ton.

Basket Willows.—While it may be questionable if the basket Willow can be grown extensively for profit in this country, except perhaps in foreign localities, no farm should be without a few plants. The long, slender branches—as tough as leather and as pliant—would be found useful in many cases. For instance, something better and more convenient than is usually at hand, is needed to bind cornstalks or millet. Many uses will suggest themselves when the article is at hand. This Willow will thrive almost anywhere, but best in a moist soil. It can be planted where most out of the way and requires little attention. It is readily grown from cuttings and a dozen plants well established, will produce more yards of useful material than would be at first supposed.

The International Dairy Fair.—We cannot too strongly urge upon our readers interested in dairy matters, the importance of at once making preparations either for exhibiting their products at the grand exhibition to be held in this city early next month, or, at any rate, for visiting it, if at all possible. Arrangements have already been made for making this the finest and most instructive display in its line ever held in this country, except possibly that at the Centennial; and here there will be none of the bickering and disagreement that characterized that department of the Philadelphia show.

BREVITIES.

PRUNE grapes-vines.

WHATELY says: "It is the neglect of timely repair that makes rebuilding necessary."

FULTZ and Clawson are the stars in the play of Wheat upon the Agricultural stage.

IT is suggested to our readers that they preserve this number of the RURAL for future reference.

BEFORE the ground freezes, take up the wooden labels (stakes)—tar the part that goes into the ground, and sprinkle it with sand while the tar is soft.

IN guarding as far as we may against the severities of winter, provide for the comforts of all farm animals from humane motives as well as from those of self-interest.

DR. HOSKINS thinks well of the Lost Nation (spring) Wheat. We would thank him if he would tell us how much he knows of its having yielded per acre the past season.

THE "Magnum-bonum," a new potato, is much praised in England. We have yet to learn whether it is really a good variety or whether it is simply greatly advertised.

IT may be well to bear in mind that the buds now formed on grape-vines contain the rudimentary fruit for another year. In pruning or laying down the canes, we should be careful not to harm such buds.

FROM Ex-Gov. FURNAS of Brownsville, Neb., we have received a basket of several varieties of apples, viz. Ben Davis, Rawle's Genet, Gilpin (Carthouse, Little Romanite), and Winesap. They are perfect specimens of their kinds.

"THE owl that watching in the barn,
Sees the mouse creeping in the corn,
Sits still, and shuts his round blue eyes,
As if he slept, until he spies
The little beast within his stretch—
Then starts, and seizes on the wretch!"

We were reminded by the above how very like the ways of the owl are sometimes the ways of some men.

THE general respect, if not affection, in which the name of Marshall P. Wilder is held throughout this country, is abundantly shown by the hearty congratulations of all upon the occasion of his 80th birthday. During a long life he has been an earnest worker in horticulture, and today there are few men in the world who have more friends and fewer enemies.

WE beg to say to those interested in our Domestic Economy Department that owing to a somewhat protracted illness of the editor, from which she is now happily recovered, a number of questions and communications have not received the prompt attention usually given to them. This week that and other departments are much shortened, or crowded out altogether.

WE repeat our advice not to spread manure or covering of any kind over the roots of fruit trees, or strawberry beds; not to lay down grape vines or raspberries until after the first hard freeze. If it is desired to cover the last two with earth, enough for the purpose must be set aside and so covered as to prevent its freezing. Our readers may rest assured that much harm results from covering such plants too early. Make the rule: Cover late in the fall and uncover late in the spring.

WE would state that we have already received more comments upon our soil experiments, as detailed under "Notes from the Rural Grounds," than we can find space for. It is notable that most of our correspondents criticise conclusions not among those of the article in question. We are happy at all times to publish the severest criticisms, if only just and pertinent. But our friends criticise us severely for what we neither said nor thought of saying, as they would discover, we are confident, were they to read our experiments and remarks carefully.

IF the people throughout the country who prize rare and choice seeds really believed that our free seed distribution amounted to as much to each applicant as the yearly subscription price of the paper, no doubt our circulation would be greatly extended by it alone. Choice seeds are dealt out sparingly in small envelopes, and twenty-five cents, sometimes fifty and seventy-five, are asked for each little packet. At the lowest price our ten packets (the choice), would amount to $2.50, which is fifty cents *more* than the annual subscription price of the RURAL NEW-YORKER.

IT seems that in England there has been a general failure of out-door tomatoes (they are extensively cultivated under glass), only a few plants on warm walls having ripened any. One case is mentioned by English journals where one grower had two acres of ground planted with tomatoes, "all carefully staked and tied," not one of which ripened. Thus it seems, that English gardeners this year have much to lament—a pitiful fruit crop, fearful destruction among potatoes, and the total failure of the tomato plant. English gardeners must try the Golden Rural Tomato.

FROM any of the numbers of the RURAL devoted to specialties, such as Strawberries, Millet, Grapes, &c., which have been issued from time to time during the past eighteen months, of course many of our usual departments are necessarily excluded. A gentleman calling at the office a day or so ago, said: "I sent for a specimen copy of the RURAL NEW-YORKER supposing it was a farm as well as a garden journal —but it was all full of Raspberries." To those who receive specimens of the present number we would say that the RURAL is not always full of free-seed distributions.

REALLY good dairymaids are rare now-a-days. The accomplishment of playing upon the piano is growing more fascinating in farmers' families. Pianos are rather more ornamental than milk-pails. A piano teacher costs fifteen dollars per quarter. Girls practice two hours per day for from one to five years. Sometimes they can then play something. But elegant music-boxes can be purchased for fifty dollars that make better music, play more tunes, and play them better than the girls—that is than forty-nine out of fifty of them. Why not buy the music-box as a reward for the young women who learn the arts of the dairymaid?

For Women.

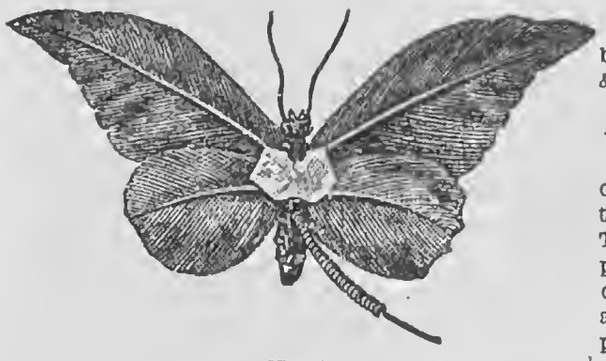
CONDUCTED BY MISS FAITH RIPLEY.

COMING EVENTS

A REVELATION.

BY THE EDITOR.

THE RURAL of Nov. 23d will contain an illustrated article on in-door garments and cloaks for ladies, for fall wear.



No. 2.

On 30th of Nov. I will publish cuts of a large number of fancy articles, suitable for Christmas gifts.

In the early part of January an article on Decorating China (illustrated) will be given, which I commend to those who are interested in this most beautiful art.

I am pleased to be able to announce, that Margaret B. Harvey, whose "Letters From a Country Girl" have been received with so much favor by Rural readers, will, in an early issue of the RURAL, tell the ladies about South Kensington-work and outline Embroidery on linen.

In response to many inquiries about cross-stitch embroidery, I will publish an article in the early part of February, giving the latest designs for monograms, initials and borders, in cross-stitch.

VASE OF FEATHER-FLOWERS AND BUTTERFLIES.

Description of Engravings.

THE feathers principally used for making these flowers are those of the goose, turkey and guinea-fowl. The design No. 12 represents a vase of flowers and foliage, with butterflies hovering over and settling on them. The Christmas rose shown in No. 8, is made of white goose feathers. The best way is to pull a natural flower to pieces, then lay one of the petals on the feather and cut it to the shape; five petals are required for this flower. The stamens are made of cotton, knotted at the end and fixed to a wire; they are first dipped into gum, then the knots at the extreme edges are dipped into a little sulphur powder to give them the yellow tint. The petals are next mounted on the stem round the stamens by means of a very fine wire; a narrow strip of green tissue-paper must be gummed round the stem. In cutting the petals, the stem of the feather should be left at least half an inch longer than is required for the petal. The leaf No. 3 may be easily made from one of the long tail feathers of a cock, cut to the shape and veined by means of a camel's-hair pencil and green water-color paint. The leaf No. 4 is made from a guinea-fowl's feather dyed green; any standard dyes answer for this purpose. No. 9, the Virginia Creeper leaf may be made with any small feathers, dyed, then cut to the shape required, all five being mounted to one stem as described for No. 8.

There are many pretty flowers which may be easily copied in feathers, and which give variety to the bouquet. For instance, daisies which are made of the very smallest goose feathers, the heart being formed of a little ball of cotton wool fixed to the stem, first dipped into strong gum, then into a stiff paste made of common ground starch and powdered sulphur, colored with a little tumeric; the petals are arranged round the center. The butterflies are made of the larger feathers of the turkey, dyed yellow and painted with brown and red, as nearly as possible like nature. The body is made of velvet stuffed with cotton wool and sewed up with a needle; the divisions must be formed by twisting fine silk tightly round; these are mounted as shown in No. 2, on a curled wire. In order to get the wings the correct shape, it is necesary to take pattern from a butterfly. These wings are sewn to a small piece of card-board, which is again sewn to the under part of the body, (see No. 2.) For No. 1 the feathery part round the body must be made of down. The antennæ are made of cotton stiffened with gum. Peacock's feathers, especially those from the neck, will be found useful for foliage. If the foregoing directions are not explicit, I will very cheerfully answer any inquiries addressed to me on the subject. FAITH RIPLEY.

ITEMS FOR CORRESPONDENTS.

BY THE EDITOR.

H. M. S., Lansingburgh, N. Y.—Where can I get bracket patterns of all sizes? Ans. J. S. Pratt & Co., 53 Fulton St., New York.

AN OLD SUBSCRIBER, asks "Can you tell me how to——an old lamp? I have a very nice one but the——is wearing off." Will the lady please fill out the blanks, so that I may know what it is that she wants to do and what is wearing off? The same writer wants to know how to make a pretty table cover. Coarse unbleached holland, or art canvass embroidered in the center and around the edge in fancy colors, makes a very pretty cover.

No. 3. No. 4.

JENNIE HAYDEN.—Twenty-five yards of silk will do for the costume you mention. I would recommend trimmings of velvet, brocade and elegant fringe. It will cost you about $150 to have it made in New York.

SARAH RUDOLPH.—I can send you samples of any kind of dress goods, or cloakings.

Miss L., Cortlandt, N. Y.—It is very unwise in you to poultice your eyes; nothing could possibly be more hurtful. Consult some occulist of acknowledged ability, without delay.

Literary Miscellany.

WEAKER THAN A WOMAN.

CHAPTER VI.

"THAT young man ought to be satisfied with his lot in life," said Jane Lester, as her niece told her of Felix Lonsdale's successes.

"He is quite satisfied, auntie," Evelyn returned gently.

"The worst thing that any man can do is to marry a girl with a pretty face," said the aunt. "Pretty girls are a mistake—they think themselves too good for anything. Felix Lonsdale has acted foolishly—Violet Haye will never make him a good wife."

"She is young, and she loves him dearly," remarked Evelyn.

"Youth and love—would any wise man build his house on such foundations?" said her aunt. "I tell you, Evelyn, it is a mistake, and Lonsdale will find it so. I read a character quickly, and I have read Violet Haye's."

"She loves him," repeated Evelyn, who could imagine nothing more unanswerable.

"Love—we know what a lasting sentiment that is," sneered Miss Lester. "If he married a sensible woman with a nice little fortune, I should have some hope; but the very curl of that girl's hair shows what she is."

Evelyn laughed as she thought of the glorious golden hair that had always been Violet's glory.

"There is no other hair in Lilford like it, auntie," she replied.

"It is a very good thing," was the retort—"I am no friend to nonsense."

No unfriendly criticisms reached Felix Lonsdale's ears—none could have hurt him. He had now the one great prize of his life; he was happy beyond all power of words to tell. He would have felt a little happier perhaps had Violet been less coy. But that very coyness had a charm of its own; it suited her; he could not imagine her other than coy; and, as for doubt or fear or mistrust, such shadows never darkened his mind.

He had settled in his own mind that he would persuade her to become his wife before chill October killed the flowers and stripped the trees. So he thought and hoped and dreamed, while a cloud was rising in the distance no larger than a man's hand.

One day Darcy Lonsdale returned with a perplexed look on his face to his new house. His wife, wondering at it, asked him——

"What is the matter, Darcy?"

After thinking for a few minutes he answered——

"Nothing; my brain seems to be full of foolish fancies."

The next time he returned home it was evening, and the pleasant tea-table, the happy circle of bright faces, might have gladdened any man's heart; but Darcy Lonsdale looked dull. Again his wife asked what was wrong, and he laughed uneasily, she thought.

No. 1.

"The very air seems thick with fancies," he answered. "I saw three of my best friends this morning standing in a group in Castle Street, and when I joined them I knew by the startled embarrassed expression on each man's face that they had been talking about me."

"What could they have to say about you?" asked Kate. "It was all fancy, Darcy."

"No; I am sure they were speaking of me. I went to the bank this morning, and as I was entering the door I distinctly heard the manager say, 'Mistaken in Lonsdale.' I heard the words as plainly as you hear them now. He was talking to one of the partners, and they were both cool, I thought, in their manner."

Kate threw her arms around his neck and kissed his anxious face.

"Why should any one talk about you or be cool to you, dear? You have done no wrong."

"No; but there is something—I am quite sure there is something, Kate—in the minds of people about me. I cannot imagine what it is."

Kate tried to cheer him; she laughed at the notion. What could there be? She knew that there was no one like him. No one could accuse him of a mean action; his life had always been fair, open, loyal, and transparent. It was absurd. He must be out of health; he should go away and rest himself for a time.

Yet she waited anxiously for him the next day. She was somewhat surprised, for there had been a perfect deluge of tradesmen's bills—an occurrence that had never happened before. The baker had sent in his bill, and the butcher wanted ready money; the upholsterers who had furnished Vale House pressed for a settlement in consequence of unlooked-for losses. Kate showed the bills to her husband.

"What does it mean?" she asked wonderingly.

"It means, my dear, that there is some subtle agency at work against us—I cannot tell what. It means also that the trades people must be paid at once. Indeed, Kate, we should have been wiser had we waited till the legacy had been paid us before we came here."

"But it is certain," said Kate, a little anxiously.

"As certain as fate," he replied; and then they talked a little more cheerfully about what they would do when the money was at command.

That same evening Felix came home looking slightly preoccupied. He had seen one of their oldest clients go into George Malcolm's office, and the Vicar of the parish, the Rev. Daniel Hunter, had passed him with the coldest of bows. He also had an impression that there was something wrong. He could tell neither what it was nor why it was.

Felix thought that there would be time to walk over to the Limes. He had a very beautiful book that he had bought for Violet, and he wanted to give it to her.

It struck him, when he entered the drawing-room at the Limes, that the three assembled there had been speaking of him, their greeting was so awkward, so constrained, so unlike the genial, kindly reception that had always been given to him hitherto. Mrs. Haye held out her hand to him, but her eyes fell, and her husband's half-murmured words were inaudible; Violet looked embarrassed; and for the first time under that hospitable roof the young lover

FEATHER FLOWERS AND BUTTERFLIES.

felt ill at ease. When he laid the volume on the table, Mr. Haye took it up.

"This must have cost something," he said, "for it is very handsome. It would be better to save money than to spend it—we none of us know when an evil day may come."

"I do not fear evil days," remarked Felix, with all the sanguine hope of a young man.

"The wisest amongst us may expect them," said Mr. Haye briefly.

Then the conversation languished, and Felix grew so uncomfortable that he decided upon returning home. He had no misgiving—he thought he had called in at an inauspicious moment—he had, perhaps, interrupted a domestic conference. He cared only to see Violet. If she would go to the gate with him, so that he would have time for a few words, all would be well.

But when he had said good-night to the two seniors, and asked Violet if she would walk to the gate with him, Mrs. Haye interposed.

"It is too cold," she said. "Violet has been complaining of headache all day; she must not go out."

And the tone was so decided, so stern, that Felix could not oppose Mrs. Haye. He held Violet's hand one minute in his; he tried to look into the depths of her beautiful eyes, but they drooped from his, and he could not see them. He left her with a few whispered words, feeling more unhappy than he had ever felt before.

He said to himself over and over again that no one was so fortunate. Had he not a partership? Had he not a certainty of calling the loveliest girl in the county his wife? What had he to fear? Yet what was the strange dull pain that made his brave young heart fail him? Why had he a keen and penetrating, a vague, indefinite feeling of an evil day to come? He tried to repress it; he could understand women being nervous, but not men.

For the first time he noticed that night a look of anxiety on his father's face, and he asked what brought it there.

"Shadows—nothing but shadows; fancies—troublesome fancies," was the reply; yet it was strange the son turned away with a feeling almost of despair.

Nor was the mystery lessened when on the day following Mrs. Lonsdale, going on her daily round of shopping, met the Vicar's wife, Mrs. Hunter, who stopped to speak to her.

"This is a very sad affair, Mrs Lonsdale," she said; and Kate, looking at her, asked quietly what affair she meant.

She looked so entirely unconscious that the Vicar's wife was surprised.

"Have you heard no bad news of—of—anyone?" she asked; and Kate answered "No."

Then Mrs. Hunter related some trifling little story; and even as she related it Kate told herself that she was inventing it. With her honest, straight-forward eyes she looked at the Vicar's lady.

"You are not telling me what was in your mind when you first spoke to me," she said. "What were you thinking of Mrs. Hunter?"

But Mrs. Hunter, after laughingly parrying the remark, hastily said good-morning in very embarrassed fashion, and walked away.

Mrs. Hunter's remark could mean nothing; yet the heart of the loving, anxious wife grew heavy within her. Sad news? What sad news could there be affecting her or hers? And, if there was sad news about anyone else, why could she not have said what it was?

She was the third who went home that day with a terrible sense of foreboding. Her pretty house seemed almost to oppress her. She wished that she had not burdened herself with a nursery-governess; as for the new silk dress, it no longer gave her the least pleasure. What was this cloud hanging over her husband and her children? Was it only nervous fancy, or was there evil looming in the distance?

She was soon to know; and when she did know it proved to be even greater than she feared.

CHAPTER VII.

"I AM very sorry—I think it unjust; but it is quite impossible to say how it will end," said George Malcolm the lawyer.

For the secret was known now—the shadow had become a substance, the vague fancies had all assumed a form, the airy nothings had become realities so stern and so cruel that they had driven Darcy Lonsdale almost to despair. Mrs. Hardman's heir-at-law, James Hardman, had even given legal notice that he intended to contest his relative's will on the ground of undue influence. He maintained—and nothing could shake his opinion—that Darcy Lonsdale had taken undue advantage of his position, that he had influenced a weak-minded woman, and had persuaded her to leave him the half of her money. It was a clever ruse, advising her to send for another lawyer; but it would not help him.

Mr. Lonsdale found that the rumors about him had been growing daily, that his friends and neighbors were talking of him, while he had not the faintest idea of the mischief that was abroad. James Hardman had been in Lilford—that he knew, and the fact had not interested him in any way; but he did not know that James Hardman had been silently destroying his reputation, had called upon his old friends, insinuated that there had been conspiracy against him, and that he intended to dispute the will. Every one in Lilford knew this before the least rumor of it reached Darcy Lonsdale. He went at once to Mr. Malcolm, but the honest lawyer had no cheering news for him.

"I am a lawyer myself," he said, "but I can never tell how a lawsuit may end; it may take the right turn, and again it may take a wrong one."

"But," returned Darcy Lonsdale, "Mrs. Hardman meant me to have the money, did she not? That one broad fact no one can dispute."

"I believe honestly that she intended you to have it. I know she did. She talked to me for some time about the good it would do to you and your children."

"Then what can there be found to dispute? She intended to give me the money, and she did give it—what is it to any one?" cried Darcy Lonsdale.

"The law deals heavily with cases like this. James Hardman will plead that he is heir-at-law, that he is the rightful heir of the late Elizabeth Hardman, that he had been brought up in expectation of receiving the money, and that you took an undue advantage of your position as her legal adviser and friend to induce her to leave it to you."

"But," declared Mr. Lonsdale, "I did no such thing. I swear to you I never asked, influenced, or said one word to her about it. How dare any man say such a thing of me?"

"James Hardman has been brought up to believe that he would inherit twelve thousand pounds, and, finding six of it given elsewhere, he is very angry about it, and says some bitter things."

"But how is it possible that any one who knows me could believe that I have acted unfairly? How can my old friends and neighbors believe it? I have lived amongst them all my life—they ought to know me better. I should not believe such a scandal of any of them"—and tears of wounded pride and wounded affection stood in his eyes. "What are a man's friend's worth, Malcolm, if they believe evil of him so easily?"

"Perhaps they do not all believe it," said George Malcolm.

"Then why do they not say so? Why not say, 'We have known you for years and we believe in you?' Why not say that instead of looking coldly on me. As I pass by they converse about me in whispers and are startled when I meet them."

"James Hardman has talked a great deal amongst them," said Mr. Malcolm slowly. "He has said some hard things of you."

"But my old friends," rejoined Darcy Lonsdale, "the people I have lived amongst so long, how can they believe such slander?"

"I am not much of a cynic, but this I must say, that I believe our misfortunes are not always displeasing even to those we call our friends."

"But these people have known me so long."

Mr. Lonsdale could think of nothing so strong as that—no argument was so potent. He had lived amongst them all his life. Why did they not trust him if he trusted them?

"If any one amongst them had come to me and had told me such a thing of another, I would not have credited it—and they are only too ready, it seems, to believe it of me. Malcolm, how in Heaven's name am I to go home and tell this to my wife? Am I to tell her that a blameless life, spent in the midst of people who have known me since I was a child, is no shield against slander?"

"I am very sorry for you," said George Malcolm; "I can say no more. I do not believe it, and I shall stand by you through all."

The two men shook hands, but Darcy Lonsdale's face wore a puzzled, wondering look.

"Can it be a jest, do you think, Malcolm—a jest to try me?"

"No, it is no jest. Hardman will get the money if he can."

"I would not take it unless I thought it were really mine—I would refuse to touch it; but I cannot do that, for I am sure my old friend left it to me for the children. I must be just to them. Great Heaven, I have kept a blameless name all my life only to meet with this fate—to see my old friends point at me as a man who would cheat his client! I wish I had been dead before I had known this. Tell me what Hardman is going to do."

"He has placed the whole matter in the hands of a London firm, and the trial will come on about the end of September. You must prepare your defence and look up your witnesses."

"If my whole life does not witness for me," said Darcy Lonsdale, with quiet dignity, "then the words of no men can benefit me."

He dreaded going home—for the first time in his life he disliked passing through the streets of his native town, for the first time he shrank from the glances and words of his old comrades.

"Heaven help Kate!" he said to himself. "How am I to tell her?"

But Kate knew already—such news travels fast. It was no weeping, hysterical wife who clung to him, half mad with womanish fear; a bright, tender face looked into his, sweet, warm white hands clasped his, loving lips kissed him, a brave bright voice cheered him with the music of home-words.

"I have heard all about it, Darcy," said his wife. "Never mind—no one can injure you. You are innocent, honest, and honorable. Never mind what any one says, Heaven knows the truth, and I love you all the more that you bear this blame so well."

Darcy Lonsdale was relieved to find his wife so cheerful, and they sat down to discuss their difficulty.

"Give the money back again, Darcy," said his wife. "If I were in your place, I would not touch one shilling of it."

"If I did that, it would look as though I feared inquiry, as though I knew that I had gained it by wrong means, and remorse compelled me to to return it. It seems to me now that I am compelled, in justification of my own honor, to keep it—Mrs. Hardman certainly meant me to have it. Then there are the children—I cannot rob them; I must not take from them what is really theirs."

"But," said his wife, "if there should be a trial, and it should go against you?"

"Then I must bear it like a man, Kate. I have had many blessings—if it pleases Heaven to send me a reverse, I must not complain."

But, for all that, she knew that his heart was sore and heavy, and that he was disturbed by a hundred doubts and fears. She soothed him, comforted him, and did her best to encourage him; but she could not persuade him to forget his trouble for a moment—it was always in his thoughts.

Presently Felix came in, and one glance at his son's face told Darcy Lonsdale that he had heard the whole story. The handsome young face was full of emotion. He went straight up to his father, and laid his hand lovingly upon his shoulder.

"Let me help you, father," he said. "No man shall say one word against you while I live."

And the two men—father and son—shook hands. There was more expressed in that silent grasp than there could have been in a volume of words.

"You have heard the story, I suppose, Felix?" said Mrs. Lonsdale.

"Yes, I have heard it, and a more cruelly unjust story never was told. Let me help to fight your battle, father. I should like to take every man who believes the story, or who affects to believe it, and thrash him."

"My dear Felix!" exclaimed gentle Mrs. Lonsdale.

"So I should, *madre*;" and the young handsome face deepened with angry scorn for every one who should harbor an evil thought of one so beloved. The love between father and son was almost pathetic in its intensity.

Presently Mrs. Lonsdale said musingly—

"What will Violet say when she hears it?"

"Say?" cried Felix, "She will be indignant She will agree with me that any man who listens to it ought to be shot. Why do you look so strangely at me, *madre?*"

"I was wondering," she said, "whether this would make any difference to her or to her parents—I mean in respect of yourself."

"Difference? *No*—yet I am wrong. Yes, it will make this one difference. She will love me the better, and cling to me the more. I have no doubt about Violet—my sweet Violet! It is the one thing needed to quicken her love for me with a new strange life."

He wondered why Mrs. Lonsdale sighed. Why need any one sigh? Violet's love, Violet's faith, were his rock of refuge. To doubt her would be death.

"I have no fear," he said, throwing back his head proudly. "Violet will love me now as she has never loved me before. My only trouble is about my dear father, and what I can do to help him."

They talked until long after midnight; they looked the evil in the face. If they went to law, and the law was against them, what then? They would be dreadfully embarrassed for ready money. The nursery-governess must go, but they could remain at Vale House, and the partnership should not be dissolved.—[To be continued.

HOW LONG?

If on my grave the summer grass were growing,
Or heedless winter winds across it blowing,
Through joyous June or desolate December,
How long, Sweetheart, how long would you remember,
How long, dear love, how long?

For brightest eyes would open to the summer,
And sweetest smiles would greet the sweet new-comer,
And on young lips grow kisses for the taking,
When all the summer buds to bloom are breaking,—
How long, dear love, how long?

To the dim land where sad-eyed ghosts walk only,
Where lips are cold, and waiting hearts are lonely,
I would not call you from your youth's warm blisses;
Fill up your glass and crown it with new kisses,—
How long, dear love, how long?

Too gay, in June, you may be to regret me,
And living lips may woo you to forget me,
But, ah! Sweetheart, I think you will remember,
When winds are weary in your life's December,—
So long, dear love, so long! [*L. C. M.*

"ROUNDING ON AN OLD CHUM."

ONE fine evening at the end of June a girl and two young men were standing under the porch of a quaint old ivy-covered house—called Ashton Cottage—that stood on the bank of the Hudson not far from Peekskill.

The trio were laughing and chatting as gaily as children just let out of school. Judging by an occasional shout for "Will," they were evidently waiting for some one else.

Tardy Will—a broad-shouldered young fellow of about eight-and-twenty, rather above the middle hight, and not by any means good-looking—soon made his appearance. His hair and beard were almost red; his features large but regular; his hands and feet well shaped, though not small; he had a hearty mellow voice, and one of the softest and most genial smiles that could be seen. He came along struggling into his well-worn coat—explaining to his companions that he had just stayed to give a helping hand to Mr. Sinclair, who had come upon a tough bit of ground in the kitchen-garden, which had been too much for the old gentleman's strength.

The four then took their way to the river, on boating purpose intent, as evidenced by the nautical costumes of the males.

"I say, Devaine," said the youngest of the three men, a bright-looking young fellow of about seventeen, "I wonder when I shall be able to sport a silk hat? I know, though, what I shall buy out of my first quarter's money,"

"When do they begin giving you a salary, Frank?" asked Will.

"After Christmas."

"Well, Frank," said the girl—a tall, finely-built brunette, whose large, thickly-fringed, dark-gray eyes, slightly *retrousse* nose, magnificent teeth, and deep dimple on either side the large, but handsome mouth, made up as fine a specimen of girlhood as one would wish to see—"do tell us how you intend to astonish——"

"The natives? Ah, you needn't pull up short, Miss Conny! Girls are such humbugs. You know you can talk slang as well as any fellow when you like," was the saucy and voluble reply of her brother Frank.

"Do you plead guilty to the soft impeachment, Miss Sinclair?" smilingly asked the handsome Devaine, with a certain *tendresse* in his voice which brought a tell-tale blush into Conny's oval cheeks.

"You haven't told us yet, Frank, what you are going to buy," said Will, after a quick, pained glance at the girl's face.

"Why, I mean to get a pair of patent-leather boots, a blue satin tie, a pair of yellow kid gloves, and a silk umbrella."

A peal of laughter greeted this confession, and great was the chaffing Frank had to stand, especially from the handsome Devaine, who in his white flannel boating-suit looked, as Frank truly said, "no end of a swell." His finely-set head, with its short dark curls, was bent with that gentle deference so flattering to a woman, towards the girl whom he contrived to monopolise—by which arrangement Will and Frank were compelled to follow; and although many a gay repartee was laughingly exchanged over the shoulders to the two behind, still there were opportunities for a remark now and then, commonplace enough in itself, but which in Devaine's tone and manner gave a subtle meaning.

Arrived at the end of the avenue, they turned to the left, along the bank, until they came to where the high wall of Van Twiller House threw a welcome shade on the river path. A little way beyond the angle of the wall was a seat, and fronting it were wooden steps leading down to the river. At the foot of these a boat was moored, and in this they were soon all seated; Frank steering, William Mostyn, and Harvey Devaine rowing. As the boat shot out into the stream, upon the bosom of which the sunlight rained a golden shower, Conny trailing her firm white fingers through the cool water, felt, although she seldom met, the gaze of the dark, close-set eyes opposite. The bright summer evening, the charm of the surrounding scenery, the beauty of the man himself, the very lull of the plashing oars—all served to feed the feeling that had stolen into Conny's heart since her acquaintance with this fortnight-old friend, whom William Mostyn had, to his own bitter after-regret, introduced.

William Mostyn was the son of a near neighbor of the Sinclairs. He and his brother had come to the neighborhood only two years before, shortly after the death of Mrs. Mostyn, which had had such an effect upon her husband as to compel him to give up the care of his business entirely to his son, and to leave New York for the quiet of the country. The Sinclairs being their closest neighbors, an intimacy had sprung up between the families.

William Mostyn, although a day never passed without seeing him at Ashton Cottage, had never known what his feelings were towards the beautiful girl who always treated him with the same frank familiarity as she would have done an elder brother, until, in an evil moment, he took the young journalist, Harvey Devaine—who had run up by invitation one Saturday afternoon for a pull on the river—with him to his friends the Sinclairs.

Before Harvey Devaine left that night poor Will knew that love had lain slumbering, in its own security, in his heart—goodness knows how long—only to be awakened by the sight of its birth in his friend and Conny.

When the boat neared the landing-steps again, the summer moon, radiant in the starry heavens, was flooding everything with its silver light.

Devaine was the first to spring on shore and help Conny out, Will and Frank staying to secure the boat.

No word was spoken by the two who went on before, and the silence became embarrassing to Conny; still not for worlds could she disturb the "charmed hush" by any commonplace observation. As though divining her thought, her companion's voice harmoniously broke the stillness—

"'How sweet the moonlight sleeps upon the bank!'"

She smiled back softly—

"'Look how the floor of heaven
Is thick inlaid with patines of bright gold.'"

In low melodious strains he still continued quoting—

"'In such a night as this,
When the sweet wind did gently kiss the trees
And they did make no noise——!'"

"I'm jolly hungry, I can tell you! What have we for supper, Conny?" shouted unsentimental Frank. "I shall take the short cut through here;" and, suiting the action to the word, he plunged into the long fragrant grass and made straight for the house, followed by the rest.

Arrived at the door, Will held out his hand.

"Good night, Conny."

"Won't you come in and have some supper, Will—you and Mr. Devaine?"

"No, thank you, Conny," was the half-sad reply: "my father is all alone, so I'll not stay. I'll just go in and say good night to your father and mother." Saying which, he generously left the two together, although the act of magnanimity cost him a hard struggle.

It was Devaine's turn to hold the shapely hand which thrilled to his touch.

"Good night, Conny." How sweet her name sounded to herself pronounced, for the first time by his lips.

"Good night, Mr. Devaine."

They stood in the shadow of the porch, and as hand clasped hand Harvey Devaine's moustached mouth touched Conny's dimpled cheek.

"Good night, Mr. Sinclair. Good night, Mrs. Sinclair." Will's rather loud leave-taking startled them apart! then with a decorous handshake they all separated.

* * * * *

"Mother, I'm going across to hear the whip-

poor-wills," said Conny coaxingly to the old lady, who, with her husband, had settled down after supper to a game of cribbage, which Conny knew would last another hour at least—it was then about nine.

"Bless the girl, can't you hear them from your own garden? Besides, you'll catch your death of cold. Has Frank gone to bed already?"

"Yes, dear, tired out," said the wilful Conny, already on her way,

Conny was soon threading her way along the moonlit walks of the grand old garden to her favorite retreat—a high summer-house overlooking the river, built almost immediately above the landing-steps where Will's boat was always kept moored. The summer-house, embowered in its ivy covering and the foliage of the surrounding trees, was completely hidden from sight.

And now, alone at last with all her fluttering, new-born bliss, recalling every word and look, remembering every intonation of the musical voice, blushing again with the memory of her lover's kiss, Conny sat wrapt in a dream of love's own conjuring.

By-and-by, borne upon the warm night air, came the harbinger of man's lordly presence—tobacco fumes; and soon from her hiding-place she saw the two men, Will and Harvey Devaine, coming along the path. Her heart throbbing with the sudden joy of seeing him who had been uppermost in her thoughts, she drew back into the shadow until they passed.

As they approached Devaine was saying—

"Your ideas, my dear fellow, won't do for the present age. In fact, I don't believe they ever applied to men and women living in the world. Out away in the back-woods I can understand a Darby-and-Joan existence. In the world, in society, where a man meets with so much temptation, I affirm it's impossible."

"I don't see it," was Will's curt and dogged reply.

"My dear Mostyn," said Devaine, seating himself on the bench just underneath Conny's watch-tower, "you never do see things in the same light as other people. Your ideas of honor, truth, business, marriage, are all very fine, but simply not practical. Who but you would ever dream of annoying me about little Ada? Did I seek her out? What is a man to do if the women are so foolish? They are all alike; they never rest until they get a fellow in their toils; and when he grows weary of the joke, they kick up the deuce's own shindy, and begin to rave about man's inconstancy and selfishness, Constancy, by Jove!"—here he laughed amusedly. "I don't believe a man could be constant if he tried."

"Yes, yes," interrupted Will gravely, as he too seated himself—"that is all very fine in the 'light-o'-love' affairs men indulge in; but when it applies to marriage, to that partnership for life, it alters the case."

"Not a bit," persisted Devaine.

"I tell you, Harvey, that when a man marries a woman, taking her to be his help-mate to share his lot, for better for worse, in riches and in poverty, and, by so doing, takes from her every other chance in the world—setting aside all religious cant and maudlin sentiment—I say he is pledged to her as sacredly as she is to him; and, to my mind, being unfaithful to a wife is as dastardly as rounding on a chum,"

As Will delivered himself of this opinion, energetically enforcing each word with a wave of his meerschaum, he rose to his feet and strode on, leaving Devaine stretched out at full length on the seat, his elbow supporting his handsome head, his cigar between his lips, which were curled with an amused and pitying smile. With one swift glance at the man lying below, and a long wistful look at Will's receding figure, Conny turned and swiftly but noiselessly retraced her steps homewards.

* * * * *

"There—I knew how it would be! You're as white as a ghost. A nice cold you'll have to-morrow! Did you hear the birds sing?"

"No, dear, but I heard a raven croak. Is papa in bed? Good night."

* * * * *

"Then this is your final answer?" The speaker was Harvey Devaine, who, pale even to his lips, was standing in the parlor of Ashton Cottage, having just taken up his hat as if to go.

"Yes, Mr. Devaine," was Conny's low but firm reply.

"Then, Miss Sinclair, I compliment you upon being the most perfect coquette it has ever been my honor to know."

This taunt only served to bow Conny's head a little lower, and to bring the hot blood rushing over face and neck.

"Good morning."

"Good morning," she just governed her trembling lips to answer; but the moment the door had closed she threw herself in a corner of the sofa and cried as though her heart would break.

* * * * *

Three weeks had passed by and Will had not put in an appearance at Ashton Cottage. Frank and Mrs. Sinclair brought home his excuses for not having called. His plea was unusual pressure of business.

Conny scarcely missed him at first, by reason of the hard battle she was hourly fighting with herself; but, like the true, brave girl she was, she never flinched from the contest, but, facing the trouble, did her best to overcome it.

At last Will who had not seen Devaine since the morning following the boating excursion, when he, Will, left for business with the knowledge of what Devaine's purpose was in remaining for a later train—made up his mind that, as the thing had to be done, and not being able to frame any more excuse for keeping away, he would get the meeting with Conny over; so in a most cowardly state of mind he went across to Ashton Cottage.

He had waited until it was dusk before he ventured to trust his tell-tale face to the scrutiny of Conny's—and most likely Devaine's—keen eyes. Passing round the garden to the back of the house, where the sitting-room was, in which the old people invariably played their evening game of cards, to his surprise there sat Conny alone, reading by the light of the lamp, which shed, to his thinking, a paler over her dear face.

For one moment he meditated flight. He never would be able to go through the form of congratulation which would be expected of him. Just then Conny raised her head, and he was seen. As he stepped through the French window, she rose hastily and, putting out both hands, exclaimed—

"Oh, Will, I am so glad to see you again!"

The glow of pleasure which spread over her face—which was thinner and paler than when he last saw it—he mistook for eager delight to impart her sweet secret to one whom she regarded as a brother.

Holding her hands very tenderly in his own, he said, looking wistfully into the beautiful grey eyes—

"Conny, I have been a sad coward. Do you know I could not summon up the courage to come and wish you joy?"

"Wish—me—joy?" she echoed slowly and wonderingly. "Oh!" A sudden light seemed to dawn upon her. "Will, you are all wrong," she said, with a faint approach to her old saucy smile.

The hands that he held were grasped so hard as to cause her pain.

"Conny, don't joke, but tell me—tell me—did not Devaine——" As he hesitated, she supplied the words.

"Ask me to be his wife? Yes."

"And you, Conny—— ?"

"I refused him, Will."

"Thank Heaven!" said Will fervently, pressing her dear hands passionately to his lips.

"Amen!" was Conny's low and solemn answer. "And now, Will," and all her bright manner returned—"come and sit down and tell me——"

"Wait a minute, Conny," said he, without relinquishing her hands; "I want you to tell me something else."

"What is it, Will?"

"If I were to"—the tender voice grew husky in its intensity—"to ask you the same question that Devaine did, what would your answer be?"

"Why, Will, my answer would be," here she disengaged one of the imprisoned hands and, laying it confidingly on his shoulder, looked gravely and frankly into his face—"'Yes.'"

And Conny never regretted having given her life into the keeping of the man who scorned the idea of "Rounding on an Old Chum." M. V.

RECENT LITERATURE.

The Political Adventures of Lord Beaconsfield. New York: CHARLES SCRIBNER'S SONS. Price 40 cents. Originally published in Fortnightly Review.

THANKS are due the publishers, for collecting these caustic and clever papers and presenting them in a convenient form to the American public. The subject of them has for many years occupied so peculiar and prominent a position in the political world, that even the feeblest attempt at outlining his personal history, could not but be entertaining and when, as in the present instance, the author shows a thorough knowledge and appreciation of his subject, coupled with literary ability of no mean order, the result is a work, which no one, who cares in the least, for a just estimate of the character and life of England's Prime Minister, can afford to leave unread.

Disraeli is usually cited as an example of what persistent, well-directed effort can accomplish, and we are constantly being called on to admire the tact and ability by which a man belonging to a proscribed race, has conquered for himself a proud position in the greatest of modern Empires. Well, the world at large does admire him immoderately, and even the few who take the trouble to penetrate behind his theatrical effects, and to get at the real man, must allow him a certain measure of greatness. No one could possibly more fully appreciate Beaconsfield's attractive qualities than does the anonymous author of the book under notice, but while doing full justice to the Premier's undoubted ability, he is given to analyzing motives and methods and to ferreting out inconsistences, and the result is rather a sorry showing for Disraeli. "To thine own self be true" has been the Earl's motto, and never for an instant has he faltered in his devotion to his own interests. He has reaped wealth, position and the homage which these bring with them; but he has done this at the cost of all that honorable men hold dear. To no principle has he been true. Expediency has been the sole guide of his conduct, and bearing this in mind, it is small wonder that we find him identifying himself at different times with political parties holding the most diverse opinions. Whig, Tory, each in turn; in one breath advocating Free Trade and the next denouncing it as a most stupendous evil.

To-day, Sir Robert Peel is a demigod, and Disraeli racks his brains for laudatory adjectives of the degree superlative, in which to express his devout admiration of his leader's qualities of mind and heart. A little later, and this fervent admirer has developed into the most implacable of foes, and the ex-idol is plentifully bespattered with vituperation and invective. Beaconsfield's method of dealing with some of his books which it is inconvenient now to acknowledge, is, to say the least, unique, and besides, it has the merit of simplicity; he merely declares that *they never have been*, this too, in face of the fact that copies of the "never-have-beens" are still extant. Truly, his Earlship is a wonderful man, and those who inquire closely into his life, are tempted to add, "fearful."

Pauline and other Poems. By HANFORD LENNOX GORDON. New York: G. P. Putnam & Sons.

THE blank verse poem, which gives its title to this volume, is a pathetic tale of the war, and one which the author might have told with more effect in simple prose. In spite of the oft recurring alliterations and high sounding phrases, the treatment the subject receives is not poetic. The shorter poems making up the volume are of no especial merit.

Nursery Rhymes and Melodies of Mother Goose. Illustrated with 50 full-page sketches "in white." By J. F. GOODRIDGE. Boston: Lee & Shepard. Price 50 cents.

IT would seem that time-honored Mother Goose affords an infinite variety and inexhaustible entertainment for people of all ages. The strength of this little book lies in its unique illustrations of the well-worn rhymes—each rhyme having its appropriate and mirth-provoking silhouette, which is in itself a whole volume of fun. We commend the book heartily to those who, seeking amusement for the little ones, are not themselves averse to enjoying a broad smile, on their own account.

The Exile. A Story of St. Augustine. By FRANCIS FONTAINE. New York: G. P. Putnam & Sons, $1.25.

THIS is a romantic poem, founded on the massacre of a band of Huguenot settlers in Florida by Spaniards, and the loves of Jean Ribault, commander of the French fleet, and Leonore de Coligny. Though at times there is something strained in the style, the poem is full of vigor and beauty, and will well repay perusal. The theme affords abundant material for both the poet and the romancer.

Merry Times. Published by Porter & Coates. Philadelphia. Price $1.25. 400 pages.

THIS is a book for the little folks. It contains contributions from Louis M. Alcott, J. T. Trowbridge, A. L. O. E., M. Ballantyne, Caroline Hadley, and many from other authors not so well known to fame. The work is embellished with over two hundred illustrations.

WATSON'S COMPLETE SPELLER (price 25 cents), and a One Term's Course in Latin, or the Study of Latin Simplified and Condensed (price 20 cents), published by A. S. Barnes & Co., New York, are excellent text-books, which every teacher should examine for himself. Even though it may not be convenient to introduce these books into all schools, teachers can gather from them many useful hints, and by putting the suggestions into practice, they can vastly improve on the old methods of instruction.

SCIENTIFIC AND USEFUL.

IT is difficult to clean glass bottles and other vessels that have been soiled with fatty substances; but if a concentrated solution of permanganate of potassium, to which a few drops of hydrochloric acid are added, be used as a wash, the cleansing is effected speedily and thoroughly.

To show the comparative estimation placed upon the principal American woods used in cabinet-making, Professor C. S. Sage gives the following table of actual prices, per 1,000 feet, in the Boston market:

Black Walnut	$75	Butternut	$50
White Oak	65	White Ash	40
Cherry	60	Sugar Maple	40

IN Germany, according to the Polytechnic Review, sawdust is employed in the production of sundry articles both useful and ornamental. A plastic mass is prepared, composed two-thirds of hard-wood sawdust and one-third glue, resin, or other binding material. This is compressed in brass molds, and the moisture driven out by heat. The articles made are bass-reliefs, pianokeys, door-knobs, brush-handles and backs, etc.

M. TREUVELOT, a foreign scientific observer, has been experimenting with butterflies in order to solve the disputed question as to the use of their antennæ. He found that they could fly when deprived of the antennæ. It has been stated by other entomologists that they fell at once without any power of flight. When temporarily blinded by covering the eyes with India ink, they could fly without dashing into objects, provided the antennæ were left on, but if cut off they fell at once. When blinded they did not perceive sugar by the antennæ, but if the stump were touched with it, the tiny proboscis was at once unrolled and searched for it. When the stumps were covered with gum arabic, they were insensible to the seductions of sugar water. M. Treuvelot concluded that the sense located in the antennæ is not merely that of touch, hearing or taste, nor a combination of all three; but one that differs essentially from any experience by human beings; it is a kind of feeling and smelling at a great distance.

LIEUTENANT SAYCE, a retired officer of the British army, has patented a steel shield for soldiers. It is carried, when required, by the men suspended in front of the chest and in this position protects the vital parts of the body; but the particular feature in these shields, and which the inventor claims as the special novelty, is their use, when several are set up in a line upon the ground, in protecting the men while lying down or kneeling and firing from behind them. The shields, being slipped off the hooks, are set up by themselves, a hinged double rest at the back supporting them, this rest requiring to be fitted in a particular manner, to enable the shield, when standing by itself, to resist the shock of a bullet striking it, without being overturned. This arrangement proves to be a considerable difficulty in perfecting the invention. The principal objection is the weight; more than this would have to be carried extra, were it once proved there was an advantage in doing so, heavier weights having been formerly submitted to in ancient times, when physical activity was as necessary as it is at the present. One cart would carry a supply for two companies of a regiment, as the shields need not be issued to the men until they are in proximity to an enemy.

BRIC-A-BRAC.

ROMANCE AND REALITY.

"HERE is the bed where Nellie slept."
She turned the snowy coverlet down:
In through the lattice the ivy crept—
What a blissful change from the heated town!

"Good night." She left me: the moonbeams fell
On flower carpet and dainty bed;
I smoked and pondered, but strange to tell
I couldn't get Nellie out of my head.

"My aunt had never a friend," I said,
"Named Nell, or Nellie, yet I am here
Seated on Nell's, or Nellie's bed—
My clothes on Nell's or Nellie's chair.

Nellie! I always liked that name,
The gods are propitious, and I perchance,
Who voted the country dull and tame,
Am here beginning my life's romance.

"How fragrant this soap, and this ewer quaint
Has the water held in which Nellie washed—
Nellie, whose face needs no nasty paint:
And the basin, too—what a pity 'tis smashed.

"How soft this towel! Nellie or Nell,
Has hung it thus. What a dear, sweet girl
She is to be sure; and this brush—ah, well,
I wish I could drop on a truant curl.

"Is she a blond? or is she a brunette?
I'm sure to love her. These nights of bliss
Are made for loving. I knew that yet
I should meet my fate in some way like this."

I sank on the pillows. "O dear, sweet Nell,
To think that your cheek has pressed this down
And your limbs reclined here, my country belle,
One day to be queen of my house in town."

My sleep was broken. 'Twas not the breeze
That sighed through the trees the whole night long;
I rather feared that it was the fleas,
Though the thought seemed wicked, and base, and wrong.

I looked in vain in the breakfast room
For Nell, or Nellie. She was not there.
"Dear aunt," I said, "are we not too soon?
Miss Nell has not finished her morning prayer."

"Nellie come here." With cheeks aflame,
I could not raise my eyes from the floor
But grim was the air of the ancient dame
As Nellie, her poodle, came in at the door.

[From the Argonaut.

SOME SALARIES.

Increase in the salaries of some of Government officers of the present date compared with the compensation to incumbents of the same offices in 1832, forty-six years ago:

1832	Salary.
President Andrew Jackson	$25,000
Vice-President John C. Calhoun	5,000
1878.	
President R. B. Hayes	50,000
Vice-President W. A. Wheeler	10,000
CABINET.	
1832.	
Secretary of State Ed. Livingston	6,000
Secretary of the Treasury Louis McLane	6,000
Secretary of War Louis Cass	6,000
Secretary of the Navy Levi Woodbury	6,000
Postmaster-General Wm. T. Barry	6,000
Attorney-General Roger B. Taney	3,500
1878.	
Secretary of State William Evarts	8,000
Secretary of the Treasury John Sherman	8,000
Secretary of War George W. McCrary	8,000
Secretary of the Navy R. W. Thompson	8,000
Secretary of the Interior Carl Schurz	8,000
Attorney-General Charles Devens	8,000

FOREIGN MINISTERS.

1832. To Great Britain.		1878.	
Martin Van Buren	$9,000	John Welsh	$17,500
To France.			
William C. Rives	9,000	Ed. F. Noyes	17,50
To Russia.			
James Buchanan	9,000	E. W. Stoughton	12,00
To Spain.			
C. P. Van Ness	9,000	Jas. Russell Lowell.	12,0

GOOD NIGHT.

Good night!
Now the weary rest by right,
And the busy fingers bending
Over work that seems unending,
Toil no more till morning light
Good night!

Go to rest!
Close the eyes with slumber prest;
In the streets the silence growing
Wakes but to the watch-horn blowing.
Night makes only one request—
Go to rest!

Slumber sweet!
Blessed dreams each dreamer greet;
He whom love has kept from sleeping
In sweet dreams now o'er him creeping
May he his beloved meet—
Slumber sweet!

Good night!
Slumber till the morning light,
Slumber till the new to-morrow
Comes and brings its own new sorrow,
We are in the Father's sight!
Good night!

RICH MEN'S SONS.

THE president of one of our largest banks said to us a day or two since, that a rich man's son had just left his place, and he was the last man of the kind he would ever employ. The man was faithful, honest, and fulfilled intelligently and well all the duties required of him; but just as he had become accustomed to his work, he found out it was too confining, and a raw clerk had to be put in his place. A bad look this for rich young men; but it is the old story repeated for the thousandth time. If rich men's sons will not endure the drudgery by which nearly all their fathers secured money and position, they must take a secondary place in the next generation; and oftener they drop out of sight amid the idle, worthless herd, if, indeed, they escape an association with loafers and criminals. What say the labor reformers to facts like these, for facts they are beyond question. Nearly every man in any leading position in the community began life poor. Let the sons of our rich men take warning and go to work honestly and faithfully every day if they hope to fill the positions honorably held by their fathers.—*Tribune.*

Domestic Economy.

CONDUCTED BY EMILY MAPLE

FRESH SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

AUTUMN has come; we are glad to leave the garden—stripped as it is of floral treasures and all its beauty gone—to gather around the kitchen fire in the morning, as long as housekeeping duties keep us in that part of the house. What a work is ours at this season of the year! Before cold days come to benumb our fingers or our faculties, we must

"Open the camphor trunk,
And bring the mittens down"

for the many little hands that need them; repair warm garments, and prepare warm flannel underwear for the dear ones in our circle. The kitchen fire is very pleasant; its homely glow has something honest and hearty; the stick that sputters and glows is grateful to our chilled hands and has a peculiar charm as coming from our own piney woods where, while the summer lasted, we often went to search for flowers, bringing to mind the sweet companionship of one, the "gentlest of my friends." But sentiment is not allowed in these degenerate days, I believe, at least so say the would-be fashionables, and just now we are busy with vegetables. Long ago I banished from the house cellar all potatoes, cabbage, celery or any other vegetable in quantity, after a severe lesson in typhoid fever, that was caused by the unavoidable decay in early spring-time. It is not difficult to build a root house, but better still for convenience in a cold climate, is a barn cellar for storage of a root crop of any kind. The air of these cellars is generally more even than that under the living-rooms, and all vegetables require to be fresh and crisp. I wonder how many people pare their potatoes and other tuberous vegetables an hour before boiling, leaving them in cold water for that time. It is a very great improvement. In this, as in many things, I often think how "trifles light as air" make a great difference in our daily life, and in nothing more than in plain cooking.

CLEANSING OF DRAINS, ETC.

I TRUST my RURAL sisters will not rest content when *house*-cleaning is over or consider their work done, until every sink, drain, cesspool, cistern and well, if need be, are looked to and emptied, cleaned or deodorized. Copperas, carbolic acid and chloride of lime are all excellent disinfectants, and were these agents unstintingly used about our drains, cesspools and outbuildings, there would, unquestionably, be less malarial and typhoid fevers and fewer cases of that dreaded disease—diphtheria—among our little ones. MARY B.

CHEAP PAINT FOR OUT-HOUSES.

WE have found that the skins, cleanings and scrapings of paint cans and pails, when boiled up in oil, make a most durable as well as cheap coating for outside work. MRS. J. BRADY.

Chickasaw Co., Iowa.

DOMESTIC RECIPES.

Whigs.

One egg, one cup of sweet milk, one cup of sifted flour, a pinch of salt. Bake twenty minutes in gem pans.

Washing-Fluid.

Two pounds of soda ash; one-half pound of unslacked lime; add nine quarts of cold water and boil twenty minutes; take from the fire and add two quarts of cold water; let settle, pour off and bottle. Soak the clothes over night in cold water; in the morning, wring out, soaping the soiled parts. To a good-sized boiler half full of water, allow one-half pint of the fluid. Put in the clothes and let boil fifteen or twenty minutes. If the clothes be then taken through one suds and two or three rinsing waters, the RURAL housewives will find that by this process much time and labor have been saved, while their clothes are very white and in no wise injured. I write from experience, having used this fluid in my family seven or eight years.

California Cake.

One egg, one cup of sugar, butter the size of an egg, one cup of milk, three heaping teaspoonfuls of yeast-powder, sifted with the flour, which should be less than three teacupfuls. Flavor to taste. It will bake in fifteen minutes in a quick oven.

MRS. MARY E. GARRISON.

Orange Co., N. Y.

QUERIES ANSWERED.

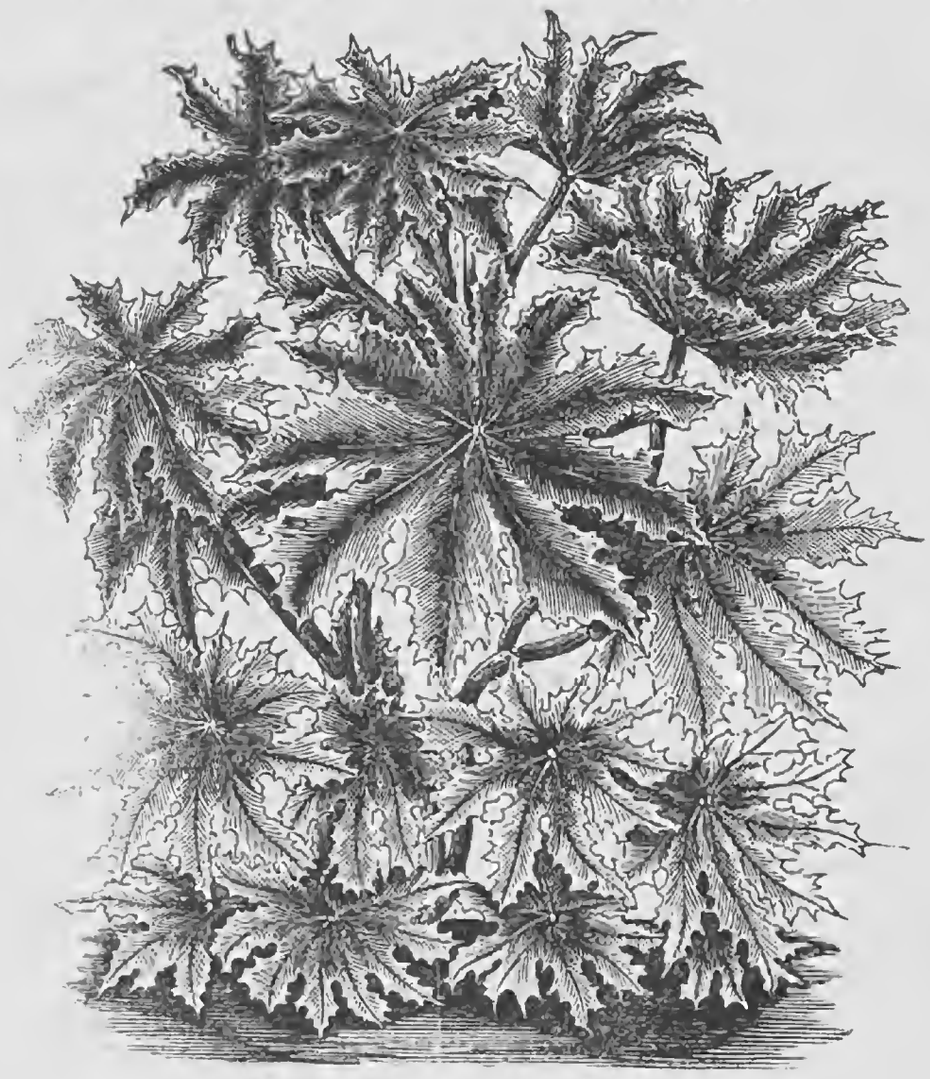
O. E. W. wishes directions for varnishing wall paper.

ANS.—In order not to injure the colors, and to prevent the absorption of the varnish, give the paper a coat of sizing, made by dissolving *white* glue in boiling water and then diluting to the proper consistency. If the paper be light and delicately colored, give a coat of white varnish; for less delicate work, furniture varnish. One coat will generally prove sufficient. Much depends upon the fineness of the brush. No part should be gone over the second time before drying.

WANTED.—A home-made varnish for shoes.

SUBSCRIBER.

ANS.—Put one-half pound of gum shellac, broken into small pieces, into a quart bottle; then add thirteen ounces of distilled or filtered water. Subject to a gentle heat until no odor of alcohol is perceptible, after which add four drachms of gum-arabic dissolved in three ounces of water. Mix and strain.



RURAL BRONZE RICINUS.—(See page 710.)

YUCCA FILAMENTOSA.—(See page 710.)

PLEASE give me a recipe for a good, cheap violet ink? ANON.

ANS.—The following is the best recipe that we know of: Mix one drachm of the desired aniline color with one and a half ounce of alcohol in a glass bottle; let it stand three or four hours and cover with alcohol, cork tight and put in a warm place; let stand for two or three days, shaking several times a day; then add a piece of camphor gum as large as a hen's egg; shake well and in a few hours add one ounce of lamp-black. Should it get too thick, add alcohol.

THE MARKETS.

PRODUCE AND PROVISIONS

NEW YORK, Saturday, Nov. 2, 1878.

BEANS AND PEAS.—With cooler weather local trade becomes more diversified, and the Bean market shows some neglect. Marrows are weak; wholesale buyers can obtain some concession from extreme rates. Mediums look as though they would not hold $1 65 for prime. Common quantities of any variety almost unquotable. White and Red kidneys, Pea and Blue beans a little something in buyer's favor. Western and Canadian field peas 70@75c., the latter in bulk and bond. Green peas slowly at $1 25@1 35; Southern B. E. peas, $2 50@2 60 per 2-bush. bag. Medium beans range fair to prime, $1 50@1 65; marrows, do. $1 50@$1 75; Pea, $1 60@ 80; White kidney, $1 60@1 80; Red kidney, $1 75@2 10; Black turtle soup, $1 50@2. Receipts of beans for week, 12,200 bush.; exports, 1,885 bbls.

BUTTER.—The receipts have included a better collection of fine quality State, and as the local demand has been looking for that style, business is more unlimited, but does not show much price-varying strength. In full dairies 21c. has been quite frequently made, but they must have a liberal lot of late made tubs to be so quoted. The outlook for summer State is very gloomy; there is no local use for off-flavors; butter, and export help is seemingly hopeless. Western butter, as before, is doing well where quality gives it a positive precedence of State, prices considered. We quote:

Dairy pails, choice, 20; fair to prime, 14@21c.; choice, half-tubs, 22@23c; other, 16@21c.; Welsh tubs, choice fresh, 21@22c.; other, 15@18c.; Welsh dairies, 18@20c.; fair dairies selected, 20@21c.; good, 18@19c.; Firkin, dairies, choice, 19c.; other, 15@18c; low grade, State, 10@13c.; State creamery, small lots, 27c.; fines, 21@23c.; held lots, 18@21c.; sweet cream, 23@26c.; Western creamery, choice, 25@27c.; fair to prime, 20@25c.; held lots, 18@19c.; dairy packed, 15@17c.; common to good, 10@14c.; factory makes at 6@12c., with little movement.

Receipts for week, 29,527 pkgs.; exports, 5,760 pkgs.

BROOM CORN.—Small lots of new are arriving: a car lot of about medium green brought 5½. Old stock quoted at for choice green hurl, 6@7c.; medium hurl, 5@6c.; choice short green, 5½@6½c.; medium short green, 5@6c.; red stubby and crooked, 4@5c.

CHEESE.—These light shipments show the indisposition to operate that has prevailed through the week. The inactive and lower country markets, and a decline in Liverpool caused easier prices and the spiritless situation. At the close 9 is the top price for fancy, although through the week up to 9¼, and even 9½ has been made for special lots.

Quotations are 8c. for fancy late made; 7@8c. for good and prime; 6@7c. for fair to good; 3@5¼ for skimmed. State, farm dairy at 8@9c. for good to choice. 6@7½c for fair to good. Wisconsin factory, fine to fancy, 8½@9½c; do. good to prime, 7½@8½c.; do. fair to good, 7@8½c. Western factory, fine and fancy, 8½@9c.; good and prime 6½@7½c.; fair, 5½@6c.

Exports past week, 22,688lbs.

Gold closes at 100¼.

Liverpool cable 47s.

EGGS.—Fresh stock has sold readily at the improvement, closing firm. State and limed stock has little call. Near points, 24@25c.; State and Penn., 22½@23c.; Western and Canadian fresh 21@22c.; poor or State, 19@20c.; limed, State, 15@17c.; Canadian, 15@16c.; Western, 13@16c.

Receipts for the week, 7,253 bbls.; do. last week, 7,148 do.

FLOUR.—Within several days a much more active export movement has been noted on both low grade winter and spring grades, and the course of the market has been for these to better prices. The higher grades are having more attention and are at steadier prices.

Latest prices are: $3.60@3.60 for very inferior to choice superfine State; $3.60@3.90 for poor to good extra do., odd lots and lines; $3.90@4.25 for good to very choice do., strictly choice and fancy lots above this; $3.00@3.60 for very inferior to choice superfine Indiana, Iowa, Michigan, &c.; $3.60@3.90 for very inferior to good shipping extra do. and $3.90@4.25 for good to choice extra do.; common to about choice white wheat extras, $3.90@4.85, choice to strictly fancy do. at $4.90@5.75; red and amber winter wheat, inferior to very choice trade and family at $3.75@5.50; round hoop Ohio at $3.70@4.10, and trade and family brands of do. at $4.15@5.50, the latter rate for very choice; St. Louis, $3.90@4.60 for very poor to good extra, and $4.60@5.75 for good to very choice; Minnesota clear, very inferior to fancy, at $3.90@5.70; Minnesota "straight," very inferior to very choice at $4.60@6.00; (about choice to fancy old at $6.00@6.50), and patent fair to very fancy at $5.25@8.50; mixed stock at from $2@4 75; city mill extra at $4 75@5 00 for West Indies (the latter rate for strictly choice in new packages); do. for England, $13.75@3.00; do. trade and family extras, $5.10@6 00; do. for South America, $5.00@5.50 for fair to very choice; No. 2 at $2.25@3.00 for very inferior to choice.

FRESH FRUITS.—Fine retailing fall apples are doing better, but the range continues low on Winter and common sorts. Exports for the week, 13,150 bbls. Fine Spitz and fall $1 50@2, the latter for King of Tompkins Co. Prime red winter, $1 25@1 37; good greenings, $1@1 25; common to fair mixed lots, 75c.@$1 12. Cranberries quiet, few extras here; eas ern bbls. $5@7 50, a few at $8; N. J. bbls. $4@6; crates, $1 75@2 for choice; $1 25@1 62 common to fair. Quinces rule high. Choice apple, $5@10 per bbl.; other $6@9, the lower for spotted. Late varieties of bbl. Pears quoted. Duchess, $8@10, extra; poor, $5@6; Lawrence, $7@8; Vicars, $4 50@5 50. Bu-lon fancy bxs. make a good display ranging $2 00@3 50 per bush. box, the higher rate for B. Clairgeau. California pears not turning out well. Seckel vs. Nellis $4@4 50; Vicars, $3; Lawrence, $4; California grapes, Tokay, $7@8 per box. Emperor, $6. per 40 lb. case. Cal Quinces $1 50@1 per bush. Hot-house grapes 50c. per lb., B. Hamburg and Muscat. State Catawbas 7@8c. per lb.; remnants of other kinds @¾@. Chestnuts steady, $1 00@4 per bush. Hickory nuts, Shellbarks, $2@2 50; B. Walnuts, 70c. Peanuts are low, arriving quite green. Virginia hand-picked $1 25@1 30; other, 95c.@$1 20.

GRAIN.—Exporters have resumed operations in wheat, purchases of which for shipment are large, and the whole situation of the market is better, with the calmer financial situation on the other side.

Latest sales are, at No. 2 spring at 94@96c., the latter for Milwaukee; New York No. 2 spring, November option, at 94c; New York, No 2 spring, December option, at 95@95½c.; No. 2 northwest, November option, at 96c.; No. 3 spring at 85@86c.; rejected spring at 80c.; ungraded spring at 80@90c; ungraded amber at $1@1 05; ungraded Michigan at $1 00@1 02; No. 2 amber at $1 02½@1 04; do., November option, at $1 02½@1 01; do., December option, at $1 04@1 04½; ungraded red at 97c.@1 05; No. 1 red at $1 00@1 05½; do., last half November, at $1 05½; No. 2 red, at $1 04@1 05; do., November option, at $1 04@1 15; do., December option, at $1 05½@1 06; do., January option, at $1 07, No 2 red, steamer grade, at $1 03½; ungraded white at 95c.@$1 01; extra white at $1 08½@1 09½; white State at $1 07@1 09; No. 1 white at $1 06½@1 07; do. November deliveries, part at $1 07; No. 2 white at $1 13. Rye at 61@64c. for State, and 59@60c. for Western. Corn at, for steamer mixed at 45½@47c.; ungraded mixed western at 46@47½c.; New York No. 2, at 47½@47½c.; New York No. 3 at 45c; New York No. 1 white at 53c. for car lots; low mixed at 44½c. for car lots; New York No. 2, November option, at 47¼@47½c.; do., December option, at 48½c.; steamer mixed, November option, at 47c.; do., December option, at 47@47½c. Oats are, for mixed State at 27½@30c.; mixed western at 30½@35c.; white western at 29@32c.; white State at 30@35c.; New York No. 1 at 30c; New York No. 1 white at 32@35c, asked and 33c. bid; New York extra white at 35c.; New York No. 2 at 28½@29c.; New York No. 2 white at 30½c.; New York No. 3 at 27½@27½c.; No. 3 white at 28½c.; No 2 Chicago at 29c.

HAY AND STRAW.—Prime grades are wanted and shipping stock in better demand.

Latest sales are at 40@45c. for shipping, and 65@75c. for retail qualities. Straw quoted at 35@45c. for long rye; 30@35c. for short rye.

Exports past week, 275 bales.

HOPS.—Emmet Wells, in his circular, says: "Receipts are largely on the increase, reaching 4100 bales for the week. With scarcely any export demand, and only a moderate call for brewers, stocks are accumulating. Values remain unchanged, though it is believed that if sales are forced, concessions in price will follow. We hope soon to open a lively trade with England for some of our finest hops, and this expectation on the part of holders of such keeps the price firm. Hops from California, Washington Territory and Oregon are now arriving here in large quantities; these goods make very fine

samples, and ought to meet with more than usual favor with our brewers, in view of the great scarcity of choice New York State hops exporters will also find them very desirable for their London customers. In next week's circular we hope to report sales and give quotations on these hops."

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, low to fair, 8@10; Eastern, new crop, 10@12; Wisconsin, new crop, 10@12; Yearlings, growth 1877 (nominal) 5@8; Olds, all growth, 2@4.

OIL-CAKE quoted at $23 for Western.

PROVISIONS have been depressed lower on large arrivals of hogs at the West. Mess pork quoted at $7.80 S for spot lots; $7.70 for November; $7.75@7.85 for December, $7.75 bid for January. Bacon at 5@5¼c. for 10 lb clear and 5¾c. for short clear. Lard at $6.15 for spot; $6.25@6.27½ for November; $6.30 for December, and $6.35@6.37½ for January. Tallow at 6¼@6¾c. for prime. Stearine at 8¾c. Beef Hams at $9.50.

POULTRY AND GAME.—Live is steady for the season: city dealers as yet have been compelled to withdraw through free receipts of Dressed. Chickens, State, Penn., and N. J., 10@11c.; Western, 9@10c. choice fowls, 10@11c.; common, including the style of western now arriving, 8@9c.; roosters, 5@6c. Turkeys, 10@12c.; good to prime common, 8c.; Ducks, 40c.@$1, pair. Geese, near prime, $1.25@1.62; other, $1@$1.12.

Dressed poultry has had an unsettled week; rainy weather damaged the appearance of early offered stock, and low prices were forced. Now the weather is somewhat frosty, and buyers are purchasing with more confidence.

Dry picked turkeys, 14@15c.; prime State and N. J., 13@14c.; fair, 12c. Chickens range 12@15c. for good to dry picked. Fowls, Phila., 12@14c; good, 11@12c.; common, 9@10c. Ducks, choice, 15@16c.; other, 12@14c. Geese, 8@10c., for Western to dry picked State. An evidence of the approach to winter is given by a long list of game. Market good with better weather. Quail, doz., $2; grouse, trapped, pair, 75c.@$1; partridges, 75c.@$1. woodcock, 40@50c. English snipe and plover, 1 25@1.50c. doz.; soft-fed pigeons, $2; Illinois, $1.40@1 60; canvas-back ducks, pair, $1.50; red head, 75c; Mallard, 50@60c; Teal, 35@40c; common, 30@35c.; Rabbits, 30@40c.; Venison, whole deer, 10@11c.; short saddles, 15@16c.; long do., 12@14c.

SEEDS.—Clover is quoted at 5½@6¾c.; timothy at $1 55@1 70, and flaxseed at $1 40, with operations limited.

VEGETABLES.—Supplies of potatoes have accumulated quite freely under the late strong prices, and the market is easier for some buyers, but no important decline is intimated. Sweet plenty and dull. Early Rose, Eastern, bbl., $2 87@3; State, $2.25@2.75; Peerless and Jackson, $2@2.50; P. Blows, $1.75@2.75. Del. Sweet, $1.50 1.75; Va., $1 25@1.37. Onions doing better. White, $1.37@1.75; red and yellow, $1.25@1.50; Chester, $1@1.12. Squash, marrow, $1.25@1.50; Hubbard, $1. 0 1.75. Cabbages, per 100, $3@4. Cauliflower, bbl., $1@2. R. Turnips and Beets, 75c. Carrots, $1@1.25. Pumpkins, 10., $3@6. Celery, 75@87c. doz.

Exports, potatoes, past week, 9,281 bbls.; onions, 283 do.

LIVE STOCK MARKETS

Saturday, Nov 2, 1878.

BEEVES.—Receipts for the week, 9,391 head do last week, 11 692 do. Medium to good natives advanced 4c, in price Wednesday last, and are ¾c. higher than at our last. Coarse oxen sold at 6¾c. dress 54 lbs.; range at the close for good stock, 7@9c. dress, 55@56 lbs.; Cherokee and Colorado steers, 7@7½c. Exporters paid 9¾c. for extra stock.

COWS AND CALVES.—Nothing has transpired that essentially changes our former range.

VEAL CALVES.—Prime veal in good demand. Hog dressed beginning to arrive regularly; best quoted 11c.; other, 5@10c.; N. J. choice fed, five, 7¼@7½c.; good and extra heavy, 5 7c.; State, 6@6¾c.; fed calves, 5½@4¾c.; grasses 2¾@3¾c.

SHEEP AND LAMBS.—Receipts for the week, 27,928 head; do. last week, 29,129 do. Supplies large and prices favor buyers in both sheep and lambs. Prime sheep, 4¾@4¾c.; other, 4@4¼c.; common and ewes, 3½@3¾c.; lambs, 4@5c.

SWINE.—Receipts for the week, 37,421 head; do., last week, 35,547 do. Sample sales as follows: Western, 150 lbs, average, 3¾c.; Kent, 143 do., 3¾c.; 116 do., $3 45¾ per 100. Ohio, 185 lbs. average, $3 56 do.; 150 lbs. average, $3 60. N. J. dressed pork, light, 5¾@6c.; medium, 5@5¾c.; heavy 4½c.

PUBLISHERS' NOTICES.

OUR new Premium List, specimen copies and agent's outfits will now be forwarded free to all who apply.

DR. SYKES, whose announcement appears in this issue, is, we are assured, a most trustworthy gentleman, who possesses a valuable specific for catarrhal affections. He is, in himself, a proof of the efficacy of his remedy.

THE ALEXIS REVOLVER, advertised in this issue, is a tremendous bargain. It is a perfect gem, just like the picture, and would actually be cheap at $6. They are all that is claimed for them, and more, too. None should neglect this chance to provide themselves with a first-class weapon at a great deal less than it actually costs to manufacture.

THE Blake Crusher, advertised in this number, is commended to those in authority in towns and villages as being a cheap and efficient piece of machinery for either making or repairing roads. It will pulverize the hardest rock, and supplies a material that, where used, will give the highest satisfaction, and by keeping the roads in good repair, reduce the cost of maintaining them in that condition. Send for circulars.

IN this issue will be found a large advertisement of Daniel F. Beatty, the great piano and organ man of Washington, N. J. This is the first gun from Mr. Beatty since his return from an extensive tour through Europe, and as usual it is aimed direct at high prices. There is no manufactured article, except perhaps sewing machines, on which there has been anything like the reduction that there has been for the past few years on musical instruments, and the fact is largely due to Mr. Beatty. His aim has always been to manufacture the best piano and organ that could be made, and then sell them for the least possible price. The result has been the rapid building up of one of the largest trades on the continent. His sales, notwithstanding the hard times, are simply enormous. It will be noticed that he to-day offers one of his handsomest styles of organs at a still greater reduction. Attention is urgently called to the advertisement as a reduction from his very low prices is not to be disregarded at this time, particularly when the offer comes from a house having a world-wide reputation for honest, square dealing.

SPECIAL NOTICES.

A FAVORITE YOUTH'S PAPER.—The YOUTH'S COMPANION of Boston has steadily grown in public favor for more than fifty years, and is now one of the most admirably conducted papers in the country.

YOU CAN CURE YOUR CATARRH

By the Same Means we Cured Ours.

Catarrh of Head and Bowels, Deafness, Etc.

167 THIRTIETH ST., CHICAGO, Jan. 1, 1878.

DR. C. R. SYKES—*Dear Sir;* I was a great sufferer from Catarrh for about twelve years previous to March, 1876. The disease located mainly in my head and bowels, causing painful ulcerations in my nose, and I could scarcely breathe through that important organ.

During the last two years of that time the catarrhal condition of the bowels resulted in ulceration, and the discharges and other appearances were much like a chronic diarrhœa.

The stomach was also involved, and this organ, together with the bowels, would at times become so distended as to become terribly uncomfortable, then relax, until "I feel all gone," is the best expression I can give for it.

My eyes were badly affected, but worse to me if possible than all the rest, was a deafness that nearly disabled me for business. It came to be so bad at last that at church I had to take a front seat, and even then, with my head spread out back of the ear to catch and concentrate the sound, I seemed to miss about half the sermon.

My memory was also greatly impaired. I shall not attempt a description of my sufferings; you from your own knowledge of the disease, can well judge what they must have been.

In March, '76, I heard of and tried your "SURE CURE," and took it according to directions; I experienced great satisfaction from the first bottle, and after about four bottles were used, my hearing *suddenly* cleared up; I was in church at the time, and it seemed as if a new revelation had been opened up to me.

I discontinued the medicine gradually, the ulcers in my head and bowels healed, the chaos in my brain was restored to order, in fact I could hear, and smell, and breathe through my nose, and have been free from the disease since that time. I cheerfully recommend your "SURE CURE" to all like sufferers, and have known several cases of catarrhal colds that yielded promptly to the remedy.

Wishing you a "Happy New Year" in your noble work,

I am, respectfully and gratefully yours,
A. C. DAVIS.

Nose Raw—Bones Eaten Out.

148 N. ADA ST., CHICAGO, Sept. 10, 1877.

OVER two years ago I was cured by Dr. Sykes' remedies. The whole inside of my left nostril was perfectly raw, and it had eaten clear around the division of the nose on the lip. Two pieces of bone had got loose and came out. I had not been able to smell for three years, or taste anything in a long time, and my lungs had got quite bad also, and I was in despair.

I had doctored at out six months previous to going with my husband to see Dr. Sykes, and not getting any better, but rather worse, was afraid I could not be cured; but in about three months the cure was completed in every particular, and has remained so ever since. MRS. S. J. HILSON.

Loss of Voice, Etc.—A Resurrection.

OAKLAND, Douglas Co., Oregon, Dec. 22, 1876.

I SUFFERED indescribably from Catarrh for fifteen years, trying various remedies and physicians, all to no benefit. It had run into bronchitis, which threatened my life. I had been scarified, cupped, blistered, and wore setons in my back till I was nearly exhausted. My lungs, stomach and bowels appeared to be perfectly ruined. I had not preached in eighteen months, and had so far lost my voice that I could hardly make my wants known.

This was my state when, in June, 1875, I accidentally heard of "Dr. Sykes' Sure Cure for Catarrh." I had lost all hope, but thought I would try just this one more remedy. My course had been downward for years, until I was reduced from 175 pounds weight to about 120. I took the measles soon after commencing the "Sure Cure" (at fifty-five years of age). Physicians and friends all said I was surely gone now, but I clung to the "Sure Cure" as my only hope, and soon began to amend.

In six months I had gained forty pounds, and now my voice and health are fully restored. My case seems more like a resurrection than a mere cure. I think the remedy rightly named—'Sure Cure'—and I cheerfully recommend it to a suffering world.

JOHN F. DENNY.

Hearing, Sight and Memory Restored.

FACTORYVILLE, Cook Co., Ill., March 21, 1877.

ABOUT the first of last February I got one bottle of your Sure Cure and Insufflator. I had been suffering about three years with Catarrh. I am now using the third bottle, and have used one of your Ear Specific; and words cannot express how good I feel. I am a new man entirely. My head, which had been completely stuffed up, is now as clear as can be; the swelling has all left my nose; my eyes, which had been for two years dead and watery, are now as bright as diamonds. I was so deaf that I was completely stupid, and I could not remember anything; now my hearing and memory are as good as ever.

Before commencing with your remedies, I called on Dr. ——. He said I had catarrh in its worst form, and if I did not have it cured immediately, I would lose my hearing entirely. He said he would cure me for forty-five dollars. So you see I have saved over forty dollars, as your medicine has cost me only about four dollars, and I could not expect more from it if it had cost me four hundred. You can use this as you wish with the greatest pleasure.

To Dr. C. R. Sykes. WM. MURRAY.

Child of Five Years.—Terrible Scent Cured.

MRS. M. M. STACY, 58 Fulton St., Chicago, March, 1875, brought her only daughter of five years to my office. She scented so bad from her head as to be soon noticed. Her mother said: "It seems half the time as though I could not dress her." Had been so about a year, and found nothing to do her any good. April 22, 1875, Mrs. Stacy wrote as follows: "To say that your treatment for my little daughter was all that you recommended, would express it but feebly, for I think in her case it has surpassed your expectations, as one bottle of your 'Sure Cure' has wrought nearly a cure, if not wholly, for her. I am only too happy to add my name to your list of wonderful cures.

[No more was needed; the cure was complete.]

Came Home to Die—Returned Cured.

ON the 11th of September, 1876, Miss Annie Green, aged twenty-four, was brought to me by her mother for treatment. Her palate (the Uvula) was entirely gone, and a hole as large as the end of my thumb, flattened, was eaten through the veil above, also a hole through from the inner to the outside of the nose as large as a pipe-stem. These were so foul as to be almost unendurable, and as raw as they possibly could be.

Her throat and stomach were completely deranged. Lungs weak and sore, with bad cough, no appetite and great general debility; her weight was reduced to only eighty-five pounds. She had been living in Colorado, where she had been treated by several physicians, at an expense of nearly $500—all in vain. She said: "I have come home to my mother to die, but from what she has heard of you she thinks perhaps you can cure me."

The only medicines I prescribed were the 'Sure Cure, Liver Tonic," (with one additional ingredient) and an ointment. The good effects were apparent in three days, and in six weeks the holes in palate and nose were healed sound, the breath sweet, no cough or soreness of lungs, and a gain in flesh of twenty-two pounds. She soon after returned to Colorado and went to work. In about two months she wrote her mother that she was entirely free from her old troubles and weighed one hundred and thirty-five pounds, making a total gain of fifty pounds.

On the 16th of the following October, Miss Green, with tears of gratitude, made this, her statement, in my office, which I took down in presence of Mrs. Ball, of 12 Clayton street, and Miss Nora Gubbins, of 24 Dussold street, Chicago. DR. C. R. SYKES.

This statement in regard to my daughter is true in every particular. MRS. KATY GREEN,
Sept. 18, 1877. 151 N. Larrabee St.

Terrible Case—Wonderful Cure.

NEW RUTLAND, Ill., June 17, 1876.

DR. C. R. SYKES—*Dear Sir:* I feel it my duty to give you a condensed history of my case. In the summer of 1872 I took a very severe cold, which settled in my head. I paid but little attention to it, as I thought it would wear out, but it came very near wearing me out instead, as the sequel will show. I had a constant pain over my eyes and through my forehead, and as the disease advanced the discharge from my nose became of a thick, yellowish matter, and very offensive. Finally the disease extended to my throat, and eat my palate off; then it attacked my tonsils and eat them both out; nor did this horrible disease stop there, but in the fall of 1874 it eat a hole through the roof of my mouth that finally got so large I could run my fore-finger up as far as the first joint, and was as raw and ulcerated as it could be, and finally the scent became so bad that no one could stay in the room with me any length of time.

In the meantime, however, I used nearly all kinds of medicines that were recommended to me, besides physicians and surgeons, and all to but little benefit, only for the time being, but which cost me an immense amount of money; in fact, nearly reduced me to poverty at last.

In the spring of 1875 my disease assumed the form of asthma, and God only knows what I suffered. I had to give up all labor and was confined to the house the most of the time. In July, 1875, I went to Michigan for my health, from there to Northern Iowa, but continued to grow worse, until life became a burden to me, and I prayed to God to put an end to my sufferings. I had lost my voice so that for about two years I could scarcely speak above a whisper. At last I resolved to come home and patiently await the grim monster—Death. I passed through Chicago on the 15th of last March, but I never dreamed that there was in that city such a Good Samaritan as I have since since found in Dr. Sykes. At this time I was but little more than a skeleton, weighing but one hundred pounds, and could not walk ten rods without breathing so hard as to be heard by persons some yards from me, and when I arrived home I was so changed my mother hardly knew me. A while after this, I happened to read one of your pamphlets, entitled "The True Theory of Catarrh," which seemed so rational and common sense, I procured some of your "Sure Cure for Catarrh," and before I had finished one bottle my breath was sweet as honey, and while using the half dozen bottles the amount of slime and matter that I raised from my throat and lungs was truly enormous, almost beyond belief, for it might be counted up by quarts, if not by gallons.

Now I raise but very little, my voice is strong and clear, no more contraction of the air passages, or asthma, and I feel better and stronger than I have felt for at least five years. I now weigh 172½ pounds, and am still gaining. My friends here look upon my cure so far as "a miracle wrought from God." And when I meditate upon my condition now to what it was three months ago, I will often rub my eyes and get up and walk around to make sure that I am awake—that it is not all a dream.

My mother has watched the effects of your "Sure Cure" on me with an interest such as none but a widowed mother can feel for an only son. And every night and morning, when we bow around our family altar, we offer up an earnest prayer that you may be blessed and prospered. Oh, thanks be to God and to Dr. Sykes that I have been spared such a horrible death. My dear sir, I owe you a debt that I never can repay. My heart overflows with gratitude to you for the kind interest you have taken in my case—a stranger, and if you think best you may publish this letter, and if any one doubts for a moment the truth or veracity of this plain statement, I would refer them to Marcena A. Hicks, or Wm. H. Weober, both the most influential citizens of our town. Respectfully yours. PERCY T. ODEKIRK.

[Mr. O. was completely cured, and taught school in Dunan, Fayette county, Iowa, all the following winter, and the next summer followed book-keeping in Fond du Lac, Wis. In November, 1877, he stayed one week with me, where he was seen by many persons. His present address is Long Point, Livingston Co., Ill.]

Another Wonder—Chunks and Bones.

SUBLIGNA, Chattooga Co., Ga., Sept. 21, 1878.

I WRITE to thank you for the wonderful cure you have wrought on me by your medicine—"the Sure Cure." No words can explain the severity of my case or express the gratitude I feel, for I am sure your remedy has saved me not only from unspeakable suffering but from the very verge of the grave. My neighbors and physicians (I had tried a dozen doctors) look upon my cure as being almost miraculous.

For four years past I had suffered from Catarrh, Headache, Neuralgia and occasional lung troubles, so severe at times as to be confined to my bed. During last November my ears and nostrils became so tender I had to cover them with flannels even in this warm climate, when I went out doors. In January I had neuralgia, 36 hours, so severe I was in perfect agony, then my nostrils began discharging a blue, offensive corruption, growing gradually yellow and thick. I felt weak and diseased all over. My nostrils finally closed up so I could not breathe through them, and if I went to sleep it was to be awakened every few minutes with strangling and suffocation. I had not had a minute's ease in months, and my sufferings were indescribable. It was in this condition, after having tried all the remedies and physicians in my reach, that I began taking the "Sure Cure." It relieved me in eight hours so that I slept nearly all night, and in the morning I felt like a new man. The third day the matter began coming away in large lumps, and the quantity passed in three days was simply incredible. This continued at intervals for about forty days, when in trying to clear my head the whole thing seemed to break loose in the upper part of my head and fall into the air passages, nearly choking me; by means of a crooked instrument I succeeded in breaking it up into small lumps and pulling and hawking it out. When I got it all out there was a gill measure full of the tough hard lumps and softer matter. I will send you some of these excrescences, bits of bone that worked out of my nose. Your Ear Specific has given me equal satisfaction with the "Sure Cure." It is now over a month since I reported the fact of my cure to you. I inclose money for two of my neighbors; their symptoms are described on a separate sheet. Our doctors have failed to help them.

My wife and children join in gratitude to God and to you as an instrument in His hands for restoring to them a husband and a father. God bless you.

GEO. R. PONDER.

"DR. SYKES' SURE CURE FOR CATARRH"

Is an Internal and Local remedy, and, if rightly used, is as sure to Cure Catarrh as Sulphur is to cure the Itch. I had Catarrh 24 years, and after expending over $1200 in vain, originated this plan of treatment, which cured me in 1870, and the number of cures since is simply wonderful—the above are only given as specimens. The Sure Cure is within the reach of all; can be sent by mail or express. Price Complete, with Insufflator, $1.50. If afraid to risk the money—to a stranger,—send 10 cts. for a book of full information, worth ten times its cost. (Postage stamps are good as cash.) Address

C. R. SYKES, M. D., 169 E. Madison St., CHICAGO, ILL.

THE GEO. WOODS PARLOR ORGANS.

These Instruments, when examined by mechanical experts will be found to be of the most thorough workmanship and elaborate finish in every particular, and by musicians as possessing unparalleled capacity for the production of musical effects little short of the Pipe Organ.

WILL OUTLAST THREE ORDINARY ORGANS,

—AND

Their Capacity for Musical Effects is simply Wonderful.

The Geo. Woods style 42 is purchased by advanced musicians in all quarters of the globe, and recognized by them as being the most complete instrument to be found in any country.

No one should purchase a Parlor Organ without examining this remarkable instrument.

OTHER STYLES ALMOST AS LOW AS THE ORDINARY CHEAP ORGAN.

For Circulars, address GEO. WOODS CO., Cambridgeport, Mass. SHOWROOMS,—608 Washington Street, Boston; 72 Adams Street, Chicago, Ill.

LIBERAL TERMS TO AGENTS, who are wanted in every town where these Instruments are not represented.

Reading for the Young.

YOUTH.

O YOUTH, sweet youth! never so dear to me
As now when I shall miss thy company.

Must thou so soon, then, go—haste thee away?
It is not long, but a brief summer day.

Which quickly sped, methinks, that thou and I
Together walked 'neath bright or somber sky,

Our path made ever gay by hope and joy;
Thy beauteous, white-winged doves, that tame, yet coy,

Fluttered and played around us ceaselessly,
Perched on thy hand or shoulder lovingly;

Then in the blue above would soar and dip,
And then return to feed from out thy lip.

Thou wast a grave companion—passing fair
Thy brow and eyes, but thy sweet smile too rare,

And unto me, perchance, thou'st scarcely proved
Too kind and fond a friend! Hast thou not moved

My eager soul with promises, that brought
How many a golden dream and happy thought,

Yet never knew fulfilment—all too vain
In air had vanished when I looked again!

But yet what couldst thou more? wherefore chide thee?
Didst thou not give me all thou hadst for me?

And now the hour has come for us to part,
I do remember with a bleeding heart.

Thou canst not even leave thy birds, to bless
My solitude with timid tenderness.

How dark shall be the path where I must go
Alone henceforward, only God may know!

Kiss me once more, sweet, one last long embrace,
One lingering look upon thy fading face,

And then farewell—nor cast one glance behind,
I cannot see, my eyes with tears are blind.

[S. Sterne in N. Y. Evening Post.

THE THREE SPINSTERS.

THERE was once a lazy girl who would not spin, and, let her mother say what she would, she could not get her to work. At last the mother, getting both angry and impatient, gave her a blow, which made the girl cry very loud. Just then the Queen passing by, heard the noise, and stopping the carriage, she stepped into the house and asked the mother why she beat her daughter in such a way that the passers-by in the street heard her shrieks. The mother, however, was ashamed that her daughter's laziness should be known, and said,

"I cannot make her leave off spinning; she will spin for ever and ever, and I am so poor that I cannot procure the flax."

The Queen replied, "I never heard of anything I like better than spinning, and I am never more pleased than when the wheels are whirring. Let your daughter go with me to the castle; I have flax enough, and she may spin as much as she pleases."

The mother was very glad at heart; and the Queen took the girl home with her. As soon as they entered the castle she led her up into three rooms, which were all full of the finest flax from top to bottom.

"Now spin this flax for me," said the Queen; "and, when you have prepared it all, you shall have my eldest son for a husband. Although you are poor, I do not despise you on that account; your unwearied industry is dowry enough."

The girl, however, was inwardly frightened, for she could not have spun the flax had she sat there from morning to night until she was three hundred years old. When she was left alone she began to cry, and thus she sat three days without stirring a hand. On the third day the Queen came, and when she saw that nothing was yet spun she wondered; and the maiden excused herself by saying that she had not been able to begin yet, on account of her great sorrow at leaving her mother's house.

So the Queen was satisfied; but on leaving she said, "You must begin to work for me to-morrow."

As soon as the girl was again alone, she knew not how to act or help herself, and in her vexation she went and looked out of the window. She saw three women passing by; the first of whom had a broad flat foot, the second such a large under-lip that it reached nearly to her chin, and the third a very big thumb. They stopped before the window, and, looking up, asked the girl what she wanted. She told them her trouble, and they offered her their help, saying,

"Will you invite us to the wedding, and not be ashamed of us, but call us your aunts, and let us sit at your table? If you do all these, we will spin the flax in a very short time for you."

"With all my heart," replied the girl: "come in, and begin at once."

Then she let in these three women, and, making a clear place in the first room, they sat themselves down and began spinning. One drew the thread and trod the wheel, the other moistened the thread, and the third pressed it and beat with her fingers on the table; and as often as she did so a pile of thread fell on the ground, which was spun in the finest manner. The girl hid the three spinsters, however, from the Queen, and showed her, as often as she came, the heaps of spun yarn; so that she received no end of praise. When the first room was empty, the three women went to the second, and at length to the third, so that soon all was cleared out. Now the three spinsters took leave, saying to the girl,

"Do not forget what you promised us; it will make your fortune."

When the girl showed the Queen the empty rooms and the great pile of thread, the wedding was performed, and the bridegroom was glad that he had such a clever and industrious wife, and praised her exceedingly.

"I have three aunts," said the girl, "who have done me much service; so I would not willingly forget them in my good fortune. Allow me, therefore, to invite them to the wedding, and to sit with me at table."

The Queen and the bridegroom asked, "Why should we not allow it?"

When the feast was begun, the three old maids entered in great splendor, and the bride said, "You are welcome, dear aunts."

"Ah," said the bridegroom, "how do you come by such ugly friends?" And going up to the one with the big foot, he asked, "Why have you such a broad foot?"

"From treading, from treading," she replied.

Then he went to the second, and asked, "Why have you such an underhanging lip?"

"From licking," she answered, "from licking."

Then he asked the third, "Why have you such a broad thumb?"

"From pressing the thread," she replied, "from pressing the thread."

At this the Prince was frightened, and said, "Therefore my bride shall never touch a spinning-wheel again."

And so she was set free from the unlucky flax-spinning.

A NEW TOY.—The latest plaything for French children is a mechanical Newfoundland dog, destined for the saving of dolls that fall into the water. He takes them in his mouth and paddles across a tank or very considerable pond, keeping his head and his precious freight above water until he reaches shore, his ample tail being used as a rudder.

ANSWER TO SANS-SOUCI.—The answer to "Sans-Souci's" question in English literature, in RURAL of Oct. 19, is Samuel Johnson.

EDITH CRATTENDEN.

THE "Puzzler" department is deferred until the next issue, when ample space will be devoted to it to make amends for the omission.—[EDS.

NEWS OF THE WEEK.

SATURDAY, Nov. 2, 1878.

POLITICAL.

THE lives of some men are full of magnificent opportunities — for keeping silent, opportunities which the chatterboxes are constantly neglecting. Such a chance has just occurred here this week; wisdom says "take hold of it," and the advice of wisdom is dutifully adopted. Before the mail shall place this issue in the hands of RURAL readers, the elections will have been held, and the People, with the aid of a little political trickery here and there, will have decided who are to be their servants in public offices until the next elections. The country is flooded with prophecies on this head, but of all the political prophets who have been "taken up" lately, the mantle of none has fallen near the RURAL office. It might not be difficult to shape a prediction so ambiguously that whichever side won, it would be possible to have the satisfaction of saying, "I told you so;" but such a Delphic trick is hardly considered candid now-a-days, and insincerity is not tolerated by the RURAL.

HOME.

It is claimed that, taking the British itemized account of losses incurred through Americans fishing in Canadian waters, it shows that the Canadians were entitled to only $12,000 a year, or a total of $1,200,000 for ten years, instead of the $5,500,000 conceded to them by the Halifax award. Then it is claimed that it would only be fair to deduct the special duties on fish and oil remitted by the United States for Canada. This item itself would amount to $3,000,000 in ten years, making the account stand $1,800,000 in favor of this country, instead of $5,500,000 in favor of Great Britain. This thing is to be discussed at length next winter in Congress, and by that time we ought to be smart enough to figure at least another million on our own side of the account. The inhabitants of Newfoundland have lately given us an opportunity for doing so, by maltreating the crews of some 20 of our fishing smacks, as well as destroying their nets, fish and other belongings, on the ground that they were fishing on forbidden limits, and on the Sabbath. Secretary Evarts says he will not hear of paying the award until this grievance has been settled satisfactorily. Secretary Sherman has a growing confidence in the entire success of resumption, and thinks that at the present rate of accumulating coin there will be enough on hand by January 1st to equal two-thirds of the outstanding legal tenders. It is expected that large quantities of gold will be shipped from England to this country.

After experimenting 20 years, S. C. Salisbury is reported to have produced from the residuum of petroleum and coal tar a new kind of fuel, which promises to supersede coal for generating steam. The fuel is carried in pipes, leaves no ashes or clinkers, consumes its own smoke, quickly produces intense heat, and has been successfully tested at the Brooklyn U. S. Navy Yard.....The Interior Department has been notified of one instance in which the United States Circuit Court has reversed the decision of Secretary Schurz, relative to the liability to pre-emption and occupancy by settlers, of land-grants to railroads if unsold three years after the completion of the roads. This adverse decision, of course, only affects the single case to which it refers, and will not change the policy of the Interior Department with regard to permission to settlers to enter upon these lands. The government will take the case to the Supreme Court on appeal.

The general impression seems to be that Tilden or his friends have ciphered him out of his chances of getting the next democratic nomination for President. Many, however, profess not to believe the cipher telegrams genuine, while others doubt the correctness of their translation, and others, again, place full or qualified faith in his profession of child-like ignorance in the matter. That report that came from New Orleans a week ago, about a monstrous republican and greenback Know-nothing conspiracy to seize upon the government, turns out as expected—a cock-and-bull romance. Jim. Anderson, the mendacious witness from Louisiana, having been interviewed at Indianapolis, exonerates Sec. Sherman from having anything to do with the so-called Sherman letter. He says it was written either by Kellogg or his clerk, was never seen by Mrs. Jenks and is still in existence in Philadelphia. Kellogg, away up in Minnesota, tells the public what it knew before, that Anderson is a monumental liar and denies his whole story. Senator Bayard of Delaware, one of the strongest of hard-money advocates, is credited with having written a letter to a friend in Indiana, saying that the election to the senate of Voorhees, one of the strongest of soft-money advocates, would be a national calamity. Yet it appears probable that the nation will have to endure that among its many other political misfortunes.

FOREIGN.

Bayard Taylor, U. S. Minister at Berlin, has just been tapped for dropsy, a gallon and three quarts of water having been drawn from him. By latest reports, he is getting on well. Last Friday week as Alfonso, the young King of Spain, was driving through the streets of Madrid, on his return from a review of a body of troops, he was shot at twice by a shoemaker, named Juan Moncasi, a native of Tarragona, aged 22. The King escaped without injury, and showed a good deal of courage, which still more endears him to the people, who warmly sympathize with him on the late loss of his Queen Mercedes. The would-be assassin boldly asserts that he belongs to the political society of the International, and that he came to Madrid for the express purpose of killing the King. Doubtless he'll soon meet the fate of Hoedel, the German would-be regicide; except that instead of being decapitated, he will be garroted, according to the Spanish mode of execution.

It gives a perfect June color, and is harmless as salt. A 25-cent bottle colors 200 pounds, and adds 5 cents per pound to its value. Ask your Druggist or Merchant for it, or send for descriptive circulars. WELLS, RICHARDSON & CO., Prop's, Burlington, Vt.

PATENTS.
In connection with the publication of the *Scientific American*, we continue to act as Solicitors for Patents, Caveats, Trade-Marks, Copyrights, etc., for the United States, Canada, Cuba, England, France, Germany, etc. In this line of business we have had *thirty-three years' experience.*
Patents obtained through us are noticed in the *Scientific American.* This large and splendidly illustrated weekly paper shows the current progress of Science, is very interesting, and has an enormous circulation. Subscriptions $3.20 a year, postpaid; single copies 10 cents. Sold at all Bookstores and News-offices.
Can I Obtain a Patent? The quickest and best way to obtain a satisfactory answer, without expense, is to write to us (Munn & Co.), describing the invention, with a small sketch. All we need is to get the *idea.* We will immediately answer, and give the necessary instructions. For this advice we make *no charge.*
We also send, *free* our Hand Book about the Patent Laws, Patents, Caveats, Trade-Marks, their costs, and how procured, with hints for obtaining advances on inventions. Address MUNN & CO., Publishers of the *Scientific American,* 37 Park Row, New York.

PERSONAL ITEMS.

Moody weighs 240 and converts sinners at the rate of 2:40.

James Gordon Bennett has taken a hunting lodge at Leicestershire, England, for the season.

Our new Premium List, specimen copies, and agent's outfits will now be forwarded free to all who apply.

A fine establishment is maintained in Paris by ex-Governor John T. Hoffman, and his wife's receptions are among the most brilliant of the gay metropolis.

The late Bishop Rosecrans, Roman Catholic Bishop of Ohio and brother of Gen. Rosecrans, did not lay up his treasures where moth and rust corrupt and thieves break through and steal. His only property was his watch.

Their excellencies the Marquis of Lorne and H. R. H. the Princess Louise will sail from Liverpool on the 14th of next month. The report that the Countess of Dufferin will accompany them is unfounded. The newly-decreed formula of court presentation is said to be a stiff puzzle to the Canadians. It is decreed that when ladies or gentlemen appear at a representative reception, the right hand shall be ungloved before the Marquis and Princess. Both hands are ungloved before the Queen. There will be no hand-shaking, only bows. At private receptions the Princess will outrank her husband, and while a gloved hand may be offered to him for shaking purposes, the right must be ungloved to her. Other folderol-derol is talked about.

Also General Agts. for SHONINGERS' Celebrated ORGANS.

Keystone Wringer

Has Greater Capacity, Is More Durable, and is better finished
Than any other wringer now made.

THE ROLLS

Are made of White Rubber clear to the shaft. No twine or wire or fibrous material, or anything else but rubber being used. The rubber is *vulcanized upon the shaft and cannot be taken off except by cutting it off.* They are more elastic than other rolls because there is nothing but rubber on the shaft, and more durable because there is no twine or fibrous material to rot out or wire to cut the rubber. They are greatly superior to any other kind of roll now known.

ASK YOUR DEALER for the KEYSTONE WRINGER

CORN HUSKER. No cold or sore fingers, if used with gloves or mittens. Can be used without gloves or mittens, if desired. Will last a lifetime. Taken 6 Premiums. One sample 25c; two for 45c; 5 for $1. CITY NOVELTY CO., 108 S. 8th St., Philadelphia, Pa.

"City Novelty Co.: MORRISTOWN, Pa., Oct. 10.

A $10 Revolver for $2.50.

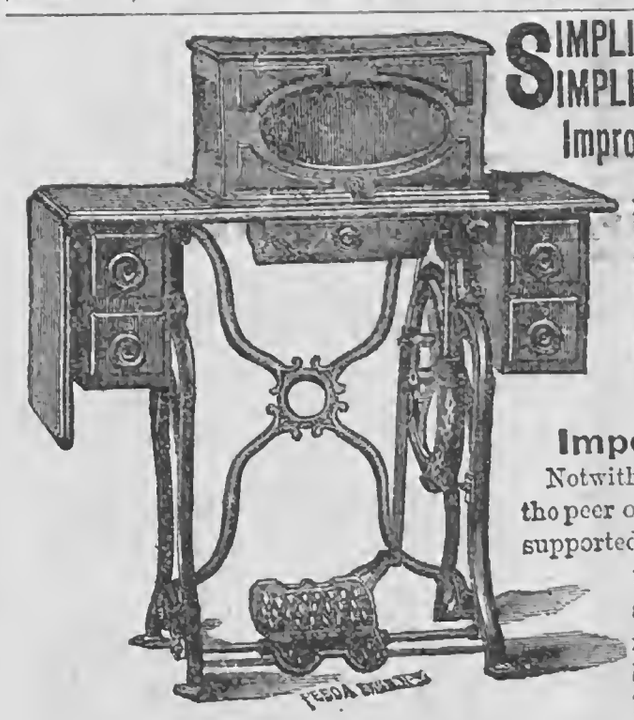
THE ALEXIS (Russian Model).

It is the most extraordinary bargain ever offered in the Gun line. Full nickel silver plate, 7 shot, self-revolving cylinder; wgt., 13 oz., using extra long Rifle Cartridges, and will kill at 100 yards.

It is the most elegantly engraved and proportioned Revolver in the world. *This engraving is just one-quarter the actual size; is made from a photograph, and exactly represents this superb weapon in shape and finish.*

These Revolvers were made by the largest manufacturer in the United States for a leading firm in Russia, and were part of the largest contract ever placed in this country for Fire-Arms. They cost over $6 apiece to make, and the engraving on each one is worth $2.00. We have bought at forced sale the entire lot for less than the stock alone cost. They are made on *honor*, the engraving is the finest ever seen in this country, and the workmanship is equal to a COLT, which it equals in every respect. The stocks are **Ebony**, the most expensive wood that could be used. *The metal is finest English steel, the barrel being octagon and superbly rifled its entire length; the cylinder is fluted, as shown in cut.* The shape of this Revolver is what is called the New Russian Model (similar to Smith & Wesson, 38 calibre, N. M.), giving a firm grip in the hand, preventing the Revolver's throwing up, and producing elegant shooting at long range. This Revolver weighs 13 oz., having an extra heavy and very long barrel, greatly enhancing its value as a target pistol. **We guarantee more than satisfaction** in every instance, and a better Revolver than $10 will buy elsewhere, *and we will refund the money in every instance where our representation is at fault.* Every one should own a good Revolver, and this opportunity will **never occur again.** We will send this Revolver C. O. D., with privilege of examination at the express office, to any point east of the Mississippi River on receipt of $1, which will be deducted from the bill; or we will, when the cash **in full** comes with order, **give free** a box of extra long target cartridges. (*The fact that this Revolver uses the extra long Rifle cartridge makes it doubly valuable, and places it far ahead of all similar ones in the market.*) We will send it by mail to any address for 20 cents extra; if sent by mail cash in full must accompany order; we cannot send C. O. D. by mail, *neither can cartridges be sent by mail.* A complete set of cleaning tools go with each Revolver, and they are packed in an elegant box. Prices of Alexis Revolver, as described above, with **EBONY** stock, **$2.50;** with an elegantly engraved Rubber stock (same as on Smith & Wesson), **$3;** with a fine $2 Ivory stock, **$3.75;** or with an elegant $3 Pearl stock, **$4.50.** The last Revolver will compare with any $15 Revolver in the world, and for presentation would make an elegant and beautiful gift. **We know that this Revolver is all that we claim for it, and is the biggest bargain we will ever offer.** *Those who bought our Rob Roy last Spring will have no hesitation in purchasing the Alexis, for big a bargain as the Rob Roy was, this Revolver is far ahead of it. The parts of this Revolver are interchangeable and readily duplicated.* Address, **G. W. Turner & Ross, dealers in Fire-Arms, Sporting and Military, 93 Water Street, Boston, Mass.** Parties in vicinity of New York can see this Revolver at Editorial rooms of the *American Farmer*, 31 Astor House. *Preserve this advertisement.*

HOGS, COWS & HORSES Can be kept on two-thirds the food if properly prepared. PRINDLE'S STEAMER is just the article required. Great reduction in price. Illustrated catalogues free. BARROWS SAVERY CO. Limited. S. Front & Reed Sts., or 614-616 Market St., Philadelphia.



SIMPLICITY SIMPLIFIED! SUPERIORITY MAINTAINED!
Improvements September, 1878!

Implements and Machinery.

I X L FEED MILL.

This mill is the cheapest, most durable and perfect feed mill ever offered. It is simple, easily managed, and can be run by Wind, Steam, Water or horse power. The chilled iron plates have grinding surfaces on both sides and can be reversed, thus making one set equal two on the old plan. An extra set is sent with every machine, and the two sets will grind Four Thousand bushels of good feed. New plates can be had for $1.25 per set. These mills are built wholly of iron, (except the Hopper,) are strong, efficient and durable. Thousands are in use on Stock Farms—every one giving excellent satisfaction. Every farmer should have one and grind his own feed.
Send for Catalogue "B" and Price List.

Wit and Humor.

DID it ever occur to you that a gymnast wears spring and fall clothing at the same time.—*Norristown Herald.*

"DEAREST," he murmured, ecstatically, as he infolded her in his arms for the first time, "let me sample the nectar of your lips." "Take a whole schooner of it," she faintly whispered, "it's all on tap."—*Newark Call.*

A LATE lecturer remarked that it would not be a very violent stretch of imagination to believe "that a Massachusetts baby six months old sits in his mother's lap eyeing his own cradle to see if he could not invent a better, or at least suggest some improvement."

Whitcomb's Remedy

—FOR—

ASTHMA,

Rose Cold and Hay Fever.

The late Jonas Whitcomb of Boston, visited Europe a few years since for the benefit of his health, which was impaired by frequent attacks of *Spasmodic Asthma.* While under the treatment of an eminent German physician his asthma disappeared; he procured the recipe which had done so much for him. This remedy has been used in thousands of the worst cases with astonishing and uniform success. It contains no injurious properties whatever.

TESTIMONIALS.

ST. LOUIS, Nov. 10, 1877.

Messrs. J. BURNETT & Co.: The relief the Jonas Whitcomb's Asthma Remedy afforded me was perfect; I have not had a bad night since taking it, and I have in no case found any relief until your Remedy came to hand. I most cheerfully recommend it to anyone troubled with Hay Fever or Asthma, for it is the only remedy ever used by me with any good effects.

Yours truly,
WM. T. MASON,
Of Messrs. MASON & GORDON, *Lawyers,*
517½ Chestnut Street.

Messrs. JOSEPH BURNETT & Co.,
Boston, Mass.:

Gentlemen,—In the fall of 1877 I used Jonas Whitcomb's Asthma Remedy and received immediate relief, and would most cheerfully recommend it to any person troubled with Hay Fever or Asthma. MRS. R. SHERMAN.

DIAMONDS

IN SOLID GOLD MOUNTINGS.

ONE DOLLAR ONE DOLLAR

THE WONDERFUL LEFEVRE DIAMONDS TRADE MARK PAT'D

Lefevre Ring, $1. Set of Studs, $1. [The Shah] Stud, $1. Lefevre Ear Drops, $1.

THE ONLY PERFECT FAC-SIMILE OF THE REAL DIAMOND IN THE WORLD.

Pronounced by the Academy of France that *M. Lefevre has really obtained artificially the true diamond.* The basis of these gems are pure crystals found in the Sierra Nevadas, from whence they are exported to the Lefevre Laboratory in Paris, France, where they are submitted to a chemical and voltaic process,

BY WHICH THEIR SURFACES ARE COVERED WITH A COATING OF PURE DIAMONDS,

imparting to them all the BRILLIANCY, HARDNESS, and refractive qualities of the natural diamond, and making them as desirable for **Wear, Brilliancy,** and **Beauty,** as the veritable gems themselves. The Ring, Studs, and Ear Drops, as displayed in this announcement, are accurate engravings of SOLID GOLD MOUNTINGS, CONTAINING THE WONDERFUL LEFEVRE DIAMOND, warranted by certificate U. S. Mint assay.

ON RECEIPT OF ONE DOLLAR we will send free, by REGISTERED MAIL, to any address in America, either article as above represented. Our "Book on Diamonds," with Illustrations of artistic Diamond Jewelry in solid (14 K.) gold, mailed free.

I have seen many imitations of diamonds, but never any that could equal the Lefevre Brilliant.—M. ELLROY, Stamford, Conn.

I am in receipt of a pair of the Wonderful Lefevre Ear Drops, for one dollar; to say that I am pleased with them hardly fills the bill, they are simply elegant.—ANDREW MORRIS, Hornellsville, N. Y.

The Wonderful Lefevre Diamond Ring, for one dollar, came to hand this morning, it is really elegant, giving entire satisfaction, and eliciting wonder and admiration from all who see it.—W. H. BEEDY, Martinsburg, W. Va.

The Lefevre Diamonds, mounted in solid gold, are truly marvelous.—B. F. AVERY & SONS, Home and Farm, Louisville, Ky.

The eminently successful experiments of M. Lefevre silences all doubt of the artificial reproduction of the true diamond.—M. DU FRENOY, the great French Scientist.

The Lefevre Diamond most effectually disturbs the slumbers of the possessors of costly gems.—Journal of Science.

☞ We guarantee the Wonderful Lefevre Diamonds for **One Dollar** to be mounted in **Solid Gold,** and will cheerfully refund the money if found unsatisfactory. Address all orders to the

AMERICAN JEWELRY COMPANY, 5 Arcade, CINCINNATI, O.

BY

THE TRAVELERS,

OF HARTFORD.

ITS STRONG POINTS ARE

Absolute Security,
In a Paid-up Capital Stock, besides the ample Reserve required by law.

A Definite Contract,
Without ambiguity or complication, which any man can understand.

Low Rates of Premium,
As low as consistent with security to the Insured.

Cash Insurance for Cash,
Without Dividend or Rebate, with no deductions at maturity, no false expectations and no disappointment.

THE TRAVELERS

HAS

Paid-up Cash Capital, $600,000.
Solid Cash Assets, $4,453,000.
Surplus to Policy-Holders, $1,225,000.
Ratio of Surplus, *Over 25 per cent.*
OF THE GROSS ASSETS.

The Travelers

IS DISTINGUISHED FOR
ECONOMICAL MANAGEMENT,
LIBERAL DEALING,
OPEN METHODS,
A CLEAN RECORD.

All Life Policies
ARE
NON-FORFEITING,
AND HAVE A
Definite Surrender Value.

EVERYTHING DESIRABLE
IN
LIFE
OR
ACCIDENT
Insurance.

Cash Benefits Paid, $4,000,000.

FRUIT TREES AND FRUIT ON THE FARM.

HENRY STEWART.

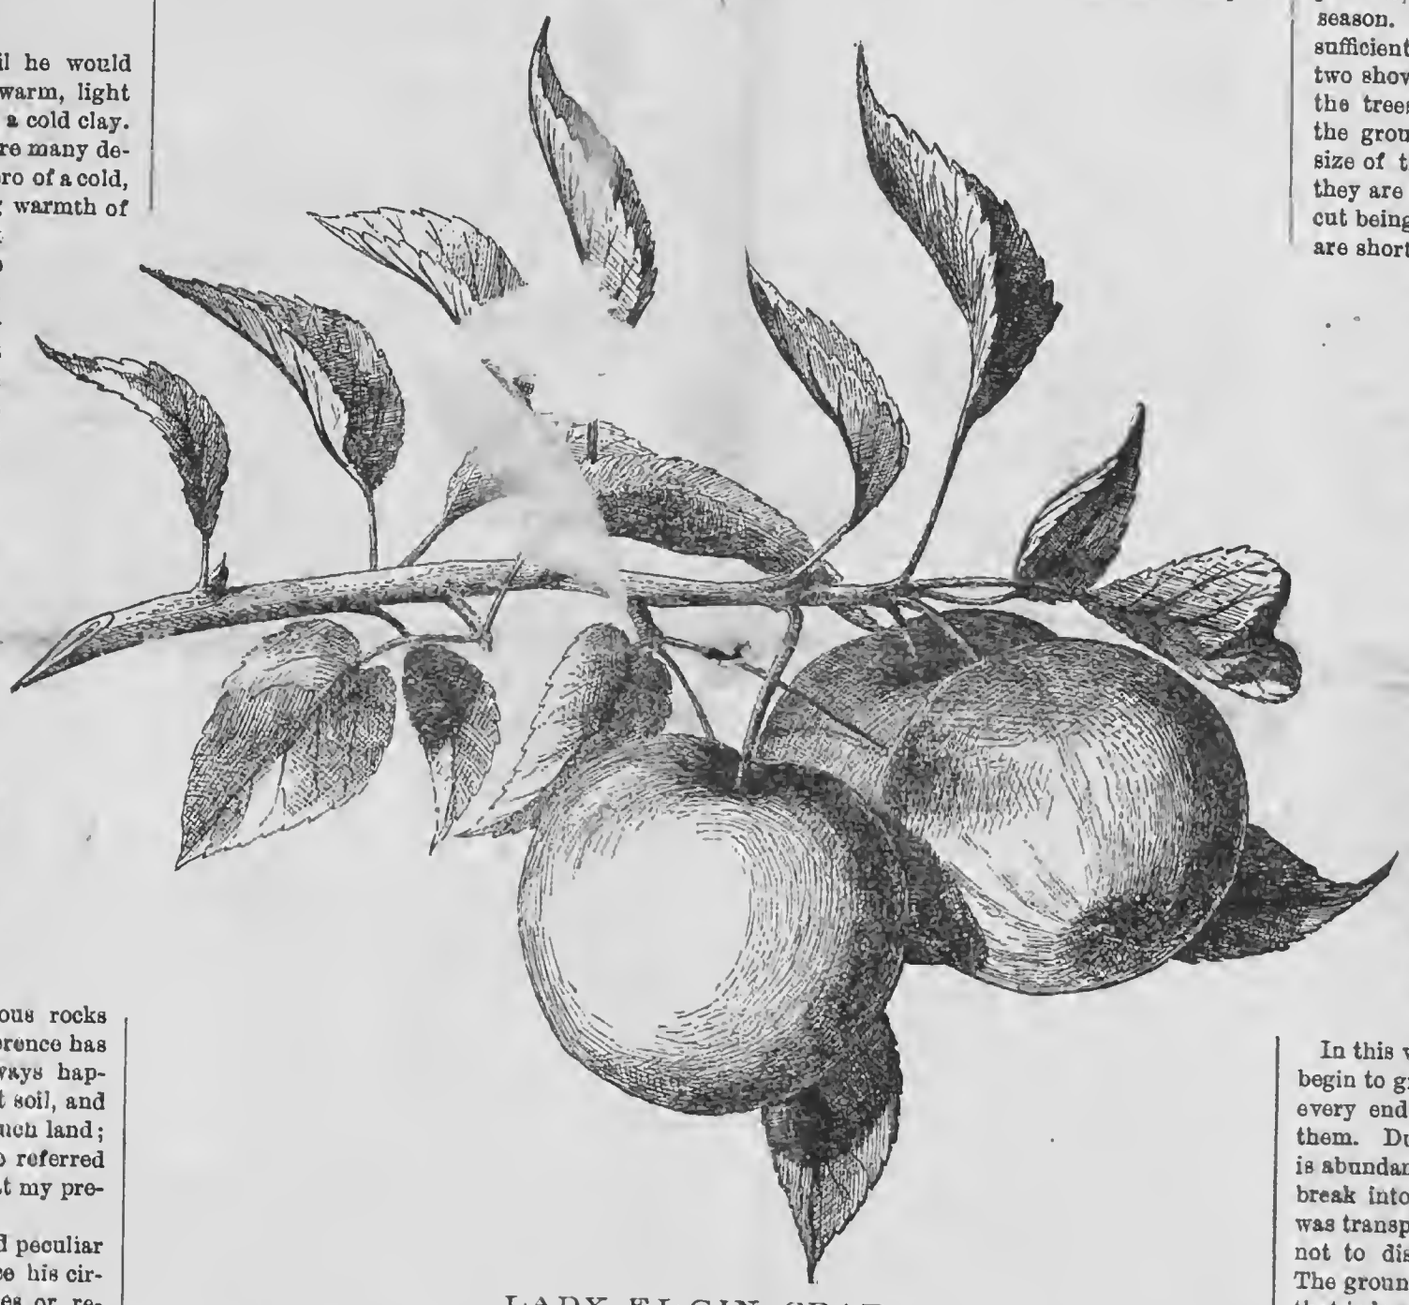
WHY I CHOOSE A LIGHT SOIL.

If you ask a gardener what soil he would choose for a garden, he will say a warm, light soil. The bugbear of a gardener is a cold clay. Between these two extremes there are many degrees; but they all verge from the zero of a cold, clay soil, up to the living, life-giving warmth of the light sandy or gravelly loam. At least such has been my experience and the results of my observation. In a rather wide range of observation, East and West, I have seen that the gravelly soils of the Hudson River counties of New York, the light soils of Long Island—famous for the Newtown Pippin,—the limestone soils of western New York, the "oak" soils of Oakland County, Michigan, and the light alluvial loams of Kansas, not to forget the sandy loams of Delaware and Maryland, all produce fruit of the finest flavor, the fairest quality and the richest color; while the trees arrive at a good old age in the highest health and vigor. Light soils are naturally well drained; they are soon warmed by the sun's rays, and retain their warmth for a long period; they respond immediately to the application of manure and are thus soon made rich. For these reasons I would choose a light loam wherein to plant fruit trees, with a fair proportion of gravel in it derived from limestone or micaceous rocks if possible. It may be that this preference has arisen from my fortune to have always happened to possess a farm of rather light soil, and that I have become used to manage such land; but then the shining examples I have referred to, could certainly seem to prove that my preference is otherwise well founded.

Every one cannot have particular and peculiar soil; but every one can generally force his circumstances to comply with his desires or requirements, to a great extent, if he will but try. Every one who plants an orchard can, at least, choose from his farm the most desirable site, and can improve the soil of that by drainage, fertilizing, cultivating and adding needed ameliorating substances—lime, ashes, muck, etc., for instance—so as to fit it for growing thrifty trees.

AN AVERAGE FARM ORCHARD.

Too often the farm orchard is planted in an ill-chosen site and its after management is consistent with the first grand mistake. The selection is made at hap-hazard, or no selection at all is made except by the irresponsible an ignorant "Tree agent;" or if a selection is make by the purchaser, it is on the faith of the gaudy pictures in the book the "agent" exhibits, and in the vain trust that the varieties chosen will be delivered.



LADY ELGIN CRAB.

Then the trees are badly planted; the holes are too small by far; the roots are crowded into them; the tops are unpruned; the sub-soil is returned upon the roots, and the tree is left to grow or die as it may. If it lives, the ground about it is cropped year after year; the trees are barked by the whiffle-trees; the roots are bruised, and from every bruise sprouts are started, which are permitted to grow around the tree and dwarf and stunt its thrift. If the tree survives, it is short-lived and unprofitable for the short time it exists. This is the history of the average orchard of the farm. Let us consider another view.

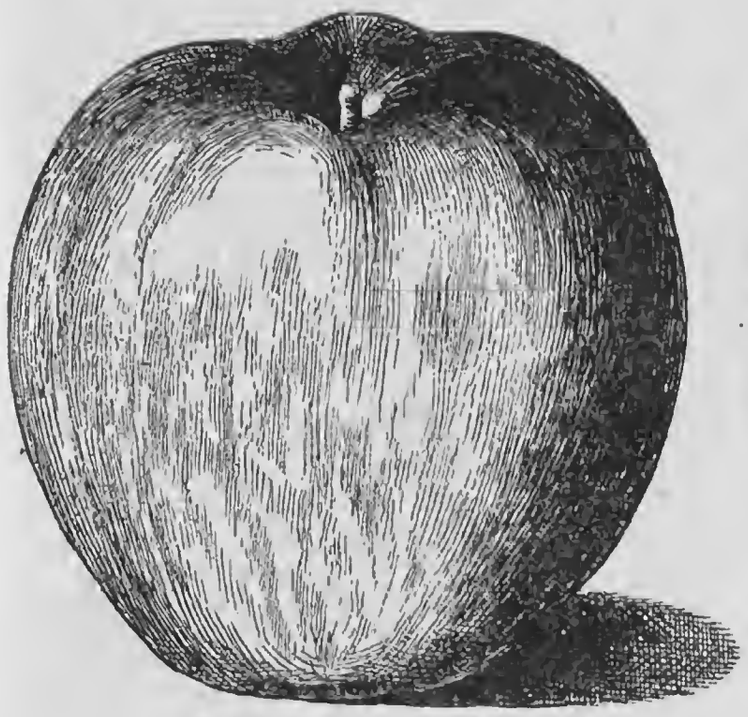
HOW AN ORCHARD SHOULD BE PLANTED.

Our friend Noing desires to plant an orchard. He chooses an elevated, yet sheltered site; well drained, warm soil; and this he prepares as carefully as he would do for his wheat crop. It is well and deeply plowed and cross-plowed, manured and planted to potatoes, roots or some hoed crop which is kept clean from weeds by constant and regular cultivation. In the summer time a catalogue is procured from some respectable nursery as near to his own locality as possible, and the varieties chosen are ordered in season. A heap of good compost is prepared, sufficient in quantity to give each tree at least two shovelfuls of it about the roots. In the fall, the trees are received and are *at once* put into the ground. The holes are dug to match the size of the roots; these are trimmed wherever they are broken or are not compact, a smooth cut being made with a sharp knife. The tops are shortened one-half and unnecessary branches are cut away. The holes, marked by stakes previously set, are at least six inches larger each way than the roots when fully spread out. The top soil is thrown to one side. The planting is done in a business-like manner. A load of compost is drawn on to the ground, and the trees are placed in the wagon with the roots covered with the compost. One by one the trees are set in the holes upon a few shovelfuls of top soil and one of compost mixed with it. The roots are carefully spread out in a natural position; the upper roots are held up while the lower ones are covered with the top soil, shaken carefully over them and well-worked among them with the hand; then a shovelful of compost is thrown in, the upper roots are spread out and covered with care; the soil is punched down compactly with a round-pointed stick and then trodden firmly; the remaining soil is then put into the hole, and *left loosely*, without treading, being heaped up around the tree for a few inches.

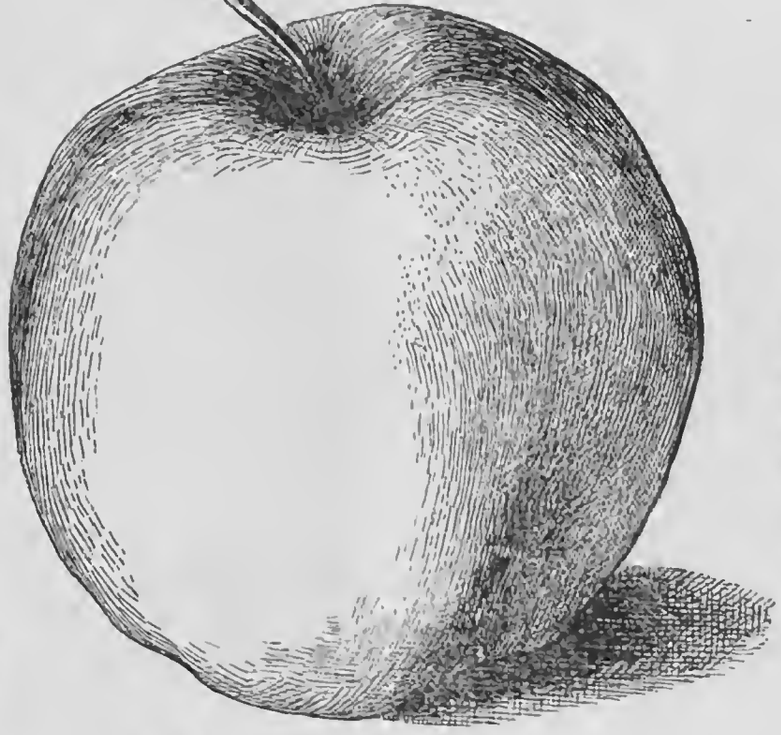
In this way the work is completed. The roots begin to grow at once; new fibers spread from every end, and seize upon the food ready for them. During the winter the new root-growth is abundant. In the spring the tree is ready to break into leaf with more vigor than before it was transplanted. The soil is then plowed so as not to disturb the roots or injure the stem. The ground is planted with some cultivated crop that is low-growing, or it is harrowed and sown to orchard-grass and clover; the trees being mulched for three feet about them with straw or coarse hay; or the surface is hoed once or twice in the season. The future of that orchard is safe. The owner will give it thought, and wherein he is not posted, he will study and learn what should be done and—*he will do it.*

VARIETIES I WOULD PLANT.

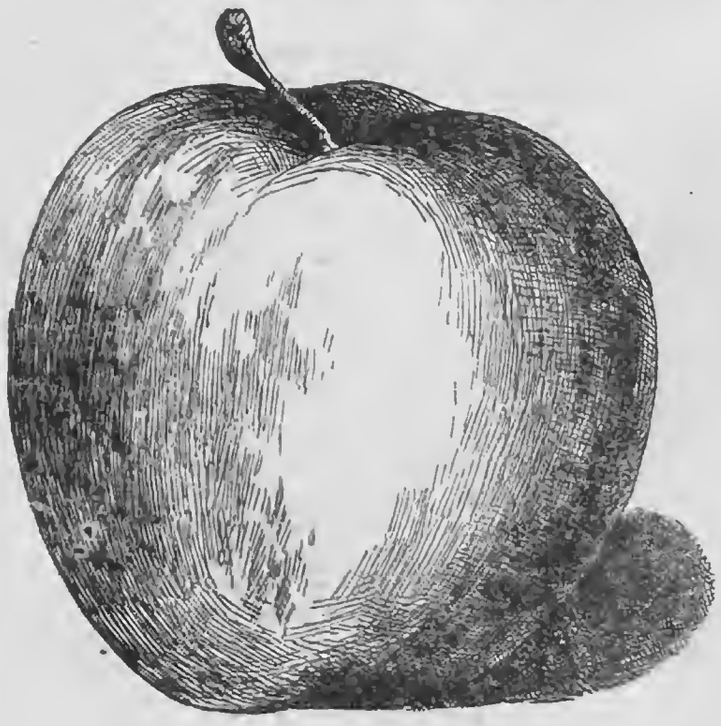
All the excellencies in the way of Apples and Pears may be summed up in less than a dozen varieties. What are wanted are good quality,



FANNY.—See page 728.



GRAND SULTAN.—See page 727.



BOURASSA OF CANADA.—727.

hardiness and continuous season. The latter is not so important, because the natural season can be lengthened artificially for a month or two by proper management. There are some good standard varieties which should be in every orchard, if it contains but a dozen trees; and they are enough if there are many thousands. It is a great mistake to think because one plants a hundred or two of trees he should have fifty varieties. There are fruits that one wants for home use, and others that are for market; but generally the popular market sorts are good for home use. My choice of ten varieties is:

Summer—Early Harvest, Red Astrachan,
Fall—Gravenstein, Porter, Twenty-Ounce Pippin, King of Tompkins Co.
Winter—Rhode Island Greening, Baldwin, Northern Spy, Roxbury Russet.

For ten Pears, ripening in the order named, I would choose for standards:

Summer—Clapp's Favorite, Manning's Elizabeth, Bartlett.
Fall—Buerre d'Anjou, Seckel.
Winter—Flemish Beauty, Lawrence.

And for Dwarfs:

Clapp's Favorite, Duchesse d'Angouleme, Louise Bonne de Jersey.

Among the newest Apples I would choose Tetofsky and Duchess of Oldenburg, as the most promising for market apples and for domestic use; the former being a precocious bearer, and both early. If I were to plant a hundred acres, I would have no more than these, and these do well with me on light, sandy loam, and with my friends who have gravelly or clay soils.

THE VALUE OF AN ORCHARD.

I consider an acre of well-planted and thrifty orchard to be worth $1,000 as an investment. It will pay from $150 to $400 per acre, according to circumstances—thorough good management being the most important of these. It is a matter, therefore, which deserves the best study and attention. One plants for the future. He waits patiently and his reward comes slowly. When it comes, it is sure and lasting if he has deserved it; otherwise the opportunity is gone for him forever. A man scarcely ever sees the planting and maturity of more than one orchard. What he does, then, in this way he should do well, if he ever did anything well in his life.

A FEW WORDS ABOUT APPLES AND PEARS.

PRES. T. T. LYONS.

FASHION IN FRUITS.

Yankees are as unlike as possible to Orientals, in their modes of thought and action. While the latter have, for thousands of years, adhered to the same fashion of clothing and style of agricultural implements, as well as surroundings in general; the former bloom forth with the newest and often the most fantastic fashions, only to lay them aside, like faded spring flowers, for something which the fiat of the "fickle goddess" may have more recently designated as "the thing."

It might fairly be anticipated that, in the supply of their pomological wants, our people would afford an exception to this rule; but I regret to be compelled to say that, in pomology as in dress, the dictum of the fickle goddess seems to rule. I give, as an illustration, the fact that, a few years since, the planter of a home or farm orchard, as a rule, was reasonably and properly ambitious to secure variety and quality for the supply of the dessert as well as the kitchen, not even forgetting a supply also for the winter evening fireside; while to-day the scepter seems to have passed into the hands of commercial orchardists, and in obedience to their behest, the planter even of a village or city garden or of a farm orchard, is asked to forget that fruit should be planted for any purpose other than for show and profit; or that there is any higher or worthier standard of value or merit than that set up by the motley crowd that may patronize the fruit-stands of our cities and towns.

So far, indeed, have our planters indulged this tendency that there is apparent danger that quality, in fruits, may become so far subordinated to mere profit that the very *elite* of our dessert or amateur fruits may become lost and forgotten; and, as a consequence, that the apple and the pear—to say nothing of the other fruits—may be remanded, along with the potato and other merely culinary vegetables, to the uses of the kitchen and cuisine. Should any one doubt the existence of danger in this direction, I could easily bring to his notice considerable districts, densely planted with orchards, in which the home need is so utterly ignored that, even in the hight of the fruit season, it might be difficult to treat a discriminating lover of the apple with a dish of this fruit, that his taste would not be likely to reject as scarcely fit to be eaten. I consider myself warranted in assuming that it is mainly due to the prevalence of the ideas indicated, that there is often a sad

NEGLECT OF SOME FINE, EARLY VARIETIES,

so that the season which can only be supplied with the beautiful and excellent Early Harvest, is largely unsupplied, even so far as the home want is concerned, for the reason that, in many localities, this variety is relatively unprofitable; while one of its most beautiful and excellent successors—Buffington's Early—has remained, for an age, practically unknown, doubtless for a similar reason. The same remarks will, with similar force, apply to Sine-qua-non, Early Strawberry, Summer Rose and others; while owing to the slender growth of those peerless sorts — Early Joe, Garden Royal and American Summer Pearmain—notwithstanding their prolific habit, they are by the same process remitted to the guardianship of the few who are willing to provide for the demands of an elevated and refined taste, even at the sacrifice of profit. To the above, as the season elapses, we may add the beautiful and excellent Scarlet Pearmain, the Mexico, the Dyer, the Hawley, the Jefferis; and there may be danger that the old-time popularity of even the Fall Pippin may be compelled to yield to that of a variety of coarser habit, less delicacy of texture and greater ability to withstand rough treatment. These remarks also apply very forcibly to that more recent candidate for popularity, the Shiawassee Beauty—a fruit with the finer qualities of the old Fameuse, somewhat heightened; but like it, unable to withstand the vandalism of railroad and market-men. The Melon apple also, which from the habit of the tree, as well as the beauty and excellence of the fruit, is so desirable for the garden or for limited grounds, seems incapable of making its way among the less satisfying but more showy or hardy sorts of the early winter. Passing to

THE MIDWINTER AND SPRING VARIETIES,

we find that the firmness necessary to constitute acceptable market fruits, is also indispensable to their keeping quality. Hence the difficulty which we have been combating, partially disappears in their case, only making itself perceptible in the case of such fruits as the Fameuse, Swaar, Esopus Spitzenburg, and some others, on account of the scabbiness or other imperfection of the fruit, or the deficiencies of the tree. Such partial imperfection, however, is sometimes overridden by other specially valuable qualities; as, in the case of Red Canada, the comparatively feeble habit of the tree is overlooked on account of its productiveness when mature, and also in consideration of the very satisfactory size and color of the fruit, together with its superior handling and keeping qualities, this being the apple so long and so deservedly popular in the markets of the northwest, under the erroneous name of Steele's Red Winter.

There is also a lack of discriminating appreciation in

PEARS;

for what we have said respecting the influence of the market idea, as applied to the selection of Apples to be planted for home use, will doubtless apply with but slightly diminished force, in the case of the Pear. The market grower seldom looks beyond the Bartlett, Flemish Beauty and Beurre d'Anjou, as standards; and the Louise Bonne de Jersey and Duchesse d'Angouleme as dwarfs; and in imitation of these, the amateur is but too prone to forget the earlier and luscious Doyenne d'Ete, Madeleine, Ott, Bloodgood, Tyson and Rostiezer; and even the Fondante d'Automne, Seckel, and a numerous *coterie* of others, peculiarly adapted to his purpose; while the small but excellent Washington remains comparatively unknown; and even the large and excellent Beurre Bosc has, so far, striven almost in vain for a recognition readily accorded to the comparatively coarse Onondaga, and not wholly withheld from the almost worthless Vicar. The time-honored White Doyenne yet stands, at the West, just upon the margin of the debatable ground, with the mark of censure upon it, on account of its occasional tendency to scab and crack. With numerous candidates for acceptance, as

LATE AUTUMN AND WINTER PEARS,

yet there are few, if any, which can be said to have been tried and proved as satisfactory. Lawrence yet maintains a doubtful contest for recognition; and Winter Nelis will fill the requirement, as far as fruit is concerned, when it can be *persuaded* not to overbear, and not to prematurely yield its delicate richness to the seductive influence of a too impressive warmth in late autumn, thus failing of the performances expected of it in the early winter. Leaving these out of the question, we can hardly yet be said to have a reliable and satisfactory winter Pear; though time may possibly yet develop it from among the comparatively new sorts now on trial, with their reputation yet to be established.

Van Buren Co., Mich.

A NURSERYMAN'S SELECTION OF APPLES FOR AN ORCHARD.

IRA J. BLACKWELL.

The Object of Planting an Orchard is either to make money or else to please the fancy of an amateur. In the latter case, the highest quality of fruit is the aim, without regard to cost or the quantity of fruit produced. This class of planters can afford to set out poor growers, poor bearers, bad keepers and small but high-flavored apples. The orchardist who plants for profit, must have trees that grow at least well; they must also bear well, while the quality of the fruit must be fair, and its size medium to large; the color should be red or striped, and, last, but perhaps not least, it must keep sound from October to March, or later. A very small supply of apples will overstock the market from June until October, while strawberries, raspberries, blackberries, peaches, pears, plums and tomatoes are abundant and cheap.

Our Orchard is situated at Washington's Crossing, N. J., the place where Washington's army crossed the Delaware, on the night previous to the battle of Trenton. We are on a ridge, which at the end slopes toward the river or southwest, while one side slopes to the northwest and the other to the southeast. The soil is a sandy loam on a red shale bottom, affording a natural drainage that is sufficient, as little or no surface-water stands on the orchard. We have over one hundred and fifty varieties of Apples that are prominently before the public or in the catalogues. The question is how many of these Apples meet the requirements of the orchardist. Of them the following are

GOOD VARIETIES FOR FAMILY USE OR MARKET.

New Jersey Harvest—Fruit, small or medium-sized; ripens in July; the tree is a good bearer.

American Summer Pearmain.—Fruit of medium size, striped; quality best, and will sell when any apple will; tree a fair bearer.

Summer Hagloe.—Fruit large and very fair, tart; one of the very best; ripens in August.

Primate.—Fruit large, yellow, tart, of superior quality, ripens in August; the tree is a crooked grower when young, but a good bearer.

Williams' Favorite.—Fruit large, striped, tart; one of the best in quality, ripening in September.

Porter.—Fruit medium to large, yellow, tart, ripening in September; tree, an early and abundant bearer of good fruit.

Fallawater.—Fruit large, green shaded with red, ripens in September and October, sells well; the tree bears well.

Cogswell.—Fruit large, red, ripening in October.

Wine.—Fruit large, striped, fair; ripens in October.

Baldwin.—Fruit large, red, ripens here in October; tree a strong grower, and a great bearer every other year.

Smith's Cider.—Fruit medium, when well grown, red or striped; quality fair for cooking or the table, ripens from October to March. This apple needs a long season, as it does not color much until October. It is the most profitable of all the varieties that we have, and south of latitude 42°, will probably do well. North of that it will not ripen well, in which case it will be of a green color and tasteless. The tree bears very young and in great profusion, the fruit being all on the outside of the tree. If I were now going to set out an orchard, in this section, for the purpose of selling the fruits, ninety of my trees in every hundred should be of this kind.

Pomme Grise.—Fruit of a russet color and medium size; does not keep long enough; quality superior, ripening from November to January; the tree bears heavy crops.

Cooper's Market.—Fruit medium, striped, tart, ripening in March. This variety may be profitable when the trees get age.

Willow Twig.—Fruit large, greenish, keeps until May, not first-class; the tree bears young and abundantly.

Lady's Sweet.—Fruit medium to large, ripens from January to May, and keeps the best of any variety that we have fruited; tree a good bearer.

English Russet—Known here as Jersey Russet; fruit medium-sized, green, a good keeper, ripening in March; the tree bears well.

The above will not supply all the wants of the amateur, while the orchardist here might profitably reduce the list.

THE POPULAR APPLES IN THE NEW YORK MARKET

are well-nigh all included in the following list:

Red Astrachan, Primate, Sweet Bough, Nyack Pippin, Porter, Twenty Ounce, Rhode Island Greening, Baldwin, Northern Spy, King of Tompkins County, Roxbury Russet. Most of the other varieties sell low. The dealers expect to get their profit out of the standard kinds and then sell the others at cost or less. Sweet apples seldom bring much, excepting the Sweet Bough and the Golden Sweet.

Before planting his orchard, the fruit-grower ought to know where he expects to market his product, and if the varieties that sell best there will grow well with him, they are the kinds to plant. The nurseryman throws away money by planting this and that, because he has a long list and only sells his choice kinds. I well remember the new varieties that were brought out some twenty years since, when most of the agricultural papers gave a long list of Apples that were promising, and I also remember selecting a large number of them, and sending North and South for the fine new Apples. It has never been our custom to invest very much in any one variety, for we desired to try a great many sorts, and now we are looking among them for an Apple that is superior to the Smith's Cider, take it all in all. We have trees grown from suckers; from the seed, and budded near the crown; also some that are grafted; some that are grafted or budded four to six feet up the stem; trees root-grafted on pieces of roots, and root-grafted on the whole root. I am of the opinion that it makes no difference, so that you get a well rooted tree. I favor trees that branch out from twelve to eighteen inches from the collar or top of ground. They bear younger; it is easier to gather their fruit; winds will not blow them over so easily, and it is less trouble to get at the caterpillars and other insects on them, and the borer that gets into the bodies of apple trees, always selects the place on which the sun shines.

Mercer Co., N. J.

THE APPLE ORCHARD.

CLINTON.

WHY THE APPLE IS THE MOST VALUABLE FRUIT.

Of all the different kinds of fruits adapted to our climate, the apple is undoubtedly the most valuable. While saying this, I have no purpose to disparage other fruits, each class of which has its merits, and each is desirable in its place and in its season; and with judicious selection, they will furnish us with their varied luxuries, from early summer, even into midwinter. But for permanency in use—running through the entire year—for variety in flavor, ranging through all the gradations and sub-gradations, from honey-sweet to sweet, to mild, to sub-acid, to acid, and to pungent sour, so that every palate may find its favorite flavor, and for the very many uses to which it is adapted in the culinary art, give me the apple as being the most valuable. Besides, there is no other fruit so generally adapted to the varied soils and climates of the Eastern and Middle States. I shall confine my remarks more directly to this fruit, and shall limit myself to the presentation of a few hints in regard to its cultivation—hints, which are the results of many years of experience as an amateur cultivator of various kinds of fruits, both indigenous and exotic.

Every man who sets out even a few trees, does so in the hope that a fine fruitage will reward his labors, yet he often neglects the conditions necessary to the realization of his hopes. It should, therefore, be borne in mind, that to insure a fair prospect of success it is essential to observe certain preliminary

REQUIREMENTS IN PLANTING AN APPLE ORCHARD.

First, Selection of Soil.—Without going into any learned disquisition on the component ingredients of what might be deemed a suitable soil—which, after all, might be unintelligible to the general reader—I will say, briefly: Select a soil, if possible, that is well adapted to the cultivation of wheat or Indian corn. This rule will be easily understood, and is sufficient for general purposes.

Second, Location.—Let this be one which is sheltered, as much as may be, from violent winds, especially from those of the west and northwest. A southern exposure is far preferable for several reasons; but an exposure to any violent winds will endanger the safety of the fruit, especially when nearly arrived at maturity. Wind-falls, as they are technically called, are comparatively of but little value.

Third, Preparation of the Ground.—Let the soil be deep, fertile, and thoroughly pulverized. If moist, let it be thoroughly drained. Planting in a heavy, wet soil should be carefully avoided. It is the hight of folly to plant the apple tree where the water does not pass off freely and speedily. Should it, for any reason, seem desirable to plant a tree in moist ground, dig no hole for the roots, but set them directly on the surface of the ground, and form a slight mound of mellow earth about the tree, sufficient to cover the roots to a suitable depth, and stake the tree carefully. As a rule, however, rolling land or even a dry hill-side is preferable to low, moist land that cannot be thoroughly and effectually drained.

Fourth, Selection of Varieties.—This will depend somewhat on the use intended to be made of the fruit, whether mainly for market, or for family use. In either case, do not plant very many kinds. If for market, let them be mostly of winter varieties, and such as are in greatest demand in the market you expect to supply. Do not forget, however, to consider, well before making your selection, what kinds can be successfully grown in your own locality. Some varieties, for instance, may be successfully grown in the valley of the Hudson, which cannot be made to succeed in less favored localities. It is a great mistake to plant a large number of varieties, as there are but few kinds that are in general demand, and which will always command a ready sale. Our nurserymen furnish lists of several hundreds, all recommended as valuable, while perhaps not more than one in a score of them is worthy of cultivation, either for profit or use. If you plant mainly for domestic use, select such varieties as will ripen in regular succession, from the earliest summer apple, to the latest keeping Russet; and with care in the selection, you may thus, with a few trees, secure a supply of this valuable fruit through the entire year.

Fifth, Planting the Trees.—In this grave mistakes may be made, either from ignorance or from want of proper care. Remember that "whatever is worth doing at all, is worth doing well." If you cannot afford time to plant your trees properly, better not plant them at all

—for the result will be likely to prove only a miserable failure. It is well to have the holes all prepared in advance of the time of planting. Dig them large and wide, so that all the roots may have ample space, without being cramped or distorted. Trim off all broken roots, and trim the tops only sufficient to insure a proper form during the subsequent growth. Even in this, it is well to leave much for future consideration. Serious injury may be done by hasty and inconsiderate pruning. Loosen the soil to the depth of eighteen inches or more. If the soil is of poor quality, remove it, and supply its place with good surface soil. Never allow any raw manure to come in contact with the roots. Avoid planting the tree any deeper than it grew in the nursery bed. Disregard all instructions as to the necessity of planting the tree so that it will face the same point of the compass as it did in the nursery, as it is the sheerest nonsense. Nature directs as to the proper depth for planting. Beyond that, exercise your own judgment. Work the fine earth carefully in between and around all the small fibrous roots. When it is properly filled in, press it down firmly with the foot. Never plant a tree when the dirt is wet, and liable to pack hard in treading it down.

If the roots are dry when the trees are received, wet them thoroughly, and bury them in moist earth for a day or two before planting. This is better than to soak them in water. But the roots should never be allowed to become absolutely dry, before they reach the purchaser. When practicable, it is well to visit the nursery in person and attend to the lifting or digging of the trees which you purchase, and see that the roots are not badly mutilated or injured, firmly rejecting all that have not sufficient roots to insure a vigorous growth. Even if you are compelled to take any such trees, better throw them away than to be at the trouble of planting them. See that the roots are covered from the sun and drying winds immediately after being taken from the ground. For this purpose, sacking or boxes should be ready at hand.

Opinions differ as to the distance at which apple trees should be planted from each other in the row. My practice has been to plant them two rods, or 33 feet apart, which takes 40 trees to the acre. As regards the season for planting, my own preference is decidedly in favor of the spring, and my choice would be about the time when the buds commence swelling.

Oneida Co., N. Y.

SOME NOTABLE APPLES.

THE FAMEUSE SUCRE APPLE.—(See cut, p. 728.)

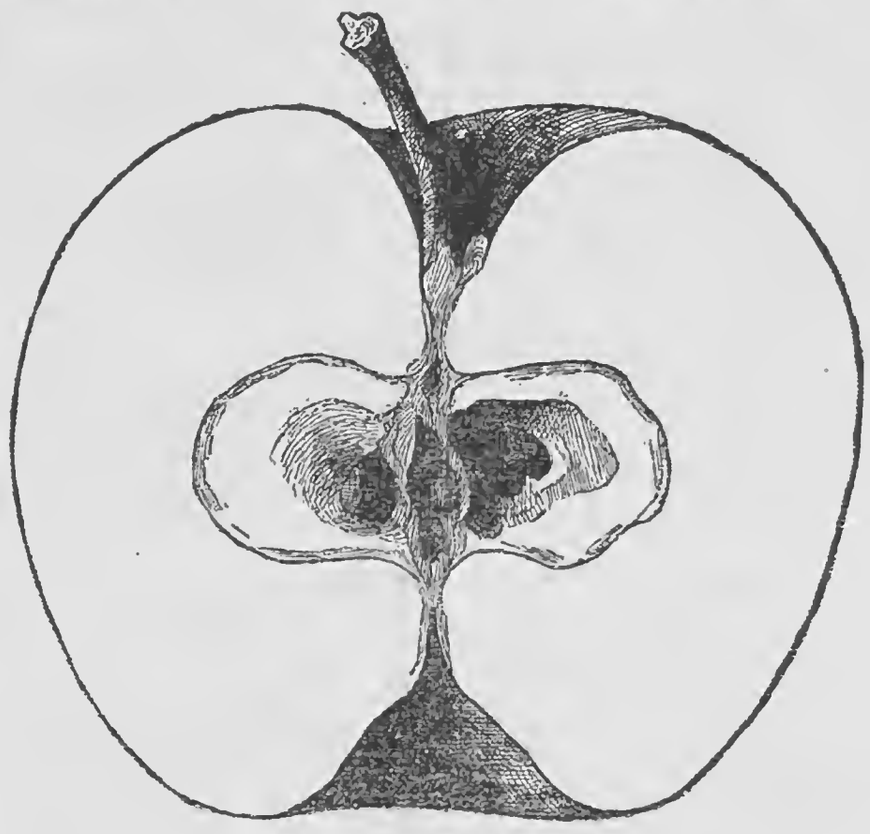
This fine little dessert apple originated upon the premises of Mr. Maurice Gougeon, near the city of Montreal. It has not been propagated by nurserymen, and but few trees are in existence, mostly in the orchards along the Corteau St. Pierre. The specimen from which our engraving was taken grew in the orchard of the Hon. E. Prud'homme. Mr. Prud'homme's gardener, M. Lortie, says the Fameuse Sucre (pron. *Sucray*) equals in productiveness the Fameuse of which it is probably a seedling. The tree is hardy, upright in growth, spreads but gradually, and its branches bear the bright gloss of health. The following is the description of the Montreal Horticultural Society: Fruit, fully medium in size, roundish, or slightly oblate, very dark red. It is very tender, but at first crisp; it is at once mildly sub-acid and sugary, the latter quality producing a rich flavor. Its chief merit is as a dessert apple, for which purpose it comes in just before the middle of September, continuing in good condition until the last of October.

THE DECARIE APPLE.—(See cut, p. 728.)

What, if a seedling, was the original tree of the Decarie (pron. *Decorrie*) Apple, says the Report of the Mont. Hort. Soc., stood in Jeremie Decarie's orchard in Coteau St. Pierre, east of the Cote St. Luke road, near Montreal. It was cut down a few years ago. It was then about a hundred years old, had a butt as large as a flour barrel, and was of a light so remarkable as to be compared to an Elm. The tree is vigorous, hardy and of erect growth, like Northern Spy. It bears light and heavy crops alternately. A tree 15 years planted has given a crop of seven barrels. The fruit is of Fameuse type, but much larger. Our engraving was taken from a specimen grown in sod. In cultivated soil it is very large, commanding marked attention. Form, roundish conic to oblong conic, often deeply ribbed, with a deep, narrow, russety cavity, and a basin, which, though medium in depth, is wrinkled and obscurely ribbed. The calyx is small and closed. Color of skin, light or dark red, sometimes very dark all over, covered with a beautiful bluish-white bloom, and with many medium-sized gray dots. Flesh, whitish, rather firm, juicy; with a slight and peculiar quince-like flavor. Season, October 15 to December 1.

THE RIABINOUKA APPLE.

This is one of the new Russian Apples imported by the Department of Agriculture in 1869. It has borne for the first time the past season, in the orchard of Dr. Hoskins, Newport, Vt., and was at first supposed to be the Alexander, which the fruit resembles in its general appearance on the tree. But a more careful study, both of the fruit and tree, reveals decided differences, which are in favor of the Riabinouka as regards the quality of the fruit. The tree is hardy, of spreading growth, and an early bearer. Further trial is requisite in order to develop its other characteristics and decide its value. Though eatable in October, it shows signs of being a keeper. It is a very large and showy apple, and attracted some attention at the Fruit Show of the Montreal Horticultural Society, the experts of which pronounced it to be decidedly not Alexander. The flesh is white, slightly tinged with red near the skin, and of a mild, pleasant flavor, with very little acidity.



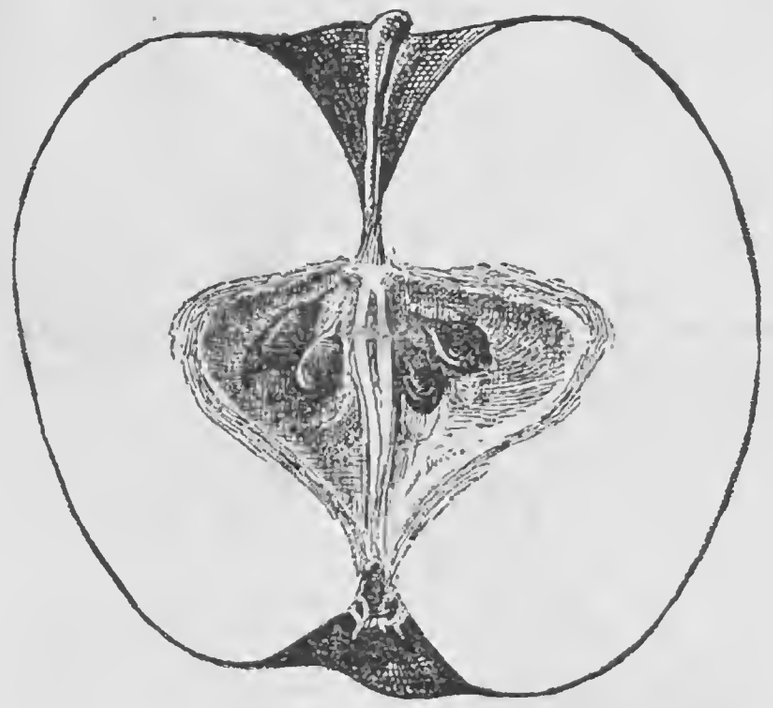
RIABINOUKA. — NEW RUSSIAN APPLE.

THE CELLINI APPLE.

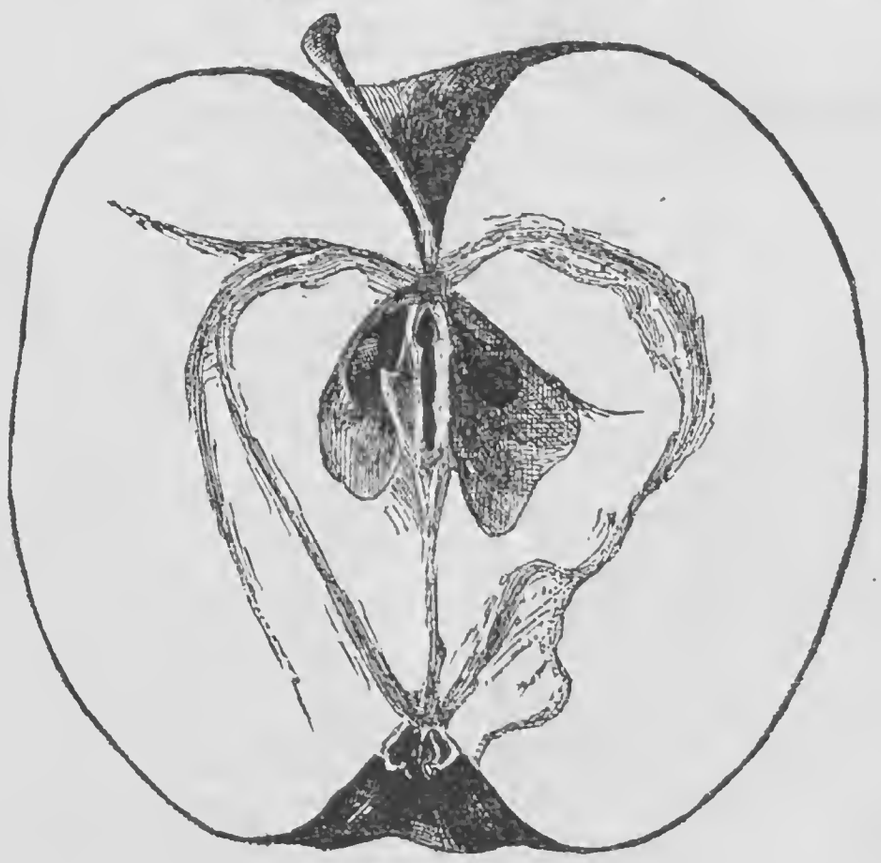
This is not the Cellini apple of the books, but a variety propagated under that name in Canada. It is said, however, to be an English apple, like the Cellini of the books, and is further distinguished by the Montreal Horticultural Society as being a seedling of the Stirling Castle. The tree is a strong and vigorous grower, forming an upright, close head, and is very hardy. The fruit is large, oblong (not oblate, like the Cellini described by Downing), even in size, and bears carriage well. In color it is deep yellow, mottled and blotched with dark red. Calyx very large and open. Flesh, slightly yellow, firm, crisp, juicy, mildly and pleasantly sub-acid. Season, September to the end of December. It is a favorite market apple in Montreal, and of increasing demand, as a tree, among orchardists in Canada.

THE NORTHFIELD BEAUTY APPLE.—(See cut, p. 729.)

This is a rather remarkable fruit, having been raised from a seed of the small, yellow, Siberian crab, by Leonard D. Cady, of Northfield, Vt. It is, therefore, sometimes called "Cady's Crab," but, whatever its origin, it is not a "crab" in any sense ordinarily attached to the word. The tree is vigorous, hardy and productive, coming early into bearing. The fruit is remarkably beautiful, above medium in size, whitish ground beautifully colored and tinted with a lively pinkish red. Flesh white, tender, fine-grained, juicy, sprightly sub acid. This apple is almost uniformly fair, even in size, and highly esteemed as a dessert fruit. In hardiness the tree is superior to Fameuse, or Red Astrachan. The fruit is rather too tender-fleshed for long carriage, but for home use or a near market, it is of great value, especially in cold localities. Its season is from October to March.



RAWLE'S GENET—(SEE SEVERAL ARTICLES.)



BEN DAVIS.

THE BOURASSA APPLE.—(See cut, p. 725.)

The Bourassa (pron. *Burrasaw*), is one of the russets of Canada, like Pomme Grise, that seem to have greatly declined in favor with growers of late, notwithstanding their admittedly high character as dessert fruits. The tree is hardy, a slow, crooked grower, never more than medium in size. It is tardy in bearing, and though once considered a good bearer, is now spoken of as only moderately, though annually, productive. The fruit is uneven in size, from medium to large, and like many winter russets, shrivels unless kept in a cool cellar. It is conical in shape with marked ridges, giving it almost a pentagonal section when cut across. The color is a rich, dark russet, with a bright red cheek in the sun. The beauty of this fruit and its rich aromatic flavor, commend it to amateurs, especially in colder sections of the country, where dessert apples of a high class, as especially those that are keepers, are less numerous than elsewhere. Its season is through the winter.

THE LADY ELGIN CRAB.—See cut, p. 725.

THIS was sent to us by Hance & Son of Red Bank, N. J., in the spring of '76 and bore the past season. The engraving shows the fruit of natural size. The tree is very productive and vigorous. The apple is prettier than the Lady Apple, having even a more brilliant red cheek upon a clear yellow ground and the flesh is tender, and of a sub-acid, rich flavor. We are inclined to praise this little beauty beyond what so short a trial could warrant us in doing.

MR. LOVETT, who is connected with A. Hance & Son, tells us that he can say nothing from his own experience, respecting Lady Elgin, except that the tree is an upright grower, with small leaves, having an unusual amount of pubescence.

IN reply to our inquiry respecting "Lady Elgin," Mr. J. J. THOMAS, Editor of the Country Gentleman, kindly replies as follows:

"I have not fruited the "Lady Elgin," but I have had specimens which grew at the West, sent me in quantity. They were by far the best of the Crabs which I have examined, being tender, pleasant and very agreeable. I have seen no other Crab which I would think of placing on the table with our fine sorts; this I think would almost answer to rival the Lady Apple. It may not be nearly so good, however, when grown here, or under more unfavorable influences.

STUMP APPLE.

I FIRST heard of the Stump Apple about 25 years ago, but paid no attention to its merit or its history. But as it has been gaining the reputation of being good and one of the handsomest of apples, besides being very productive, I made inquiry of Thomas Roe, of Monroe Co., N. Y., who has had it in bearing many years, and to him I am indebted for the following information:

The tree was first discovered growing up between the forks of an oak stump, on the farm of Richard Harris. Owing to the locality and position in which it grew and the difficulty in digging up the stump, it was allowed to remain until it fruited, when it was found to be too valuable to be destroyed. After the death of Richard Harris, one of his sons exhibited the fruit at Rochester Horticultural Society meeting, and it was voted the name of "Harris's Seedling," in honor of the owner of the land upon which the tree grew.

The tree is a great bearer and the fruit is in shape like Black Gilliflower, a very highly-colored red, and uniform in size. If properly picked and ripened, in order to bring it to a higher state of perfection, it is really a delicious fruit. [Mr. Downing says that its supposed origin is Delaware.—EDS.] FROST.

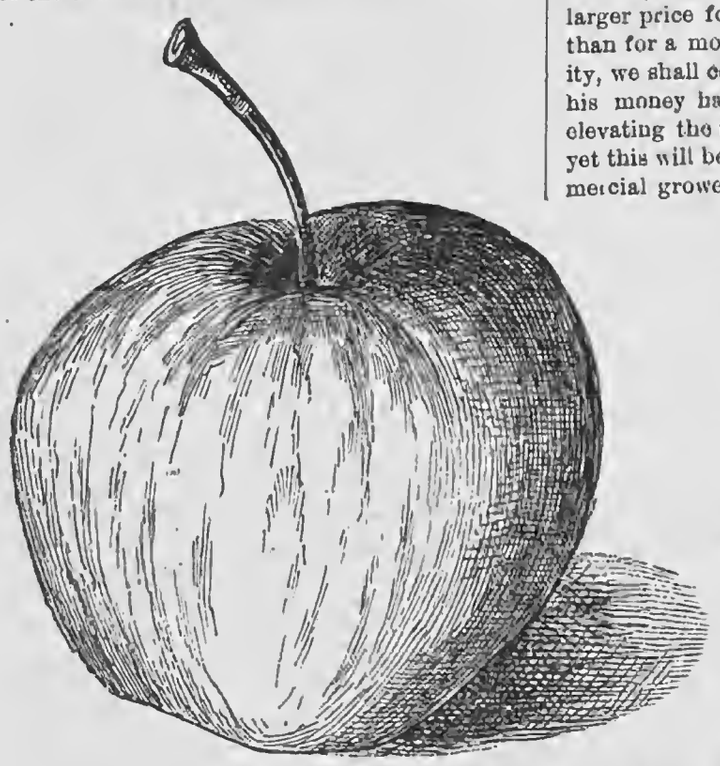
THE GRAND SULTAN APPLE.—See p. 725.

DR. HOSKINS, of Vt., who kindly furnishes the sample for the engraving of this apple, says of it:

"This large, early and beautiful apple (one of the new Russians) has fruited freely with me the present season, and fully sustains the high opinion I got of it from the few samples obtained from the tree in previous years. Like many of the Russians, it bears very young and very profusely. It is of about the same season as the Yellow Transparent (my description of which, last year, was copied in hundreds of papers, all over the Northern States and Canada) being about gone by the 20th of August, or near the time when Tetofsky and Red Atrachan begin to come into eating. In quality and size it is superior to the Yellow Transparent, and bears its fruit quite differently, all over the tree, and near the ends of the branches, instead of upon short spurs on the larger limbs. In color it is greenish white, changing to a pale translucent yellow at maturity. It is a very soft, mellow apple, with a decided and agreeable sub-acid flavor, and some aroma. In size it exceeds a well-grown Porter apple, and is similar to the Porter in shape, but less conical. It hangs well to the tree, and ripens in succession from August 1st to August 20th. The tree is thrifty, but not so strong a grower as Yellow Transparent.

THE ST. PETER'S APPLE.

The Apple illustrated in this issue over the above name, is one of the varieties the cions of which were imported by the national Department of Agriculture in 1869-70. It is the variety numbered 372 in the official list, the Russian name of which is given as "Petrowskoe." The fruit from which our illustration is taken, was grown in the orchard of Dr. Hoskins, on the banks of lake Memphremagog, near to the Canada line—one of the severest districts for testing the hardiness of fruit trees in the country. Dr. H. furnishes us with the following description of the tree and fruit:



St. Peter's Apply.

"It is called 'St Peter,' a name that led me to expect something very large and fine. But, in fact, it proves a little apple, averaging about six or seven inches in circumference. In appearance it very closely resembles the 'Early Joe,' though somewhat less flattened. and not so deep a red in the sun. The following technical description, when compared with that of Early Joe in the books, will show their close resemblance as to fruit, even in minute particulars: Size medium or rather small; roundish oblate, sometimes approaching conical; smooth and regular; color, with numerous short, broken red stripes on a yellow ground, a nearly uniform bright red in the sun, dotted with fine white specks; stem from an inch to an inch and a half long, rather slim; cavity shallow, acute; basin small and regularly corrugated or plaited; calyx closed; flesh white, fine-grained, very tender, slightly crisp, juicy, sub-acid, spicy; quality very good. Ripens (in northern Vermont) during the last two weeks in August. Tree, when young, an upright, slim, free grower; shoots reddish-brown, with a few inconspicuous white dots; leaves of medium size (small for a Russian) waved, finely crenate.

"Though the fruit is so much like Early Joe, the tree is very distinct. As to the quality of the fruit, while I cannot rank it with the Early Joe, as 'best,' it fully deserves to be called 'very good,' and decidedly 'best' for a Russian—no apple of that class within my knowledge being entitled to rank with the 'best' of American dessert apples. But when we consider that the St. Peter is entirely hardy, or 'Ironclad,' in the coldest section of New England, where Early Joe is grown only with difficulty in favored localities, and not by any means in perfection, we may consider the St. Peter as quite an acquisition to our list of nice, early dessert fruit."

THE FANNY APPLE.

Downing says of it, that it is a very handsome and valuable apple either for market or family use, ripening a week or two later than Red Astrachan, and of better quality, and that it is not as well known as it should be, although it is thirty or forty years since it was first introduced. Its origin is somewhat uncertain, but it is supposed to have originated near Strasburgh, Lancaster Co., Pa., on the property formerly owned by Jacob Beam, and not far from where the celebrated Belmont, or Gate Apple, was first found. The tree is a vigorous grower, spreading, and an abundant bearer on alternate years.

HOW FAR SHALL WE GO IN THE ATTEMPT TO CREATE A DEMAND FOR FRUIT OF THE BEST QUALITY?

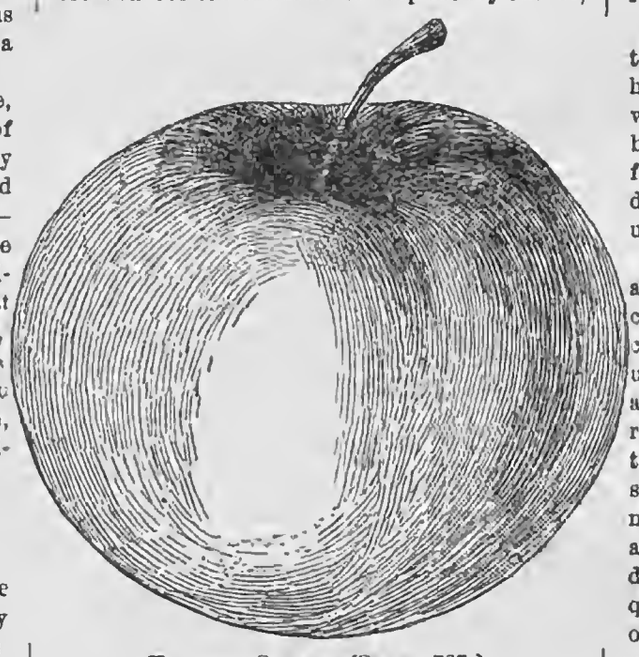
The following short discussion is furnished us from the minutes of a recent meeting of the Michigan State Pomological Society, by Secretary Garfield.

Mr. Stearns, of Kalamazoo—While we have a due regard for the present wants of our market, I am satisfied we shall make some progress in educating people to ask for fruit of good quality. It will not do to make an innovation of this character so suddenly as to sacrifice the best interests of commercial growers, but the fact stares us in the face that the apples which bring the most money are not necessarily fruit of excellent quality, and it appropriately comes within the limits of our Society to suggest methods by which the market shall demand a good quality of fruit as well as handsome specimens.

M. B. Williams, Sangatuck—I must confess that, in my opinion, we can, as growers, do little beyond what the mass of consumers demand. We are growing fruit to ship, and from it we get an income to support ourselves and families. We cannot afford to sacrifice this income or any part of it for the sake of educating the consumer to a higher or more delicate taste. We are bound, as commercial growers, to furnish the fruit that will bring the highest price in the market, and if the consumer is willing to pay a larger price for a big red apple of poor quality than for a modest-appearing fruit of first quality, we shall certainly grow the former to meet his money half way. We may theorize about elevating the taste of the people all we choose; yet this will be the action of the successful commercial grower every time. This Society combines amateur and professional men; if the former can do this educating, the latter will find no adequate excuse for not following the course they have made easy and profitable, but the market growers will not and cannot afford to take the initiative in this matter.

C. N. Merriman—I wish to enter my solemn protest against the doctrine of my brother fruit-grower. I believe it is in the power of the commercial grower more than of any other man to lead public opinion in this matter, and he can, by planting judiciously, raise as fine-appearing apples of first quality as he can of second or third quality, and in the end this policy will certainly bring him a larger return. The grower, to be successful, must produce such fruit as to bring buyers to him, and he must bring every thing to bear to induce this state of things. Quality must certainly take a prominent place in his decision upon what to plant. I can name a half dozen apples that appear but rarely in our markets, that are as good in quality as the very best, and notwithstanding their excellence in this point, nothing is lost in the ability of the trees to bear abundantly or in the appearance of the fruit. I tell you, Mr. President, we ought to go on record as a Society in favor of bringing to the front fruits valuable for their superior quality, and make that a market point.

Mr. Smith, Parma—I am working for dollars, and I am not willing to take the whole crowd of consumers upon my shoulders and "boost" them into a higher position as regards taste, with the poor prospect of pay for it that is promised. We are not far enough along to regard quality much yet. Perhaps in planting an orchard for our children to reap money out of,



Fameuse Sucre—(See p. 727.)

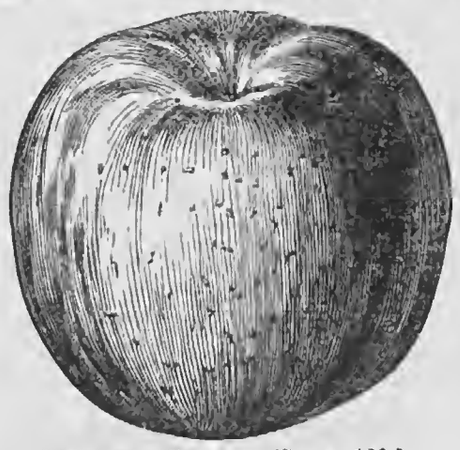
it would be well to look toward a little advancement in this direction, but not a great deal. It is too slow a process to be counted of much importance when we are figuring for dollars.

Mr. Holloway—It is demanded that this society should take firm and high ground in favor of a good quality of fruit. It is not the mere question of dollars and cents. There is something higher than mere profit. Different soils produce different qualities of fruit of the same variety. In my location the Baldwin is hardly worth eating, but I can produce the Yellow Bellflower in perfection. We must study the habits of Apples and then we shall get quality. We must learn the requirements of fruits. This Society cannot stop on the question of dollars and cents. This Society should be a leader in favor of quality. We must educate the tastes of the people, and third-rate Apples must be shoved out. Apples of first quality go to Europe, and for this and other reasons we should maintain quality.

S. O. Knapp, Jackson—It was a hobby of mine to elevate the tastes of people in relation to fruits. But I found it a hard task. I grafted largely of the Benoni, a variety of excellent quality, and now I have a good call for it. It is a little discouraging, however, to attempt to elevate the taste of people. They like good-looking fruit. I would recommend that we aim to combine good-looking fruit with good-keeping qualities and good-eating qualities—such an apple is the Northern Spy.

J. D. Baldwin, Ann Arbor—It is a pretty expensive business to educate rapidly, and, although I am in favor of taking ground looking toward an improved taste, still, as commercial growers, we must not lose sight of the margin that supports our families. It has been a favorite opinion of mine that people able to purchase, will seek good quality and will be willing to pay for it, but I confess this season my faith in this direction has been somewhat shaken. We have at Ann Arbor a considerable population whose money comes in the form of good salaries. I have often watched these men as they selected from the fruit-stands, and I have found they will pass the beautiful, melting Seneca Chief Strawberries for an inferior, perhaps nameless, sort, for the sake of the two or three cents per quart to be saved. Now, I do not wish to be put on record as opposed to such economy, but in marketing fruit, we must consider the disposition of the people who are to buy.

Mr. Holloway—I have one further remark to make: Michigan as a fruit State is in its infancy, and its future success in that line, will, as sure as you live, depend upon the quality of its fruit. If we are to look out for money, we must look beyond this year, or this decade. We have the location and circumstances that will give us a prominence throughout the world for the production of apples, and we cannot successfully do otherwise than make this reputation as perfect as possible. We can raise



Meader's Winter—(See p. 130.)

firm apples of good color; why not produce those of excellent quality as long as it is not more expensive I tell you, gentlemen, unless we look carefully to quality, we are living beneath our possibilities, and ought to be censured for it.

H. S. Rogers, Volinia—We can scarcely do better than supply the demand. If we consumed here in Michigan all the fruit we raised, it would be well for us to educate people's taste, but, inasmuch as only a small proportion of the fruit grown here is consumed within our borders, we are assuming a good deal of a task in undertaking to educate the taste of the world.

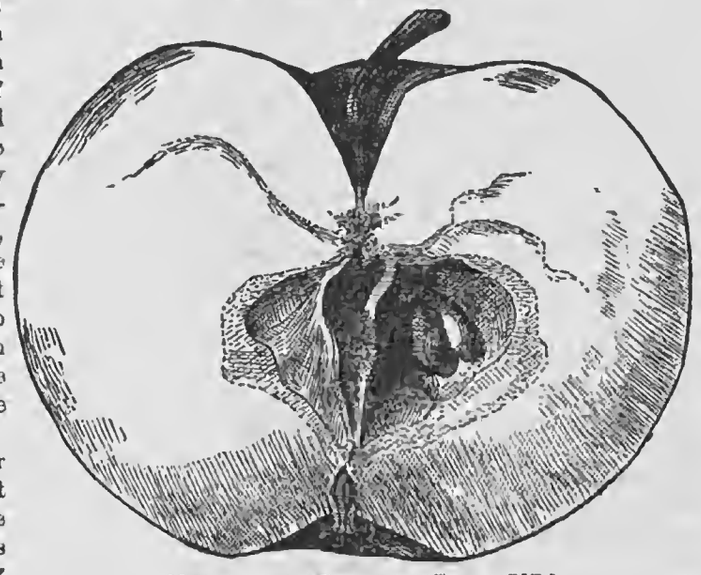
Mr. Harrison—I have shipped a good many apples, and there are some things that should come into this discussion as matters of no inconsiderable import, that have not been touched upon. The consumer demands a good-looking apple as well as a good-tasting apple when it reaches its destination. This involves the fact that a good-shipping apple must have a tough skin. The apples with a tough peel rarely rank as number one in quality, so that often, to get an apple that will be in good shape when at its destination, we must sacrifice something of quality. The Pennock apple we rank as one of our poorest sorts, because its quality is below medium, still I have never shipped a variety to New Orleans that would sell as well, because it opens there better than any I know. You may say it is popular there because the consumers do not know what a good apple is—which is true—and all because we cannot get the good apples there in shape to eat.

Secretary Garfield — Just one point I wish to make, and that is, that different localities require different kinds of fruit, because of locality and not because of any prejudice or education in taste. A malarial district will not consume sweet apples, and varieties of medium acid are scarcely salable at such places. They crave a sharp acid and will call for apples containing it. This same demand will come from other localities where fat meats are consumed largely; while in the South, where less meat is eaten, they ask for a milder fruit. Nearly all their native fruits when ripe, are very sweet. The inhabitants do not call for very acid fruits, and if we raise it for them, we should cater to their wants.

Mr. Pringle—I speak from a consumer's station, and desire earnestly that the men who grow our fruits shall look more to quality. If I get hold of a barrel of apples that are excellent, I inquire what they are, and who grows them. I am not alone in this habit. The people who are the largest purchasers will readily second any movement toward a better quality of market fruit. To be sure, we like fine form and color for a dessert fruit, but in getting these we do not want to sacrifice quality.

BONNE DU PUITS ANSAULT PEAR.

For an engraving of this delicious pear, readers may refer to the Rural of Nov. 10—1877. A



Northfield Beauty—(See p. 727.)

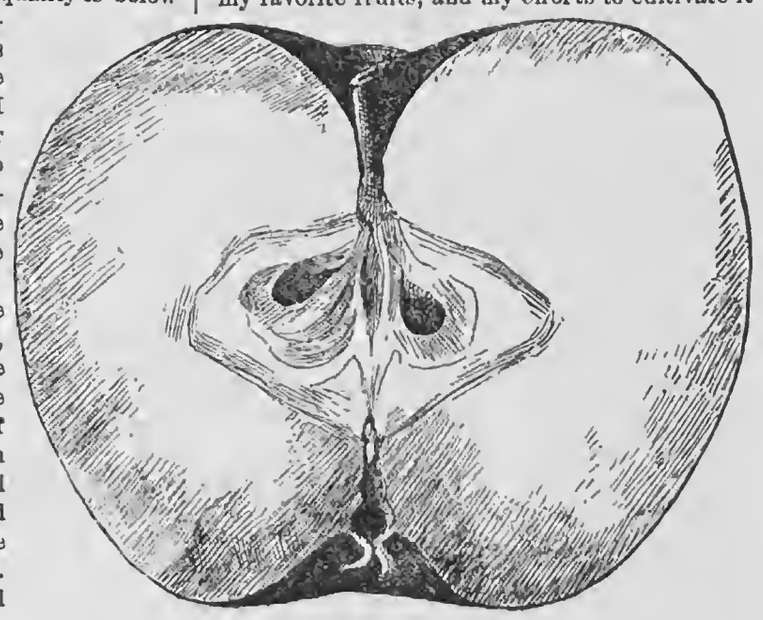
small box of them was sent to this office by Ellwanger & Barry of Rochester, N. Y., several weeks ago. They were quite green and hard when first received, but ripened beautifully in a few days. All who ate them said—"It is the best pear I ever ate"—or, "It is as good a pear as I ever ate;" and the latter was our own report. If the generality of people were asked, "How would you improve the Seckel?" the answer would be, "Make it a little more sprightly," or "not *quite* so sweet." You have it in the Ansault Pear—and a little more. If we were asked—"How would you improve the Ansault," we should say, "Make it a shade sweeter." Now they may be had ripe at the same time, so that if perfection in pears is wanted—eat them together!

In the Rural of Nov. 10, Mr. Charles Downing tells us that "the tree is moderately vigorous and very productive and a first-class Pear for the amateur, but rather too small of its season, September, to meet the wants of the general market-men; fruit scarcely of medium size; skin, light yellow, nearly covered with thin, light-russet; flesh, fine, juicy, melting with a sweet, rich, slightly vinous flavor." While eating some of the pears above referred to, the flavor seemed to us more than "slightly vinous" and so we wrote to Mr. Downing. To this he replies: "If you leave out the word *slightly* in my description of last year it will be right—so I find it in my corrected notes of last year, and so it is in my appendix of 1872."

PEAR CULTURE IN NEBRASKA.

BY EX GOV. R. W. FURNAS.

As a rule, among Nebraska fruit culturists, Pear culture is not considered a success. This seemingly prevalent idea, however, is attributable more to want of attention, treatment and proper selection of varieties than to soil, climate or any other of the natural surroundings. I am confirmed in this opinion by the fact that where lovers of pears have observed the essentials named, most gratifying success has followed. Better accommodation for penetration of the soil is required by pear roots than for most other fruits. This I consider one of the indispensable requisites to successful pear growing here, as well as elsewhere. The pear is one of my favorite fruits, and my efforts to cultivate it



Decarie of Canada—(See p. 727.)

have proved as successful as with anything else. Those of my neighbors and acquaintances who have given care and attention, have met with like success.

At our late State Fair, an extraordinary pear exhibit was made from orchards in this, Nemaha

county. Such fruit experts as Dr. Warder of Ohio and Dr. Furnas of Indiana, who were present and served on the Fruit Committee, so pronounced. No finer specimens could be desired than were shown of Bart'etts, Seckels, Lawrence, Beurre d' Anjou, Duchesse d' Angouleme, Sheldon, Howell, Bello Luorative, Doyenne Boussock, Buffum, Vicar, White Doyenne, Flemish Beauty, Louise Bonne, Swan's Orange, Beurre Diel, Glout Moroeau and other leading and well-known, excellent varieties. Some destructive instances of pear blight I know. But these were owing to improper selection of location and want of treatment. It is not my purpose here to give a dissertation on Pear culture, but simply to give a few rambling thoughts, with an expressed opinion that Pear culture, well directed, can be made as profitable as the culture of other fruits.

BEN DAVIS APPLE IN NEBRASKA.—(See ent, p. 727.)

What we in Nebraska, and in the West generally, cultivate under the name of "Ben Davis," in New York is known as "New York Pippin," if I mistake not. This apple, for profit, with us, heads the list. Very many of the most experienced would say: "If I were to plant one hundred apple trees for profit, at least ninety of them should be Ben. Davis." It comes into bearing early, bears regularly each successive year; the tree is hardy, prolific and a rapid and luxuriant grower; the fruit is showy and attractive to the general purchaser. It handles well, keeps well and, therefore, is number one for shipping. I have known five bushels picked from one tree, seven years old from the graft. As to quality, it has very many superiors. Indeed, in this respect, in my estimation, it will scarcely bear the classification, "fair to middling." In this assertion I think I express the opinion of a majority of those who have experience.

The Jonathan, with us, is showing almost as many popular characteristics as Ben. Davis. It does not come into bearing, however, quite so early, and is not so prolific. The quality is so far superior, however, as to make it the more popular with those who appreciate that feature in fruit.

Nemaha Co., Neb.

TWELVE GOOD MARKET VARIETIES OF PEACHES.

J. W. KERR.

For market purposes the varieties ripening before Troth's Early have no representative on the Eastern shore of Maryland. Very early Peaches are grown South, and, of course, these reach market ahead of those grown on our "Shore;" consequently the novelty of the "first ripe peaches," together with "Fifth Avenue" prices, has disappeared ere ours are ready to gather from the trees; hence, those varieties with a a permanent or at least with a less fluctuating value, are more sought after.

Troth's Early, would, of course, be my first choice; and this everybody knows without a description.

Montain Rose would be my next choice. This is a fine, large-sized, well-colored and good-flavored peach, when grown in good soil.

Mary's Choice comes next; yellow, free, not a heavy bearer, but invariably of fine size, and good quality for a yellow-fleshed peach.

Old Mixon Free: This variety, with all its good qualities, only pays as a market kind when peaches are somewhat scarce; for when there is a full crop the market is usually flooded at the season of the ripening of this one.

Crawford's Late: This is a reliable, and I believe a generally profitable sort; as much so as, or more than any other variety ripening with it.

Roulette: A splendid yellow-fleshed peach, ripening a little after Crawford's Late, of fine size and as dry as a Troth or a Smock, and on this account it is a first-class shipper. Another strong point in its favor, is its hardiness in the blossom; having a large blossom like that of Hale's, Beatrice, Amsden, etc, it seems to withstand the severest weather much better than many other varieties.

Fox's Seedling: A good Peach and a fair bearer after trees obtain some age; but while they are young the fruit has the very unpopular failing of rotting on them before it is ripe.

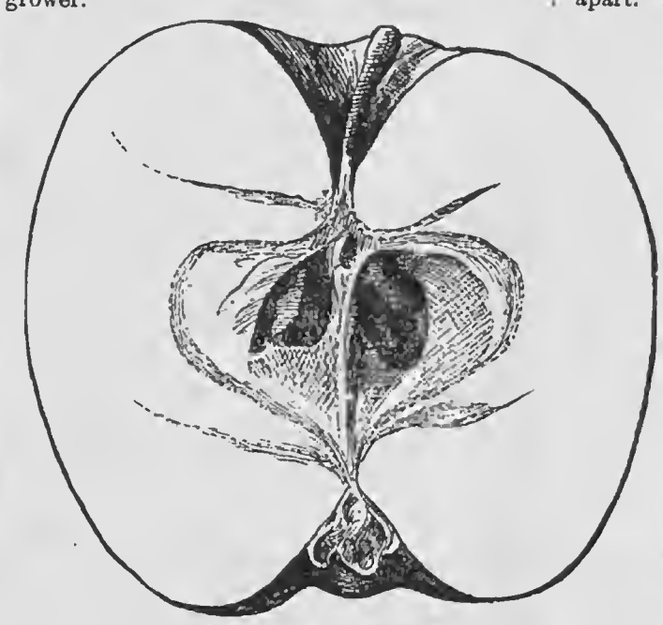
Silver Medal: For a white freestone peach this is without a rival. The fact that it is white at the stone and ripens some time after Crawford's Late, coupled with its fine size, makes it a desirable variety for loamy soils in good tilth.

Beer's Smock at this time is the most popular peach known to our growers. It is much sought after for canning purposes, being rather dry in comparison with some other kinds. It also ships and keeps well.

Washington: A very large yellow peach, as late as Smock, with an iron-clad blossom: of course desirable.

Hold On: This evidently is slightly akin to the Smocks. The tree is tough and wiry, and somewhat slender in its habits; the glands on the leaves reniform. This variety is very productive, and when in good soil—somewhat sandy—it has the merit of producing extremly few small peaches, considering its vast prolificacy—a very valuable yellow-fleshed, late-ripening sort.

Bilyen's October: The tree is not a great bearer, but the fruit has some striking characteristics. It resembles an Old Mixon, hanging long before ripening, which it does in October in ordinary seasons. It surpasses all other varieties known to me as a free-stone keeper. I have kept them on a shelf or in an ordinary room four weeks after pulling, yet they showed no signs of rot at the end of that time; having only shriveled slightly on account of the dry atmosphere; blossom large; tree a good grower.



Little Red Romanite.

Now, of course, I do not attempt to maintain that there are not other varieties equally meritorious in some respects with those on the above list; for instance, of those ripening between Mountain Rose and Old Mixon Free, I might name Reeve's Favorite—a very good Peach, somewhat shy in bearing. Stump-the-World, Beer's Melocoton, Ward's Late, etc—all fine Peaches, but no better than those on the list, in any respect, while the season from Troth's to the close is completely covered by those named. It will be observed that there are no Clingstones in the foregoing collection; the reason for which may be briefly stated as follows: The Heath and its progeny are the only Clings that possessed anything like substantial merits as market peaches; but in the last five years they have for some cause deteriorated to such an extent as to render them unprofitable and unpopular.

Carolina Co., Md,

SALLIE WORRELL PEACH.

Early in August we received a peach from Mr. C. W. Westbrook of Wilson, N. C. It was received in perfect order; was of medium size, very juicy and of good flavor. This was raised by an old lady whose name has been given to the peach. Mr. Westbrook says that last season some specimens grew as large as 14 inches in circumference.

FRUIT NOTES FROM NEBRASKA.

Horticulture is in its infancy in this part of Nebraska. A few years since it was generally supposed this would never prove a fruit country. A few ventured on fruit raising, however, and to-day success is written on their banners.

Fall seems to be a favorable time for handling nursery stock. The best location for an orchard here is a northern slope. Trees should be set inclining to the west of south, to lessen the effects of the sun. A windbreak is very desirable, and is more necessary on the south side than on the north. A young orchard should have clean culture until June, then a thorough mulching of loose, rotten straw that will let all the rain run through and afterward shade the ground. Sometimes mulching is piled up around the tree, forming a roof that throws off our dashing rains and thus starves the tree it is designed to feed. Make the ground beneath and the mulching saucer-shaped to retain the rain.

The best varieties of apples here are, Summer, Cooper's Early White, Duchess of Oldensburg, Red Astrachan, Red June, Fameuse, Haas, Maiden's Blush, Ben Davis, Rawle's Genet, Stark, Dominie and Winesap. The best Siberian is Whitney No. 20. In

CHERRIES.

Early and Late Richmond and the English Morello are the first choice.

Among Plums the Miner is most nearly exempt from the curculio.

Peaches do splendidly on the upland, seedlings often surpassing budded trees of the East.

In Grapes, Concord takes the lead.

Currants and Gooseberries, yes, and Strawberries are not a success in the hands of the average farmer. They need more attention, more hoeing and irrigating than, in our haste, we are inclined to bestow on them.

In Raspberries Mammouth Cluster takes the lead.

In Blackberies Snyder is the favorite.

Field Crops.

EXPERIMENT IN PLANTING CORN.

F. HODGMAN.

Here is the result of an experiment which I tried the present year, to learn the comparative values of different methods of planting corn with regard to the amount of seed used and distance apart. For this purpose, when planting, I selected a plat of ground in the field which was as nearly uniform in quality as I could find. It had received no manure for three years.

I first planted four rows twenty inches apart, putting one kernel in a hill and making the hills twenty inches apart in the rows. There were thirty hills in a row.

Next to these I planted four rows forty inches apart, putting two kernels in a hill and making the hills twenty inches apart in the rows. There were thirty hills to the row.

Next I planted four rows forty inches apart, making the hills forty inches apart in the rows, and putting three kernels in a hill. There were fifteen hills in a row.

Next, I planted four rows forty inches apart with the hills forty inches apart in the row, putting four kernels in the hill.

Corn of the same variety grew adjacent to the plat on which the experiment was made, on all sides except the east. The corn came up well, but some stalks were destroyed by smut early in the season. So far as cultivation was concerned, it was all treated exactly alike, being kept clean and free from weeds by the use of a hand cultivator four or five times during the season. It was not hoed, and there was no difference in the relative amount of labor bestowed on the different parts of the plat. The corn was allowed to fully ripen on the stalks without cutting. I have husked it with the following result:

Lot	Row							lbs.
1	1.	had 24	stalks.	bearing	37	ears,	weighing	12¾
	2.	" 28	"	"	28	"	"	10¾
	3.	" 26	"	"	27	"	"	11
	4.	" 27	"	"	30	"	"	11
2	1.	" 60	"	"	52	"	"	19
	2.	" 60	"	"	55	"	"	20
	3.	" 60	"	"	50	"	"	16½
	4.	" 58	"	"	54	"	"	20
3	1.	" 42	"	"	46	"	"	17
	2.	" 46	"	"	47	"	"	16
	3.	" 44	"	"	44	"	"	17½
	4.	" 46	"	"	48	"	"	19¾
4	1.	" 56	"	"	56	"	"	19
	2.	" 59	"	"	50	"	"	19¾
	3.	" 59	"	"	53	"	"	19¾
	4.	" 57	"	"	51	"	"	18
Summary, Lot 1 had 105 stalks, bearing 122 ears, weighing 45 1-2 lbs.								
"	2	" 238	"	"	211	"	"	75½ "
"	3	" 178	"	"	185	"	"	70¾ "
"	4	" 231	"	"	212	"	"	76¾ "

From this table we learn that the average weight of ears on—

Lot 1 was 5,967 ounces
" 2 " 5,725 "
" 3 " 6 075 "
" 4 " 5,773 "

The yield per acre, estimating the space occupied by each hill as being in Lot No. 1, 20 by 20 inches; in Lot 2, at 20 by 40 inches; and in Lots 3 and 4, at 40 by 40 inches, would be for—

Lot 1 5,817 lbs.
" 2 4,583 "
" 3 4,581 "
" 4 5,000 "

Lot 1, Row 1, was at the east side of the field, and had no corn growing next to it on the east side, and so really occupied more ground than I have estimated in calculating the produce per acre of lot 1. On this row more than half the stalks bore two ears each. I did not weigh the stalks for the reason that when the corn was husked, they had become very dry and the high winds had stripped them of the greater part of the leaves. I make no comment on the result, leaving every one to his own conclusions. I will only add to this, that when the corn was about three inches high, each alternate row received a top-dressing of a small handful of hen manure to each hill, applied close about the corn. The variety of corn was the improved Triumph Sweet Corn.

Kalamazoo Co., Mich.

The Herdsman.

MILK RECORD OF JERSEYS.

W. S. Wickham of Flushing, L. I., sends us the following statement of milk yielded by his small herd of Jersey cows:

Josephine 2d,
No. 2355, A. J. H. Book. Dropped her last calf March 28, 1878.

Gave in June	742	lbs.	of milk.
" July	651	"	"
" August	707	"	"
" September	526	"	"
" October	544	"	"
Amount in five months	3180	"	"

During September she was stung by insects and lost her milk for a week.

Deborah of Staatsburgh,
No. 3193, A. J. C. C. H. R. Dropped her last calf May 21, 1878.

Gave in June	636	lbs.	of milk.
" July	614	"	"
" August	620	"	"
" September	560	"	"
" October	532	"	"
Amount in five months	2962	"	"

Bessie Comet,
No. 5810, A. J. C. C. H. R. Two years old. Dropped her last calf March 11, 1878.

Gave in June	541	lbs.	of milk.
" July	395	"	"
" August	439	"	"
" September	499	"	"
" October	517	"	"
Amount in five months	2441	"	"

The last heifer weighs only 450 to 500 pounds, live weight. He would like to hear from others as to the amount of milk they get from their registered Jerseys. In this case, the milk was weighed directly after milking each cow and he can vouch for the correctness of this record.

The Vineyard.

GRAPE LEAVES.—No. III.

W. C. BELLAMY.

This northeast portion of Alabama, embracing a spur of the Blue Ridge, which is but a continuation of the great Apalachian Chain running parallel with the Atlantic coast, is certainly well adapted to the culture of certain varieties of the vine; and if our people could only become awake of that fact, this could easily be made a wine-producing region.

In addition to the Scuppernong and its volunteer seedlings, to which most of my first "Leaf" was devoted, there are other Grapes that are well suited to the various sections of the South and which could be made a source of considerable income. The well known Concord, with reasonable care, is here free from rot or mildew, and produces good crops of fine, large fruit. Several of my neighbors, owning but a few vines, make annually enough of excellent wine for their own use from one vintage to the next, but notwithstanding the fact that there is no tax on wine made for sale in this State, there is very little made here. California, however, is reported to have furnished upwards of six million gallons for sale from her last vintage. This, at the very moderate price of one dollar per gallon, would bring to the State an income equal to that from the sale of one hundred and twenty thousand bales of cotton at the present price, and when the fact is taken into consideration that wine is produced at far less expense than cotton, the actual profit must be very much greater.

On one of our mountain sides, in sight of my prolific vineyard, a stock company planted a large vineyard previous to the war, and employed an Italian to manage it. They unwisely planted mostly the Catawba, but they set out a few Scuppernongs also. As the Catawbas did not suit the locality, the vines did not bear fruit enough to pay the expenses, and as the yield from the few Scuppernongs would not justify keeping up the vineyard, it was abandoned and has gone to ruin. The Italian still lives there and ekes out a precarious livelihood by selling fruit from the few Scuppernongs—which still thrive through all their neglect—and from a few Concord vines and fruit trees he has since planted. The old Catawba vineyard he plants in cotton, and he told me lately that he made only three hundred pounds of cotton on nine acres of it. If, instead of the insensate folly of attempting to raise cotton, he had put out more Concords or Scuppernongs, he might now be independent, but he never seems to have realized that if one Concord or Scuppernong would thrive, he might as easily have ten thousand.

I do not suppose I can hinder the production of our great staple, nor would I be so unwise as to do so if I could, but I might be instrumental in inducing some men to abandon a ruinous for a profitable crop. A certain man made, last year, from thirty-one Scuppernong vines, only four years old, thirty-four barrels of wine and expects to make fifty this year. That wine rarely sells for less than two dollars per gallon. Now the result can be easily figured up.

The Concord requiring closer pruning, an acre will accommodate with ease three hundred and fifty to three hundred and seventy-five vines, producing three gallons of wine to each, making an aggregate of upwards of a thousand gallons of wine, which, even at fifty cents a gallon, would bring in a larger income than could be derived from an equal area under cotton. But this is not a cotton region, the best lands here rarely producing over two hundred and fifty or three hundred pounds per acre, while twelve long months of tedious toil are needed to plant, cultivate, gather, gin, pack and haul it to market, where only ten or twelve cents per pound can be got for it. Wine, on the other hand, is made in half the time and with far less than half the labor. Now, which has the balance in its favor? Because St. Paul said to Timothy, "Drink no longer water, but take a little wine for thy stomach's sake and thine own infirmities," I would not take advantage of this saying and encourage drunkenness. On the contrary, I have little doubt that if pure native wine were in as general use with us as it is in Spain, France and Italy, there would be far less of the more baneful effects of distilled liquors throughout the country.

Calhoun Co., Ala., Sept. 21, 1878.

Farm Economy.

CLOVER FOR AMERICAN FARMERS.

W. J. FOWLER.

THERE is no good farming without clover. In a few exceptional instances near cities, where large amounts of stable manure can be procured, fields may be and are cultvated for years in succession without seeding; but this is market-gardening rather than farming. In the blue-grass regions of the South and West the grasses are used for pasturing large herds of cattle, horses other stock, and little, if any, clover is sown; but this is stock-growing and breeding rather than farming. The high price of his produce, and easy access to manures near cities, enable the grower of special crops to dispense with the cheaper means of maintaining the fertility of his soil. In the Far West, the original virgin fertility of the land is not yet exhausted and the necessity for any manure is scarcely felt. Between these extremes is the great body of farmers whose crops will not pay enough to manure their fields every year, but who are under the necessity of doing something yearly to keep up or increase the productiveness of their land. To these, who are, strictly speaking, the farmers of the United States, and who constitute ninety-nine hundredths of all who till the soil, clover as a renovating crop, is a necessity.

HOW CLOVER HELPS THE SOIL.

Wherever clover can be grown, the means for restoring exhausted fertility are always at hand. It does this in many ways. On heavy loams or clays clover roots penetrate the subsoil, opening it to the fertilizing influences of air and light. They take from the subsoil the manurial elements, chiefly mineral, which have lain dormant or beyond the reach of less vigorous feeders. The surface soil on land long cropped is generally deficient in mineral fertilizers. As the clover plant is mainly near or above the surface, what is brought from the subsoil helps to make the surface richer. At the same time another important renovating process is going on. The clover leaves form a mulch, protecting the surface from the heat and rapid evaporation of moisture which would otherwise occur. Under this shade there is strong reason to believe that unavailable nitrogen is transformed into nitric acid or unites with some base forming a nitrate, and is thus made available as plant-food.

I omit, in this enumeration of the benefits from clover, the advantage which many believe it to possess of using atmospheric nitrogen by absorption through the leaves. This is a mooted question, and, though important, its decision does not involve that of the necessity of growing clover. If clover has this power, it is probably through the ammonia held by dews and rains on its leaves and is thus helped by the use of gypsum or land plaster, which often produces remarkable results on the clover plant. There can be no doubt that a growth of clover heavy enough to form a mulch, adds to the nitrogenous fertility in the soil. Clover is rich in nitrogen. In the decay of its leaves and roots it gives the soil just what is wanted to grow a maximum crop of any kind of grain. On the wheat-growing soils of western New York farmers have found by experience that growing clover enables them to produce as large crops of wheat as in the early days when the virgin fertility of the soil was not exhausted. There is even an increase in fertility on cropped land regularly seeded with clover. Some years ago a successful farmer had occasion to remove a fence between two fields, throwing both into one. The fence was a crooked rail fence, and had been unmoved many years. He supposed, as a matter of course, that this uncropped land would prove the richest; but instead of this being the case, there was a poor streak through the field where the fence stood, which was not remedied until several years afterwards, when he applied a dressing of manure to restore equality. The clovered land on either side was without any fertilizer excepting clover, and yet it had constantly increased in fertility.

CLOVER ON SANDY SOIL.

The use of clover as manure has heretofore been chiefly on light, sandy soil deficient in vegetable matter. Here the soil, when not in crops, must be continuously seeded with it, and, as often as possible, the entire growth of the plant must be plowed under. Treated thus, sandy soils, which would otherwise become a barren waste, are rendered productive. In some localities are farms which consist mainly of drifting sand, which not even a mortgage will hold, and by their side other farms naturally no better that, by the use of clover, have been made fertile. Pure sand has no capacity for retaining manures. Adding vegetable matter, as we do with clover, we may add whatever else we choose, with the assurance that it will remain a fixed benefit. On heavy land clover benefits the crop by disintegrating the too compact mass. On sand the decaying clover forms the soil on which the crops must grow. It makes heavy soil lighter and light soil heavier.

CLOVER AS A WEED DESTROYER.

The advantages of clover in cleansing foul land have never been appreciated. As usually grown, in thin seedings, it does not have this advantage. Sown as it should be, at least a peck of seed per acre, and allowed to form a dense mat, clover will smother and destroy most annual weeds, and greatly aid in suppressing those hardy perennials, thistles and quack-grass. But to do this effectually, clover should be grown with the least possible check. No pasturing should be permitted when the ground is moist enough to poach by the feet of cattle or horses. Especial care should be taken of clover while young. The best farmers now will not pasture the first year after seeding. In a season like the present, I would make an exception. Clover this year blossomed and in some places seeded from last spring's seeding. So soon as the blossoms began to appear I would pasture lightly to keep down the blossoms. This makes a rich food for cattle or horses, and, as blossoming is very exhaustive to the plant, light pasturing rather promotes its vigor. But the second year no hoof of horse or cow should be allowed in the clover field, except as horses are used to cut and harvest the hay. If cut early in June, the second crop will grow more rapidly and the crop of seed will be generally better. It is during this second growth that the clover roots make most progress in penetrating the sub-soil. For this reason, as also because I like to feed a good deal of clover hay, I have as much as possible mown every year.

PLOWING UNDER CLOVER.

The advantages of this practice are generally well-known. For many years it was the only recognized mode of using clover in this section. The farmer who mowed his clover, and especially he who grew a second crop for seed, was thought to be "ruining his land." So he was most undoubtedly, if the clover hay was sold from the farm. In the old days of exclusive wheat growing, scarcely any farmer had stock enough to eat one-half or even one-quarter of the clover that the farm produced. Plowing it under was in these circumstances almost the only mode of using it, and the result showed that the practice was profitable. It had the advantage of saving labor and of distributing the fertilizer more evenly than it could be in any other form. Of late years, however, the increase of stock necessitates the use of more clover as hay. We find that this clover hay makes much richer manure than what we have been accustomed to get from timothy and natural grasses. The growth of clover roots from June till September often leaves as much in the soil as we should plow under in June. Hence, whenever we have sufficient stock to consume it, clover may be mown without detriment to the fertility of the soil.

CLOVER AS HAY.

The old idea that clover hay is injurious to horses has been pretty thoroughly exploded. Dusty hay is hurtful, and clover from its succulency and the difficulty of properly curing it, is most apt to be dusty. Clean, bright clover hay is never injurious to any horse. Care must be used in feeding it. Horses are so fond of clover that, if allowed all they can eat, they will distend their stomachs and thus hurt themselves for traveling. Clover is rich food, and if given in small quantities with grain, horses will work and travel on this food as well as on timothy. The advantage which timothy has is that it is so hard and tasteless that few horses will fill themselves with it; hence with grain they are in the best possible condition for work or travel.

SEEDING WITH CLOVER.

Clover seed in all northern climates should be sown in early spring, with some grain crop. Wheat or rye is much the best. Spring grain is apt to make too large a growth and smother the young plant. If sown on winter grain the ground should be harrowed thoroughly to make a mellow seed-bed. This practice is also beneficial to the grain crops, thus securing a double advantage. All the attempts I have seen to sow clover seed without grain, have been failures. The young clover is benefited by the protection of the grain leaves in early spring. Before summer heats come, it has, or should have, a root deep enough to withstand ordinary droughts.

MANURES FOR CLOVER.

In my own practice no manures, excepting gypsum and superphosphate, are used for clover. The latter is applied with the grain crop, and only benefits clover as a secondary consideration. No coarse manures should be thrown on clover at any time, as they will destroy the plant. The free use of gypsum insures a good growth of clover on ordinary soils, or, if additional fertility is needed, it is all the better if the manure has been applied to other crops a year or two previous, and thoroughly incorporated with the soil. On sandy land clover is often greatly benefited by a liberal dressing of ashes. The lack of potash is, on many soils, a reason why clover fails to catch, and sorrel or other weeds take its place.

VARIETIES.

Writing of clover as a farm crop, reference has naturally been had chiefly to the common red clover, Trifolium pratense, which is the best adapted to all farm purposes. White clover, Trifolium repens, is a small variety, but makes an exceedingly sweet and rich pasturage for cows. Where improvement of the soil is the chief end desired, and especially if the crop is to be plowed under in bulk for that purpose, the large red clover, commonly called Pea-vine clover, is worthy of attention. The experiments with Alsike clover have not proved it as valuable as the older and more generally cultivated kinds.

Monroe Co., N. Y.

Farm Topics.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

THE sight of thirteen Duroc and Victoria breeding sows, with a host of young pigs, led Esquire Davidson to exclaim, "If I had so many hogs I should go crazy!" It does take considerable to feed such a lot of hogs, but the keeping is not expensive when one has made calculations beforehand. Our pigs now live entirely on raw pumpkins, and many of them are fat enough to butcher. Before being fed pumpkins, they ran in the orchard and fed on the apples which dropped off and on grass. Before the apples began to fall, they had nothing but the grass. As soon as the pumpkins are fed out, one of the corn-fields will be cleared of corn, and they will all go in there to pick up the scattered ears and to eat the turnips which were sown amongst the corn. By the time the corn-fields are stripped the root-ground will be ready for them, and here they will thrive quite into the winter, eating the tops and refuse.

All this time the old hogs will not be fed anything extra, but the young pigs are taught to go into an inclosure where they can get all the corn they want. Mangels and sugar-beets will constitute the bulk of the winter food, with a change to apples and a light feed of corn. The turnips in the corn lots are now growing fast, and what the pigs do not eat will make rich manure. A pound of turnip seed costs this year seventy-five cents, and sown broadcast on the surface, required no labor but that of sowing. The first shower works the seed in, and the crop is started. It needs no attention afterwards. Counting the cost and labor, there is no crop which will pay better, and with lots of turnips and other roots, forty sows and pigs will not worry us, but, on the contrary, afford a satisfactory prospect.

The girl says the chickens, when she dresses them, are bloody inside. This is because their necks have been wrung. If the heads had been cut off, they would have bled freely and the bodies would have been emptied of blood. Wringing the necks tears the veins and arteries in two, and allows the blood to congulate readily and thus stops the flow. A clean cut would not do this. This is the reason why, in castrating an animal, the cords should not be cut off, or the umbilical cord on the young, but both should be scraped apart and then scarcely any blood will flow.

We are shipping our apples to New York by the canal. It costs fifteen cents a barrel to send them from Schenectady, 166 miles, and ten cents to have them sold when they arrive. The barrels cost fifteen cents and we pay ten cents to have the apples picked. This foots up fifty cents cash out for each barrel with no charge for barreling and hauling. If they net us $1 a barrel we shall be satisfied. This year we have picked the apples and placed them in small piles under the trees, where they remain until put into the barrels. Some of the neighbors have barreled them up and left them in the orchard until the cold weather comes. It is not a good plan to put them in heaps inside of a building, as they will heat and rot. An old fruit-dealer used to head them up in the orchard as soon as picked, and then stow them away in the cellar until wanted. He said this was the best plan. He was careful to have all the barrels dry, and his theory was that the barrels absorbed the moisture from the apples and kept them in just the right condition. Apples are ripening earlier than usual this year, and if people are not careful, they will lose a great many on this account. Many Greenings are now fit to eat, and this is two months sooner than they often are. The hot, dry weather has hastened their maturity. We shall leave our apples out of doors as long as possible, believing they will keep better than if housed; anyway it will be less trouble to look them over.

We are going to take courage for the future, as not a single pear tree has blighted among a thousand. Perhaps there will be another thirty years' interval before blight comes again.

The big, heavy-bodied fowls are apt to bruise the bottoms of their feet, causing blind ulcers, which make them very lame. We never had one get well, although we have applied liniments. A Dorking rooster had these humble-foot or ulcers on two of his toes. We cut the toes off and seared the ends. He is getting well. The ulcers would have killed him.

Everywhere.

FLORIDA NOTES.

THE health of most parts of Florida is good. We have had no cases of yellow fever excepting a few at Key West, which were brought there on vessels calling at that port. Crops of all kinds were excellent before the storm that lately swept over the Peninsula. This lasted three days and nights, and prostrated a great deal of sugar-cane, damaged the cotton crop very much in some places, and laid low a good many bahana stalks and blew off a great many oranges, etc. Moreover, the floods in the southern part of the State drowned much stock of all kinds and destroyed crops, fences and buildings. I have been traveling over two years in the Land of Flowers, most of the time over what is known as the Peninsula of Florida; and for the benefit of those who contemplate moving from the frigid North to this delightful climate, I can cheerfully recommend what is known as the Lake Region for orange and fruit culture, as well as for health, good water, and pleasant situations for homes.

This Lake Region embraces a belt of land about one hundred miles in length, and twenty or thirty miles in width, from which the water flows into the Gulf and Atlantic, so that it is the highest land in the State. This belt is the home for the Orange and the whole citron family of fruits, the trees having suffered less from the exceptionally cold weather, two years ago, than they did two hundred miles south of here. This was owing to the numerous lakes and elevations hereabouts. Most of these lakes are of pure spring water, abound with the finest of the finny tribe, and nature could not have formed more beautiful situations for orange groves, or for family residences, than those which surround many of them. This remark is especially true of Clay, Putnam and parts of Bradford counties. The people in these counties are becoming much elated with the prospect of a railroad being built to run from Palatka on the St. John's River, or from the Halifax River, by way of Palatka and the Lake Region to Lake City in Columbia Co.; this would give all of the country on the Halifax and Indian Rivers, and all of the upper St. John's River, an outlet for freight and passengers. There is also a prospect of a ship-canal being built from Matanzas Inlet, on the Atlantic, to Fort Waller at the month of the Suwanee River, on the Gulf coast. This would afford the shortest route from New York to New Orleans, being over one thousand miles less than the route now sailed. Moreover, all those dangerous reefs around the southern coast of Florida, would by this route, be avoided, saving millions of dollars annually in the way of shipwrecks, extra insurance and freight, besides the loss of time and many lives incurred on the outside route.

TH. PENOYER

RURAL SPECIAL REPORTS.

ORLEANS CO., VT. Sept. 13, 1878.

I HAVE had the Lady Elgin in fruit for several years; the trees were received direct from Dr. Andrews. It is of good flavor and keeps pretty well, but it never becomes soft, and it is too small. The Marengo is another failure here—so complete that it is difficult to make anybody who sees it believe that it can be good anywhere. The Van Wyck Sweet—trees from Maxwell Bros. —has fruited with me this year. The fruit is good and of good size, but in neither respect superior to Pringle's Sweet, while the tree is much inferior in point of hardiness—indeed it is too tender for our severest winters, and probably will prove a total failure in Minnesota and the colder parts of Wisconsin. There is quite a number of Sweet Crabs: Beebe's Sweet of Minnesota has not yet fruited with me, but it is highly recommended. Chase's Winter Sweet is of fair size and quality, and keeps as well as Tolman Sweet. I have tried over 100 Siberians, and the best of them all is Meader's Winter, figured seven or eight years ago in the RURAL, and described by F. R. Elliott. See out, 728.

H.

KANAWHA CO., West Va., Nov. 6.

WE need at least a thousand copies of the RURAL in this part of the country. If the people would get them, read them, and follow their suggestions when applicable to their circumstances, there would soon be a great improvement in all branches of agriculture hereabouts; but, alas! we are half a century behind the times. We have land that was good fifty years ago; it has been planted with corn or wheat every year since then and still some of it yields 30 bushels to the acre of corn; but most of it is badly worn out. We have everything, except a progressive spirit, to make a good farming country—coal, timber, iron, a fine climate, a healthy location. But not one-fifth of our hill lands is cleared yet, and good hill land can be bought for from $3 to $10 per acre.

SHERMAN, Chautauqua Co., N. Y., Nov. 5th.

THE first snow of the season fell here on October 23d, but it was only a sprinkling. The weather this fall has been fine, indeed. Farmers have had a golden opportunity to do fall plowing and ot[illegible]. Corn was a good crop; but we

have few apples and potatoes. Turnips and beets are also good crops. Butter is worth from 18@20c. per lb; eggs, 16@18c. per doz; wood, $1 per cord; hemlock lumber, $6 per M.; corn, 60c. per bushel; oats, 25@28c; wheat, $1; buckwheat, 50@60c; honey, 20c. per lb.; flour, $5 20 per bbl. M. L. D.

OFFERLE, Edwards Co., Kan. Oct. 28.

WE have had a long dry term here and it looks dark for the next crop of wheat—no rain since harvest. I have just taken 160 acres of land and put in 24 acres of wheat, but if I have to replant in the spring, times will be pretty hard on this farm at any rate. This part of Kansas is filling up very fast and, with few exceptions, with a very intelligent and industrious class of people. But it requires time, money and patience to develop the resources of even a rich land like this. W. A. S.

GRAND RAPIDS, Mich., Nov. 5, 1878.

I SEE the Longworth's Prolific Strawberry is referred to in some papers as fulfilling the requirements of an ideal Strawberry. There are some things, however, which are indescribable by any words in the English language, and a good "strawberry" taste is one of these. Hence I shall await a taste of the Longworth before casting a vote for or against it, for hitherto I have never seen it. C. W. G.

RIDGEFIELD, Conn., Nov. 4, 1878.

This is called the Gem of Conn. The fall so far has been unusually pleasant and mild. There have been a few frosts. Pastures all the season have been fresh and green. Crops are luxuriant. Prices are: wheat, $1; corn, 56c.; potatoes, 75c. per bushel; butter, 25c. per pound. K.

IOLA, ALLEN CO., Kansas, Oct. 30, 1878.

CROPS hereabouts are unusually good with the exception of spring wheat and potatoes; rust injured the former, while dry weather made the latter a very short crop. Wheat, 50 to 75c.; corn, 20c.; oats, 16c; potatoes, 50 to 75c.; cattle, $3 50; hogs, $2. H. M. S.

SPEEDSVILLE, Tioga Co., N. Y., Nov. 2.

PLEASANT weather and some hard frosts, and a very little snow on the last night of October. Farmers are plowing, husking corn and making cider for their own use; very little of it is sold; it brings only $1.00 a barrel; apples are only 15 to 20 cents a bushel. L. C. L.

CORNING, Steuben Co., N. Y., Nov. 2, 1878.

QUITE cold but pleasant; ground froze night before last for the first time this fall. In my "report" on page 682, I find the price of oats to be quoted somewhat higher than they should be; it ought to read 25c. instead of 50c. F. H. D.

STARK CO., Ills., Nov. 3, 1878.

THE weather has been very fine this fall. Farmers are busy harvesting their corn and preparing for winter. Pork is from 2½c; to 3c. per pound; hay, $14 per ton; potatoes, 50c. per bushel; new corn, 20c. per bushel. H. E. M'C.

Miscellaneous.

WHAT OTHERS SAY.

APPLES FOR PENNSYLVANIA.—Secretary Edge, of the Penn. State Board of Agriculture, records the following, as according to the votes of his correspondents, the best apples—summer, fall and winter:

SUMMER.		Strawberry,	6
E. Harvest,	192	Vandevor,	6
Red Astrachan,	124	Porter,	6
Bough,	70	Fameuse,	4
Townsend,	18	WINTER.	
Benoni,	10	Baldwin,	118
Doane,	6	R. I. Greening,	98
Red Stronk,	5	N. Spy,	78
Culoh,	4	Smith's Cider,	42
FALL.		Rox. Russett,	40
Malden's Blush,	101	King of Tompk. Co.,	40
Smoke House,	94	Seek-no-further,	38
Rambo,	70	Romanite,	18
Queen,	61	Swaar,	8
Fallwater,	54	Spitzenberg,	8
Gravenstein,	18	Ben Davis,	4
York Imperial,	10	Newtown Pippin,	4
Wineap,	8	Ridge Pippin,	4
Doctor,	6	Rome Beauty,	4

KEEPING APPLES.—Upon this subject the Germantown Telegraph says: 1st.—Apples to be good keepers, must be free from bruise or blemish. 2d.—They must be spread out on shelves or packed in barrels, and kept in an atmosphere of from forty to fifty degrees, better from forty to forty-five—that is at a temperature as equable as possible. Some cellars are just the thing and preserve them beautifully. Others are too moist. Where this is the case a few bushels of stone lime should be used. Sliding shelves, six inches apart, latticed bottom with a single layer of fruit, are extremely convenient, as they allow of constant examination without disturbing the fruit. A friend informed us some years ago, that with a large stand of these shelves in his cellar, with a few inches of lime on the bottom of the cellar, he kept his apples into May in perfect condition and of good flavor.

APPLES.—Mr. M. B. BATEHAM said at the last meeting of the Ohio Horticultural Society, that a serious drawback to the profitable culture of Apples is the fact of heavy and light crops in alternate years, causing a glut in the market at one time, and a scarcity the other. He gave the following figures to show the great disparity in different years:

1874, bushels of apples in Ohio			15,918,794
1875,	do	do	1,530,049
1876,	do	do	29,619,200
1877, estimated,		do	3,000,000

He proposed early thinning in abundant years, and keeping orchards in a thrifty state of good culture. The codling moth is a formidable enemy to the apple crop, and the best modes of preventing its ravages have been a continued confinement of sheep and swine in the orchard through the entire season of growth and for successive years, with the additional aid of paper bands around the trees for the capture of the insects.

LOW TOPS FOR FRUIT TREES.—Several writers have lately presented their views of the merits of low tops for fruit trees in the agricultural Tribune. It is a good plan for dwarfs, and also for such standards as are of upright growth, Mr. Charles Downing comments, but the branches should not be less than two feet from the ground, and three would be better. For standard trees of the kinds which have a spreading habit, the branches should not be less than four feet from the ground, and five is better, because when loaded, the branches with the fruit will lay on the ground, and of course the fruit is worthless for eating or cooking. It is true that the body of the tree is injured where exposed to the sun both winter and summer, but in most cases at the hight here named the branches will shade the bodies, and if not, a piece of cloth or stiff hardware paper tied on, will answer the purpose of sufficient protection.

HINTS ABOUT HORSE-BITS.—A writer in a German contemporary strongly counsels horse owners who study the health of their cattle to banish from their harness-rooms all bits but straight ones of the simplest possible construction. Through a long series of years he found, from practical experience, that powerful young horses frequently fell off in condition without any appreciable cause, their food being plentiful and of the best quality, and no symptoms of general ill health being apparent. On searching carefully for the cause of this state of affairs, he found, in nearly every instance, that the horses' tongues had been more or less injured in consequence of the employment of curved, jointed, hinged, or otherwise complicated bits. The sore and tender condition of so sensitive an organ as the tongue, necessarily prevented the animals doing justice to their food, and short rations with the usual amount of work, naturally led to a loss of condition. Unfortunately the mischief generally escapes attention until it is tolerably far advanced.

OF how much "stuff" is published by the best of Horticultural Journals the following bit is suggestive:—

Smilax.—For rapidly covering large spaces of wall the hardier species of this genus are well adapted, being very elegant, and not of such a common aspect as Ivy. There are several North American species, of which the most suitable are S. rotundifolia, glauca, and tamnoides, all readily procurable at nurseries, and growing in almost any kind of soil.—*London Gardener's Chronicle.*

This Smilax is our Greenbriar. S. rotundifolia forms impenetrable thickets in our woods, and is armed with prickles. It is just about the last plant we should care to select for ornamentation. Glauca and Tamnoides are of the same feather.

KEEPING FRUIT IN SAND.—A writer in the London Garden says that he keeps fruit in this way all the year round. He has had French crabs two years old. The Catillac pear has remained sound twelve months. The fruit must be sound when stored, and the sand must be quite dry. The chief advantages of packing in sand are, the exclusion of air currents, the preservation from changes of temperature, and the absorption of moisture which favors decay. Much will depend on the apartment in which the experiment is tried, a dry or cool one being best.

PROMOTING FRUITFULNESS.—The London Garden says that the best way of converting vigorous but unfruitful pear trees, or such as produce fruit of inferior quality, into remunerative ones, is to head them down while the sap is dormant, and to re-graft on all the extremities as soon as it begins to flow in spring with some tried sort. The double grafting will be certain to induce fertility, and in a few years the produce will exceed what it is possible to obtain by any less radical measures.

DUCHESSE ON SANDY SOIL.—A writer in the Weekly Tribune says that of the pears grown in his poor sandy soil this season, some Duchesse d'Angoulome weigh twelve to fifteen ounces, and are ten to twelve inches in circumference around the base and about the same from the top around the bottom. They are of fine flavor and very juicy. He thinks he deserves credit for proving this, for all the writers on fruits, from A. J. Downing to the present time, have asserted that good pears could not be grown on a poor sandy soil. He has only moderately fertilized the soil on which these pears are grown.

YEARNINGS.—Under this heading a writer in the Phrenological Journal says:—"We have all seen fools in high places, to which wise men—moneyless—dared not aspire. We know how the politician buys his triumph, and how mean measures make their way. We know how "patronage" keeps merit from its due and makes it yearn its life away. The least conscientious will push and scramble, and override the considerate, and we have either to fight them with their own weapons or let them take precedence of us. We dispise their weapons and so they go ahead.

INDELIBLE INK.—The London Garden gives the following recipe for indelible ink for zinc labels: 12 to 16 grains of bichloride of platinum dissolved in one ounce of distilled water.

DUCHESSE D'ANGOULEME.—"It has been remarked," says Mr. J. J. Thomas "that when this Pear weighs less than four ounces it is worthless in flavor."

NOT ON END.—The Journal of Chemistry says, the barrels in which fruit is stored should not stand on end; pile them up one upon another, the ends horizontal.

LOUISE BONNE.—A writer in the Maine Farmer thinks that Louise Bonne de Jersey on Quince, leaves nothing to be desired in the way of a Pear.

BOOKS RECEIVED.

PRIZE LIST of the Chicago Fat Stock Show to be held in the Exposition building, Chicago, from the second to the tenth of December, 1878. We have several times already commended this exhibition to the best attention of our readers. The list of premiums offered for choice Shorthorns, Herefords, Devons and other pure breeds as well as for grade cattle, and also for different varieties of sheep and swine, is liberal, and we trust that our readers living within a reasonable distance of the western metropolis, will become either exhibitors at the show, or at least, visitors to it. It was originated by the State Board of Agriculture, under whose auspices it will be held. It is not intended to be merely a local show, but its aim is to be national.

AMATEUR'S HANDBOOK of Practical Information for the Workshop and Laboratory. This is a handy little book, containing clear and full directions for bronzing, lacquering, varnishing, tempering tools, waterproofing, and a host of other matters of convenience and utility in every household. A copy will be sent post-paid for ten cents by the Industrial Publication Company of this city.

CIRCULAR from the General Land Office showing the manner of proceeding to obtain title to public lands under the Preemption, Homestead, Timber Culture and other laws. This pamphlet of 68 pages would be useful to all who may be intending to settle on the government lands out West, or elsewhere. It is sent out by the General Land Office, Washington, D. C.

PAMPHLET of 12 pages descriptive of the course of study at the College of Agriculture connected with the University of Minnesota, at Minneapolis in that State.

CATALOGUE of Veterinary Instruments manufactured and imported by John Reynders & Co., 303 Fourth avenue, N. Y.

The Querist.

ANSWERS TO CORRESPONDENTS.

Money at two per cent. per Annum.

Phenix, Elora, Pa., and others, referring to a late Editorial in the RURAL, in which it was stated that money is lying in the banks ready to be loaned at the rate of two per cent. per annum interest, wish to learn where money can be borrowed at that interest on good security. Having previously seen with suspicion such statements in newspapers, it is asked whether the RURAL also might not have thoughtlessly ventured upon a misstatement on this point.

ANS.—The rate of interest here referred to, is that asked for what is called "loans on call," or "call loans," with the best kind of collaterals. In all loans of this kind the money loaned must be promptly forthcoming immediately on demand, without any notice; and the loans are generally made only for from a day to a couple of weeks or so. The security must be deposited with the lender, and must be of such a nature that it can be instantly converted into cash, in case the borrower fails to repay the loan promptly on demand, and must always be valuable enough to leave a margin over the sum borrowed. For instance, a man wants $100,000 for a few hours or days, or weeks, it may be; he has bonds and other securities worth more than that sum, but he doesn't want to sell them on account of a mere temporary pressure. Well, he goes to his bank, deposits there U. S. or other bonds worth $110,000, and borrows the sum he stands in need of, promising to repay on demand. The money will lie idle in the bank's vault unless it is loaned, and accordingly, under the circumstances, the bank can afford to lend it at a low rate of interest. Frequently, however, when business is brisk, and money therefore in demand, the interest on just such loans is as high as at the rate of four or five per cent. per annum.

Prickly Comfrey—Alfalfa.

N. C., Berlin, Conn., asks 1. the botanical name of Prickly Comfrey and whether it is suitable for a forage plant. 2. Would Alfalfa be likely to thrive well in that locality, and where could the seed be obtained. 3. Is it a good time to prune pear and apple trees this fall.

ANS.—1. The botanical name of Prickly Comfrey is Symphytum asperrimum. We have tried it thoroughly, and found that none of the stock on the farm would touch it. Nevertheless, others praise it as a forage plant. These say that after a little forcing, stock will take to it kindly, get to like it and thrive well on it. We did not use the forcing process with our animals.

2. We cannot say whether Alfalfa will thrive so far north. It is reported by one party to have done well as far north as Herkimer Co., N. Y., yet we know of a case where it was winter-killed in New Jersey, while red clover planted beside it, was uninjured. It must have a deep, mellow soil, and the best practice is to sow it in drills from 18 to 30 inches apart. It should be cropped but lightly the first year, if at all; in its third year it is in full bearing, and may afterwards yield from three to five crops each season for an indefinite length of time. It must be planted from March to May, and the earlier the better. The seed can be had from most extensive seed dealers, such as R. H. Allen & Co. or Thorburn & Co. of this city. Should our correspondent make a small experiment next spring, we should like to learn the result.

3. Yes.

Dynamite Cartridges: Carbonate of Soda Preserving Milk.

G. W. Grant, Oceana Co., Mich., asks 1. Where are dynamite cartridges made, and from whom can they be purchased; 2. having read, in a former number of the RURAL, that carbonate of soda put in milk would keep it sweet a longer time, he inquires how much of it should be put in a gallon of milk.

ANS.—1. Dynamite cartridges are made by the Atlantic Giant Powder Co., of this city, among others, and can be procured of Varney & Doe, 61 Park Place, New York.

2. To put carbonate of soda in milk prevents or corrects acidity; sometimes the milk is slightly acid when drawn from the cow and, of course, it soon sours in that case. Otherwise it sours soon in warm, damp weather. A pinch of carbonate of soda dissolved in a gallon of milk will correct the slight acidity in the first case. To prevent acidity from occurring for 36 hours in very warm weather, one-fourth of a teaspoonful may be used to a gallon of milk.

Miscellaneous.

A. H. Huffman, Huntington Co., Ind, asks 1. where can seeds of Catalpa be purchased. 2. Should apple and pear seeds be kept dry. 3. When should they be planted. 4 Could seeds of trees or small seedlings be obtained from their native wilds.

ANS.—1. Of Thorburn & Co., N. Y. City.

2. They may now be obtained at Cider Mills. Place the seeds in sand slightly moist. (3) and sow in the spring. The box containing seeds may be buried or kept in the cellar.

4. Yes, but the seedling fruit would be worthless. The wild trees could only be useful as stocks upon which to graft.

S. D. Hartwell, Walworth Co., Wis., asks how to get rid of a plant, called Box Wood thereabouts, a specimen of which he sends us. It covers a good part of the cemetery, and is spreading into the adjoining fields. When mutilated, a white sap exudes.

ANS.—This is Cypress Spurge, Euphorbia Cyparissias, a European plant sometimes cultivated in gardens, and thence escaping to fields and roadsides. Cutting it to the ground frequently with lawn-mower or sickle will destroy it.

E. F. M., Beverly Farms, has a golden leaved Holly, some of whose branches are covered with leaves while others are entirely naked and apparently dead; and inquires how it may be rejuvenated throughout.

ANS.—We could only advise taking it up, examining the roots and replanting in a leaf-mold soil.

M. M. R., North Greenwich, N. Y. sends a leaf and asks the name of the plant from which it was plucked.

ANS.—It is probably a species of Chamæpeuce, a sort of thistle. The specimen is imperfect, as the flowers also should have been sent, to enable us to come to a right conclusion.

C. S. Greenpoint, N. Y., asks whether vines should be pruned after the first frost, such as visited that place on the 5th inst.

ANS.—Yes.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, NOVEMBER 9TH:

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY NOV. 16, 1878.

We shall issue our premium List as a supplement of four pages next week. Notwithstanding the reduction of our paper from two dollars and a half to two dollars; notwithstanding our free seed distribution which, at our lowest estimate, will require us to supply two hundred thousand envelopes of seed, we have never before offered so valuable a premium list, or one in which the articles were scaled so low. They will be found to be as represented, and so varied that everyone may find something that he needs. All may rest assured that $2.00 is the very lowest yearly subscription to this journal either in clubs or any other way. Those sufficiently interested in the RURAL'S welfare to be willing to secure clubs, will be entitled to a cash commission or to select suitable articles from the premium list, which are, of course, more valuable to those who wish them than a cash commission, since they are in part paid for by those who find it advantageous to advertise in our columns, and we are therefore enabled to offer them for less than their market value.

Our readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

Many of our friends continue to send us Two Fifty instead of *Two* Dollars, the new price of RURAL. In such cases we will either refund the fifty cents or make the subscription term fifteen months, as may be preferred.

Our Free Seed Distribution will remain open to all subscribers who may apply for them, until further notice.

THE RURAL NEW YORKER *is invariably discontinued at the end of the subscription term.*

APPLES BEARING ALTERNATE YEARS.

There seems to be much more mystery made about this question, of the reason why apple trees produce most of their fruit on alternate years, and in most localities, North, on the odd years, than there is any need of. Let us look into it a little, and see whether there are not good reasons for it, sufficiently obvious to one who will think a little, if not exactly on the surface of things.

In the first place, nature and the pomologists agree in dividing apple trees into the two classes, of profuse bearers on alternate years and of moderate annual bearers. There are two other possible classes on this basis,—the shy bearers every year, and the profuse bearers every year. But the first of these are not knowingly planted to any great extent, and the second are few in number, and, except in very favorable localities, short-lived; for they soon die of over-bearing. The question, then, as regards the first great class, resolves itself into the one why the profuse bearers on alternate years all get to bear, or not to bear, together. Plainly, it seems to us, for climatic causes. Take a young orchard, for instance, and it does not show this peculiarity for several years after it comes into bearing. Then comes a season that, by winter injury or spring frosts, destroys the fruit-buds or the bloom, and that year there are but few apples, and afterwards the trees in that orchard, so far at least as the biennial bearers are concerned, bear, or do not bear, simultaneously. The moderate annual bearers do not fall into line with them; but, for the reason that they *are* moderate bearers, and that on the off year of the biennial trees all the insects are concentrated upon them, they have little effect upon the aggregate production of the year.

Now about the "odd year" of which so much has been said and written since Mr. Cole brought up the subject, and persistently kept it before the public in his paper and in his "American Fruit Book." It is plain that if our first explanation is correct, namely, that climatic causes are the causes that unify the bearing of the biennial bearers, then, as there *are* only odd and even years, the year on which they bear must be either an odd or an even one. Now, in Mr. Cole's time the main bulk of the commercial orchards of the country were contained in the district comprising southern New England and the country south of the great lakes, extending down into Pennsylvania. The climate of this section is quite uniform, the same changes or "waves," as they are now called, occurring at the same time over the whole of it, with slight local exceptions. Consequently the orchards were brought into line by the climate, and mainly bore the same year, which happened to be the even year. That this was not a rule without considerable exceptions, was plain from the many contradictory examples brought out in the controversy raised by those who discussed the matter; yet substantially it was demonstrated that the even year was the bearing year, *with exceptions.* As apple culture has extended into climates more or less diverse from that of the section referred to, the exceptions have increased. Yet even now, that section produces so large a percentage of the whole crop that failure there has a great effect upon the supply, and the consequent prices of fruit. But there are now large areas where the odd year is the bearing year; and for this reason, though prices are higher on the odd years, the country is tolerably well supplied with apples every year. This will be increasingly so as soon as some sections of the South, excellently adapted to orcharding, have developed their capabilities in that direction. And the same may be said of a considerable section North, if the attempt to carry orcharding into successful operation there on a large scale, by the introduction of hardier varieties, attains the success that is hoped for, and already partly realized.

Now there is an important corollary to be drawn from the above stated facts, which is worthy the attention of fruit growers, namely, that no human efforts can alter the bearing year. It now happens to be, over a large area, the *even* year. A freak of climate may change it to the *odd* year over the same area, but nothing else can. High culture will compel some varieties that are naturally biennial to become annual bearers, but all fruit produced on the years when the majority of orchards do not bear, will be inevitably subject to an onslaught of insects which will greatly injure the crop. Some orchardists maintain, with a show of reason, that for this reason it would be better if not an apple were grown the odd year, where the even year is the bearing year, or on the even year, where the odd year is the year of fruit.

AGRICULTURAL LITERATURE.

According to the newspaper statistics sent out by the advertising agencies, the combined circulation of the agricultural newspaper press is about 600,000, which, as the census reports 6,000,000 farmers in the Union, is about one copy to every ten farmers.

It used to be queried in England, with a contemptuous accent and a supercilious wrinkle of the forehead, "Who reads an American book?" They have got over all that, what with the popularity of our poets and historians across the sea; but the question "Who reads an agricultural book?" still awaits a satisfactory reply. The agricultural book trade is about the very smallest branch of the great business of publication, and though the book-agent pervades the land, and knocks often at the farm-house door, it is with a volume of Mark Twain, or of some popular theologian,—it is never with "How Crops Grow," and "How Crops Feed," of America's great agricultural chemist, or with Downing's "Fruit Trees of America," that he beguiles the scrip from the farmer's pocket. He knows his market and equips himself accordingly. He may sell the life of some general or politician, or even of "Josiah Allen's Wife," but the lives of the great farmers, stock-breeders and horticulturists are still unwritten, because nobody cares to read them. When we see the portraits of Liebig, of Johnson, of Lawes, Bates, Bakewell, Hammond, Downing and Thomas, looking down upon us from the walls of the farmer's sitting room, and their lives and writings in his hands, or upon his table, we shall expect to see a surcease of leading editorials in our agricultural exchanges upon that well-worn topic, "Does Farming Pay?" "Reading," says Bacon, "makes a full man," but too many of our farmers, as yet, prefer to be full of bacon rather than of Bacon's wisdom,—or of the wisdom that is profitable (if they only knew it) to the production of bacon and beef, or of cream and peaches.

Timely Hints.--If there is a likelihood of your barn blowing down during the coming winter, or of its falling to pieces of its own accord, it would be well to prop it up! Of course, *all the cracks should be stopped up*—but it might be well to bear in mind that a nail hole or so might be left as ventilators, so that the animals will not be in danger of smothering to death! We would like much to vary our *Hints* from week to week and from month to month, so as never to repeat the same suggestions. If we have ever before advised "stopping up the cracks," we trust the importance of the advice will prove a sufficient excuse. The origin of cracks has never, that we know of, been scientifically investigated. Are they of fungoid origin? Are cracks in the barn related to Pear cracks? What a field for scientists! Whatever the origin of cracks, no doubt the intelligent farmers of the country are under a load of obligations to agricultural editors who never fail to warn them of the best time to stop up those in their barns. Without this timely advice, we must suppose the barns of our country would be all cracks. If we could only ascertain the *cause* of cracks and wipe the cause out of existence, there would then be no occasion for stopping them up. That is plain. We have a mind to call the attention of Congress to this subject in the hopes that an adequate sum of money may be appropriated for its *thorough* investigation.

BREVITIES.

"You are a dwarf beside me," said the Quince to the Pear.

A barrel of fine apples or pears is a sensible holiday present.

A temperature of just 32° Far. is probably the best for keeping apples.

Ex-Gov. Boutwell thinks borers are the cause of "yellows" in the peach.

Now is as good a time as any to apply manure to fruit-trees, and there is none better than barn-yard.

Mr. Downing says, in reply to our inquiry, that the Bourrassa is said to succeed well in Canada, but is not profitable here, although of good quality.

The Madeleine Pear is said to have derived its name from ripening about the period of the fete of St. Madeleine.

For our part, we wish the Duchesse (her of Angouleme we mean) had remained in the hedge near Antwerp where she was born.

Ah! Mon Dieu or *Poire d' Abondance* is a Pear that was much esteemed in France and England twenty-five years ago.

For Apples and Pears which thrive best throughout the various parts of the country, see RURAL of Nov. 17, 1877.

Mr. Meehan inveighs against the weight of name that the excellent pear Bonne du puits Ansault bears. It is *well* and *good.*

Andre Leroy (Angers, France) is probably the most extensive nurseryman in the world. He recommends the general cultivation of Russian Apples.

Thousands of pages have been written and published about the horizontal training of pear trees, all of which to practical men in this country, might as well never have been written.

Anybody that reads the many reports of Pomological Societies and all of the pomological books that are published, will be forced to the conclusion that new ideas of value come very slowly.

Mr. Downing writes us that he thinks many western apples, such as Ben Davis, etc., which are now very large and fair, but not equal to ours in flavor, will, some years hence, when the virgin soil is somewhat reduced, not be so large and coarse-fleshed, but less in size, more compact and richer in quality.

The English papers think that it is not American cheese but English carelessness that will be the real reason of English dairy losses. They grant, however, that American importation is growing not only in quantity, but in quality, and it is only by manufacturing the best qualities that cheese-makers can now-a-days succeed.

Some love winter—Some love summer—But as for us, if we may be allowed freely to express ourselves, we would prefer fruit; that is, apples, pears, grapes, strawberries, raspberries, currants, blackberries and gooseberries. Plums are too pecurculio to be added to this list, and as for cherries, we are convinced that robins and cat-birds need them all.

Robert Douglas & Sons, so states the Prairie Farmer, sell about twenty millions of trees annually from their nursery in Waukegan, Ills. So far as we are aware, this is the most extensive evergreen nursery in the world. Last spring, Mr. Douglas sent us a number of "sports" of American Arbor-vitæ and other evergreens which are very distinct in character.

It is always well to plant dwarfs so that the quince stock is beneath the surface of the ground. The borer is especially fond of the quince—but not of the pear stock. Some plant dwarfs deeper than is necessary to elude the borer so as to induce roots to form on the pear stock, thus converting the dwarf into a standard. This seems to us objectionable for several good reasons.

Very little is said at present about the Paradise stock for Apples. This stock dwarfs the variety worked upon it as much as or more than the quince dwarfs the Pear. The Paradise-stock dwarf Apple can not be recommended for large growers or for market purposes, but for the garden or amateur, we can not hesitate to recommend it from the gratifying results of our own experience.

G. H. & J. H. Hale of So. Gladstonbury, Conn: call upon us to say that the Henrietta is a Seedling Raspberry and is everything that they represent it to be. That it resembles Belle de Fontenay and may possibly be a seedling of that variety, they do not wish to deny. They claim for it superiority over Belle de Fontenay in several respects which, they think, will become apparent after further trial.

We condemn the practice of heaping up the earth about the stems of fruit trees as generally recommended. Some say this mound will steady newly transplanted trees and will also tend to keep away mice. The only effects of this mound, to our thinking, are to soften the bark underneath, rendering it more sensitive to the alternations of freezing and thawing of February and March, and to induce sprouts from the parts so covered.

Some varieties of Apples are hard workers. Some are not fond of bearing progeny and prefer the lighter work of forming leaves and twigs. Some work so hard during one summer that they are forced to rest all the next. It is so with man and animals. After a hard season of work, a longer period of rest is needed. This is the "off" season of Apple trees and of animals too. It does not seem worth talking about in the latter case, but in the former it is a matter worthy of grave speculations.

Some of the Pears which succeed best as dwarfs (that is, grafted on the Quince) are Louise bonne de Jersey, Bourre d' Amalis, Glout Morceau, Duchesse, Vicar of Winkfield, Easter Bourre and Dearborn Seedling. In some places the Seckel thrives also much better on Quince. There are many that succeed well both on Pear and Quince. Of these we may mention Buffum, Tyson, Madeleine, Beurre Superfin, Rostiezer, White Doyenne, Jaminette, Bloodgood, Beurre d' Anjou, Urbaniste, Josephine de Malines and Doyenne Boussock.

Trees may be transplanted in winter during mild spells. But if not ordered from the nursery already, we should now, for this climate and farther north, prefer to wait until spring. Trees, however, may be heeled in now and then planted in the spring. For this purpose, dig trenches in dry places, as wide as the roots of the tree. Dig the trench in the form of an inclined plane and place the roots in the deepest part. Only the upper portion of the trees will then be above the level of the ground. Work mellow soil about the roots and fill until the soil of the trench forms a mound above the ordinary level of the earth. Here they will winter in perfect safety.

We earnestly request that all letters containing money, or any communication intended for the Business Department *of the paper, be addressed to the Editor, the Publisher, or* The Rural New-Yorker, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money*

Literary Miscellany.

A SIMILAR CASE.

JACK, I hear you have gone and done it,
Yes, I know; most fellows will;
Went and tried it once myself, sir,
Though you see I'm single still.
And you met her—did you tell me?
Down at Newport, last July,
And resolved to ask the question
At a *soiree*? So did I.

I suppose you left the ball-room
With its music and its light;
For they say love's flame is brightest
In the darkness of the night.
Well, you walked along together,
Overhead the starlit sky,
And I'll bet—old man, confess it—
You were frightened. So was I.

So you strolled along the terrace,
Saw the summer moonlight pour
All its radiance on the waters
As they rippled on the shore;
Till at length you gathered courage,
When you saw that none as nigh—
Did you draw her close and tell her
That you loved her? So did I.

Well, I needn't ask you further,
And I'm sure I wish you joy,
Think I'll wander down and see you
When you're married—eh, my boy?
When the honeymoon is over
And you're settled down, we'll try—
What? The deuce you say! Rejected,
You rejected? So was I!

[*Acta Columbiana.*

WEAKER THAN A WOMAN.

CHAPTER VIII.

THE autumn was come; the golden glory of summer had given way to it.

The little town of Lilford had experienced a social earthquake. The great trial of Lonsdale *versus* Hardman had been decided, and the verdict—no one but the twelve intelligent jurymen who gave it knew why—was against Darcy Lonsdale; the will was declared null and void, and the whole of the property was to be given to James Hardman.

That was hard; but hardest of all were the cruel things said by the plaintiff's counsel. Darcy Lonsdale listened to them like one in a dream. He heard all kinds of underhand motives attributed to him; he heard himself described as a conspirator, as one who had taken advantage of his position to influence a weak-minded woman. He listened to words which burned him, which branded him—which almost robbed him of his self-respect—which so completely bewildered him that, if he had been a weaker man, he would not have known whether he was guilty or not. The blameless life of which he was so proud, the blameless name which he valued above all other blessings, were bespattered. As he listened to the cruel words, which fell like molten lead on his heart and home, he could have cried aloud that it was all false—he had lived in Lilford both as boy and man, and all his old friends knew that he was incapable of doing any creature a wrong or an injury.

He called for witnesses. He might have made a far better defence than he did but that he trusted so entirely to the notion that his own innocence must be patent to all men. The verdict was against him—unjustly so, some said, for the judge had summed up favorably for him—and Darcy Lonsdale went home crushed and heart-broken.

Those were dreary days in Vale House.

"I shall never hold up head again," said Darcy Lonsdale with a deep sob. "I shall never look my fellow-men in the face."

That his old friends should have believed this of him pained the brave honest heart. He had a long illness, from which it was feared at first that he would never recover.

It was a dreary time. The business fell away; the town's-people said to each other, with a grave shake of the head, that they could not trust a man of whom such things had been said—they could not leave their interests, as before, in his hands. One after another the old names disappeared from his books. Men he had known all his simple life fought shy of him, avoided him—and the dreary time passed on.

Felix worked hard, but it was like rowing against an angry current. There were some gleams of comfort; one of them neither father nor son ever forgot.

It was an evening in October, dark and chill. For the first time the invalid had come downstairs, and the weight of anxiety upon him was like a weight of lead. Those were days of strict economy in Vale House. There was no tempting fruit for the feeble appetite. The best medicine that the invalid had were the cheering kindly words of his wife, the love of his son.

That evening Felix came home late from his office; he was tired owing to the hard work and ill fortune of the day. He fought nobly with misfortune, but he fought in vain. His kind face brightened when he saw a letter for him. It must be from Violet. Who would write to him except Violet? And despite all his sorrows his heart glowed as he thought of her, his beautiful love. Oh to escape, if only for one hour, and sun himself in the light of her presence! He saw her so seldom now. He was hard at work during the day, and the nights were too cold for walks and rambles. He occasionally went over to the Limes; but the welcome that he received there was not of the warmest, and he could not see Violet alone.

He took up the letter with a smile, and read it. It was not from Violet, but from her father, Francis Haye, saying that the marriage must be deferred for at least a year, as he was quite sure that under the circumstances Felix could not hamper himself with a wife. "Violet was," he said "of the same opinion, as he would see;" and indeed there was a rose-tinted, sweet-scented note from Violet—just a few lines—to the effect that she thought her father was right.

He laid the notes down with a feeling of burning pain, a thrill of passionate anguish that frightened him. Nothing on earth, no power of man, should take her from him. She was his own and he would hold her until life was ended. Then he owned to himself that Mr. Haye was right—cruelly right—that without money, with an invalid father, a failing business, he could not take a wife. It was right to defer it. He must be patient. After all, he had not lost her, he reflected. She was still his own.

There came to him a mad desire to see her, to caress the golden hair, to kiss the lovely lips that had on them the breath and the fragrance of roses, to clasp the sweet white hands in his own, to hear the music of the voice that had no equal—a wild, mad longing. He read her note through again to see if he had overlooked some kindly word, to see if she had written "my love." Then he thought, to himself, that the little note was written for her father to see—for his faith in her was great; he could not believe that her love for him was not as true and as fervent as his love for her.

"Have you some good news there, Felix?" asked the feeble voice of his father; and the next moment Felix had repressed the emotion so rapidly mastering him, as he crushed the letter in his hand.

"It is only a note from Violet, father," he replied; and the satisfied smile on his father's face rewarded him. Darcy Lonsdale knew that while Violet was true to his idolised son nothing else would hurt him.

They were alone—father and son—for Kate had gone to the nursery—when the hall-door bell rang. Felix said cheerfully—

"Here is a visitor."

"Few visitors will come here; we have lost a fortune, not found one," said Darcy Lonsdale, who had never spoken a cynical word before.

But it was a visitor, and one whom they were both well content to see. It was Evelyn Lester, with a basket of grapes and delicacies of all kinds for the invalid, and, what was better still, with the light of love and kindness on her sweet face, and with words of sympathy on her lips. As Felix saw her bending over his father, he half wished for a moment that Violet had done something like this—had come to see them in their distress. Then he blamed himself for wishing that she were other than she was. Violet was a goddess to be worshipped—Evelyn a mortal woman. He saw his father's face brighten as the girl's sweet voice soothed him with well-chosen words.

"I knew you would come, Eve," he said. "Felix place a chair for her close here by my side; it is like breathing the fresh air of May to look at you, Eve. Now tell me, child, something that will brighten me."

It was a pretty picture—the invalid lying on his couch, the girl with her sweet face and earnest eyes bending over him, and, watching them at a distance, the handsome son; the fire burned brightly, the lamps were lighted, while outside the north wind wailed mournfully.

Evelyn took up a bunch of ripe purple grapes.

"I want to see you eat some of these," she said. "Mrs. Lonsdale told me that you ate nothing yesterday." And taking the grapes one by one in her white fingers she held them to his lips.

How could he refuse? He was so weak and feeble, he had been so completely crushed by cruel words, that the girl's simple kindness moved him.

"I have been heart-broken, Eve," he said. "I do not care to get well."

"You will live it down," she returned gently; "and those who have doubted you will be the first to feel ashamed of their injustice."

"You have never doubted me, Eve?"

"Oh, never! How could I? I should doubt all the world first."

Then she rose from her chair and knelt down by his side; she took both his hands—such thin, worn hands!—in hers, and held them there.

"I came to say something to you, Mr. Lonsdale," she said; "and now that I am here I have hardly the courage. Promise not to be angry with me."

"I could not be if I tried, dear child," he replied.

"You have known me all my life," she said—"have you not?—ever since I came here, a little friendless child."

"Yes it is true, Eve."

"And you have always been kind to me. I have come to you in a score of childish troubles, and you were always kind to me. Now I want you to let me repay you for all your kindness." She spoke so quickly that he could not interrupt her. "I want to help you. You know that I have money, plenty of money, all lying idle—for I want none, and aunt Jane will not touch it. Do accept it; let me give it to you. I shall never want it, for I shall never marry. Do take it; you would make me happier than any one in the wide world if you would. I am so grieved and so sorry that I would go out and work for you if you would let me. If you will not accept it, borrow it until you can repay me. Do not refuse me—let me help you."

Felix had come nearer to her, listening in wonder to the passionate words.

"So you would give me all your fortune, Eve?"

There was a glad light in her eyes when she raised them to his.

"I would—double my fortune if I had it," she replied.

"And why, Eve—tell me why you would be so good to me?"

The rich crimson flush burned in her face; she knew why, but she could not tell him.

"Because I love you all, and you are my dearest friends," she replied.

"And you would give it to me all without reserve, Eve?"

"All, and more if I had it," was her answer; and then there was silence for some minutes, while the fire burned brightly and the north wind wailed.

"My dear Evelyn," said Lonsdale—and his voice was broken with emotion—"how shall I ever thank you?"

An expression of perfect rapture came over the girl's face.

"You will let me do it?" she cried. "You have made me one of the happiest girl's in the world!"

The thin hands clasped hers, the sunken eyes looked tenderly into hers.

"Will I let you give it to me, my dearest Eve? No—a thousand times no! It is not for the money I am thanking you, but for the thought, for the intention. You have gladdened my heart, you have gladdened my life—you have given me the courage to get better, you have given me hope, I shall be so much the better for your coming."

"But that is not the point!" she cried. "Dear Mr. Lonsdale, do accept the money. Ah, if you knew how little I care for it, and how much I care for you—if you knew the pleasure it would give me, you could not refuse!"

He drew the sweet face down to his and kissed it.

"My dear Eve, I would rather have this offer made to me than any other. You have restored some of my self-esteem, child, some of my self-respect."

Evelyn looked up in wonder, for Felix had bent down and kissed her hand; he gazed at the sweet flushed face with wonder.

"Eve," he said, "you are an angel. I shall never forget that you have given a desponding, almost despairing man, hope."

And again there came to him just a passing wish, a faint fleeting desire, that Violet had shown the same affection for them; but again he checked the thought. Violet was a golden-haired goddess, and goddesses did not go about making offers of their possessions to unfortunate men.

Eve could hardly be comforted because they would not take her money. She did win one promise from Darcy Lonsdale, and that was, that if he saw himself very hardly pushed he would borrow a few hundreds at least to go on with.

But, though she had not succeeded in the one great object of her visit, she had at least done good—she left more hopeful hearts behind her.

Later on, when Felix had seen Eve home and Katie had listened with eyes dimmed by tears to the story of her generosity, the family sat round the fire discussing the event.

"I shall get well now, Katie," said Darcy Lonsdale; "yesterday I felt that it was a matter of indifference to me whether I lived or died, and now I have hope. Some persons in the world retain their old faith in me. I shall get well, and, as Evelyn says, I shall live my trouble down."

He had not been so cheerful since the first shadow of the cloud appeared; and from the depths of her heart Kate Lonsdale blessed the generous girl who had done so much good.

"I wish," she said to herself, "that Felix had chosen Evelyn. I should think of his future with hope if he were going to marry her." For in the depths of Mrs. Lonsdale's loving heart there lurked some little fear of beautiful Violet Haye.

So the winter passed. Mr. Lonsdale recovered his health but slowly; the spring of his life seemed broken—he found living his troubles down more difficult than he had anticipated. He had withdrawn himself from all positions of trust; he gave up his office as churchwarden, he would no longer be overseer.

"If they could believe that of me," he said, "I will hold no trust amongst them."

And he did not. What business was brought to his office he did, but he no longer mixed with his fellow-men. He had taken a leading part in all the business of the town; now he was absent from all the meetings, and there was a sense of remorse amongst his old friends—a slight feeling that perhaps after all they had misjudged him. Still he found life hard. There were times when the brave heart would have given way but for the few nearest and dearest to him had trusted him.

Felix had had his difficulties; he had hastened to the Limes as soon as possible after the receipt of his letter. Francis Haye received him coolly.

"I do not wish," he said, "to part you from Violet—I do say that the marriage must not take place until you are in a better position to support a wife."

There was nothing for it but for Felix to submit; he had to trample down the wild longing, the passionate love—and his sorrow educated him. He learned patience, perseverance, endurance, and self-control. The trial would have been easier to bear had he found that Violet was distressed about it. He looked in vain for some trace of sorrow on the lovely laughing face—for some sign of regret; there was none. She had written a very pretty note of condolence to Darcy Lonsdale, and when Felix talked to her she shook her golden head and said it was very sad; but when he went to her with his heart full of passionate love, passionate longing and regret, and spoke about their marriage being deferred, she looked very gravely at him and said—

"It cannot be helped, Felix; and after all what does it matter? What difference will a few years make? By not marrying now, we both escape the misery of living on limited means."

But he was half mad with his misery, and was not to be put off with such words. He took her white hands in his, and held them in an iron grasp.

"Have you no pity to extend to me?" he cried. "Have you no word to comfort me? Have you no heart? That which is a relief to you is deadly anguish to me. Oh, Violet you would have been a truer woman if you had clasped your arms around my neck, if you had laid your face on my shoulder, and consoled me!"

The ring of passion in his voice frightened her, as it always did; she shrank with a scared face from the great love she could not understand.

"I have to work and wait," he said. "Oh, my beautiful love, I would work for you as no man has worked, if need should be! It is not that, but I had built up my hopes, and it is hard to see them all destroyed. I had believed that this year I should take my darling home to begin the life that would be joy for me. I am young, and feel keenly; it is a terrible disappointment to me—a terrible blow. Oh, Violet, help me to bear it!"

She raised her beautiful, half-frightened face to his.

"What can I do to help you?" she said.

"Kiss me. I will not have a shy, coy, formal kiss, Violet. Kiss me as though your heart answered to mine. Say you are sorry for me, and that you will love me and help me to wait. Say all this—my heart is hungry for it."

She did as he wished. She laid her golden head on his breast and whispered to him that she was sorry for him, and then she raised her fair face and kissed him. In that moment he welcomed sorrow, he welcomed pain—it was all changed into untold bliss for him because it won a little kindness from her.

"I shall bear it all now, my darling," he said. "The waiting, the suspense, the uncertainty, the disgrace—I shall bear it all. I shall remember these moments, and I shall bless the pain that brought me this happiness."

A few moments afterwards she looked up and gave a little low laugh.

"How strange it is!" she said. "After all, you know I never quite promised."

Felix smiled. He was too happy just then to think seriously of her words.

"I have given you the greatest love, Violet, that a man can give a woman. You will not give me ashes in return. I have no fear—my heart rests on you. The only thing that I deplore is that months must pass yet before I can call my darling my own; yet I shall wait and work in hope. All things shall come to him who knows how to wait; and you will come, my beautiful love, in time."

There was something pathetic in his deep love and his great trust.

He left her that evening feeling happier than he had felt for some time. Violet loved him. She had never been so kind to him before. He forgot that he had asked her for the kindness—it had not been spontaneous. "There is a silver lining to every cloud," he thought, as he walked home. "But for this trouble I should never have known how Violet loved me. She was so shy and reserved before, now she is kind and gracious. Sorrow has been my sun—it has brightened my love."

Felix kept his word. He worked hard and denied himself much that makes life bright, but the labor was of love. He could not see Violet so often to the Limes in the evening. On the part of Francis Haye there was a sort of armed neutrality. He watched the young lovers, he took care that they should not enjoy many *tete-a-tetes*, but he did not take any active proceedings. He was a worldly man, and after all Felix Lonsdale might accomplish something out in the world. The chances were, all things considered, in his favor. Felix had his consolations in the shape of little love-letters, enclosing violets, forget-me-nots, pretty leaves, or some rare flower—letters that in after-years were like strains of half-forgotten music to him. They were very simple letters, but they were far more dear and precious to him than if they had contained gems of poetry and wonders of prose. The arrival of one of them brightened his whole day. How he read and re-read it, pondering each word in his mind, to see how much it conveyed, and then locking the letter away at night with his treasures. In what words of rapture he answered Violet's notes—for he had but one love, Violet; one hope, which was to win Violet; one faith, which was centred in Violet.

So winter wore away, and genial, lovely spring heralded by snowdrops and crocuses, came to gladden the hearts and souls of men.

CHAPTER IX.

"Sir Owen Chevenix." The inhabitants of Lilford uttered the name with awe and respect. Those who had never seen Sir Owen made a point of talking about him; while those who had not only seen him, but talked to him, were elevated almost to another sphere. Sir Owen was a man of note. He was that much-to-be-envied person, a millionaire, and he had just purchased the finest estate in Loomshire. It was called Garswood Hall, and lay between Lilford and the town of Oldstone.

There had been great excitement about this property. It had belonged to Lord Garswood, who was chiefly famous for his great love of travel. It was seldom that he spent two years together in England; and now that he had resolved upon living entirely in the East, Garswood Hall, with the grand estate belonging to it, came into the market, and the fortunate purchaser was Sir Owen Chevenix.

Sir Owen had arrived in great state at Garswood. Servants, carriages, horses, grandeur of all kinds, had preceded him. The number of horses in his stables and of servants in his household, the marvels of gold and silver plate at the Hall, the wonders in the shape of magnificent furniture—these things formed the staple of conversation in every house in Lilford. Then came the crowning intelligence, he was not married—this millionaire on whom Fortune had lavished her gifts; and the excitement rose to a great height when this became known. Maids and matrons took the greatest interest in him, the grandees of the county waited upon him, fashionable mothers offered him advice about his household, about the parties he intended giving, and about the people he must invite, while the squires were

much interested in his stable and pack of hounds. The younger ladies wondered what he would be like, and which among them would be the happy one chosen as queen of Garswood.

He must marry; that was very certain—he could not live alone at such a place as Garswood The matrons looked mysteriously at each other, and said that it was to be hoped he would settle soon; it was so much better for a man to marry young. Sir Owen himself made inquiries about the fairer portion of the population.

"Have you any pretty girls in this part of the world?" he asked one day of Captain Hill, the sporting man *par excellence* of the neighborhood.

"I believe so," he replied—"I have heard people say so. It is not in my line, you understand."

"Exactly. Well, it is in mine—and a very pleasant line I find it. The only thing I dreaded in coming hither was that I should find nothing but rustic beauty of the milkmaid sort. I have a decided distaste for it; and the fact of the matter is, I am looking out for a beautiful wife."

"It is a very sensible thing to do," said Captain Hill.

"It is all very well," continued Sir Owen, "for philosophers to say there is nothing in beauty. That is all a mistake; every woman ought to be beautiful. I will go so far as this—I would rather marry a woman with great beauty and a thousand faults than a plain woman with the virtues of an angel. I like something pleasant to look at."

And these ideas of the millionaire were soon known throughout the neighborhood. Beauty was at a premium; the plain faces gave up the contest.

Sir Owen Chevenix very soon became the great man of the county. He did not like Oldstone, but he did like Lilford; he had little patience with the gentry, but he liked the sporting squires. He was so lavish in his orders, so extravagant in his expenditure, that the tradesmen of Lilford looked upon him as an especial gift of Providence, while his coming seemed to have given fresh life to the county.

When the month of blossoms came round, Sir Owen was quite settled at Garswood. He had won golden opinions by not going up to town for the season. Now that he was a landed proprietor, he declared his intention of remaining on his land.

He had already attended one or two meetings of different kinds at Lilford, and he received an invitation from Doctor Hunter, the Vicar, to attend the annual festival of the school-children, held always in the month of May. At first he had laid it contemptuously aside. What had he, the sporting Baronet, as he liked to hear himself called, to do with school-children? He sent a check which caused the good Vicar to open his eyes. Then, some one having said that all the *elite* of the neighborhood attended the *fete*, he went.

In a field near the Vicarage the school-children played to their hearts' content; while in the Vicarage grounds the *elite* enjoyed themselves in quieter fashion. The military band from Oldstone was there, pretty white tents were erected, there were croquet and lawn-tennis, quadrilles for those who liked dancing, and archery for those who enjoyed shooting. Sir Owen Chevenix, having heard that all the pretty girls in the neighborhood would be there, decided on going himself. No one but Doctor and Mrs. Hunter knew of his intention, and they had kept it a secret, intending to surprise their guests. As a matter of course, beautiful Violet Haye was to be there. Evelyn Lester had been invited, and the Vicar had discussed with his wife the advisability of sending an invitation to Felix Lonsdale.

"There is a black mark against the whole family," said the Vicar, who forgot at times that his Gospel was the Gospel of Peace, and thought more of justice than mercy. "I do not say that Darcy Lonsdale was guilty of that which was laid to his charge, but there is a mark against him."

"Against the father, David, but not the son," corrected his wife.

"You might as well try to distinguish between husband and wife as between father and son," rejoined the Vicar.

"There is another thing," said the diplomatic lady; "we must ask Violet Haye. She is, in truth, the greatest attraction we shall have to offer, and, as they are lovers, I do not quite see how they can be parted on such an occasion."

"I shall do it against my will," remarked the Vicar.

"Well, that is far better than not doing it at all," replied Mrs. Hunter. "It will be a kind of test; if we see that people seem shy of Felix Lonsdale, we must not ask him again."

So Felix received an invitation. If he had known how and why it was given to him, he would have placed it under his heel and have gone twenty miles in an opposite direction; as it was, it gave him unbounded pleasure. He was to meet Violet; he would spend a whole half-day with her; he would see her beautiful and admired, yet with the proud consciousness that she was his—all his—his promised wife; and when he reached that point in his reflections he remembered how she had raised her face to his with the laughing words, "I have not quite promised." Still that meant nothing; there was no truth so sure as Violet's.

The prospect of that one day to be spent with her delighted him. He sat up the greater part of the night, so that by his unusual holiday business might not suffer. It seemed to him the time would never come when he would meet Violet.

Nor had the beautiful Violet Haye been unmindful of the coming *fete*. Her father had looked grave over the milliner's bill when it was given to him; but Violet had determined to be queen of the *fete*. Mrs. Brownson, Mrs. Baulders and Miss Stanley would certainly be there, perhaps even Lady Batle, and she must be dressed suitably to meet these potentates.

A beautiful costume of white muslin, rich lace and blue ribbons was provided, with a wonderful little hat that seemed to be made of feathers; and Violet decided that she had never looked so well before. She pictured to herself an easy sovereignty. Eve Lester was the only one she feared; but then Eve was never given to dress and flirtation.

The month of May had never set in more beautifully. The world was all thrilling with new life, the green leaves were springing on the trees, the hedges pink and white with hawthorn, the violets nestling in the fields, the primroses growing in great golden clusters at the foot of the trees; the air was fragrant with the odor of a thousand sweet flowers, all nature glad and bright. To be in the midst of all this beauty, and with Violet, was something for Felix to dream of.

Lovely laughing May had given her fairest hours for the *fete;* every one was full of congratulations—the sunshine, the music, everything was so beautiful. Felix saw nothing but the bright face of his love. They walked over the smooth green lawns together; and then Violet, turning suddenly to her lover, said:

"Have you heard all the wonderful stories about the new-comer, Sir Owen Chevenix?"

"I find but little time for gossip," he replied; "still I have heard that he is wealthy, and likes to spend his money freely."

Violet's face had quite a light upon it as she continued:

"People say that his plate is superb. Felix, I should like to eat my dinner off a golden plate."

"It would be no better for that, Violet," he replied, longing with all his heart to be able to make her such a present. "You know the saying about the dish of herbs?"

"Yes, I know it, but I do not believe in it. How wonderful it must be, Felix, to live in such a grand house, to have so much money and so many luxuries!"

"I know something that I would rather have than all Sir Owen's luxuries," said Felix.

"What is it?" she asked eagerly.

"Your love, Violet." And she knew that he meant what he said.—[To be continued.

MRS. PURDY'S PARQUISITES.

One day, some time since, we were summoned to the parlor to see a visitor who had sent up neither card nor name. As we entered the room, an under-sized, wiry, active, elderly, quaint-looking woman rose to greet us. We were struck at sight with the brightness of her dark, handsome eyes, and the russet redness of her thin, brown cheeks. Her dress was of calico, starched and ironed to a miracle, and she wore an indescribable air of independent out-of-fashionness, which took our fancy at the start.

She was living on a ranch not a very great distance from San Francisco. She was born in England, had come over to this country in her girlhood, had spent some years in Connecticut, had married in Pennsylvania, had tried her fortunes in the West, and had finally drifted to California—all of which we learned in the course of after conversation, and noted that her speech bore evidence of her wanderings.

She stood for a moment confronting us, while she darted forth a keen look from under the great round hat, which was tied down, Canada-fashion, at the ears and projected immensely fore and aft.

"Be you the woman that writes in the *Pacific*?"

"I take charge of a column in the *Pacific*, for the Woman's Board. Won't you sit down?" The interview promised to be interesting.

She dropped suddenly into her chair, and revealed as she did so, a good-sized covered basket which stood by her side.

"Wall, now, I am mighty glad I have found you! My old man he takes the *Pacific*, bein' brought up a Congregational, and I read it for my Sunday readin'—leastways your part of it partikelar, and very often permiskus, too. So I felt kind o' 'quainted with you like, and thinks I to myself the very fust time I go to San Francisker I'll take a run over to Hoakland and see if I can make her out."

"I am very glad to see you; very glad you like our column so well; we want all our friends to like it."

"Wall, when you first begun that column all about the missionaries and sich, it kind o' took me, and I determined I would do all I could to raise a little money. I've knocked round this world consider'ble myself, though not doin' it for the heathen, which ain't sayin' I hain't never found none, and that ain't neither here nor there, but I know by my own feelin's what it is to be in a strange country and everything queer and homesicklike, let alone the language, which must be powerful discouragin', specially if a body's hard to learn, which I don't s'pose the missionaries is, but some on 'em may be. We live on a ranch here-a-ways (with a jerk of the head), and my old man he's toler'ble close, and no wonder, bein' we've twice been burnt out and hain't no children to look after us bime-by and old age acomin', if we live, and our sheep dyin' off the last year or two"—and she made a sudden halt, looking at us intently.

Here was evidently a warm heart—one that had learned sympathy for others by its own experience; one that was too loyal, likewise, to cast reflections on any one else in doing its duty.

"I dare say," we replied, seeing that a reply was expected, and not knowing very well what else to say.

"Wall;" she resumed, in a tone of good-natured toleration, "I know he had enough to see arter, and so I determined to raise what money I could myself and give him no trouble about it. And, of course, I makes my own butter; so arter that, when I churned, I puts away a little in a missionary jar, which I called Mexico, and we neither on us never missed it, and arter a while Mexico was full of butter and we no wuss off; and bimeby I sold it and put away the money. Says I to myself"—and a smile came into her eyes—"That's my parquisities. Everybody has parquisities in these days, and why should not I?"

"It was all the same about eggs, for of course we lays our own eggs; and says I to myself, 'Now shall I parquisite two eggs out of every dozen or two layin' hens?' which I concluded to pre-empt two young layin' hens, me namin' 'em 'Japan' and 'Turkey;' and bein' lonely-like out there on the ranch and no one to talk to, I conversed with them, as if they was folks; and I declare for't, I raly think they understood me, for arter I had told 'em two or three times that they was parquisite hens and must lay accordin', and shouldn't have no excuse 'bout grain and gravel, 'cause I would give 'em plenty of both, them two hens went to layin' to that degree that I couldn't have done better myself, and they cut-cut-ca-dacut-ed me out to them nests that much and that reg'lar that it reely seemed as if they had missionary on the brain, and they laid me forty dozen of eggs, did Japan and Turkey last year, and I got two bits a dozen for 'em all round, which was pretty good parquisitin' for two—hens, and the money put away with the fust, do you see?" and she came to the usual sudden stop, and waited for us to speak.

"Certainly. What wonderful hens you must have!"

"Yes, that was pretty good. And then there was my calf, which my husband bein' so keen for money of course we doesn't eat our calves but sells 'em. And one of our cows she dropped a calf that was a poor, puny little creatur, and the butcher he wouldn't give nothin' for it, and my husband he said it would cost more'n it would come to to raise it, and he was for knockin' it on the head and sellin' the pelt, which I begged him agin it, and said I would raise it on skim milk, which wasn't good for nothin' to nobody, if he would let me have it, and he said I might if I wanted to, and was a great fool for my pains. So I took it, and the rains came on and I went missionaryin' out to the shed every mornin' and every evenin', and hot milk to carry to it, which it a' most sucked the end of my finger off, larnin' to feed, and wet my feet, and slipped down into puddles, and got rained on tremendous, and had the rheumatiz dreadful, me feelin' afraid all the time I shouldn't make nothin' of her, but determined to try, and after some months of such work she took a start.

"And the way that calf grow'd when she set about it beat all you ever see, besides makin' me into a Woman's Rights woman, which I have believed in ever sence, and shall as long as I am in this world and the next, too, if the men have all the say there as they do here, which I don't believe; and my calf, I named her 'Parquisite,' and shortened her into 'Parkie,' and she grow'd into a handsome heifer and begun to knob out on the forehead, and me a tellin' her how good lookin' she was gettin', and she a lookin' at me kind o' cur'us like as if she was a thinkin' on it over, and a runnin' arter me whenever I came where she was, and a rubbin' her nose on my shoulder, and me a tellin' her how much butter she would be givin' me bimeby, and what a stiddy hincome she would be for the missionaries, and one day a man rode up to the door and jumped down from his horse.

"Wall, my husband he took him all over the ranch, and he looked at the wheat and the vineyard and the fruit and the stock, and they looked at Parkie a long time and seemed to be talkin' her over, and I was awful proud (great fool!), 'cause I thought they was admirin' her. Then the man he staid outside and my husband he come in and went through the kitchen where I was, and says he, careless-like, 'I'm thinkin' of selling the young heifer.' 'What young heifer?' says I, never thinkin' of nothin', and says he, kind o' sharp-like, 'The calf;' and says I, jumpin' up, 'What, my calf?' and says he, mighty scornful, 'Your calf! it's my calf I'd have you to know!' and then he went out to the man agin.

"I sot right down and burst out cryin'. My husband is awful sot when he is sot, and I knew it wasn't no use to say nothin', and I just cried like a great baby, and with tears all runnin' down I watched the man drive away my Parkie, and she a hangin' back and he a whippin' her, and she never was struck before in her life; and just then my husband came in, and says he, as if he was a makin' up for all, 'You can have ten dollars of the money, if you want it,' and that made me mad. I didn't say nothin', but I just looked at him, and he didn't have no call to stay in that kitchen the rest of that day, I tell you; and I took on two or three days all by myself, and got mad every time he spoke or came near. And one day as I sot by the kitchen table, with my work done up and a clean apron on, he walked in and threw a ten-dollar piece into my lap, and says he, 'There is the money I promised you,' which I caught and threw right back at him just as hard as I could, and it hit him and fell on the floor, and he laughed and went out milkin.'

"By that time I had got to be awful wicked, and sot thinkin' to myself about Saint Paul, and how he says Sarah obeyed Abraham, calling him lord, and I hain't had no patience with Saint Paul ever since. We get the other side of that story in the Old Testament, which it is pretty easy seen how Abraham had to give up to Sarah and let her have her own way, and what would she have said if he had gone and sold her pet camel I should like to know?

"Wall, the money laid on the floor three days and me a sweepin' around it, and it seemed as if I couldn't touch it, which at last I made myself go and pick it up and put it with the rest of my parquisite money, and me a blubberin' while I did it; and may be it won't do no good to the missionaries on account of so behavin', which I did ask the Lord's pardon for gettin' mad over it, and hope to be forgiven. But all along of that calf I shall always believe in Woman's rights, leastways in Woman's wrongs, and all the old bachelors may preach till they are black and blue. And Saint Paul never was a married woman, and never had no idea what they have to put up with, and never brought up a calf neither, not as I ever heard of—did you?" and a smile spread over the worn, rugged face.

"No, I cannot say that I ever did," I replied, smiling back.

"And here is the money," she said, suddenly producing her purse; "and I hope you won't refuse 'cause I acted so. And if you have a mind to make me a life member with it there will be some to spare," and she placed in my hand thirty dollars in three shining gold pieces, the fruit of how much toil, self-denial and pain! "And," said she, sinking her voice, and swiftly lifting up and uncovering her basket, "I want to know whether missionaries like hard-b'iled eggs? I have brought some down, and if you think them three lady missionaries would like 'em, I want you to send 'em to 'em. They'll keep, for I b'iled 'em myself fifteen minutes by the clock, and it would please Jap and Turkey most partikelar if they could understand, and I shall tell 'em, and they're all I've got now to talk to, butter not bein' alive-like, and Parkie being took away. And if I should tell 'em that their own eggs which they've cackled over is hard b'iled and sent to the lady missionaries, it would encourage 'em like maybe, which, if you can't send 'em to heathen lands, p'raps the Board would like 'em, leastways the yelks, as many does who won't eat the whites."

As she spoke she rapidly emptied her basket on the table near, and hurried away, leaving me gazing in a half-dazed condition at the pile of hard boiled eggs, while I held the shining eagles, her generous donation, clasped stupidly in my hand.—*San Francisco Pacific.*

MAGAZINES.

Scribner for November.—The most noteworthy feature in Scribner for November is the beginning of Haworth's, the new novel by Mrs. Burnett, author of That Lass o' Lowrie's, the serial publication to continue throughout the magazine year, which begins with this number. The opening scene of this story is an English foundry, and the range of characters introduced promises to be wide and varied. The story is sufficiently picturesque to admit of four illustrations each month, two of which are to be by Mr. Bolles, and two by Mr. Dielman.

The publishers announce that during the coming year there will be four frontispieces (a feature introduced into "holiday numbers" only). These will be portraits of eminent American poets, to be drawn by Wyatt Eaton and engraved by T. Cole (from whose hands came the Lincoln and Bryant portraits), and in pursuance of this plan, the first one—of Mr. Longfellow—is given in the November number, accompanied by a full critical and biographical sketch, by R. H. Stoddard, with illustrations of the poet's study, drawing-room, "the old clock on the stairs," the lawn, Charles River, etc., by Swain Gifford and Francis Lathrop.

Another paper on a popular subject is A Night with Edison, by William H. Bishop.

Johnny Reb at Play is the first of several papers by an ex-Confederate soldier, Mr. A. Redwood, upon interesting phases of life in the Southern army. Mr. Redwood is his own artist, and draws for his rollicking paper pictures of regiments snow-balling, the Kimbomikin, Joining the Cavalry, Wearing a Confederit Watch, etc. The next paper will show the heroic and pathetic side of this life.

The Spelling-Bee at Angel's, by Bret Harte, is reported by Truthful James in the style of the author's early metrical successes.

There is also a paper on the Picturesque Aspects of Farm Life in New York, by John Burroughs, who can farm as well as write.

A Wind-Storm in the Forests of the Yuba is by John Muir, who took his notes from the top of a spruce-tree during the terrific gale.

The illustrated material is completed by a paper on Chambly Fort, on the Richelieu River, by Henry Sandham, the Canadian artist.

The unillustrated papers also cover a wide field. A Modern Playwright, by J. D. Osborne, is a sketch of the oddities and experiences of Eugene Scribe, and reflects much of interest concerning the French stage and its best playwrights and actors, including anecdotes of the dramatic methods of Rachel and Ristori.

Our Patent System and What we Owe to It, by James Richardson, is an effort to answer every objection yet urged to this system, which the author thinks will be put in jeopardy during the coming session of Congress. The idea that inventions are inimical to workingmen is incidentally discussed.

The Apparition of Jo. March, by Noah Brooks, is an original and laughable addition to tramp literature.

Parsons and Parsons, by Edward Eggleston, is a collection of humorous anecdotes for readers lay and clerical.

Mr. Boyesen's Falconberg reaches a fourth installment.

The poetry of the number includes a sonnet on Beethoven by Celia Thaxter, four songs by one of the two young Goodale sisters (not, however, accepted on account of the youth of the writer), and The Poet's Fame, by R. W. Gilder.

In the Departments, Dr. Holland writes of the progress of the Magazine (now entering upon its ninth year), of Greenbacks and Green People, and of Theodore Thomas. Home and Society contains the first of several papers on Hints to Young Housekeepers, by Mrs. S. W. Oakey, and Green Autumnal Foliage, by Samuel Parsons, and takes note of Sir Henry Cole's suggestion of a College of Domestic Economy. The review of Mr. Adams's book on railroads is a resume of that timely and important volume. The World's Work contains a full review of Progress in Electric Lighting, with an announcement that of 117 new inventions described in that department, 57 are known to have gone into active use. Bric-a-Brac is crowd-

ed down to a single page, which includes a cartoon on the labor question.

ST. NICHOLAS FOR NOVEMBER.—Begins the sixth volume of the magazine with seventy-two pages and fifty-two pictures filled with enchantment for the boys and girls.

Two new serials begin in this number. One for boys, is by Frank R. Stockton and has the inviting title A Jolly Fellowship. Its first installment describes the voyage of two boys to one of the Southern States, where the scene of the story is laid; and the seven telling illustrations are by James E. Kelly. Further on in the number the youngsters will find a short biographical account of Frank R. Stockton, with a portrait, which will pleasantly satisfy their curiosity as to this favorite author. The other serial for girls, is by Katharine D. Smith, and this first part has three pictures: two of them, by Frederick Dielman, are unusually fine.

Mrs. Mary Mapes Dodge, the editor, herself contributes to this number the poem entitled A Mistake, illustrated by Addie Ledyard; and a paper called Monkeys and Dogs to the Front, giving a lively account of some remarkable trained dogs and monkeys, with fourteen capital pictures by L. Hopkins.

One of San Francisco's curious new wire-cable railroads is described and thoroughly illustrated under the title Towed by Rail, the pictures being from photographs taken especially for this article.

There are five complete short stories, all illustrated. The first one, A Boy's Service, tells of the daring of a boy hero of the Vaudois mountains, during the religious persecutions carried on by Louis XIV. of France; the illustration, by Sol Eytinge, is used as the frontispiece to the number. Next comes Who Told? by Sarah Winter Kellogg, a story for girls with a fine picture by Walter Shirlaw. Then follow, at intervals: Handsome Hans, the history of a brave and beautiful war horse, with a fine illustration by Kelly; The most thoroughly Educated Young Lady in Miss Neal's School, a Thanksgiving story by Hope Ledyard; and The Poor Relations, a tale of the wonderful achievements of a shrewd and lucky dwarf with a picture by Geo. F. Barnes.

Among the other attractions of the number, besides poems by Lucy Larcom. C. P. Cranch and others are: The Three Wise Men, some funny verses humorously illustrated by Hopkins; The Magician's Lesson, a short and striking play by G. B. Bartlett; the usual large-print pages for the youngest readers: and Jack-in-the-Pulpit and the other departments.

HARPER'S MAGAZINE for November beautifully concludes a beautiful volume. The number opens with a bright little paper describing a Free Kindergarten in New York City, with exquisite pictures by Miss Curtis, of real children involved in the enchantments of Froebel's wonderful system. The same number contains a very interesting and attractively illustrated paper by Henry W. Elliott on Wild Babies, from Alaska to the Gulf. The quaint style of Abbey's illustrations has had no better illustration than in the Fire-Wizard, which Mrs. Helen S. Conant has happily rendered from an old German ballad. With the single exception of the paper on David Teniers—fifth in the series of Old Flemish Masters—the illustrated articles in this number are all American. Mr. Benjamin's description of the Sea Islands off our South Atlantic coast is full of interesting legend and romance, associated with this unique congeries of islands, and is accompanied by twenty-four beautiful illustrations.

John Muir contributes to this number an exceedingly interesting and well illustrated paper on the New Sequoia Forests of California.

Edwin P. Whipple's paper, Some Recollections of Rufus Choate, will not disappoint the large number of readers who have been looking forward to its publication.

Black's Macleod of Dare and Hardy's The Return of the Native—are continued; and there are two excellent short stories, The Angelique's Novitiate, by Kate P. Osgood, and The Thousand and Third Night, by G. D. Carrow.

Prof. Taylor Lewis's The Power and Pathos of Euripides—a posthumous paper—will prove of especial interest to all readers who admire the strong examples furnished by ancient classical literature.

The Editorial Departments are as interesting and entertaining as usual.

ATLANTIC MONTHLY for November opens with an admirable paper on the Nationals—their Origin and their Aims. The second installment of Home Life of the Brook Farm Association is a most entertaining chapter. Presidential Elections contains some timely suggestions. W. D. Howell's gives five chapters of his new serial, The Lady of the Aroostook. Chas. Egbert Craddock's, The Star of the Valley, is as artistic a story as we have seen for many a day. The Contributors' Club (one of the most attractive features of this magazine) is as bright and entertaining as usual.

SEWANHAKA, THE ISLAND OF SHELLS, a finely illustrated paper in Lippincott's Magazine, for November, well repays a careful perusal as also does Geo. Keenan's Unwritten Literature of Caucasian Mountaineers. Through Winding Ways, a delightful serial by Ellen W. Olney, will be enjoyed by all lovers of good literature. The bright, little story, Deserted, contains an account of a song-and-dance entertainment, given under the most extraordinary circumstances, and to a most peculiar audience. Music in America is a discriminating article, in which the author does full justice to whatever ability we, as a nation, possess in that line. The After-Dinner Speech of the Baroness Contaletto, is a capital bit of satire. In fact, so good do we think it, that we mean to give all RURAL readers an opportunity to judge of it for themselves. A carefully prepared paper on The Harvesting-Ants of Florida (illustrated), will interest the professional as well as the amateur naturalist.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

THEN, NOW AND HEREAFTER.

MARGARET B. HARVEY.

I.

Oh, precious heart!
Thou knowest when my spirit drooped in pain,
And gently thou didst bid me hope again.

My wearied soul,
Like gladdened lark, with sudden thrill did rise,
And soar to the blue heaven of thine eyes.

Their wondrous light
Seemed like the gold through azure poured at morn,—
And where the singer's lost, the song is born.

And sweet the strain,
Or ringing jubilant, the humble bird
Cares only that the skies and sun have heard.

II.

Long years have passed,
And now my soul, like tired lark, doth soar
To warm blue skies and golden sun no more.

Her notes are hushed.
Beside her ruined nest, 'mid leaves and mold,
Alone she cowers in the damp and cold.

But still a song
Is quivering faintly, though her voice is dumb,
And some glad day a flood of joy will come,

For once again,
Like gladdened lark, my longing soul shall rise
And soar to the blue heaven of thine eyes.

LETTERS FROM A COUNTRY GIRL.—No. 8.

MARGARET B. HARVEY.

On Dress.

MEN, in describing the toilets of poor young ladies, and women who have never had to fix over their old clothes, in doing the same thing, write something like this: "By her taste she had made the cheap goods so beautiful that her appearance could scarcely have been improved had she been arrayed in the most costly fabrics."

To those who don't know, this sounds pretty. There *is* something attractive in the idea of a young girl's own loveliness lending grace to poor materials,—but, alas, the simple idea is all there is of it. It is impossible to dress well without good materials, first of all and always. I grant that the main beauty of a dress is in the making,—that common materials, made up with taste and care, will please the eye,—but this is not all. The question is, "What is worth this trouble?" Cheap goods have nothing but their external appearance to depend upon for effect, so they need to be well made up if made up at all. And then, when you have expended time and strength and anxiety and skill upon them, how long will you have anything to show for your pains? Rain streaks, damp shrinks, dust discolors, beyond remedy, and what is almost a work of art amounts to nothing because of its flimsy foundation.

On the other hand, good materials, by their intrinsic value, are able to sustain themselves, no matter how plainly made. Gotten up simply, they are still elegant; elaborately, well worth the trouble; injured to any extent short of destruction, they are capable of being restored; and, finally, they last in good condition, until, perhaps, you are tired of them.

Most persons desire good materials for better wear, but are in the habit of purchasing inferior articles for everyday use. But I think this is a mistake. I know that cheap now is always very dear at last. Resolve always to have some fabric with a good, honest name appended. I don't include calico in the class *cheap goods*. Calicoes ginghams, chintzes, percales are solid and reliable, of one pure material, and quite all they pretend to be, filling a place that nothing else could take. They can be made nicely, they wear well, they can be renovated easily, and look pretty as long as they hold together. But half-wool poplins, mixed *derbeges*, low-priced bourettes, cotton velvets, imitation laces, are worthless. To attempt anything satisfactory with them is pouring water through a sieve, and to make a show with the most elaborate arrangement of any of them, is acting a falsehood. I know a young lady who is always well-dressed, and yet she spends almost nothing for her clothes. She buys little, but takes care of what she has, and saves the pieces. And this is somewhat the way in which she manages.

She needs a dress. By saving her money she gets a handsome black silk, but she knows that for the next five years she won't get another best dress, so this must be taken care of. By different arrangements of laces, necktie, flowers, gloves, etc., she wears this same dress to church, at weddings, parties, concerts and everywhere. With her coat and plain gloves and collar, it answers for the street; with a handsome ruche and jewelry, flowers, white kid gloves, and elaborately-arranged hair, it is full dress, and so on, *ad infinitum*. It cost her considerable at first, but rain doesn't hurt it, dirt glances off it, it can be easily matched, and can be kept in repair, and because she always has something available, she doesn't have to buy any ordinary dresses to eke out her wardrobe, and almost before she knows it, she has, with her usual resources, saved enough to buy a handsome cashmere.

The pieces left from her silk trim it, and she can often wear the polonaise with the silk underskirt. And for over two years, winter and summer, (with, in the greatest heat, a white body or two) she has needed nothing else as regards solid dresses. Either of her skirts serves as a foundation for a calico, percale or linen overdress, while the handsomest white may be worn over her silk. So far good. But more. Her sister gets tired of her name redingote, and she alters and wears it over her silk, and with cardinal ribbon it is gorgeous.

When it comes to more extended renovations, she finds she has chosen wisely. She replaces fringe on her silk overskirt with guipure lace, which has been lying in a drawer several years. Her cashmere polonaise is not of style. She cannot, at present, afford any new material. So, of the body she makes a basque; of the underskirt, sponged and pressed, an overskirt; and with the rest, a sham skirt. Out of the lower part of the polonaise, with contriving and twisting, she makes a pretty dolman, and trims it with the fringe off the silk, which, beautiful when purchased, is still good.

After a while, from the dolman she gets a sacque, trimming it with folds of the never-failing silk, replacing the now worn-out fringe with the guipure from the other dress, which, meanwhile, has undergone another renovation and is like a different dress with its dainty knife-plaitings, while the cashmere is again made over. In hats, the same process. Within four years she purchased just two hats—a complete silk velvet, and an untrimmed black straw. But, every winter she has a handsome velvet bonnet, and every summer a stylish, quiet hat. The same velvet in winter covers different buckram frames; in summer trims the same modified hat. The same beautiful ostrich tips, recurled by her own fingers, adorn both, hanging differently perhaps, and the distinction between the hats of different seasons lies mainly in a simple wing or spray of flowers.

As for coats, the cashmere receives a coarse flannel lining for winter. A year or two before, a little walking jacket of cloth nearly threadbare, took on new youth by a border of rich fur, and when the young lady can afford fitting cloth for a new basque, she will reduce the cost of the completed garment by making it herself and putting this same fur upon it.

She could tell you many little things. One is, don't buy any pronounced fashionable goods unless you have plenty of money. A handsome bourette costs as much as a handsome silk, yet goes out of style in a season or two, while silk never does. Another is, it is a mistake to suppose that dresses made with overskirts and ruffles are extravagant. They endure refurbishings impossible for dresses so plain as to show all parts. And it is well to consider everything, even buttons, ribbons, etc. Smoked pearl buttons, for instance, never wear out, and can be used over and over again, upon all sorts of materials. The same with black gros-grain ribbon—its variety of uses is perfectly marvelous. In feathers, remember that breasts and bands never get out of curl; that real ostrich tips never crack like made tips. For under-clothing, it pays best also to have neat, white pearl buttons, for they last a lifetime. Good, all-wool materials are the only ones that dye nicely. Collars, cuffs and handkerchiefs should be of the very best quality. Above all, avoid cheap ruches. Gloves, neckties and shoes are the most expensive articles, yet even here much may be saved. In gloves, for spring, summer and autumn, it is best, for ordinary wear, to have them of *white* (not dark) lisle thread. The former wash beautifully, the latter do not. This same young lady, whose best kids are always exquisite, has worn, day after day, from May till October, one pair of white, four-button, thread gloves, washing them every other day and mending them often, always having her toilet neatly finished. In ties, with one real black guipure and one white valenciennes, a lady may be well provided for during many years, brightening her toilet by combining with either a little knot of ribbon or flowers. With wash goods for everyday, cashmere for better, silk for best, with little variations according to fancy, any girl may get along comfortably. But, if she still needs another dress for going out in the morning, for traveling, for chilly weather, the next best thing to an old cashmere, is a soft, all-wool *de beige*. Though this latter is a material becoming to nobody, it may be made to look well by accessories, and it is, itself, substantial, serviceable, and almost impossible to soil or crumple.

Though I hope most ladies will have a little more variety than the one alluded to above, still no one knows until she tries what may be accomplished on a little. The girl described actually has gone on and looked well, in the manner pointed out, for over five years. Perhaps, if all of the little shifts were known to the public, no woman would think herself poor,—happy thoughts, such as buying fine cambric remnants, here and there, to make a white dress, the whole costing about two dollars; trimming a jacket with the pieces of an old parasol; letting down the wide hem of a pair of gloves, stitching the edge neatly and working button-holes, to make them two inches longer; blackening a belt with shoe-blacking; and many, many little devices, producing great results in effect.

I re-iterate, *never buy poor materials*. What could this girl have done with her almost empty purse had she not had the remains of fitting fabrics upon which to exercise her taste and skill? And when I say that it is every lady's duty to be well-dressed, I am very sure that I set no impossible task.

WHY SHOULD NOT FARMERS BE LEGISLATORS?

H. B. N.

LAST week, I was invited to attend a Grange picnic at one of my neighbor's. The day was fine—one of those soft, balmy September days, that we read about but seldom enjoy. About one hundred in all, were gathered together, to enjoy the good things which each had donated, and to talk over the bountiful crops which the good Father had vouchsafed to them. It was a beautiful sight. The tables spread beneath the green trees and loaded with the handiwork of the thrifty housewives and as I looked upon the scene, I thought, in all the world where could we find such a picture of independence and true enjoyment as among the farmers? They are really the men who rule the world; sturdy, honest and upright, and I wondered while looking into their intelligent faces, why it was that our Congress was not composed of such men. Truly, they are the representative men of our nation;—and could we but have such to make our laws instead of the dissipated, broken down politicians, our country would not be in the condition it is. It would not cost us millions yearly to send men to Congress who do little else but get drunk, quarrel and bring disgrace upon us.

I noticed that there was a much larger attendance at the Grange picnic than at the Farmers' Club, and came to the conclusion that it was the good things to eat which attracted them, and thought, perhaps it might be well for the ladies to donate edibles to the club. The theory that the nearest way to a man's heart is through his stomach is a correct one, and perhaps some of our male members might be coaxed into performing their duty by the promise of cakes and coffee.

Our fair came off on the 25th and 26th of September. The ladies deserve a great deal of credit and the gentlemen came up at the last hour much better than we expected. Our fruit being cut off this year made quite a difference in the general appearance of things, and all are looking forward to 1879, when we hope for a better display. Each and every one concerned deserves credit for the part they have taken, and I would like to add that my neighbor who owns the hogs *does not* belong to the Grange or Farmers' Club, nor had he anything to do with the fair, but he has kept his hogs shut up for several weeks.

Bonnie Repose, Sept. 29th.

FINISH IT OFF.

MRS. J. M. M'C.

"I AM tired of the sight of this dress Phebe, I have had it around unfinished so long. I made fully three-fourths of it the day I got it, for I was full of enthusiam over the business then and if I had kept right on should have finished it the next day, and have had the use of it all this warm weather. I laid it aside, however, to settle on the question of sleeve trimming and have not yet quite decided. It will seem like an old dress to me, when I first wear it, I want it, too, this very day, but I hate to touch it."

"Milly, don't indulge yourself in notions that way. Thread a needle and go to work. It is only one seam after another one button-hole after another, and so on until the whole is done. Make a fair start and conquer your disinclination, and then the dress is as good as done. There is a delusion and a snare in this putting off until 'you feel like it.' There is nothing so hard as bringing up the arrears of work that ought to have been done before. If you cannot do it, because you are weary or ill, that settles the question. We who are own masters must make ourselves do a great many little tasks that we feel no affection for. It is the only way to keep squarely abreast with work.

This putting off habit grows rapidly, and follows one into every department. The fact that we do not like to do a particular thing comes to be thought a sufficient reason for letting it lie over. Fanny L. always detested stocking darning, and I have known her to crowd a drawer full of those that needed mending, until she had not one good pair to put on; then she was forced to begin the darning business in earnest. There was nothing she liked better, than to get a little bee of us together in her room and provide us each with a darning needle and cotton and set us to work. But it was a very poor way of managing, and I sometimes wonder how she gets along now that there are little toes to darn for.

Come, Milly, now for that cambric suit of yours. If you will give me an old paper I will cut you a pretty cuff pattern that I know will suit you. I took it in at a glance as a lady was passing my window. First, I marked it down on a piece of paper, and then cut away until I had it to suit. I like it very much, and have modified it in several ways since for different dresses. The wrist of a dress is so small you can afford to make a very elaborate trimming for it and not feel that you waste much time either; yet the finish there and about the neck, give a style to the dress hard to accomplish otherwise.

Whatever you do, dear, finish it off once for all. Iron it out and hang it in your wardrobe and see if you do not get a good night's sleep. Take my rule, Milly, and see if it does not bring you a great amount of peace and comfort in this matter of sewing. Always finish a piece of work at the earliest moment you can. Stick to it until it is done. Of course, when over-wearied, you must rest; but pick it up again at the very next chance you get. In this way I keep well beforehand with my sewing, though as you know very well, it is not a slight enterprise."

TALKS ON TIMELY TOPICS.—No. 8.

ROSE GERANIUM.

Phantom Bouquets.

IN a previous article I gave directions for the delicate process of preparing skeletonized leaves. Those whose experiments were successful may be glad of a few hints regarding mounting.

Of course, stems must be improvised, and of these there are two kinds. The first are made of fine wire, covered with white wax; the second, which are my favorites, are of simple white crochet cotton, stiffened with starch and gum-arabic. When dry, it is sufficiently pliable for the purpose, and different sizes may be employed for vine, twig and tendril.

If a wreath is to be made, procure a background of fine black velvet. Fix it firmly and smoothly to its place, and then skillfully gum the parts to their places to complete the design.

A cross is most effective as a receptacle for these airy products. In covering one, always cut the velvet bias, so that the folds may be more easily drawn out.

Instead of black, white velvet or white frosted plush may be used with good effect. In either case all should be immediately secured from dust and air by a covering of glass.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

NOTES.

When making coffee, add a pinch of salt.

In poaching eggs, if the bottom of the dish be greased before pouring in the water, it will prevent their sticking.

A pinch of brown sugar added to stove blacking causes it to stick and polish easier.

A friend tells us she was told by an excellent cook, to thin her buckwheat cakes in the morning with a half teacupful of cider.

To prevent wooden bowls from cracking, either pour sweet, hot lard over them or *immerse* in cold water, bring to the boiling point, boil an hour or longer, then let the water cool gradually when the bowl may be taken out.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

"Old Stranger is failing in her milk," said the milkmaid one morning in November. "Give her carrots and corn straw," said I, "and she ought not to fail yet." There is a great deal in the way a pet cow is cared for at this time of the year. A few hurried days of careless feeding will reduce the milk both in quality and quantity, and at no time of the year are milk and cream more appreciated than during the autumn months. How delicate the custards! what rich squash pies we can make! and at no other season is a bowl of bread and milk so relished by the children, for the days are cool and bracing, and their appetites are good. In making custards, a little gelatine improves the appearance, and the secret of making them *well*, is to stir sufficiently. A little cream is a great improvement put in with the flavoring. All these things one cannot get if the cow fails in her milk.

It was something like this that formed the subject of our breakfast-table talk, and looking round I detected the amateur cook smiling dreamily. "Let us share," I said. "I was thinking," she said, "of the party last summer when I was assisting some ladies to prepare trifles. Each one chose her task, while I waited for orders, and the whipped cream fell to my share. I was told it was hard work, though I had never found it so at home, but then we had never whipped more than half a pint at a time. Well, I began, and slowly the half gallon swelled and foamed, became little globules floating in the dish, gathered and came forth soft, pale butter. More cream was sent for from another dairy. This was three times repeated and each time with the same result. Had I placed the dish in ice before commencing and put in the merest pinch of soda, this would not have happened; but then one never does know or remember a thing till too late."

"Did you taste that apple trifle the other day at Mrs. Stairs?" asked the family epicure. "Yes, yes," was answered by those present with every gesture of intense satisfaction, and as it may be useful to those who have apples in profusion during this season of plenty, I shall pen it for my readers:

One dozen tender apples of good flavor; a large cup of sugar for the custard, and a large tablespoonful for the apples; of milk not quite a quart; three eggs and the juice of one lemon; a pint of cream beat with powdered sugar. Slice the apples, place in a jar, cork lightly and set in a kettle of warm water, bringing to a boil gradually. When the apples are tender and clear beat to a pulp; sweeten with the tablespoonful of sugar, add the lemon juice and place in a glass dish. Make a custard of the milk, sugar and eggs, with a little isinglass; boil till it thickens and put it away till cold. Then, when the apples are cooled and firm, pour the custard over, and lastly your whipped cream. Is is a pretty Autumn dish, and well repays the trouble of preparing it.

RAG-CARPETS.

Allow me to give my experience in the making, wearing and durability of rag-carpets. To *my* mind they are exactly what a plain family room, inhabited by several healthy, restless children, ought to have on its floor. I am sure I do not know how I should have done without them, when I was bringing up my little ones.

Now, if a lady concludes, *all at once*, to make a carpet of rags and devotes her whole time for some days, or perhaps weeks, to the preparation of "rags and chain," she will weary and disgust every one and not enjoy her carpet when she gets it. Let me suggest a better way. I may say here that I tried the bustling way at first, but experience taught me better.

When one's husband or boys have really "got all the good," as the old ladies say, of a suit of clothes, and you feel that you do not need to lay them by for future possibilities, rip up the garments, shake and brush well. Choose some dull, rainy evening when you are tolerably certain of having no visitors for the work. Then cut your rags, trim corners, tack with strong thread, make into large balls, sew some strong cotton material on the balls to keep away moths, and lay them by. When another pile of old things accumulates—six months later perhaps—do the same. I assure my sister readers of the "Rural," that in a surprisingly short time they will find, upon weighing the nice balls, that the rag-carpet is no longer doubtful. The shears or scissors have not been used long enough at any one time to hurt the fingers, nor has any weary disgust been experienced. Cotton cord may be bought from many factories already dyed in bright colors, and one's taste may be gratified by the contrast of stripes. But to those who wish to do things in the cheapest way, I will say that coarse factory yarn doubled and loosely twisted, makes an excellent warp and can be dyed at home. Every farmer's wife knows the virtues of maple-bark set with copperas for dying a purple or slate, also of copperas-dyed cotton thread, set by dipping in lye of wood ashes. These are, I think, the cheapest and easiest dyes for *cotton*. *Pretty* they are not—but I am writing for those who prefer comfort to appearance.

Perhaps some do not know that an apronful of peach leaves boiled in water, will make a yellow dye for *cotton* (which will wash out, however), and the said decoction of peach leaves, with the addition of some of the above-mentioned lye from wood-ashes, will dye *wool* a good bottle-green, which can't be washed out at all. I am speaking of strictly domestic dyes which are almost of no cost. There are, however, many experienced old ladies who are only too happy to instruct less informed matrons in the more elaborate arts of dying. I have cut, trimmed and tacked, at odd times, the rags or filling for one hundred and fifty yards of nice rag carpeting, without ever feeling the work burdensome. And now that my boys have grown up and gone off into the world, I have no longer the old clothes to cut up, nor do I need to exercise such close economy, still, I recommend it to others who are in the morning of life, as it were, and who wish to be industrious and economical.

One item of information I must not omit. It is not the *masculines* of the family alone who can contribute cast-off clothing for the carpet. The worn out aprons, dresses and under-clothing of the little girls, properly managed, make an excellent filling, and the carpet is smoother as well as prettier. Tear them up into as fine strips as you well can, tack and make them into balls. If the clothes are white or light-colored, make the long strips into hanks or skeins and dye them in maple bark before winding into balls. No matter how streaked or blotched they look—it will not show. Then have your carpet woven with alternate threads of pantaloon and dress—a coarse thread of the heavy woolen cloth, and then a finely *beaten up* strip of the cotton. It will wear longer and look better than if made entirely of the thick heavy rags. I am writing of carpets striped in the chain *only*. Of course, there are those who prefer a checked carpeting and who choose to arrange a pattern or check according to their own fancy. These can be made very pretty, but are a great deal more troublesome to devise and carry out.

My aim in writing is not to assist those who have abundant time, means and appliances for gratifying their various tastes in domestic manufactures, but to assure some of the burdened housekeepers that with proper management, they may have neat, plain carpets without any great trouble or expense. I am supposing that the weaving is entrusted to some one skilled in such work. I never had anything to do with that part of the business save to pay the bill, which always seemed to me ridiculously small.

Mrs. S.

Summerville, N. C.

DOMESTIC RECIPES.

Corn Bread, No. 1.

Two teacupfuls of sweet milk; one-half teaspoonful of soda and one of cream of tartar; one good-sized handful of prepared flour; butter the size of an egg; mix sufficiently stiff with Indian meal; sweeten with sirup to suit the taste. Bake one-half hour.

Corn Bread, No. 2.

Two cups of milk; two and one-half of Indian meal; one-half of prepared flour; two tablespoonfuls of sugar or molasses; a teaspoonful of soda and two of cream-of-tartar.

Mrs. M. Randall.

QUESTIONS ANSWERED.

Ginger Snaps.

M. L. B. wishes directions for making good, crisp ginger snaps. We append the following, knowing it to be an excellent recipe: Two cups of molasses; one-half cup of sugar; one and a half cup of melted lard; two thirds of a cup of cold water; two teaspoonfuls of saleratus; two teaspoonfuls of ginger and one of salt; flour enough to roll thin. Bake in a quick oven.

Raised Biscuit.

Please give a reliable recipe for raised biscuit?

Ithaca, N. Y. A. E. M.

Ans.—One quart of rich milk; one cup of butter; one cup of yeast; a cup of mashed potatoes; a teaspoonful of salt and flour enough to make a stiff batter; let rise over night and in the morning knead, adding flour but no wetting; let stand until light; then knead into biscuit; again let rise for about twenty minutes and bake.

News of the Week.

Monday Nov. 11, 1878.

POLITICAL.

The returns from the elections held last Tuesday, though not yet officially announced in most of the States, are known with sufficient accuracy to indicate pretty clearly the results. The following list, made up according to the latest dispatches, shows the political affiliation of the members of the House of Representatives elected from the different States to the next or forty-sixth Congress: Alabama, democrats, 8. Arkansas, democrats, 4. California does not elect Congressmen until September, 1879. Her present delegation stands, republicans, 2; democrats, 2. Colorado, republican, 1. Connecticut, republicans, 3; democrats, 1. Delaware, democrat, 1. Florida, democrats, 2. Georgia, democrats, 9. Illinois, republicans, 12; democrats, 6; greenback, 1. Indiana, republicans, 6; democrats, 6; greenback, 1. Iowa, republicans, 7; greenbacks, 2. Kansas, republicans, 3. Kentucky, democrats, 10. Louisiana, democrats, 6. Maine, republicans, 3; democrats, 1; greenback, 1. Maryland, democrats, 5; republicans, 1. Massachusetts, republicans, 10; democrats, 1. Michigan, republicans, 9. Minnesota, republicans, 2; democrats, 1. Mississippi, democrats, 6. Missouri, democrats, 12; greenback, 1. Nebraska, republicans, 1. Nevada, republicans, 1. New Hampshire, republicans, 3. New Jersey, republicans, 4; democrats, 3. New York, republicans, 25; democrats, 8. North Carolina, democrats, 6; republicans, 2. Ohio, democrats, 11; republicans, 9. Oregon democrats, 1. Pennsylvania, republicans, 17; democrats, 9; greenback, 1. Rhode Island, republicans, 2. South Carolina, democrats, 5. Tennessee, democrats, 9; republicans, 1. Texas, democrats, 6. Vermont, republicans, 2; greeeba k, 1. Virginia, democrats, 8; republicans, 1. West Virginia, democrats, 3. Wisconsin, republicans 5; democrats, 3. Wyoming Territory, republicans, 1. Dakota Territory, republicans, 1.

According to the above list the next House of representatives will consist of 151 democrats; 130 republicans; 8 greenbackers and 4 to be elected in California. Later returns of a more accurate nature may slightly change these numbers, for in some districts the votes for the several candidates are so close that the official count only can decide the matter. The tendency of the returns, however, is considerably in favor of the republicans, and many of their best informed organs insist that the full returns will show a considerable reduction of the democratic majority here indicated. Despite the fact that the republicans lost 11 congressmen in the October elections, they have made steady gains nearly everywhere in the State and national contests at this time. In this State, besides carrying their State ticket by about 11,000 majority, they have carried the Legislature by a majority of 60—the heaviest majority they have ever had in that body. This triumph secures the unopposed re-election of Conkling to the Senate; and if the peace within the party lines continues, the victory may make the senior Senator from the Empire State "a bigger man than old Grant" as republican candidate for the Presidency in 1880. They have also secured a U. S. Senator instead of Barnum in Connecticut, having elected a majority of the legislature of that State.

In this city Tammany Hall has been completely overthrown, Schell, its nominee for Mayor, having been defeated by a majority of upwards of 19,000 in favor of Cooper, the candidate of the republicans and anti-Tammany democrats; the former having cast about 52,000 votes and the latter about 28,000, against Tammany's solid 61,000. As the combination also elected a strong majority of the Board of Aldermen, all Cooper's nominations to offices will be confirmed, so that during the next two years the spending of the $40,000,000 annually laid out here, will be chiefly in the hands of the new mayor and his backers. The remainder of the combination ticket was also elected by majorities varying a trifle in numbers. Many of the most important Tammany officials, however, hold over for different lengths of time, and cannot be removed, except for cause, and with the consent of the governor. Chief among these is John Kelly, the successor of Tweed as Tammany Boss, who now holds the office of Comptroller, the most important post in the city government, and whose term does not end for nearly two years. As Tammany has been Tilden's bitterest enemy, its defeat is regarded as a triumph for him, and it is said he will probably run as democratic candidate for governor of the State at next election, so as to keep prominently before the people with a view of again securing the nomination for President in 1880.

In Massachusets, Butler has been defeated by a majority of about 25,000, although the old man managed to poll 110,000 votes. In view of the tremendous odds of respectability, money and social as well as political influence against him, he certainly made a stout fight; but both an account of his record, character, platform and methods, it is to the honor of the old Bay State that she did not allow him to triumph. Talbot, the republican candidate, won by the union of the respectable class of democrats with the same class of republicans: Abbott, the democratic nominee secured only about 10,000 votes, the remainder of that party having split in favor of either Butler or Talbot, the former having secured the most of them.

The democrats will have a good working majority in both branches of the next Congress. On the fourth of next March the terms of 25 U. S. Senators expire; of these 17 are republicans and 8 democrats. As the legislatures which elect the successors of these, are already chosen, it is possible to state with almost entire certainty the political complexion of the new senators. The following States will send republicans: Colorado, Connecticut, Illinois, Iowa, Kansas, New Hampshire, New York, Nevada, Pennsylvania, Vermont and Wisconsin. Democrats will be sent by the following: Alabama, Arkansas, California, Florida, Georgia, Indiana, Kentucky, Louisiana, Maryland, Missouri, North Carolina, Ohio, Oregon and South Carolina. Of these California, Kentucky, Maryland, Ohio, Oregon and Vermont have already made choice of senators.

It may possibly happen that the next election for President may be made by the House of Representatives, as it has already been twice in the history of the Union, and as nearly occurred at the last election, for a third time. This has hitherto occurred when there have been more than two candidates in the field, and none of them has secured a majority of *all* the votes cast, though one or other of them may have gained a plurality, or more than either of his competitors. In such a case, the President is elected from the candidates by the vote of the members of the House, acting, not in their individual capacity but as representatives of the States that elected them; in other words, each State has one vote in making the election, and a majority of the Representatives from the State previously decide in whose favor that vote shall be cast. Thus, in such a case, Nevada, which has only one Representative, would have precisely the same influence in deciding the issue as New York with her 33 Representatives and a population proportionally greater. At present the democrats hold congressional majorities in nineteen States, or in just half the whole number, namely, Alabama, Arkansas, Delaware, Florida, Georgia, Indiana, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Ohio, Oregon, South Carolina, Tennessee, Texas, Virginia and West Virginia. The republicans control the delegations from 18 of the States, leaving California still in doubt. If the republicans should carry that State next year, dividing the delegations evenly between the two parties, some novel and perhaps dangerous results would arise in the event of the Electoral College failing to elect a President in 1880.

An impartial view of the elections shows that the greenback party will hardly ever amount to much in American politics; that though the people are not content with the republican party, yet they are scarcely willing to throw it over yet a while for its rival; that a solid South has a strong tendency to bring about once more a solid North; that the hard-money doctrine gains adherents as it is more freely explained to the multitude; and that the American People are sufficiently intelligent and honest to act on the whole for their own best interests.

MISCELLANEOUS.

It's fortunate for Miscellaneous and Foreign news that, like Christmas, a general election comes only rarely, for it forces other news out. Indeed there is but little of general interest to tell in either, this week. Abroad news with regard to the Eastern difficulties is still very contradictory. With regard to Turkish affairs, Russia speaks fairly of her intention to comply with the terms of the treaty of Berlin, having some four months yet to do so; but all the time she is said to be massing troops towards the south, to be ready for any contingency. In India, Great Britain is still waiting for an answer to an ultimatum she has sent to Shere Ali, forbidding his alliance with Russia and demanding an apology. At home the great news of the week, hereabouts at any rate, is the theft of the body of the late millionaire A. T. Stewart. The tomb in this city, in which the body was temporarily deposited until the completion of the grand Cathedral being erected for its reception at Garden City, L. I., was broken open on Wednesday night, and the corpse removed. A reward of $25,000 for its recovery was stimulated all the detectives and thief-catchers, but as yet no clue is known to have been found to the outrage.

The Cheyenne Indians, lately reported on their way to join Sitting Bull, have been captured in a half-starved condition. When surrounded and required to surrender, they positively refused to do so, if they were to be sent back to the reservation from which they had escaped to avoid starvation. They will be handed over for trial to the authorities of the States and Territories in which their late depredations were committed, just as Santa Anna and Big Tree were some years ago. Gen. Sheridan, in a report on the Indian question, dwells strongly on the hard and thankless task which a small, insufficient body of troops has on hand in keeping the red-skins in order over an enormous extent of territory. He lays the blame of most Indian troubles on gross mismanagement in the Indian Department or rather among its subordinates; says that the appropriations made by Congress, if properly spent, are ample to supply the aborigines, whereas these are now in a miserable, half-starved condition. He is strongly of opinion that kind treatment administered with tact, steadiness and justice, would remove from our western frontier all the appalling horrors arising from Indian outrages. Owing to the heavy expense it entails on the nation, the suffering and loss it is constantly causing our frontier settlers, and the horrors that periodically arise from it, this Indian question urgently demands some permanent settlement.

Herman.

PUBLISHERS' NOTICES.

A WEEKLY NEWSPAPER is one of the needs of every family; and one of National character and reputation is worth more than half a dozen of the ordinary kind. Such is the CINCINNATI WEEKLY TIMES. Published in the central section of the Union, it represents more truly the interests of all sections and classes, than those issued from the extreme East or South. Its Editorials, Correspondence, News and Market Reports are first-class all the time. Persons seeking Homes in the West will find in it much reliable information on this subject. We will be pleased to receive subscriptions for the TIMES with the RURAL, one year each, at the low rate of $3.25.

WE confidently refer our readers to the card of Dr. C. R. Sykes, in our issue of Nov. 9. Mr. F. W. Jones of the Chicago Farmers' Review says: "Dr. Sykes is an old resident of Chicago, a regular graduate, honest, honorable and responsible, and as a physician takes first rank in his chosen specialty of catarrh and its complications."

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 9, 1878.

During the week business has been at a pause, in consequence of local political excitement, and values have been, to a considerable extent, nominal. Improved weather and want of stock have latterly brought out a better attendance of buyers, and prices, for some articles, already show firmness.

BEANS AND PEAS.—Supplies of medium beans exceed current wants, and $1.65 is extreme for choice: fair to good, $1.50@1.60; marrows of desirable export grade are not plenty, $1.75 quoted and obtained for choice; other qualities, including prime old, $1.50@1.70; Red kidney, in limited demand, quality not generally attractive, range $2@2.10; White kidney have some call at $1.75; Pea beans scarce, but quiet, at $1.75@1.80; Black or turtle soup beans, jobbing at $1.85@2. Green peas, as before, $1.20@1.35; Southern B. E. peas, $2.50@2.60 per 2-bush. bag. Canadian field peas, 74@76c. in bond; Western, do., spot and track.

BEESWAX.—Shippers are taking small lots at 26½@27c. Exports past week, 1,372 lbs.

BUTTER.—Fine State indicates considerable wholesome strength in prices, and trade is steady with fairly free sales. The most prominent advance for the week is in high grade dairy pails and extra fresh half tubs, now rated 22@24c. Some of the latter would sell up to creamery if sellers would submit to the separation of tops from lines. A good many little lines arrive at this season and they help out the single package trade, as wholesale buyers in the present hardness of the market have to carry their share of the longer lines. Choice full dairies can be readily sold at 20@21c.; occasionally 22c.; but, as before, there is a free offering of useful table stock at 16@18c.—firkins seldom exceed the latter rates.

Welsh dairies, 17@19c.; selected fall, 21@23c.; other, 17@19c.; good dairy pails and half tubs, 19@20c.; creamery, choice, 26@27c.; good to prime, 22@24c.; early packed, 18@20c.; low grades of State, 10@14c. and dull. Western makes good prices when fine but the bulk of the offering is cheap. Creamery ranges 22@26c. good to fancy; 17@20 early packed. Selected dairy, 15@17c.; good to prime dairy and nice ladle-packed factory, 12@14c.; other factory including milled, 6@10c.

CHEESE.—There have been taken this week, by shippers, 31,001 boxes. This is almost entirely of the choicest factories and has pretty well absorbed the receipts of these parcels. Prices on these choice lots have been well supported—not affected by the dull accounts from the country. Sales have been chiefly at 9c., but special lots reaching 9¼c. Good and lower grades yet drag and are about nominal.

Quotations are 9@9¼c. for fancy; 7@8c. for good and prime; 6@7c. for fair to good; 3@5½c. for skimmed. State, farm dairy at 8@9c. for good to choice, 6@7½c. for fair to good. Wisconsin factory, fine to fancy, 8½@9¼c.; do. good to prime, 7@8¼c.; do. fair to good, 6@7c. Western factory, fine and fancy, 8½@8¾c.; good and prime, 6½@7¼c.; fair, 5½@6c.

Receipts past week, 20,319 boxes.

Gold closes at 100⅜.

Liverpool cable 47s.

COTTON.—The market has fluctuated widely, according as the English advices have been favorable or otherwise; dealings have been brisk; closing prices are for November, 9.26@9.27c.; December, 9.34@9.35c.; January, 9.45@9.46c.; February, 9.57@9.58c.; March, 9.68@9.69c.; April, 9.79@9.80c.; May, 9.90@9.91c.; June, 10.00@10.01c.; July, 10.09@10.10.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands	*Ala.*	*Orleans.*	*Texas.*
Ordinary	7 7-16	7 7-16	7 11-16	7 11-16
Strict ordinary	7¾	7¾	8¼	8¼
Good ordinary	8⅛	8⅛	8¾	8¾
Strict good do	8 13-16	8 13-16	9 1-16	9 1-16
Low middling	9	9	9¼	9¼
Strict L. middling	9¼	9¼	9⅜	9⅜
Middling	9 15-16	9 15-16	9 9-16	9 9-16
Good middling	9 9-16	9 9-16	9 13-16	9 13-16
Strict G. middling	9 13-16	9 13-16	10 1-16	10 1-16
Middling fair	10 5-16	10 5-16	10 9-16	10 9-16
Fair	10 15-16	10 15-16	11 3-16	11 3-16

Stained.

Good ordinary.. 7 3-16; Strict good ordinary.. 8 1-16
Low middling.. 8 9-16; Middling.. 9 15-16

DRIED FRUITS.—Small fruits generally are much higher, blackberries alone excepted. Apples have some export demand and a good home trade. Peaches of choice quality favor sellers.

Southern Plums, 13@13½c.; State plums, 15@16c. New blackberries are quoted at 5@5½c. Peaches—Peeled, new Georgia, at 6c. for poor; 8@9c. for fair to good; 10@10½c. for prime, choice North Carolina, 11@11½c.; good do., 8@9c.; unpeeled new halves, 3@3½c.; quarters, 2@2½c. Pitted cherries, 20c. bid and 22 asked. Apples—Old State quarters, 2½@2¾c. New apples, 2½@3c. for southern quarters in bbls.; 4½@5½c. for prime sliced, and 6@7c. for fancy; State at 5½@6c. for new sliced; western at 3@3½c. for new quarters. New raspberries, 30c.

Exports, past week, 219 bbls. apples.

EGGS.—The market during the week has taken one of the sudden jumps that suits neither buyer nor seller. Quotations have advanced too high for consumption, while their influence will tend to throw in more stock than can be sold at a good round price. Light supplies and colder weather have caused the excitement, and the new prices are not expected to last. Near points 26c.; fresh State, Penn., Western and Canadian, 25c.; poor quality, 23@24c. Southern begins to appear, quoted 24@25c. Limed in fair demand, for the moment at 15½@18c.

Receipts for the week, 7,295 bbls.; do. last week, 7,143 do.

FLOUR.—Export and home trade demands have been active, and the market is the turn better.

Latest prices are: $3.00@3.65 for very inferior to choice superfine State; $3.65@3.95 for poor to good extra do., odd lots and lines; $3.95@4.25 for good to very choice do., strictly choice and fancy lots above this; $3.00@3.65 for very inferior to choice superfine Indiana, Iowa, Michigan, &c.; $3.65@3.95 for inferior to good shipping extra do. and $3.95@4.25 for good to choice extra do.; common to about choice white wheat extras, $4.00@5.00; choice to strictly fancy do at $5.00@5.85; red and amber winter wheat, very inferior to choice trade and family at $3.85@5.50; round hoop Ohio at $3.75@4.15, and trade and family brands of do. at $4.20@5.65, the latter rate for very choice; St. Louis, $4.00@4.75 for very poor to good extra, and $4.75@5.75 for good to very choice; Minnesota clear, very inferior to very choice, at $3.70@5.50; Minnesota "straight," very inferior to very choice at $4.30@6.00; (about choice to fancy old at $5.00@6.50), and patent fair to fancy at $5.25@5.50; unsound stock at from $2.50@4.75; city mill extra at $4.85@5.10 for West Indies (the latter rate for fancy in new packages); do. for England, $3.75@3.90; do. trade and family extras, $5.10@6.00; do. for South America, $5.10@5.60 for fair to very choice; No. 2 at $2.35@3.00 for very inferior to choice.

CORN MEAL.—Sales at $2.35 for Brandywine, and $2.15@2.65 for yellow Western.

FRESH FRUITS.—Apples continue in buyers' favor for large lots. Red fruit mostly sought after for export. A good supply of Spitzenbergs is noted this season. There is a fair demand for selected retailing sorts; mixed lots dull. Fancy Kings and Spitz, $1.50@1.75; Greenings, Spys and Baldwins, $1@1.25; common lots, 62½@90c. ₱ bbl. Quinces scarce and firm at $7@10. Catawba grapes, 6@7c. ₱ lb.; State cases, $3@3.50 ₱ case. Pears not in commercial quantity. Boston still sends some, showing large specimens for fancy use. Cranberries rule easy with cheap apples to compete with; the extremes are for high-colored, hard stock: bbls., $5@7, the latter for Capes; crates, $1.25@1.75 for fair to good; $2@2.12 for choice. Florida oranges are of uneven quality; quoted at $3@6 ₱ half-bbl. box. Chestnuts unusually steady: $3.50@4 ₱ bush. Hickory nuts, $2@2.25 ₱ bush, which is better than last season. It is thought the decline in peanuts is checked; present range, 90c.@$1.20 for good to hand-picked Va.

Exports of apples for week, 14,402 bbls.

GRAIN.—The export movement has quickened, and all articles are higher, and closed favoring holders.

Latest sales of wheat are, of No. 2 amber at $1.01½@1.05; ungraded red at $1.01@1.07; No. 3 red at $1.03@1.03½; No. 2 red, at $1.06@1.06½; No. 1 red, at $1.07@1.07½; red Canada, in bond at $1.01; ungraded white $1.06@1.09; extra white at $1.10@1.11; white State at $1.08@1.09½; No. 1 white at $1.08½@1.09; ungraded amber at $1.04½@1.07½; No. 2 Milwaukee spring in store at 97½c.; No. 2 spring at 94c.; No. 3 spring, 90c.; ungraded spring at 80c.; No. 3 amber, November option, at $1.04½@1.05; do., December option, at $1.05½; do., January option at $1.05¾@1.06¾; No. 2 red, November option, at $1.06½@1.06¾; do., last half November, at $1.07¼; do., December option, at $1.07@1.07¼; do., January option, at $1.08¼@1.08¾; No. 1 red, to arrive in November, at $1.07¼; No. 1 white, November delivery, at $1.09; do., November 25 to December 10 delivery, at $1.09@1.09½; No. 2 Green Bay spring to arrive at 95c.; New York No. 2 spring, November option, at 94@94½c.; do., December option, at 95@95½c.; No. 2 northwest spring, December option, at 97c. Rye at 57½@60c. for Western, and 59@63c. for State. Corn at, for steamer mixed 46½@46¾c.; New York No 2, at 47@47½c.; white western at 50@52c. No. 2 white at 50½c.; mixed at 46@48c.; New York No. 2, November option, at 47c.; do., December option, at 47¾@47½c.; do., January option, at 48¼@48½c.; steamer mixed, November option, at 46¼@46½c.; do., December option, at 46½c.; do., January option, at 46¾@46½c. Oats at , for New York extra white, quoted at 38½@40c. New York No 1 at 31c; New York No. 1 white at 33½@33½c; New York No. 2 at 30@30½c.; New York No. 2 white at 32c.; New York No. 3 quoted at 29c.; New York rejected at 28c.; No. 3 white at 30c.; mixed western at 28½@31c.; white western at 30@30c.; mixed State at 29@31c.; white State at 31@36c; No. 2 Chicago at 31c., averaging about 33¾ lbs.

HAY AND STRAW.—Receipts are not more than can be conveniently handled and prices rule firm.

Latest sales are at 40@45c. for shipping, and 65@75c. for retail qualities. Straw quoted at 35@45c. for long rye; 30@35c. for short rye.

Exports past week, 737 bales.

HOPS.—Emmet Wells, in his circular, says, "Trade has been fairly active this week considering the intervention of the election holiday. Prices remain unchanged. The demand runs chiefly on fine goods which are scarce and command full rates. Our London letters give but poor encouragement for business from that source. The quotations of 75s. and 80s. per cwt. are really no better than our home brewers and dealers are willing to pay here, and our opinion is there must either be an advance in the price in London or a decline here before much business can be done on export account. It is simply a question as to who can hold out the longer, the buyer or the holder. Choice American hops, from their extreme scarcity, ought to command more money than we quote; but brewers, both home and abroad, seem determined to work up their old stock before facing the new crop at more money than their 77's cost them. Nearly half of the hops shipped to London this week and last were of last year's growth, and all went on owner's account. No sales of Pacific coast hops have been made this week, prices cannot, therefore, be quoted.

Quotations are for New Yorks, new crop, choice, 13@15; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, low to fair, 8@10; Eastern, new crop, 10@12; Wisconsin, new crop, 10@12; Yearlings, growth 1877 (nominal) 5@7; Olds, all growth, 2@4.

OIL-CAKE is plenty and quoted at $28 per ton for Western.

HONEY.—Demand fair but dealers have to accept late figures. Single comb, clover, 16@17c.; two comb, do., 14@15c.; buckwheat, 10@12c.; strained, 8@10c.

POULTRY AND GAME.—Live poultry arrives heavily in opposition to advices at this part of the season when dressed becomes a feature. Prices low.

Fowls and chickens, 8@10c.; roosters, 4@5c.; turkeys, 8@10c. ₱ lb.; ducks, 45@90c. ₱ pair; geese, $1@1.50.

Dressed poultry has had a fair business, though moderate prices were accepted—a fact that has kept life in trade. Shippers must bear in mind that slovenly-dressed stock loses value in the New York market. Thanksgiving stock should be in market at least two days before the 28th, weather permitting.

Turkeys, N. J., prime, 11@13c.; State, prime, 10@12c.; Western, prime, 9@10c; Phila. dry-picked, extra, 13@14c.; poor to good, 8@10c.; chickens, Phila. dry-picked, 13@14c.; N. J., prime, 11@12c.; do., fair to good, 10@11c.; State and Pa., prime, 10@11c.; State, fair to good, 8@9c.; Western, 8@10c.; Fowls, Pa. and N. J., prime, 11@12c.; poor to good, 10@11c.; Phila. dry picked, prime, 13@14c.; State, prime, 10@11c.; Western, 9@10c.; Ducks, N. J. and Phila., 13@14c.; State, 12@13c.; Western, 11@12c; Geese, 8@12c.

Game is well represented in items and trade is fairly supported.

Quail, prime, ₱ doz., $1.50@1.75; Grouse, drawn, ₱ pair, 65@75c.; undrawn, 85@90c.; Partridges, State, ₱ pair, 85@90c.; Western, 60@75c.; Eastern, 50@65c.; Woodcock, State and Jersey, 50@60c.; Western, 35@40c.; tame Squab, ₱ doz., $1.75@2; Plover, ₱ doz., $1@1.25; English Snipe, ₱ doz., $1; Reed Birds, ₱ doz., $1; Canvas-back Ducks, $1.25@1.50; Mallard, ₱ pair, 40@45c.; Teal, ₱ pair, 30@35c.; common, ₱ pair, 20@30c.; Red Head, Western, 10@30c; do. Hd'r Gr. 35@75c.; Venison, short saddles, 14@15c.; long saddles, 12@13c.; carcasses, 8@9c.; Hares, ₱ pair, 50@60c.; Rabbits, 30@35c.

PROVISIONS have tended lower, the arrivals of hogs west being much beyond expectations. Mess pork quoted at $7.50@7.60 for ordinary on spot lots; $7.55@7.60 for November and December deliveries. Bacon at 4¼ for long clear and 5¼c. for short clear. Lard at $6.17½ for spot; $6.17½ for December, and $6.20 for January. Stearine at 6¾@6¾. Beef Hams at $15. Beef, new barrelled, $10.50; $11 for mess, and 11.50@12 for extra mess.

VEGETABLES.—Regardless of the high rates for potatoes the better sorts are most active. Western stock 25c. per bbl. under Eastern. Eastern Early Rose, $2.75@3 bbl., including N. S.; Peach Blows, $2.75@3.00; Peerless and Prolific, $2.50@2.75. Sweets easy again Del. or S. N. J., $1.25@1.50; Va., $1.25. Onions firm. White, $1.50@1.75; red and yellow, $1.25@1.50; Chester, $1@1.25. Cabbages, $2.50@4.50 per 100. Cauliflower, $1.50@3. Celery, doz., 75@87c. Hubbard squash, $1.50@1.75 bbl.; marrow do., $1.25@1.50. R. Turnips 75c.@$1. Carrots, $1 bbl.

Exports, potatoes, past week, 2,295 bbls.

SEEDS.—Timothy brings $1.20, if prime. Clover is in freer demand and quoted better, or at 6¾@7¾c.; for primo and choice.

TOBACCO.—The export movement has been less active, but the home demand is very fair. Quotations are for

Reading for the Young.

MY DOLL'S WEDDING.

My dear little dolly was married:
A sweet little wedding we had:
She married her cousin from Boston,
A red-cheeked and one-legged lad.

She was dressed all in white silk and laces,
With wonderful red 'rocco shoes,
And he in fine velvet and gold braid;
To admire him she did not refuse.

The cake was filled all full of raisins;
The frosting ran over the top.
And apples and cookies for each one,
With candies we bought at the shop.

And Jenny and I held the dolls up;
They were ready to faint with the heat,
In front of dear mamma, the priestess,
Who sat straight on the bright crimson seat.

[*Youth's Companion.*

SINGING MICE.

HENRY LEE.

A FEW days ago I was invited by a medical friend to visit him at his house, and hear two musical mice sing a duet, the performance to begin punctually at 8 P. M. I had never heard a singing mouse, though I had read and been told a good deal of the vocal accomplishments the little animal occasionally displays; so I gladly availed myself of the opportunity, and duly arrived half an hour before the commencement of the concert. My friend explained to me that every evening two little mice came out from behind the skirting-board in his dining-room, and sang for their supper of cheese, biscuit, and other muscine delicacies which he took care to place on the carpet for them always at the same hour. One of them had received the name of "Nicodemus"—an allusion, I suppose, to a certain furtive visit by night—and the other was known as "The Chirper." To "make assurance doubly sure" that they would fulfil their engagement, and not disappoint me, their supper had been withheld from them on the evening previous to my visit.

True to time, just as the clock struck eight, and while we were conversing, there came from a corner of the fireplace, "Chirp, chirp, chirp," the same note being repeated several times at the rate of about thrice in a second, and gradually becoming louder. Presently a slight movement was visible about one end of the fender; and, after some hesitation, a little brown mouse came out upon the carpet, leisurely sniffed about for its accustomed meal, came close to my chair, looked wistfully up to my face, and I was introduced to "The Chirper." As a critic, I am bound to say that "The Chirper's" performance was of second-rate quality; but it was merely a kind of *lever de rideau*, and the principal artist was yet to appear.

We had not to wait long. At the conclusion of "The Chirper's" ineffective solo, a prolonged trill was faintly heard from behind the scenes, followed by others, each more audible than its predecessor; and ultimately "Nicodemus," the soprano, came forth before the audience, perfectly self-possessed, and showing no signs of "stage-fear."

The song to which the little creature gave utterance again and again in our full view was as sweet and varied as the warbling of any bird. It most resembled that of the canary, but the melody of the nightingale was occasionally introduced. Every note was clear and distinct, but withal so soft, so gentle, tender and *pianissimo*, that I can only compare it to the voice of a bird muffled by being heard through a down pillow. In the room was a canary, whose cage was suspended in one of the windows. He had settled himself to roost, and his head was under his wing, but at the sound of "Nicodemus's" serenade he awoke, and listening attentively, and fantastically leaning alternately to right and left, peeped curiously down to the floor. I learned that mouse and bird were intimately acquainted with each other, and that the former frequently visited his feathered friend and staid to supper. Accordingly, while we looked on with interest and pleasure, "Nicodemus" climbed up the drawn curtains, entered the bird's cage, and partook of the seed—the canary showing no symptom of disapprobation or disturbance, but merely from his perch peering down on his visitor in a ludicrously quaint and odd manner. During his supper-time "Nicodemus" obliged us, from the cage, with several repetitions of his song, "The Chirper," down below on the carpet, occasionally coming in with a monotonous contralto accompaniment, and sometimes emitting a sound like the squeaking of a corkscrew through a cork. The two little songsters, having done their best to please us, were rewarded with all that mice could wish for as components of a feast, and, after selecting the portions they severally preferred, gracefully retired.

The singing of mice has been attributed to various causes: It has been thought to proceed from disease of the lungs or vocal organs, and to be akin to the wheezing characteristic of asthma.

Of course, I can say nothing about the condition of the livers of the two mice I heard sing last week; but they did not act as if they were afflicted with disease of the liver, or any other organ. Brisk and vivacious in all their movements, darting now and then back to their hiding-place, as if to keep open their means of retreat while foraging, they looked the impersonation of vigorous health and bright activity; and, like every one else who has heard them, I feel quite sure that their song—especially that of "Nicodemus"—is not involuntary, nor the result of any disease of the respiratory organs, but an intentional and conscious utterance of a series of notes in musical sequence. As Mr. Buckland says (*loc. cit.*), "The song is a genuine song, as good and as musical as that of a lark on a fine summer morning."

Prof. Owen tells us that the anatomy of the mouse is very similar to that of birds; and all who have seen this little rodent in the act of singing have noticed that the throbbing of its throat is like that of a bird in full song, and that it then elevates its snout as a bird does it beak.

It is remarkable that in almost every case of a singing mouse having been seen as well as heard, it has been described as very small, much browner than the common gray or slate-colored mouse, and as having very large ears. This exactly applies to my little entertainers, "Nicodemus" and "The Chirper." They are both very tiny mice, their coats are very brown (not so much as to be fawn-colored), and their ears are abnormally big. I should be tempted to regard the singing mouse as a peculiar variety, if this idea had not been contradicted by the recorded fact that one out of a litter of common mice has become a "cantatore" or "cantatrice," while the rest have remained incapable of "favoring with a song."

The fact is that, although singing mice are not very rare, they are not common enough to have permitted any common zoologist to note their birth and parentage, observe their habits in life, and dissect them after death in a series so complete as to give assurance of scientific accuracy.

LEARNING TO SPELL.

ALLOW me to submit to the attention of teachers and parents of the advanced and advancing class, who take delight in your paper, a valuable aid in school training. It is a radically new mode of teaching spelling, which, while this is its primary object, is of great service in training the voice, also for preparing the hand and eye for future lessons in writing and drawing, in appreciating scales, and geometrical and geographical lines and directions, in exciting interest on the part of the learners, and in enabling the teacher to give more instruction.

I send you a copy of a pamphlet of example exercises in this method. It contains all that a teacher can require to make use of the plan in school, and exercises enough for perhaps three months of daily use.

The original French method was shown in the French or Belgian exhibit at our Centennial, but not being of a nature to attract the eye, did not excite observation. It has been in use in France for six or eight years with rapidly increasing extension. Their need of a better way with the spelling difficulty is perhaps greater than even ours.

The pamphlet is entitled, "Examples of Spelling Lessons by Ocular Instead of Oral Dictation,' and the method is to place before the learner's eye the pronunciation of the words of the lesson, in simple sound-signs from which he writes them in the proper spelling; referring, as we all do, to the image of the word stored in the memory and seen by introspection. The jingle of letter-names, so painfully and slowly learned, is no guide to the hand in actual practice; and the learning of them is a monstrous infliction upon children who can be gay and happy over an exercise that is reasonable and within their power to solve.

The new plan delivers them from this incubus, and takes them along a near and pleasant way. The gain in time alone is estimated by French authorities, after experience in more than 1,000 schools, at a whole year! How much valuable instruction may be acquired in this length of saved time in useful branches which could else never be reached. In a school of eight grades under the writer's observation, the method was introduced in the second grade near the close of the spring term. It has been successively introduced since, into successive higher grades, up to the sixth, and with results in all which seem to justify the opinion just quoted, and which certainly show that it is easy for the teacher, even when unprepared and wanting in practice in the phonetic analysis of words; and, also, pleasant and stimulating to the scholars.

The sound-signs used are simple, each consisting of but a single stroke, yet as easily combined and as distinct when combined as common script or type. They are entirely unlike the letters in common use, and they are purposely made so; this dissimilarity being the main principle of the system, and the one that makes it so rapidly effective in making ready and accurate spellers. For if they resembled each other, as misspelled words resemble correctly spelled ones, there would be found in the mind a bewildering confusion of images, the wrong ones fastening themselves as tenaciously as the right ones. On this account care is taken to avoid showing the child any type form of the word other than the plain form seen in books and newspapers; no phonetic alterations of type nor even diacritical marks are employed or approved of while thus teaching current English spelling.

All *bona fide* teachers should make a study and trial of this common-sense method, which has its base in the very elementary rudiments of speech, and which cannot but affect beneficially the entire school course, and all subsequent employment of school acquirements. W.

LETTERS FROM BOYS AND GIRLS.

A Smooth Dog and an Elephant.

DEAR UNCLE TRUE—If I may so call you—I thought I would try and write to you. I live in the town of Cohocton, N. Y., and am a farmer's daughter. My health is constitutionally bad, so that I could not attend school, and therefore my education is but poor; my writing especially. I have a request to make and hope some of my cousins will be kind enough to answer; or, maybe, my Uncle True can tell me where I can get the verses entitled, "James Bird" and the "Lily of the West." And will the editor please send me a large picture of a smooth dog and an elephant? Perhaps you will wonder what I want them for, and I will tell you. I want them for guides by which to make the animals in cloth. Now I will tell you how I prepare autumn leaves. I select the brightest and best, and place them on an old cloth on an ironing board with the face uppermost, and smear each leaf with beeswax, and with a moderately hot sad-iron pass it quickly over them. I have ironed some on a branch, so that they look as natural as life.

LIBBIE E. JONES.

A Chance For City Cousins.

DEAR RURAL COUSINS AND UNCLE TRUE:—I have never written to you before, and now I would like to begin to have some conversation with you, too. If you please, would you kindly let me drop in? I would like to hear from some of the cousins that live in the city. I live in the city and would like to hear from some of you. Some wild city girl, like myself, please answer and let me known what city she lives in and all about what she does there. I don't see any city cousins writing now-a-days, nor country ones either for that matter. I hope UNCLE TRUE will stir the cousins up and make them write more than they do, for my part I like your letters very much. Some one please answer and oblige.

Detroit, 1878. AGNES DANE.

For Twenty Long Years.

DEAR COUSINS:—As my first letter was printed I thought I would try again. I was very glad to see that Lillie Lee had not forgoten us. She says she would like to know what the other cousins are doing? I, for one, am enjoying myself in different ways. I have been to the seashore twice during vacation. I do not see much of Slayer-of-conceit lately. I wish he would write again. I have just been rumaging through some old RURALS, which I do occasionally, as my Grandpa has taken the RURAL for about twenty years, and has saved almost all of them. I guess I had better stop as this letter is long enough. I thank Lillie Lee very much for those candy recipes.

River Edge, N. J. LIZZIE.

Lost the Address.

DEAR UNCLE TRUE AND RURAL COUSINS:—I have long wished to join your pleasant circle of cousins, but did not know until now where to direct. My brother takes the RURAL. I like it very much. I hope that you, Madcap Mollie, will stir up the cousins to write more and oftener.

Waterbury, Conn. CLIP BIRD.

The Puzzler.

RIDDLE.

I NEVER was caught nor likewise bought,
And I never can be sold;
I am with the lame and halt,
And with the soldier bold.
I am with the rich and lofty,
And also with the poor;
I am in the house of God,
And by the prison door.
But in dark dungeons I am not found,
Nor in the silent grave;
But on the sides of mountains,
And on the rolling wave.
And I never do any good,
And I likewise do no harm;
I am found in every workshop,
And also on the farm.

☞ Answer in two weeks. L. LAXTON.

FRACTIONAL PUZZLE.

TAKE one-sixth of bamboo; one-sixth of laurel; one-eighth of chestnut; one-eighth of palmetto; one-sixth of willow; one-eighth of laburnum; one-eighth of rosewood; one-eighth of magnolia; one-sixth of baobob; one-sixth of linden. Take one from each and form a tree.

☞ Answer in two weeks. BALTO.

CHARADE.

A SHIP was sailing on the bay,
My second was on it, so they say;
Now every second had my first, it is true,
But still there was only one in the crew.

☞ Answer in two weeks. T. J. CARLE.

DOUBLE ACROSTIC.

1. A TOWN in Pennsylvania. 2. A town in Michigan. 3. A town in Nebraska. 4. A town in New York. 5. A town in Rhode Island. 6. A town in Maine. 7. A town in Arkansas. The initials form a western city; the finals an eastern city.

☞ Answer in two weeks. MERMAID.

TRANSPOSITION.

WHO het dwil dwin shiwelts rothghu ony lapem eter,
Nad ryd salvee ear gliniaf, fingall;
Dan eth ghint drib gittins neloa no het eal,
Ot shi meta si fingiae, gineall.

☞ Answer in two weeks. MARY WALEY.

CROSS PUZZLE.

1. PEEVISH. 2. Stockings for men. 3. A loud sound. 4. Act of contracting. 5. Oranges of a certain kind. 6. Two at a birth. 7. A garment. 8. Two. 9. A learned man. 10. Thick twisted thread. 11. A head-dress. Centrals form part of Europe.

☞ Answer in two weeks. LITTLE ONE.

Sabbath Reading.

BETTER THINGS.

BETTER to smell the violet cool, than to sip the glowing wine;
Better to hark to a hidden brook, than watch a diamond shine.

Better the love of gentle heart, than beauty's favors proud;
Better the rose's living seed, than roses in a crowd.

Better to love in loneliness, than bask in love all day;
Better the fountain in the heart, than the fountain by the way.

Better to be a little wise, than in knowledge to abound;
Better to teach a child, than toil to fill perfection's round.

Better to sit at a master's feet, than thrill a listening state;
Better to suspect that thou art proud, than be sure that thou art great.

Better to walk the realm unseen, than watch the hour's event;
Better the "Well done!" at the last, than the air with shoutings rent.

Better to have a quiet grief, than a hurrying delight;
Better the twilight of the dawn, than the noonday burning bright.

Better a death when work is done, than earth's most favored birth;
Better a child in God's great house, than the king of all the earth. [*George Macdonald.*

STABILITY OF GOD'S CHURCH.

REV. DR. MACLAREN remarks in one of his published sermons:—"If it had been possible to destroy the church of the living God, it had been gone long, long ago. Its own weakness and sin, the ever new corruptions of its belief and paring of its creed, the imperfections of its life, and the worldliness of its heart; the abounding evils that lie around it, and the actual hostility of many that look upon it and say, Raze it even to the ground, would have smitten it to the dust long since. It lives, it has lived in spite of all, and therefore it shall live. 'God will establish it forever.' In almost every land there is some fortress or other which the pride of the inhabitants calls 'the maiden fortress,' and whereof the legend is that it has never been taken, and is inexpugnable by any foe. It is true about the tower of the flock, the stronghold of the daughter of Zion. The grand words of Isaiah about this very Assyrian invader are our answer to all fears within and foes without: 'Say unto him, The virgin, the daughter of Zion hath despised thee and laughed thee to scorn; the daughter of Jerusalem hath shaken her head at thee. I will defend this city to save it for my own sake, and for my servant David's sake.' 'God will establish it for ever.' And the pledges of that eternal stability are the deliverance of the past and of the present."

SERVING THE LORD WITH GLADNESS.

WE must serve something or some one. If we serve ourselves we gain nothing by it; for we can give ourselves only what we already have. If we serve our fellow-men, obey their commands, promoting their interests and enhancing their glory, we can obtain from them only what they have to give. Perhaps they will not perceive the value of our service, and have no grateful appreciation thereof. What they can give is perishable and of little worth. If we serve any lust we are the slaves of a beast. If we serve any passion we are the slaves of a demon. God permits us to serve Him, that is to obey His commandments, cooperate with His great movement and promote His glory. The service of God is a duty; it is also much more, it is a privilege. Christians dishonor their religion by representing Christian life as a chain that must be worn for a season, instead of a magnificent robe which adorns them. Serve the Lord with gladness. Be glad that you are permitted to serve Him. Engage in His service cheerfully. Let His service be the fountain of your highest joys. Do not act as though you would say, "Ah me, I must pray, I must fast, I must give Him my time, my labor, ah, me!" Go before His presence with singing. Sing praises unto Him, that He permits you to give anything which in any wise connects itself with Him. The only permanent joy on earth is the joy of God's salvation.—*Rev. Dr. Deems.*

BE STRONG IN THE GRACE THAT IS IN CHRIST JESUS.

Tim. ii, 1.

WE want to be strong in ourselves, or if we may not have confidence in ourselves, to have some fellow-creature on whom we can rely. But God will have us confide only in Jesus. God would trust no one but Jesus, and we should not even wish to do so. There is grace in Jesus. All grace is in Jesus. He says, "All things are delivered unto me of my Father." And the apostle says, "It pleased the Father, that in him should all fullness dwell." He is the fountain of grace, and we are to look to him at all times, and for all the grace we need. He giveth liberally and upbraideth not. Let us not fancy ourselves strong because of any grace we have received, or on account of the grace possessed by any one we love; put let us exercise confidence in Jesus alone, who giveth more grace. We are as our faith is; if therefore our faith is fixed on Jesus, if we exercise steady confidence in his veracity, word, and love, we are strong. But it is only as we feel weak in ourselves that we shall do so.

A LITTLE will satisfy nature, less will satisfy grace, but nothing will satisfy a proud man's lusts.

PERSONAL ITEMS.

Alfonso XII. is twenty-one.

Senator David Davis says that three days are enough to love, court and marry in.

Mr. Sartoris, Nellie Grant's husband, is said to have grown aldermanic in size, and now bears a striking resemblance to the Prince of Wales.

Mr. C. C. Fulton, editor of the Baltimore American, made a 155 days' trip to Europe on less than $1,000, and says he didn't try to economize, either.

Mr. Moody says he has parted from Sankey for a year, until he can get some new sermons, the old ones having been published and republished so many times that he is ashamed of them.

Twelve years ago Deacon Benson of Ft. Wayne, Ind., a man then forty-eight years old, was worth $500,000. He speculated, lost money, became a passenger conductor, then a saloon keeper, then a street car driver, then a pauper; last week he died in the hospital and was buried in the Potter's Field.

Senator Stanley Matthews had to be pulled feet foremost out of a back window in Washington the other night—not that there was anything the matter with Mr. Matthews' head (for he never gets so), but the vehicle that he was riding in upset and smashed against a pile of street debris, and he had to be extracted from it in that undignified manner.

A twenty-pound keg of powder exploded in the arms of Colonel William J. Sanford, Democratic nominee for Congress in the Third Alabama district, when he was a boy, and on hearing that the lad had escaped without injury, Senator Yancy predicted that he would live to be hung—or elected to something.

The lack of sympathy in some papers is atrocious; witness this way of "putting it" by one of them: "Hepworth Dixon has gone to Cyprus, has tumbled off his horse and has broken his collar bone—and yet there be people in England who make loud-mouthed affirmation that the annexation of the island has been productive of nothing but evil."

Major Forbes is off for Afghanistan as war correspondent of the London Daily News. The London Times, Telegraph and Standard are represented respectively, by Captain Charles Norman, Mr. Frederick Boyle and Mr. Philip Robinson. All four of these distinguished correspondents will send information to the RURAL!!!

Trees, Seeds, Plants, &c.

CITY OF BOSTON,

CITY HALL, November 5, 1878.

Proposals will be received at the office of the Clerk of Committees, City Hall, Boston, Mass., until FRIDAY, Nov. 22, 1878, at 1 o'clock P. M., for furnishing the Plants required for the Public Grounds during the year 1879.

For information in regard to the Plants wanted and the terms and conditions under which the contract will be awarded, see printed specifications, which may be obtained of the Supt. of Common, City Hall, Boston, Mass.

The right to reject any or all proposals which may be received is hereby reserved. Proposals to be addressed to the undersigned and marked "Proposals for Plants."

CURTIS GUILD,
Chairman Committee on Common and Public Grounds.

THE YOUTH'S COMPANION
A WEEKLY PAPER FOR
YOUNG PEOPLE
AND THE
FAMILY

It aims to be a favorite in every family—looked for eagerly by the young folks, and read with interest by the older. Its purpose is to interest while it amuses; to be judicious, practical, sensible, and to have really permanent worth, while it attracts for the hour.

It is handsomely illustrated, and has for contributors some of the most attractive writers in the country. Among these are:

J. T. Trowbridge,	Dinah Muloch Craik,
James T. Fields,	J. G. Whittier,
Rebecca H. Davis,	Louise C. Moulton,
Charlotte Mary Yonge,	C. A. Stephens,
Edward Everett Hale,	Harriet P. Spofford,
Rose Terry Cooke,	A. D. T. Whitney,
Louisa M. Alcott.	

Its reading is adapted to the old and young; is very comprehensive in its character. It gives

Stories of Adventure,	Stories of Home and
Letters of Travel,	School Life,
Editorials upon Current Topics,	Tales, Poetry,
Articles on Health,	Selections for Declamation,
Biograph'l Sketches,	Anecdotes, Puzzles,
Religious Articles,	Sports and Pastimes.

Subscription Price, $1.75. Specimen copies sent free. Please mention in what paper you read this advertisement.

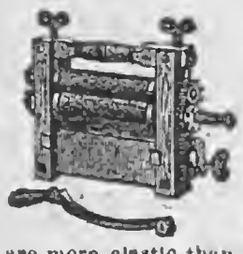
PERRY MASON & CO.,
41 Temple Place, Boston.

TO ADVERTISERS! We fill orders for the insertion of advertisements in the newspapers of the United States and Dominion of Canada. To furnish advertisers with reliable information concerning newspapers and their rates, and thus enable the most inexperienced to select intelligently the mediums best adapted to any particular purpose WE ISSUE SEMI-ANNUAL EDITIONS OF

AYER & SON'S MANUAL FOR ADVERTISERS. 184 8vo. pp. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists carefully revised in each edition, and where practicable prices reduced. The special offers are numerous and unusually advantageous. It will pay you to examine it before spending any money in newspaper advertising. The last edition will be sent postpaid to any address on receipt of 25 cents by N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

Implements and Machinery.

Keystone Wringer



Has Greater Capacity, is More Durable, and is better finished Than any other wringer now made.

THE ROLLS

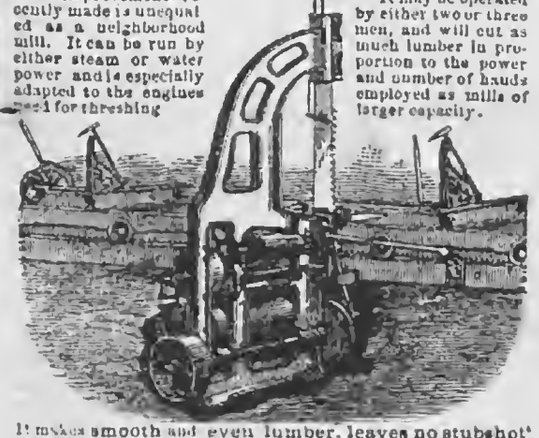
Are made of White Rubber clear to the shaft. No twine or wire or fibrous material, or anything else but rubber being used. The rubber is *vulcanized upon the shaft and cannot be taken off except by cutting it off*. They are more elastic than other rolls because there is nothing but rubber on the shaft, and more durable because there is no twine or fibrous material to rot out or wire to cut the rubber. They are greatly superior to any other kind of roll now known.

ASK YOUR DEALER for the KEYSTONE WRINGER

Portable Mulay Saw Mill,

With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power and is especially adapted to the engines used for threshing

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.



It makes smooth and even lumber, leaves no stubs shot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc. to CHANDLER & TAYLOR, Indianapolis, Ind.

Miscellaneous.

HOW TO BE YOUR OWN LAWYER AGENTS WANTED. $50 to $125 a Month. An Encyclopedia of Law and Forms. For Business Men, Farmers, Mechanics, Property Owners, Tenants, everybody, every business. Saves many times cost. Selling fast. Send for Circular and Terms. P. W. ZIEGLER & CO., 518 Arch St., Philadelphia, Pa.

PATENTS.

In connection with the publication of the *Scientific American*, we continue to act as Solicitors for Patents, Caveats, Trade Marks, Copyrights, etc., for the United States, Canada, Cuba, England, France, Germany, etc. In this line of business we have had *thirty-three years' experience*.

Patents obtained through us are noticed in the *Scientific American*. This large and splendidly illustrated weekly paper shows the current progress of Science, is very interesting, and has an enormous circulation. Subscriptions $3.20 a year, postpaid; single copies 10 cents. Sold at all Bookstores and News-offices.

Can I Obtain a Patent? The quickest and best way to obtain a satisfactory answer, without expense, is to write to us (Munn & Co.), describing the invention, with a small sketch. All we need is to get the *idea*. We will immediately answer, and give the necessary instructions. For this advice we make *no charge*.

We also send *free* our Hand Book about the Patent Laws, Patents, Caveats, Trade-Marks, their costs, and how procured, with hints for obtaining advances on inventions. Address MUNN & CO., Publishers of the *Scientific American*, 37 Park Row, New York.

TEAS 5 lbs. Best Sample Tea, $1,50; 5 lbs. Very Best New Crop Tea (green or black), $2. Sent in packages of 5 lbs. and upward to any address on receipt of price. Circulars mailed free. THE CANTON TEA CO., Importers, 148 Chambers St., N. Y. Post-Office box 872. Agents wanted

Wit and Humor.

GOING UP THE SCALE.

A "MAJOR" loved a maiden so,
His warlike heart was soft as "Do."

He oft would kneel to her and say,
"You are, of light, my only 'Re.'

"Ah! if but kinder you would be,
And sometimes sweetly smile on 'Me.'

"You are my life, my guiding star,
I love thee near, I love thee 'Fa.'

"My passion I cannot control,
You are the idol of my 'Sol.'"

The maiden said, "Fie! ask Pa,
How can you go on thus? Oh, 'La!'"

The major rose from bended knee,
And went her father for to 'Si.'

The father thought no match was finer,
This "major" once had been "a minor."

They married soon, and after that
Dwelt in ten rooms all on "one flat."

So happy ends the little tale,
For they live on the grandest scale.

"KEEP your patients alive," said an old doctor to a graduating class of students: "dead men pay no bills."

THE individual who called tight boots comfortable, defended his position by saying they made a man forget all his other miseries.

How conscience doth make cowards of us all. Bob Ingersoll left for the seaside as soon as the hot wave began to shake his theories.

WHAT is the difference between a catechism and a cat fight? One is categorical and the other is cat-eye-gore-ical.—*Cincinnati Breakfast Table.*

MINNESOTA has a man who is so pious that he will not engage in sheep raising because the lambs gambol on the green.—*Cincinnati Breakfast Table.*

MR. WILLIAM E. PLEADWELL and Miss Leleah B. Larkin were married at Brockton on the 10th. William Pleadwell and long, so Leleah consented, though she knew he was fond of Larkin.

THE Post Office Department has ruled that a husband has no control over the correspondence of his wife. But this decision will not prevent a man from carrying his wife's letter around in his inside coat-pocket three weeks before mailing it.—*Norristown Herald.*

JOHNNY, who goes to a crack school, went a-fishing the other day. "What did you catch, Johnny?" said his mother, on his returning. "I captured an Anguilla Bostoniensis, mother, a fine specimen of the Malacopterygious fish," answered Johnny, promptly. Of course his mother knew he had caught an eel.

THE New York World evidently has designs upon certain classes of our population, for it remarks unobtrusively, but suggestively, "Organ grinders make from $14 to $16 a day at Grenada, Miss. Book agents are in great demand at New Orleans. A hundred able-bodied lightning-rod men are needed at once in Memphis."

CURIOSITIES—Judicious applause. Unostentatious charity. A German who dislikes beer and dogs. An artist who is not jealous. Perfect harmony in the love affairs of feline species. A true disciple of Izaak Walton who never deviated from the truth. A mother willing to acknowledge the superiority of a neighbor's child. An Italian who can't play on something—an instrument or our credulity. A critic who did never carry, or was unwilling to, a satchel from a stage entrance.—*Saratogian.*

Ease Attainable by the Rheumatic.

Yes, although they may despair of relief, it is attainable by rheumatic sufferers, for there is a remedy which carries off, by means of increased activity of the kidneys—important channels for blood purification—the acrid element to which pathologists the most eminent attribute the painful symptoms—a theory completely borne out by urinary analysis. The name of this grand depurent is Hostetter's Bitters, a preparation likewise celebrated as a remedy for constipation, which causes contamination of the blood with the bile—and a certain means of relief in dyspepsia, fever and ague, and nervous ailments. It is, perhaps, the finest tonic extant, and is highly recommended as a medicinal stimulant by distinguished physicians and analysts, who pronounce it to be eminently pure and very beneficial. The press also indorse t

ROGERS' SAW.

The best Christmas Present for a Boy is a Rogers' Scroll Saw.

It will put him in the way of doing something at once which will please him better than play, and enable him to make a little spare change by selling the articles which he manufactures. While it educates him to habits of industry, it also gives him a trade which he can fall back on in after-life if all other plans fail. Boys are not apt to think of these matters in advance, but their parents ought to attend to this part of their education when their habits are being formed, and it is easy for them to learn. More than 200,000 people are now using our Saw, and most of them with great success.

On receipt of $3 we will send a very nice Foot-power Saw, with Tilting Table for inlaid work and Drilling Attachment, with extra Saw Blades, Designs, &c., &c. It is nicely boxed and weighs 30 lbs. It is the only really good, cheap Saw in market and will never fail to give satisfaction. All Hardware Dealers keep them, or will get them if requested to.

THE WONDERFUL LEFEVRE DIAMONDS TRADE MARK PAT'D

Lefevre Ring, $1. Set of Studs, $1. [The Shah] Stud, $1. Lefevre Ear Drops, $1.

THE ONLY PERFECT FAC-SIMILE OF THE REAL DIAMOND IN THE WORLD.

Pronounced by the Academy of France that *M. Lefevre has really obtained artificially the true diamond.* The basis of these gems are pure crystals found in the Sierra Nevadas, from whence they are exported to the Lefevre Laboratory in Paris, France, where they are submitted to a chemical and voltaic process,

BY WHICH THEIR SURFACES ARE COVERED WITH A COATING OF PURE DIAMONDS, imparting to them all the BRILLIANCY, HARDNESS, and refractive qualities of the natural diamond, and making them as desirable for **Wear, Brilliancy,** and **Beauty,** as the veritable gems themselves. The Ring, Studs, and Ear Drops, as displayed in this announcement, are accurate engravings of SOLID GOLD MOUNTINGS, CONTAINING THE WONDERFUL LEFEVRE DIAMOND, warranted by certificate U. S. Mint assay.

ON RECEIPT OF ONE DOLLAR we will send free, by REGISTERED MAIL, to any address in America, either article as above represented. Our "Book on Diamonds," with illustrations of artistic Diamond Jewelry in solid (14 k.) gold, mailed free.

I have seen many imitations of diamonds, but never any that could equal the Lefevre Brilliant.—M. ELLROY, Stamford, Conn.

I am in receipt of a pair of the Wonderful Lefevre Ear Drops, for one dollar; to say that I am pleased with them hardly fills the bill, they are simply elegant.—ANDREW MORRIS, Hornellsville, N. Y.

The Wonderful Lefevre Diamond Ring, for one dollar, came to hand this morning. It is really elegant, giving entire satisfaction, and eliciting wonder and admiration from all who see it.—W. H. REEDY, Martinsburg, W. Va.

The Lefevre Diamonds, mounted in solid gold, are truly marvelous.—B. F. AVERY & SONS, Home and Farm, Louisville, Ky.

The eminently successful experiments of M. Lefevre silences all doubt of the artificial reproduction of the true diamond.—M. DU FRENOY, the great French Scientist.

The Lefevre Diamond most effectually disturbs the slumbers of the possessors of costly gems.—Journal of Science.

☞ We guarantee the Wonderful Lefevre Diamonds for **One Dollar** to be mounted in **Solid Gold,** and will cheerfully refund the money if found unsatisfactory. Address all orders to the

The Herdsman.

OUR CATTLE ILLUSTRATIONS.

THE HOLKER HERD.

HOLKER HALL is the name of a beautiful estate belonging to His Grace the Duke of Devonshire. It is upon the northern shore of Morecambe Bay in Lancashire and supports one of the finest herds of Short-horns in the world. The sales have long been looked to as furnishing well-bred Bates animals of rare breeding and the herd has the merit of having been bred at home and not purchased. A selection of animals from this herd was sold at auction on the 18th of September, and the Agricultural Gazette, in comment upon the herd previous to the sale, gives very attractive portraits of four of the animals, which we reproduce. The dissertations upon the merits of particular animals and their influence in the herds would hardly be interesting to our readers. It is enough to say that the Bates tribes most in favor and comprising the bulk of the herd, are those pre-eminently favorites on this side of the Atlantic, namely, Oxfords, Wildeyes and Barringtons. The breeder, Mr. Drewry, has practised sending the cows of this herd to the most famous Bates bulls within his reach, and has thus introduced the best strains of blood by breeding rather than by purchase, and, of course, has followed up successful leadings. It is pleasant to see the familiar names of American-bred bulls occurring in the pedigrees of these fine animals.

The heads are strikingly fine, and have a high-bred style and quality which it is a great satisfaction to see so truthfully portrayed. Those of the bulls, and particularly that of the old bull, Duke of Wetherby 5th, who headed the catalogue, are especially life-like.

MILKING SHORT-HORNS.

There is no doubt but that the Short-horns are the deepest milking breed in England. At

SOME THINGS WE HAVE TO BE THANKFUL FOR.—(See Ed. Page.)

the recent Dairy Show held at the great Agricultural Hall at Islington, near London, the highest prize was won by Mr. Wodehouse's cow "Countess." She was exhibited with her twin calves and the group was greatly admired. Her general outline is well shown in the engraving which we present, but the photograph seems to be a little confused about the calves. There were, however, two nice calves which gave evidence of abundant nutrition and promise. Countess's pedigree is what Short-horn men would call a very "plain" one, but her form was excellent and though her udder and teats were not perfect, they were good and certainly serviceable. The sire of the calves was shown also, a fine "Knightly" bull named "Royal Havering 2nd" who was got by 3rd Duke of Geneva, an exported bull, and out of Mr. McIntosh's "Lady Knightly," a cow which was imported into this country.

Eastern breeders value milk-giving qualities in a Short-horn. There is something so tangible and satisfactory about the production of 20 or 30 quarts of milk a day that we cannot blame farmers for favoring families which are constantly paying for their own keep in this way; and it is a question which may well be mooted whether the grade cows of any other breed will equal the Short-horns as milk-producers.

AN ITALIAN BULL.

A bull of the *Val-di-Chiana* breed of Tuscany was shown with other cattle of the same kind at the cattle show connected with the Paris Exposition, by Mr. Landi of Florence. The accompanying engraving is from a photograph and must represent the animal very accurately. These cattle are of a tawny gray color, varying to light dun, the oxen being long-horned and of better form than the bulls. They are a fair type of an unimproved breed, slow-maturing, heavy-boned, coarse, thick but loose-hided, slab-sided, making little milk and poor beef. The picture offers a striking contrast to those of the well-bred animals exhibited in this number of the RURAL.

JERSEYS IN THE WEST.

ONE very noticeable feature of our leading Western Fairs during the season just past, has been the prominence, in point of numbers at least, of the Jerseys. At St. Louis they outnumbered all other breeds combined. I notice that the St. Louis correspondent of the RURAL puts the number of Jerseys at 135, but according to Mr. FILLEY, the very efficient superintendent of the cattle department, the actual number was 165, five better than at the Centennial and the largest collection of the breed ever seen on this continent, and in point of quality not very far in the rear.

This liberal patronage of the St. Louis Fair on the part of Jersey breeders, is largely due to the fact that the management was among the first to recognize their rights as exhibitors. The fashion in these parts, as in fact all over the country, has been to discriminate in the matter of premiums in favor of the Short-horns, and in many places it has only been by dint of the most persistent efforts that the Jersey men have been able to secure judges who had any adequate knowledge of the Jersey breed. Something of the character of the obstacles they have had to contend with, was shown by a remark made by one of the officials, who stood in very intimate relations with the cattle department of the Indiana State Fair, at Indianapolis. It was to the effect that he regarded the introduction of Jerseys as an actual detriment to the cattle interest of the State. His words and his manner indicated that, in his estimation, the management was conferring no inconsiderable favor upon the Jersey exhibitors in permitting them to show their stock.

But, in spite of this prejudice, the little Jersey is very rapidly pushing its way to the front. Some sales made at St. Louis were quite significant. Mr. Jackson, who had on exhibition 54 of the Beech Grove Herd of Indianapolis, including 20 of his later importation, sold to Gen. Guitar, of Mo., six head for the sum of twenty-seven hundred dollars, or an average of $450 per head. Another exhibitor sold a two-year-old heifer for $300. Even Jersey grades are looking up. A neighbor of mine has just sold sixteen head, mostly yearlings, for eight hundred dollars. Since the first of January he has sold two thousand dollars' worth at prices similar to the above, and finds a demand far beyond his ability to supply.

Arboricultural.

THE BEST TIME TO PLANT TREES, PLANTS, ETC.

THE argument so generally advanced in favor of fall planting, that farmers have more time in fall, than in spring to do their work properly, is one that cannot be overlooked, and yet it does not seem to be quite conclusive.

If trees and plants *must* be shipped long distances, the fall is undoubtedly the best time to do it. I should much prefer to have trees set where they are to stand, than to have them "heeled in" over winter. But when it is possible to procure those freshly dug, give me spring planting every time. Neither should the planting be done too early in spring. Let any one set a portion of his trees or plants in the fall, and reserve a portion quite late the following spring, until growth has commenced, then have them freshly dug, and immediately set out, and compare results. The better plan is to prepare the land thoroughly in the fall, have it all marked, and then the planting will consume very little time and, as I believe, it will prove more satisfactory to defer this until spring.

Currants, Strawberries, and perhaps, Raspberries are exceptions to this rule. The arguments that by fall planting the earth becomes firmly settled about the roots by the time growth commences, has no force. One should "firmly settle the earth about the roots," at the moment they are planted, trusting nothing in this way to time or change, as neither will be likely to "patch up" his neglected job. I have set trees in the fall and, under certain circumstances, may do so again; but under no sort of circumstances will I ever set grape vines until late in the spring. Where freshly dug vines can be procured, I prefer to wait until the buds have started. When they are shipped from a distance, this is, of course, impossible.

Such are my opinions upon this subject. Others may, and probably do, think differently.

Dairy Husbandry.

DAIRYING AND DAIRY COWS OF NEW ENGLAND.

R. GOODMAN.

FAVORITE BREEDS OF DAIRY COWS.

DURING the last fifteen years a great change has taken place in the character of the cows used for dairy purposes in New England, and the Short-horns, Jerseys and Ayrshires have been substituted largely for the old mixed breeds in addition to being bred for sale to the Middle and Western States.

THE DURHAMS OR SHORT-HORNS, are not well adapted to the pasturage of New England, and many of the early breeders of this stock have removed to richer preserves in New York or nearer the setting sun, while nearly all those who continue the business here confine themselves to the old-fashioned Short-horns, more noted for hardiness and milk-producing qualities than the high-priced, beefy Duchesses and other illustrious families.

THE JERSEYS have crept steadily into public favor, not only as family cows, but as the most useful for large butter dairies, and they are now numerically at the head of the list. Moreover, buyers from the West and South are constantly making drafts upon the herds of New England, and this will continue until, as a breeder from Illinois remarked, every woman at the South and West has a Jersey cow.

THE AYRSHIRES have continued to improve in the estimation of those whose business is the production of milk, and with the Jerseys, have, by crossing, added largely to the better qualities of the mongrel stock of the country which has, in fact, only been kept up to fair condition by the constant use of blooded bulls. The action of the State Board of Agriculture of Massachusetts, which authoritatively controls the thirty Societies of that State, in prohibiting them from giving premiums to grade bulls, has had a decidedly beneficial effect, and now that pure-bred and registered bulls can be had of all the prominent breeds at reasonable prices, the farmers are adapting themselves to the new conditions with the best results.

THE DUTCH, misnamed Holstein, cattle are, to some extent, in favor, and a few Swiss are to be found, but the Jerseys and Ayrshires take the lead and are pre-eminent in their special departments.

Two marked results are noted as the consequence of the growing attention to these fancy cattle, as they were formerly slightingly called, namely, greater care and attention to the animals themselves and their surroundings, and a better quality of product, including calves, butter and milk. Just as the youngster who owns his colt, takes pride in its keeping and grooms it carefully, so the owner of thoroughbred, high-priced stock gives attention to their appearing well, keeps the byres clean, beds with saw-dust or poor hay, increases the milk and butter production by judicious feeding, and carefully rears the calf which will bring a good cash price when six months old. The great benefit of fancy farming by wealthy men, is that it incites those who have not so much money to spend to imitate their flusher neighbors in those improvements and appearances which can be arrived at by labor and taste, and no one can fail to have perceived the great advantages which accrue to any farming neighborhood by the advent of one or more amateur agriculturists who work with golden plows and spades. There may be some heart-burnings at first, but in the end the hard-working man gains in knowledge, and is justly grateful for the information he has obtained without cost, and finds that the new processes put money in his purse.

SALE OF GILT-EDGED BUTTER.

Naturally following such attention to details have been the more excellent quality of butter and quantity and quality of milk, and the consumers of the latter now, as a general rule, obtain it free from the impurities of the stable and other vile odors; whilst the lovers of good butter and even those who have acquired a taste in Europe for the delicate flavor of that compound there, can find in every large city an article equal to that made anywhere in the world. When consumers are willing to pay a dollar a pound for it, and the guests of hotels call for the brands they prefer as they do for wine or cigars, butter-making has become a fine art, and in the hands of the Darlingtons of Pennsylvania, Starr of Echo Farm, Connecticut; Burnett of Massachusetts, and others who might be named with them, it has become a profitable and constantly increasing business. In nearly every town or village in New England to which city residents resort during the summer months, there will be found one or more farmers who make Jersey gilt-edged butter, and get for it double the price obtained by their neighbors for their inferior product, and their customers who know how thus to discriminate between the best and its inferiors, engage their butter for the ensuing winter to be made and sent weekly in small amounts. Thus, in addition to the large quantity of high-priced butter sold by the large family grocers, and that specially delivered by the agents of noted makers, great numbers of families in the cities are directly supplied from the country with fresh-made butter, in quantities ranging from five to ten pounds a week, at prices from 50 to 60 cents a pound. Nearly all the hotels and clubs in New York, Philadelphia and Boston receive from private dairies their best quality of table butter, and no one of any taste can fail to discern the great improvement in this article at such places during the past five years. The wealthy people, as a rule, only purchase this quality of butter for their own table, letting their grocers supply that used in cooking, but they are beginning to find out that good butter is even more essential for the latter purpose than to be eaten directly; for the bad used for culinary purposes has to be eaten, and in fact there will soon be but two kinds of butter—the very good and the very bad, and oleomargarine will be substituted for the latter, if it continues to be manufactured in as cleanly a manner as at present.

Cheese making has almost entirely devolved upon factories, and there are a few creameries which make an excellent quality of butter, and, as they increase in number, the quality of butter generally will advance, but the real gilt-edged, sought by the epicure, the refined in taste and those addicted to the article as found in the capitals of Europe, can only be made in private establishments, where the best cows yielding the richest homogeneous milk, are properly fed and cared for, and all the appliances are of the best sort, and the *art* of butter making is understood in all its details. Such butter will always command a paying price, and as the wealthy denizens of the cities are constantly demanding it, there is a wide and comparatively unimproved field for the intelligent and ambitious dairymen of the Eastern States, as well as for those near to the markets of the large cities of the Union.

Milk from some dairies is now transported in quart or half-gallon glass vessels, and delivered, sealed up, directly to families who can thus be sure of a clean article with the cream on top, which can be skimmed off for the coffee and the balance fed to the baby, without danger of resulting diphtheria or other malarial diseases.

BERKSHIRE CO., MASS.

Sheep Husbandry.

FALL MANAGEMENT OF SHEEP.

PROFESSOR E. W. STEWART.

HARDINESS OF IMPROVED BREEDS.

IT is claimed by some who keep the hardy Merino, that the Long-wools cannot be fed with profit in our rigorous Northern climate; that they require so much more attention, and so much better feed, that it is only contending against nature to attempt it. This opinion, however, is quite extreme and held only by those who desire a breed of sheep that require little attention. The same accusation may be brought against all the improved breeds of cattle, as compared with the wild Texans and the scrubs of the Western plains. The magnificent Short-horn is not as capable of enduring the rigors of a cold winter on what it can pick through the snow as the Chillingham Park cattle; but are they thence to be discarded and the latter substituted for them? The American Merino is a much better developed animal than the Spanish Merino, and the best American flocks will not stand anything like the neglect of the former without serious injury. The Indian is more hardy and can stand more exposure than the most civilized European or American, but this fact is hardly to be taken as proof that Indian civilization is preferable.

There is a great deal too much nonsense about this or that improved breed being less hardy and requiring more care than the common, thin, unimproved stock of the country. If Bakewell had not improved the method of breeding and feeding the Leicester sheep, it would have remained as long-legged, thin, and slab-sided as ever. All improvements in breeds of sheep have been accomplished by better food and greater care than had theretofore been given, and if this improved condition is to be maintained, then, there is a

NECESSITY FOR A FULL-FEEDING SYSTEM

to be kept up through the entire season. These improved breeds are more profitable feeders, requiring less food for a pound's growth than common sheep. The question then that properly comes, is, not how little food is necessary to keep sheep in store condition, but how much food can be digested and assimilated consistently with health. The more food sheep can digest within a given time, the greater will be the per cent. of gain and therefore of profit. The skillful feeder will watch the condition of his pasture and the condition of his sheep, and see that they are supplied with abundant food at all times. An increase of condition always brings an increase of fleece.

There are usually several classes of sheep kept; as breeding ewes, lambs, young ewes and wethers. The breeding ewes should be kept in good condition, not fat, and they are not likely to get in too high a condition after suckling lambs through the summer. They should be kept well in fall preparatory to breeding again. Ewes will require as good feed to recover what they have lost in milking as wethers will to get fat. A strong, healthy ewe is likely to bring a vigorous lamb, which will develop early for market, if desired. But any neglect in fall feeding, after the weather becomes cold and stormy, will tell most disastrously upon breeding ewes and the lambs they will bring.

SHELTER FROM STORMS

is absolutely necessary for economical feeding. No flock-owner can afford to dry the drenched fleeces of his sheep with extra food. This extra food should go to put his sheep in better condition, instead of being expended in keeping them warm during exposure to cold storms. Open sheds should be provided, accessible to the sheep in fall, and no labor will be required to induce them to avail themselves of this shelter. They know enough to "get in out of the rain." Here also should be arranged some troughs in which could be placed daily a pint of grain for each sheep, when the pasture becomes impaired by being eaten too close or injured by frost. Oats and corn, mixed half-and-half, form a good ration, and will pay an excellent profit when fed to improve the condition of sheep in fall. It should be remembered that the mild fall weather is much more favorable to improving the condition of sheep with a small grain ration than the cold winter weather. Half the amount of grain will then put on a pound of flesh, that will be required when the thermometer averages 20 degrees. When the weather becomes very cold, good rations are required to prevent loss in thin sheep instead of producing gain. Sheep that are in good condition at the beginning of winter, are not troubled with cold and will gain on a moderate ration all winter.

Erie Co., N. Y.

The Poultry Yard.

HATCHING CHICKENS.

PREPARE a box 15 inches cube, closed on all sides but the front, on which nail a narrow slat opposite the egg place, leaving an opening below, so as to be able to clean it the more easily. Place in it a sod, grass side up. If the weather is warm, place the eggs directly on the sod for moisture; if cold, cover it with cut straw—long straw may entangle the hen's feet—do not use hay, as it is apt to get musty; level the surface of the sod, to prevent breakage of eggs. If the eggs get soiled, wash them with warm water

Place the box in a retired place away from the roosts and from other fowls. The boxes should be somewhat different from the laying boxes to prevent mistakes, and yet of the same general appearance, to make the hen feel at home. Generally Brahmas and Cochins may be moved and set almost anywhere. Medium-sized fowls are less likely to break the eggs. Set from 9 to 15 eggs, the number depending on the weather and size of the fowl and eggs. Those outside are apt to be chilled in cold weather. An odd number is preferable, because then the arrangement of them more nearly approximates an oval.

Examine the hen carefully to see if she is free from lice; if she is, set her after dark on some

common or china eggs for a couple of days to learn if she means business. Sprinkle the whole nest with sulphur and dust it among the hen's feathers and under her wings, to prevent the spontaneous generation of vermin and to kill any lice that may have escaped observation. All fowls will generate lice if they do not take a dust bath often or if they are not protected artificially. Do not use coal oil, as any grease will smother the chick germ—the embryo likes air in common with other animals, and the shell is porous to let it in.

Do not disturb the hen, but some Asiatics require to be lifted daily off the nests for food, exercise and dusting. In lifting, place the hands under the wings and separate the feet, to free her from the eggs. If the weather is hot, do not worry about her staying off two or three hours. It is a good plan to set two hens at the same time and then give all the chickens to one to raise. Fresh eggs hatch in 21 days—stale eggs take a day or two longer.

Leave the hen and chickens alone for a day, unless all the eggs are hatched. The absorbed yelk affords sufficient nourishment to the chicks for 24 hours. Chickens need drink before they need food. Feed them the first day on the chopped yelk of hard-boiled eggs mixed with milk. Then with oat-meal, pounded pop-corn, stale bread-crumbs and sweet milk. Do not wet corn-meal too much; it is better boiled and mixed with boiled potatoes. After a few days, cracked corn is good food. Milk is always good, whether sweet or sour. Give pure water, pure air, feed often, and keep everything clean, dry and comfortable. J. H. CAMPBELL.

Lucas Co., O.

THE BEST BREED OF FOWLS?

A CORRESPONDENT from Batavia, N. Y., referring to an article about the merits of Leghorn Fowls, that appeared in the RURAL of Oct. 26, claims that the Leghorns are the best egg-producers. He has had ample experience in breeding choice poultry and maintains that the Leghorns are prolific layers of good-sized, very rich eggs. Moreover, the birds are very handsome, their bright yellow legs and snowy-white plumage forming a very beautiful contrast. The chicks, too, are very hardy and can be easily reared. He has a hen six years old that lays as well now as she ever did (!) and she has never wanted to sit. The combs of the fowls of this breed, however, are so large that they require a warm place in winter to prevent these appendages from freezing. In his opinion, the Black Spanish rank next to the Leghorns. Of all breeds they lay the largest eggs. They are non-sitters. They have a large red comb, a large white face and glossy black plumage, so that he considers them very showy fowls.

EXCELLENCE OF SOUR MILK.

A CORRESPONDENT writes from Otsego Co., N. Y., that he has found a sure preventive of gapes in chickens in his method of feeding them. He feeds corn and oats, ground and mixed, and wetted with sour milk; with the addition of some curds, when the chicks are quite young, and plenty of sour milk to drink all the season. He thinks the latter a sure preventive of gapes, and if that could not be had, he would fall back upon water as next best.

He has also fattened three pigs on sour milk exclusively. Two were half-bred Berkshires, and the other a cross of white breeds. One of the former was killed when seven months old, and dressed 207 pounds. The white one met its fate when it had enjoyed life and sour milk for seven months and sixteen days.; and it then dressed 214 pounds. The other half-breed when eight months and five days, dressed 235 pounds. They were fed five or six times a day, shut in a small pen, and had no food, except milk. Of course, he does not consider the weight remarkable, but he had met with poorer success when he had fed less frequently.

Field Crops.

MILLET AGAIN.

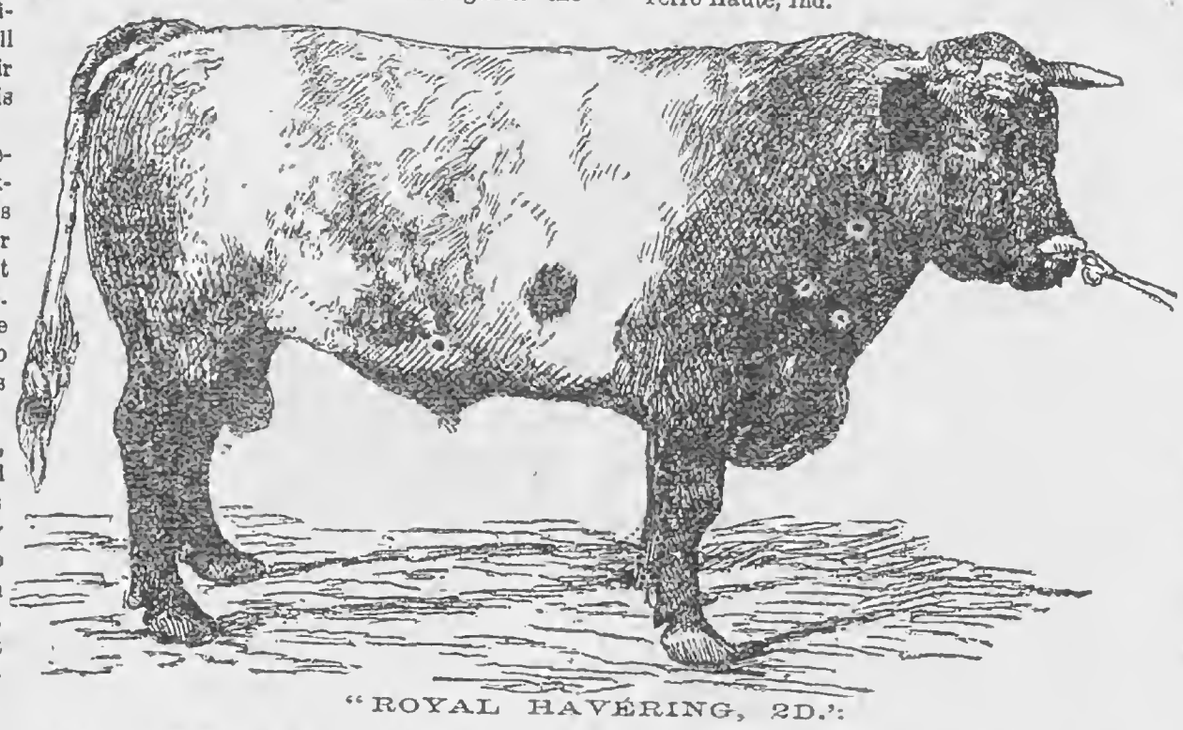
THE new method of treating subjects in the RURAL NEW-YORKER is a great advance on the old way. The articles on Strawberries, Raspberries and Grapes, were especially valuable. The subject of Millets, however, is lacking to some extent, particularly the article of Prof. Beal. Either he is not acquainted with the different species of millet in common use, or else he is not clear in his statements. The following is a sample: "Besides the common name of Hungarian-grass, it is also often called Golden millet, Cat-tail millet, Italian millet, etc."

There are three kinds of millet well known to all dealers in the West, under their proper names, but I have noticed that seedsmen and editors in the East have not yet learnt the distinction between them. A year ago a Western seedsman advertised German millet in an Eastern agricultural paper, putting its price at about half that charged by Eastern dealers. Having had few responses to the advertisement, inquiry was made as to the reason, and he was told that "Golden" millet was the kind wanted—that they did not care for the common variety.

The fact is that the new variety—which was first grown to any extent in Tennessee, and thence has been used much throughout the West—has been called German millet from the beginning. It is for sale by all seed dealers in Nashville, Memphis, Louisville, Cincinnati and St. Louis, under that name and by no other, so far as I am aware. At last it reached the East, and in some way the name Golden was attached to it. These, then, are the three varieties in commerce—Common millet, German or Golden millet and Hungarian-grass. The German produces much larger heads, more seed and more grass to the acre than the common. The seeds of these two varieties are alike in color, but the German is nearly round, while the common is of an oval shape and more glossy. The Hungarian is shaped like the common, but it is of two colors—yellow and dark-brown—and in the Chicago market, that containing the most brown seed, is rated best.

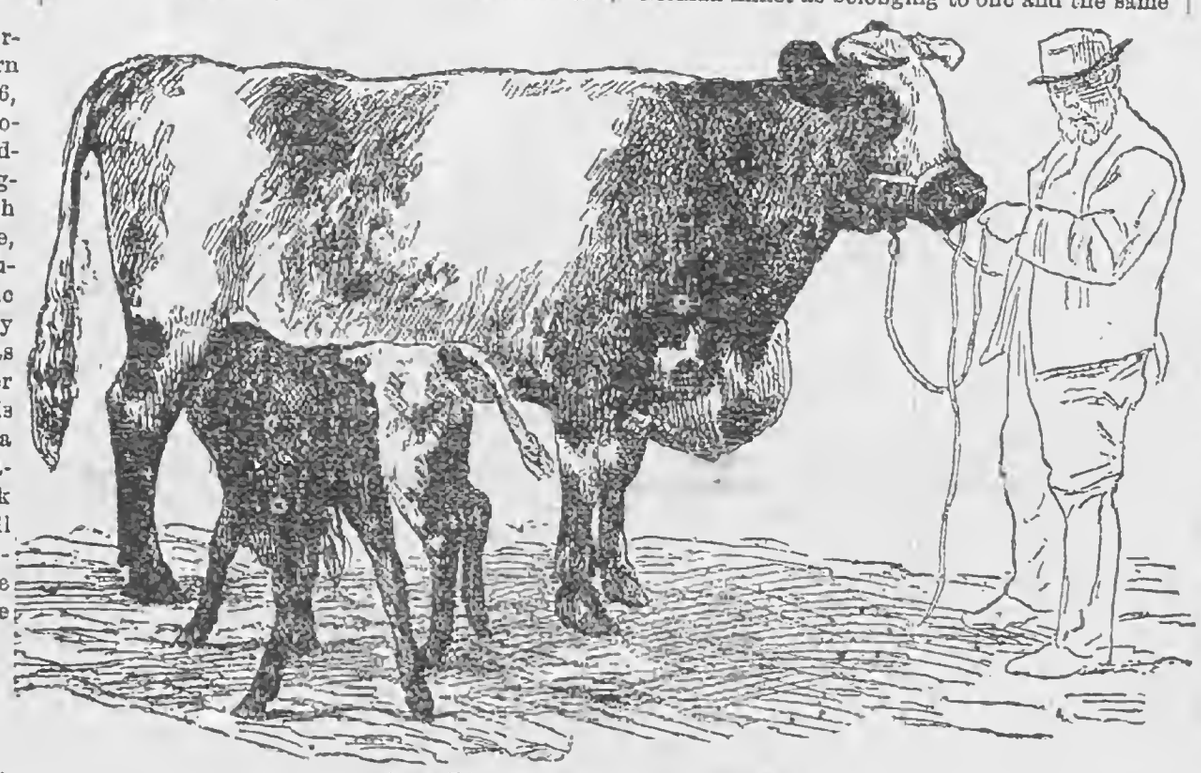
As to effect on stock: it is undoubtedly true that Hungarian has killed many horses. I never heard of its injuring cattle. I believe, however, that Hungarian can be grown and used in such a way as to be a safe food for horses. I have no authenticated case of injury caused to animals by the use either of common or German millet. J. A. F.

Terre Haute, Ind.



"ROYAL HAVERING, 2D.":

In reference to this article and others for which we cannot find space, Professor Beal says: "The seedsmen and editors in the East" and the botanists are all willing and trying to learn. On the authority of Dr. Asa Gray, I gave the scientific name of Hungarian-grass and German millet as belonging to one and the same species viz., Setaria Italica or Germanica. He still questions which one of the two is the correct specific name. After examining specimens which I have raised for some years as Hungarian-grass, I had no hesitation in calling them Setaria Italica, or what most men mean by that name.



"COUNTESS" AND TWINS.

About other specimens which I had before me, I admit that they were unlike those which I called Hungarian-grass. They answered well the description of what many call Setaria Germanica, German or Golden millet. Now comes the question as to the characters of Setaria Germanica: Dr. Gray thinks that Golden millet and Hungarian-grass are, at most, only varieties of one species and not distinct species; that is, that they are as much like each other as are Clawson and Gold Medal wheat, or some large, yellow Dent corn and white Dent corn. The numerous specimens which I have seen show so many intermediate forms, that I confess my inability to define them all, and therefore made no attempt. The specimen from which my drawing was made in a late number of the RURAL, was what I supposed to be a good form of German millet.

"DUKE OF WETHERBY, 5TH, (31,033)—Holker.

Farm Topics.

SALTING WHEAT-LAND.

AGRICULTURAL progress is made mainly through discoveries by experimenting and by scientific researches, and whatever tends to advance the farmers' interests and help them to overcome the obstacles against which they have to contend, should be made public. The sage remark that "he who makes two blades of grass to grow where but one grew before, is a public benefactor," is applicable to the progressive farmer wherever he may be found.

Experiments in farming are not always successful, and many of them are attended with loss and vexation to the experimenters; but occasionally something useful is found out that amply repays all past expenditures and trouble. Such has been the case with some people of late in the experiment of salting wheat-land.

Last spring Mr. Joshua Knight, of Ogle Co., Ills., sowed 13 barrels of salt on 20 acres seeded to wheat, and left a strip in the middle of the piece without salt. The ground on which he sowed the salt produced over eighteen bushels of good spring wheat per acre, while that on which there was no salt was hardly worth cutting—the wheat being badly shrunken, injured by rust, chinch bugs, etc.

I consider this a fair test, and it has never before been published, though I deemed it of sufficient importance to report it to the Department of Agriculture. A similar experiment was tried in Iowa last spring, and the result was published in the Iowa City Republican, as follows:

"H. G. Coe, of Cedar County, tried the experiment of spreading three bushels of salt broadcast over two acres of his wheat-field. The yield was forty bushels per acre, while the rest of the field gave only nine and a half bushels per acre. The straw was bright, not being injured by rust, as the wheat alongside of it was, and it stood six inches higher."

The following, from the Montreal Gazette, is *apropos*, as it gives the results of valuable scientific experiments on the effect of salt on wheat:

"In an interesting series of experiments recently made on the farm of the Royal Agricultural Society of England, the manurial value of salt was unmistakably indicated. An acre of wheat dressed with 300 pounds of common salt yielded thirty-nine bushels of grain, with a proportionate amount of straw; while an adjoining acre, left unmanured, produced only twenty-nine bushels per acre, with the straw imperfectly developed. The entire cost of the crop is not stated, but this experiment shows that the additional ten bushels resulting from the salt were produced at a cost of 30 cents each. In another case a piece of ground intended for wheat was plowed the preceding fall, and again in May, when it was sowed with salt, and afterward plowed before seeding. On the 1st and 2d of September wheat was sown at the rate of two bushels to the acre. The crop, when harvested, yielded, according to the estimate of the owner, Mr. John Park, not less than forty bushels of grain to the acre, with a luxuriant growth of straw. From these and many similar cases, the inference seems to be that salt is a specific for the wheat crop, imparting solidity to the grain and firmness to the straw. But it must not be concluded that equally good results will always follow the application of salt."

From the foregoing, it seems evident that salt has a beneficial effect upon wheat-land, and I hope the farmers will give this matter a further trial and report the success of their experiments *pro bono publico*. W. B. DERRICK.

Ogle Co., Ills.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

WE must make more meat. Every farmer should inscribe this sentiment over his barn-door, and when he goes in and when he comes out, he should study upon it until every mouthful of food produced upon the farm is utilized to the best possible advantage. Even a turnip leaf has its value, and can be transformed into milk or meat. If into milk, it is in the best form to make pork. An ear of corn may be made to count two; first, in the form of muscle and fat; and then as food for another ear, and by borrowing a little from the soil and air, it will count for a hill and be multiplied four-fold. If the turnip leaf is allowed to dry up or to go to

waste, it represents nothing, and if the ear of corn is sold, it returns only the price of itself, whereas if fed out judiciously, it has a double or quadruple value. It is a reflex axiom, "More meat, more feed; more feed, more meat." It requires judgment and experience to work out this idea to perfect success. The sooner we begin, the better. A small start is better than no start at all. When we learn to feed one animal successfully, we may venture with more.

A successful farmer in this vicinity has been looking for a flock of sheep to eat out his barns. He wants sheep because they are but little care and are sure to sell for all he may have to pay for them. He will be satisfied if the sheep bring in the spring the price he pays now. It may be asked, "Where is the profit in this sort of an investment?" He may pay $4 for the sheep and feed all winter and sell them for $4. The kind of fodder he intends to give them is not marketable, or if it is, the price is too low to pay for hauling. The sheep will consume this and convert it into manure. It will be kept on the farm, and next year this savings bank investment will pay a profitable dividend. We know a man who sold out straw for two dollars a ton and drew it several miles. For every load sold, this man made himself poorer by a good load of manure.

The black-walnuts which were partly dried last winter in the wagon-house chamber, would not grow when planted. All nuts, to grow well, must be kept moist. Now, boys, is the time to gather them and start a little grove. Put the nuts in the ground just where you want them to grow and cover them about an inch deep. Be sure to plant a variety. Choose out the best shaped walnuts, and the largest chestnuts. Do not forget some butter-nuts. The butter-nuts and walnuts will do well on moist land, but the chestnuts like a dry soil the best. We have got our chestnuts all planted, and have put some of them in a bed to transplant when they are two or three years old. Last fall we planted a row of hickory nuts, and now we have a lot of little hickory trees about six inches high. It will be some time before they bear, but our little boy will grow up with them and by the time they bear nuts, he will be old enough to gather them. He will not have to wait so long for the chestnuts, as they will bear in eight or nine years. Won't there be fun then, and these will be his trees, and you can all have a lot of them too. Put them in some corner and get father to make a fence around them. If you will plant the nuts, we will promise that the fence will be built.

The soft and small nubbins on the corn stalks may be stripped off and fed to the beef cow, and so save the bother of husking them. By leaving the husks on, the animal will masticate the kernels, and there will be no waste.

Pomological.

NOTES ON APPLES FROM ONEIDA CO., N. Y.

JONATHAN TALCOT.

THE season of 1878 is near its close and the crops in this latitude are nearly all secured and the farmer has reason to rejoice in his bounteous harvests and give unfeigned thanks to the Giver of all his blessings. Our crops have been above the average the past year. The apple crop especially has been very abundant, but the fruit is so cheap that many will be left to rot under the trees where grown. Such a course is not wise, for as feed for farm stock they are fully equal to the various roots grown on many farms for cattle-feeding purposes. They are especially good for milch cows. If fed to them in small quantities at first, and increased to a peck or half a bushel for each cow per day, the results will be very favorable, and if a little meal is given with the apples, all the better for the cows, and the milk they will then give will be richer and better for making both butter and cheese.

Perhaps some farmers may desire a better quality of apples and will be looking about them the coming winter for a selection for a young orchard of a few trees to replenish the old one. To all such I would say: "Select such varieties as are known to do well in your own vicinity, and then if you wish to try some new sort, do so; but don't make up your list from the new sorts so often offered by tree peddlars, or pretended nursery agents, unless you can afford to be disappointed in your expectations in regard to them, when they come into bearing. Send your order to some reliable nurseryman to be filled and have him add a few trees of the newest varieties, such as he thinks most desirable, or select a few yourself. Then test them on your own soil with your method of treatment, which should be a liberal one, if you would be successful in the cultivation of good fruit."

There is a great pleasure in testing and fruiting some new variety of fruit on one's own grounds, and if the variety proves itself hardy and of good quality, a great acquisition is gained, and another source of pleasure and profit is added to the homestead of the fruit grower. In Oneida County the apple is the fruit *par excellence* for both rich and poor, and in seasons like the present, none is so poor that he cannot have plenty of them, especially in the fall and early winter, as they cost but a trifle except the picking up. In some cases indeed, they are given to the poor for the picking alone.

In setting out my orchard, I made the too common mistake of selecting too many varieties, not knowing which would do the best, but on trial, I have found which has proved most hardy and which has borne the most fruit. In other sections, other varieties would doubtless do better than here, and hence the need of making such selections as will do well where the trees are to be located. In my orchard no sort has borne either so many or such handsome apples as the Hubbardston Nonsuch, while the Baldwin has been a failure, and so has the Esopus Spitzenborg. The Swaar, too, has been nearly worthless from some cause. The Yellow Bellflower has been hardy and a good bearer in alternate years, but I do not consider it a profitable Apple, although a few may be kept for variety and early winter use. The Rhode Island Greening is a standard Apple, moderately hardy and productive. Seek-no-further and Peck's Pleasant are good for sweet apples. Talman Sweet, and Lady's Sweeting are hardy and good bearers, especially the Talman's Sweet, and for sauce or baking, the Talman Sweet is not excelled by any variety known to me. Both are long keepers, the Lady's Sweeting excelling in this respect, keeping nearly, or quite, as well as any of the Russet family and retaining its freshness and juiciness till late in the season. The Black Gilliflower is a hardy tree and a good bearer, but many don't like them, and a tree or two for one's own use, is all that is desirable of this sort.

For early varieties, the Early Harvest, Red Astrachan, Bough and Primate, are all good sorts, and where they flourish, will give satisfaction. For fall, the Autumn Strawberry, Gravenstein, Fall Pippin, Porter, Norton's Melon, and Fameuse, are all good sorts that are very desirable for the farmer to have in his collection, if his soil is suitable for their growth. Other sorts are valuable and, as said before, each person should make his selection from such as will best suit the location in which they are to be grown, or the fancy of the grower.

Rome, N. Y., Nov. 8, 1878.

Horticultural.

SOME OF THE RASPBERRIES.

H. HENDRICKS.

THE HUDSON RIVER ANTWERP has been for many years past the principal variety of Raspberry cultivated here along the river from which it takes its name, and when nicely grown, it is still perhaps the best red Raspberry we have, all things considered. The great objection to it lies, however, in its tenderness, the canes being large and succulent, and requiring protection in winter in all this latitude. And this I certainly consider a very grave objection attended with much labor and some loss, despite the opinion of an enthusiastic neighboring writer and grower for the trade, who says the children can protect the vines in a few minutes after school hours. A Raspberry or a Grape that will not endure our winters without laborious protection, had better give place to another variety that will. I may say, however, that I have never given the Antwerp any winter protection in my garden, and yet it has usually fruited well and, at times, abundantly. But the vines were planted on the south side of a building, which doubtless gave some slight protection. Most growers in this vicinity, however, bury them in winter. The Antwerp ripens early here, produces well, is quite firm and fine-flavored. With a full knowledge of the enormous operations in this fruit on the river at Milton and Marlborough, in the lower part of this county, you will not lack for magnitude.

THE PHILADELPHIA more recently introduced, has the advantage of being more hardy, but in all other respects it certainly is inferior to the Antwerp; especially in size and flavor of fruit, if not in vigor of plant as well.

THE CLARKE is quite similar to the Philadelphia and scarcely more desirable although it is also quite hardy. I have grown both these for some years past, but will now replace them with others of more value.

THE FRANCONIA, though of foreign origin, is in every respect a very desirable sort. It is as large as, and more hardy than the Antwerp, more acid, darker in color, and a week or ten days later at this point, a feature which, in itself, is an important one. Indeed, I am surprised that the Franconia is not more largely cultivated throughout the country, and can only account for it from the fact of its being so little known. Why, only yesterday an experienced and careful cultivator, a lady friend, said to me: "Why, you don't mean to say the Franconia Raspberry will stand our winter unprotected? I have always covered mine the same as the Antwerp; but now I do remember one or two plants were neglected last winter, and really they came out and bore just as well as the others." Hence it is obvious that the good qualities of this variety are not generally known or understood.

"DUKE OF OXFORD," 44th.—Holker.

"DUCHESS OF OXFORD" 21st.—Holker.

THE HIGHLAND HARDY originating in this valley a few years since, is now quite largely grown here and seems, thus far, to bear out much that was claimed for it on the start. The vine is vigorous, perfectly hardy and bears most abundantly. I think I never saw a finer display of raspberries than I witnessed on the grounds of a neighbor here this season. He had a large plot of ground devoted to this sort and the vines were uniformly loaded with a marvelous amount of ripening fruit. True, they are not large, but the flavor is good, flesh firm, light red in color; and, at least in this soil and locality, we regard it as a valuable sort. It is also very early, coming in just after the rush of strawberries is over. It has withstood a temperature of 30° here without injury; and its extreme hardiness admits of copious manuring, which increases the size of the berries.

HERSTINE is perhaps one of the best new red varieties for home use, though too soft for a distant market. It is large and productive, hardy and fine-flavored, and in every way promising.

THE GANAROUA is a hybrid between the red and black, being of a brownish color. It is quite popular in some localities, though but little grown here and lacking in flavor.

BRINCKLE'S ORANGE is the finest Raspberry for amateurs and family use on the whole list, in my opinion. The fruit is large and showy and most delicious in flavor. Indeed it is difficult to conceive of a finer dish of berries than one composed of these transparent orange-colored beauties; they are very attractive and inviting. There is, however, much diversity of opinion in regard to its general constitutional vigor. Ellwanger & Barry find it quite hardy at Rochester; Mr. Roe finds it somewhat tender down here on the Hudson; Mr. Poety, on the east bank of the river, at "Ellerslie," finds it quite hardy, and thus growers differ on this point. With me it is hardy, vigorous and productive; and I shall continue to regard it with much favor, advising a place for it in every private garden where fine fruit is appreciated. It has the peculiarity of adhering firmly to the stem after being fully ripe, and never drops.

THE HENRIETTA is a new Eastern seedling for which great size of fruit and extra flavor are claimed. The berry is said to be 4½ inches round!

THE PRIDE OF THE HUDSON, raised on Mr. Roe's ground, if not too tender, may prove a valuable sort. Of the

BLACK-CAPS

I have fruited Davidson's Thornless, Doolittle and Mammoth Cluster.

DAVIDSON'S THORNLESS, on account of its smooth, purple canes, is surely an acquisition, but aside from that, it has not proved of much value here, being an indifferent grower and bearer, and not large.

THE DOOLITTLE is an old sort, succeeding fairly in some sections, but I think far surpassed in every respect by the Mammoth Cluster, except that it is earlier.

THE MAMMOTH CLUSTER I have had excellent success with; its fruit is large, handsome and abundant, and, so far as I know now, it is the best Black Cap we have.

THE GREGG, of which dealers give us such glowing accounts of late, I cannot yet speak about with certainty. It is, however, really large and fine, and quite promising. Another season will tell the story.

All these, and other still newer sorts, need further trial to establish their several claims to public favor. There are many other varieties, both new and old, which might be named, such as Brandywine, Caroline, New Rochelle, Turner, etc., each having some points of value in certain localities; but those I have named above embrace about all, I think, now considered of special value to the general grower. We can scarcely hope to thoroughly combine in any one variety all the most desirable requisites of hardiness, vigor, size, flavor and firmness. For instance, high flavor and great firmness of flesh are incompatible, and will not be found to exist in the same berry. We must therefore be content with those sorts combining the largest measure of good qualities, each for himself seeking those best adapted to his soil and locality. And yet we must not fail to aid and encourage the pains-taking hybridizer and originator of new kinds, for to him great credit is due.

It has often occurred to me that the Raspberry has not received the amount of attention its merits deserve. Its cultivation is comparatively easy, and success with it quite certain. The fruit is most wholesome, delicious and refreshing, supplying on our summer table successfully a gap that nothing can fill. Medical men advise us of its eminently healthful proper-

ties, and some even regard it as a specific in certain maladies. Surely it deserves a place in every garden.

On the Hudson.

THE HENRIETTA RASPBERRY AGAIN.

In The Rural of the 9th inst., I observe a note by Mrs. E. Morely, in regard to the origin (?) of the Henrietta Raspberry. I would state that the note referred to only goes to prove more conclusively, if further evidence were necessary, that the Henrietta and Belle de Fontenay are one and the same. The note reads, "It was first found among the roots of a currant bush. There were no other Raspberries on the premises. The garden was contiguous to a gentleman's grounds, where there was a variety of fruits, among them *several kinds of Raspberries.*" The root of the Belle de Fontenay possesses such a decided disposition to *travel*, and is so well furnished with adventitious buds that it assumes the character of a rhizoma or root-stock, and will spread and multiply nearly or quite as rapidly as couch-grass or quick-grass (Triticum repens), so much dreaded by farmers and gardeners. It is not at all unusual for this Raspberry to thus travel or creep, under ground, twenty-five or even fifty feet. Not long since I heard a learned and most reliable nurseryman say he believed that if a single plant of it were planted in the center of an acre lot, and left to run, it would, at the end of five years, cover the entire lot. A *fence* would be no barrier whatever to it, and I doubt if a *stone wall* would, unless sunk deeply in the ground. Therefore to prove at all that Henrietta and Belle de Fontenay are *not* identical, it will be necessary for your correspondent to *first* prove that there was no Bello de Fontenay in the "gentleman's grounds," "contiguous to" "the garden."

In speaking of the Belle de Fontenay, in Rural of Oct. 12th, the type made me say, "*over* producing suckers in infinite numbers," which should have read, "*ever* producing suckers," etc., of which I meant to inform you before.

J. T. Lovett.

Red Bank, N. J., Nov. 7th, 1878.

Miscellaneous.

SANITARY ARRANGEMENTS OF THE HOMESTEAD.

BY A JERSEY FARMER.

THE BACK YARD

is the great trouble of the housewife. Here everything "common and unclean" gathers and molds and rots, causing nuisance, discontent and mischief. The difficulty lies all in want of arrangement and the proper disposal of the wastes of the house. A great amount of extra labor is thus caused at the most inconvenient times, and if the matter is not attended to, much trouble ensues. Vermin is also encouraged by the presence of the accumulated waste matters, and this is not one of the least of the troubles; for, when vermin once find a hiding place, they spread everywhere and cause great loss by their depredations. The first and most important thing to consider in the arrangement of the back yard, is the well. Many people think that unless the well is open, the water cannot be kept pure. This is all wrong. Spring water, which is considered the best of all, is not exposed to the air. It is confined in subterranean channels and escapes pure, sparkling and *full of air bubbles* from its dark, underground source. One of the best of all wells is

THE DRIVEN WELL,

and this is simply a pointed pipe forced down through the earth into the stream of water flowing below. By the working of the pump attached to the top of the pipe, a quantity of sand or gravel is removed from about the lower end of the pipe, and an underground cistern is formed in which the reservoir of water exists. This is shown at Fig. 1. Unfortunately this useful well, although no new thing, has been patented, and every person using one of them is in danger of being threatened with prosecution for damages. But it is here referred to only as an illustration of the mistaken idea, that

A CLOSED WELL

is not a healthful or a safe one. On the contrary, it is the only safe and healthful one, and the water supply of any well should be kept perfectly free from any outside contamination,

"DUKE OF OXFORD" 45th.—Holker.

even through the presence of air, which always carries injurious germs with it. The only safe well is one that is closed in perfectly, so that earth-worms even cannot g ain access to it, that surface water cannot find its way into it, or in-

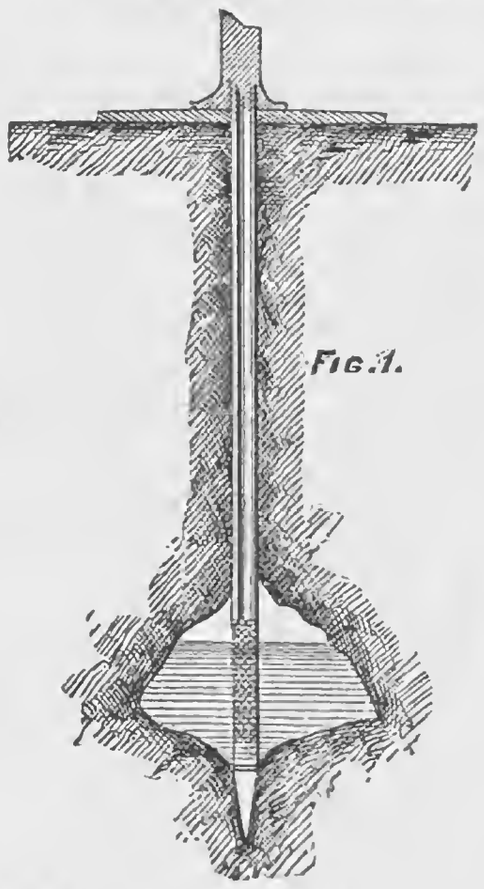


Fig. 1.

fusorial or confervoid growths cannot occur in it. The water will then be pure. Such a well may be made by lining it with cement pipes, that are manufactured for this purpose, or with brick laid in water-lime mortar. Or such a well may be made by building up the sides with stone or brick to the level of the water and then covering it with flag-stones or an arch, and filling the rest of it with earth again. The surface about the top of the well should be graded, so as to have a slope in every direction away from it, that surface water may be carried off and not soak down into it. This should be done the more carefully in wells that are not filled in above, because then there is the greatest danger that surface water and many impurities would gain admission. The best way to finish off around the top of a well, is to cover with a large flag-stone or with chestnut plank and then cover this with six inches of water-lime cement, spreading it several inches beyond the sides of the well. If a good pump is put in the well, no repairs need be made for years and the cost of all these items of safety will be less than that of one doctor's bill, not to speak of the cost or misery of a funeral of some loved one of the family. To prevent this, cost is of no account, as against safety.

The next weak point of the back yard is

THE CESS-POOL.

This should be the most carefully arranged, and it may be so that it shall be perfectly inoffensive and actually a source of profit instead of loss and disease. Then this necessary provision for comfort may be placed in a woodshed close to the house or in some sheltered spot, and may be made ornamental and comely, as it well deserves to be, instead of being a loathsome thing, to be hidden away out of sight in an inaccessible locality, just as the water-closet and bath-room of a well-furnished house are made as handsome and luxurious as possible. With a cess-pool, such as is shown at Fig. 3, all this may be done and an inoffensive provision for the comfort of the most delicate members of the household procured in the most accessible part of the premises. The cess-pool, both walls and bottom, should be wholly made of brick laid in water-lime, or with common lime mortar. In the latter case, the wall and floor should be well soaked with pitch to be made water-proof. A convenient shape for this will be as shown—a floor with sloping sides in front and rear, and with the rear sill of the house over it raised nearly to the level of the seat, so that nothing can fall on to it. The house stands only partly over the reservoir. The portion uncovered by the house is closed by a platform and trap-door of plank, through which dry earth, or common loam from the fields or coal ashes, are thrown in daily in sufficient quantities to absorb all offensive matter. When half full, or at more frequent stated times, the cess-pool is emptied (with a large hoe, such as is used for scraping streets,) by drawing out the contents, which will be perfectly inodorous and inoffensive, on to a temporary platform of boards. This should then be carted away to the manure heap, or to a field and spread directly upon the soil or the grass. This is very little trouble; but if it were greater it ought to be done.

It is some trouble to be clean; indeed it is more labor than to be godly; and yet cleanliness is considered next in importance to the highest virtue, so far as our welfare is concerned. And this business begets cleanliness in every sense of the word; for a man who permits foulness to be apparent about his house, is not a clean person, so that, in spite of the trouble, it should be done; better let the pig-pen go uncleaned, for a time, than neglect the cess-pool. To procure all the ventilation that may be needed, a wooden pipe (*a*), shown by the dotted lines, is carried

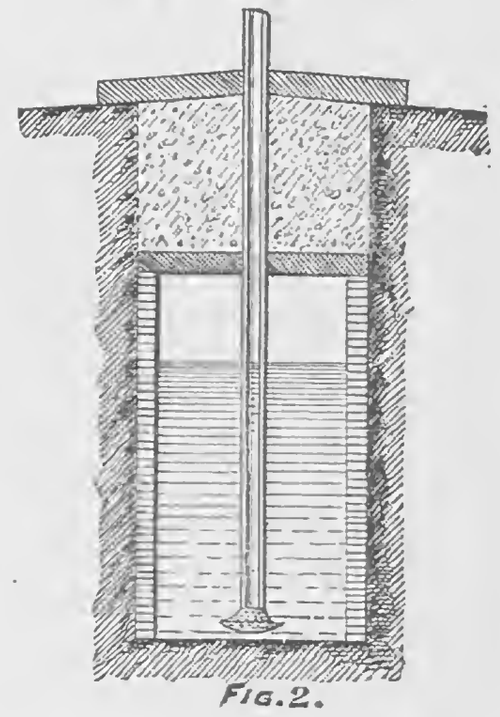

Fig. 2.

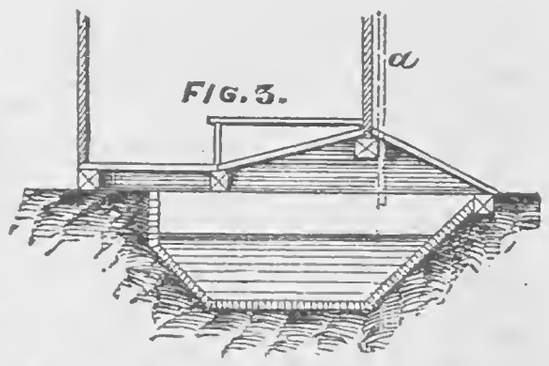

Fig. 3.

from the cess-pool up the rear wall of the building to a hight of three or four feet above the eaves of the roof. Whatever garbage is produced about the house, that does not pass away by the drains—if these are provided—should be gathered into a tub and removed daily to the pig-pen; otherwise this waste may be deposited in the cess-pool and should be covered at once with a shovelful or a scoopful of the earth which should be kept on hand in a pile at all times, with a shovel ready for use.

Entomological.

THE COTTON BOLL MOTH.

W. B. Pratt, Marion Co., Ind., lately sent us a half a dozen specimens of an insect intruder on his green corn. Last year the pest attacked his early corn, but did not appear on the late sorts. This year, however, it has made its appearance in almost every ear of his latest variety; and he wishes to learn what the "critter" is; its origin, metamorphoses, end, and any possible remedy or preventive that may have been devised for it.

ANSWER BY B. PICKMAN MANN.

The specimens sent have not preserved their original appearance well, but from what can be concluded by the examination of them and by the account of their habits, it seems likely that they are caterpillars of the cotton-boll moth (Heliothis armigera). My attention was first called to the ravages of this kind of caterpillar by seeing an ear of corn filled with a repulsive-looking and fetid-smelling black fungus. I took this home with me to examine it more closely, and found upon this one ear seven distinct species of larvæ, some of them, at least, of the most destructive character. The most prominent of these larvæ was of this species.

THE PERFECT INSECT, OR MOTH,

measures about 40 mm. across the extended wings, which are generally of a tawny or pale clay-yellow color, with a faint greenish tinge. The front pair are branded with two or more bars or rows of pale olive and rufous, and have a crescent-shaped, dark mark near the center. The hind wings are paler than the front wings, and invariably have, along the outer margin, a dark-brown or black band, in the middle of which is an irregularly shaped spot of the same color as the wing. There is likewise a dark spot in the center of the wing, and the nerves are black or dark-colored.

THE EGGS

are laid during warm evenings in summer and fall, when the moth may be seen hovering over the tops of the plants about sunset. This happens as early as June and continues until August. One egg is deposited upon the silk or point of each ear of corn. Each female moth is capable of consigning to their proper places more than five hundred eggs. The egg is of a pale straw color, tapering, cylindrical in shape, and regularly ribbed longitudinally.

THE CATERPILLARS

hatch out in three or four days. When full-grown they are from 35 to 40 mm. in length, varying in color from pale green to dark brown; the head is reddish, and the under side is yellowish-white. There is a double line of darker color down the middle of the back, or the whole back is covered with fine longitudinal light and dark lines, and on each side of the body is a clear brown stripe with a yellowish stripe below it. Each ring, or segment of the body, has about five black dots, or spots, on each side, from which arise soft hairs. There are two or three broods in a year, according to the length of the season. The first brood feeds upon the undeveloped tassel of the corn-plant, which is the staminate or male flower, boring into the stalk for the purpose, and is developed in time to attack the ear and the female flower or silk, during its second brood. This it does by penetrating into the point of the husk and cutting off the silk, so that the pollen is unable to reach the unimpregnated germ, which therefore fails of its development. It also feeds upon the kernels of corn while they are still soft and milky.

But the damage done is not confined to the actual consumption of grain, for the ends of the ears, when partially devoured and left by this insect, afford a secure retreat for hundreds of other smaller insects, which, under cover of the husks, finish the work of destruction begun by the caterpillar, eating holes in the grains or loosening them from the cob. A species of greenish brown mold or fungus is very apt to attack such ears, the dampness from the exuded sap appearing to favor such growth. The kernels or grains then swell up to a great size, and become filled with the filthy spores of the fungus, which burst out and sow themselves in every direction. Animals fed with the corn which has been attacked by this disease, frequently die from its poisonous qualities.

When the caterpillar is full-grown it descends into the ground, where it forms a rough, oval cocoon by gluing together the particles of earth with the silk which issues from near its mouth. In this cocoon it sheds its last skin, and becomes a green chrysalis, but soon turns to a bright chestnut-brown color, with four thorns at the extremity of the body, the two middle ones being stouter than the others. At the end of three or four weeks, in summer, the moth is developed, the moths from the last brood appearing in November.

THE HABITAT OF THIS INSECT

covers a vast extent of territory, for it has been found in North and South America (I found it in Brazil), the United States, England, Japan and Australia. It is very destructive, especially in dry seasons, when the growth of the plant is retarded by the drought; for it not only feeds upon the silk and the soft kernels of roasting-ears of corn, and upon the flowers and balls of the cotton-plant, but also upon pumpkins, tomatoes and other vegetables. For instance, during a year of drought (1860), the corn crop in the State of Kansas was so much injured by this caterpillar and the diseases it introduced, that one county which had raised over 150,000 hectolitres of corn in 1859, produced less than 20,000 in 1860, and most of the other counties suffered as badly. There can be no doubt as to

THE BEST TIME TO ATTACK THESE PESTS,

for all who have studied the matter, agree on the necessity of adopting some practicable method of destroying the early and less numerous broods in the caterpillar state, or in the perfect moth state, as it is entirely from these early moths (which do little damage) that the immense multitudes are generated, which commit such ravages on the crops. This is evident; for if we consider that should only two female moths be allowed to deposit each two hundred eggs in safety, the third generation, if undisturbed, would amount to the considerable number of forty thousand caterpillars. The devastation these insects would cause can be better imagined than described, especially if the moths developed from them were also allowed to deposit their eggs in safety. Happily, however, nature has provided them with many enemies, such as birds and the ichneumon flies, which destroy immense numbers of them. Several

REMEDIES

have been proposed, and some have been tried. The surest method is to go through the cornfield and remove the caterpillar wherever it is found at work, but this is slow and almost impracticable, unless done to the first brood. But a method which would avail completely if adopted at the exact time that the first moths appear, is to light fires in various parts of the plantation in the early evening, as the moths are attracted by light, and perish in great numbers in the flames. Some successful experiments in killing these moths with molasses and vinegar were made by Col. Sorby of Georgia, and are described in one of the U. S. Patent Office Reports, from which I take the following account:

"We procured eighteen common-sized dinner plates, into each of which we put about five centilitres of vinegar and molasses, previously prepared in the proportion of four parts of the former to one of the latter. These plates were set on small stakes or poles driven into the ground in the field, one to about each hectar, and reaching a little above the plants, with a board about fifteen centimetres square, tacked on the top to receive the plate. These arrangements were made in the evening, soon after the moths made their appearance; the next morning we found from 18 to 35 moths to each plate. The experiment was continued for five or six days, the plates being distributed over the entire field; each day's success increasing, until the numbers were reduced to two or three moths to each plate, when it was abandoned as being no longer worth the trouble. The crop that year was but very little injured by the caterpillars. The moths were caught in their eagerness to feed upon the mixture by alighting into it and being unable to escape. They were probably attracted by the odor of the preparation, the vinegar probably being an important agent in the matter. As the moths feed only at night, the plates should be visited late every evening, the insects taken out, and the vessel replenished as circumstances may require."

It is also said that the odor of certain chemical substances, such as cresylic soap, or carbolic acid, sprinkled on the plants, will prevent the moth from laying her eggs upon them, but experiments of this kind have not always proved successful.

I must acknowledge my indebtedness for much of the above account, to the writings of Messrs. Glover and Walsh.

The Querist.

ANSWERS TO CORRESPONDENTS.

MALADIES OF STOCK.

What Ails the Hogs?

J. J. Davis, Woodson Co., Kansas, says that he has some Berkshire pigs one year old that won't weigh nearly as much as they should do, while some that were farrowed last March are not bigger than those a month old ought to be. Yet they have had the run of 20 acres of timber with running water and all the corn and slop necessary to keep them in good condition. The slop and meal were cooked, too, during the cold weather. Some of them droop around and have thick white matter running from the corners of their eyes, while on some of the others the skin appears dry and harsh. He has given them salt, ashes, copperas, salts and turpentine, but with very little success. He thinks it is the liver that is affected, and asks the real nature, cause and cure of the ailment, whether it is contagious, and if it would be likely to affect hogs brought from other places for breeding purposes.

ANS.—This description is not sufficiently detailed to allow us to speak with confidence in regard to the nature of the trouble. It may be some form of parasitic disease, or it might possibly be the results of a mild form of the hog fever, generally called cholera. The digestive process is evidently impaired, and we are inclined to believe this due to intestinal or hepatic parasites. In this case, the treatment followed should have produced good results, especially the turpentine, if given in sufficient quantity. It is advisable to give a dose of jalap, one drachm each for pigs, and after this has cleared out the bowels, give a teaspoonful of oil of turpentine to be followed by another dose of jalap in three or four hours. As a preventive, pigs should never be allowed to run on the same pasture as the old hogs and all such pastures should be changed yearly.

Spaying Cows.

M. H. M., Lexington, Mass., asks for recent and reliable information with regard to the practice of spaying cows. "I am aware," he says, "that the books for fifty years, and perhaps longer, agree in stating, in terms suspiciously similar, the manifold advantages secured by this operation. If all they say is true, and there are no drawbacks which they fail to mention, it seems strange that the operation is not more generally practiced on dairy and family cows, where stock-breeding is not only of no consequence but altogether unprofitable. I have never heard of an instance of the practice being followed in this section, although it is a milk-farming region, despite the trouble and expense of the method in vogue, and although not one calf in five is raised here. A more extensive practice of spaying cows of a certain character and for certain purposes, would undoubtedly result in the elevation of the character of dairy stock, as only the best animals would be retained entire for breeding purposes."

ANS.—Spaying cows is not practiced for the reason that the benefits derived from it are not in general sufficient to counterbalance the expense and danger of the operation and leave a profit besides. If a dairyman has good cows it is not to his interest to dispose of them in twelve, fifteen or eighteen months after calving, even if he can secure a good yield of milk for that time. Nor is it to his interest to incur the expense of spaying in order to fatten his cows that are poor milkers, when he can accomplish this result as well in the first months of gestation. In some circumstances, near large cities where animal food is very high and cows are kept but a few years at best, and sometimes but a single season, it would be well for dairymen to consider this operation.

Black-Leg in Cattle.

R. M. Crane, Orleans, Neb., asks: Is there any known cause or cure for black-leg in cattle? Is it more liable to attack one condition of cattle than another?

ANS.—Anthrax always develops on lands with rich soils, underlaid by impervious subsoils. The drainage of such soils is sufficient to prevent the disease; where this cannot be done, cattle should be pastured on high, naturally drained land during the months in which this disease is likely to appear. The disease is probably not contagious through the atmosphere, but contact of the blood or other liquids of the affected animal with the skin, or eating the flesh may produce the disease in other animals or in man. It is more liable to attack fat, high-conditioned animals than others. An exhaustive article on this disease, from the pen of Dr. SALMON, D. V. M., appeared in RURAL for May 11.

Corns on Horses.

Mathew Odell, Flint Co., Mich., asks for a sure remedy for shoe boils on a valuable horse of his.

ANS.—If the corn has suppurated, make an opening for the escape of the pus; poultice for two or three days with bran mixed with hot water, then dress with tar and apply the shoe so that it will not bear on the part. If it has not suppurated, proper shoeing will be sufficient.

Coryza, or Nasal Catarrh in Swine.

J. D., King's Creek, Ohio, asks for the name of a disease which afflicts his hogs and a remedy therefor. It commences with sneezing which can only be relieved by bleeding at the nose. The infected hogs thrive very slowly on their feed, but do not die of the ailment.

ANS.—This disease of swine is called coryza, or nasal catarrh, and is as old as history, and was mentioned by Aristotle, in his History of Animals. As treatment, give castor oil till a laxative effect is produced, and follow with nitrate of potassa in ½ to 1 ounce doses, according to size of animal. Fumigations with sulphur or tar, by burning in a moderately tight building where the animals will be compelled to breath the air charged with the fumes, is also advantageous. In some cases the disease is very obstinate and cannot be profitably treated.

Caponizing Cockerels.

S. H. F., Selby, Ohio, asks how to caponize cockerels.

The following is a description of a simple way of performing this operation, practiced very successfully by a neighbor of ours. There are several bulky books which give a full account of the process, but in all of them an expensive outlay for instruments is recommended, but with the process we now describe very little outlay for tools is required as most of the necessary instruments are in many homes.

In the first place, secure the bird to be operated on to a bench or table. This is easily done by arranging three holes through the bench about an inch apart. Pass a cord through these, forming two loops on the bench between the holes; pass the bird's left foot through one loop, tie the lower leg, then draw the right or upper leg forward, and secure that to the bench, through the other loop, the bird lying on his left side. His wings can now be laid back so as to expose his side, and a weight laid on them to keep them in that position. The feet cannot be held still without tying them. With a penknife, or, what is better, an ink-eraser, cut with one clean cut a gash between the last two ribs, an inch or more from the back-bone, an inch and a half to two inches long—obliquely downwards—according to the size of the bird; cut through both skin and flesh with the same stroke, but not more than a quarter of an inch deep, so as not to cut through the intestines. Do not cut any lower down than the cartilage that connects the ends of the ribs. To keep open the incision while continuing the operation, a piece of old clock spring about six inches long, is used, and a quarter of an inch broad—but the width is not material. This piece of spring when extended—not in use—forms a semicircle. The two ends are tempered soft, and bent up at right angles to the spring at a distance of a quarter of an inch from each extremity. Press the two ends of the spring together and insert in the wound, so as to keep it extended, while the two turned-up ends keep it from springing out.

The intestines are now in view covered with a membranous skin. This must be cut with great caution so as not to cut the intestines. The instrument for doing this is made out of a crochet hook made sharp, and cutting on one side, the point, and on the inside the barb, so as to cut when pushed forward or drawn back, at will. If the bird has been kept from food—as it should be—two nights and one day before, the intestines will be small and allow room for further work. The testicles are now seen enveloped in the same kind of membrane as were the intestines. If the bird has been kept fasting, they will be all the more readily seen. If they are not easily detected, the intestines may be gently pushed forward toward the breast. The membrane inclosing the testicles must be cut with the hook very carefully, as there is an artery between the two. Now, insert a small spoon—a salt spoon is the best—hold it under the lower testicle; place the testicle in the spoon, then cut away to edge of the spoon with a pair of spring pincers curved at the points, such are used by dentists; take away and clean the spoon. Then the same operation is performed with the upper or left-hand testicle, letting no blood get beyond the spoon. When this is done and the spring removed, sew up the wound with a surgical needle which is curved; use floss for thread.

With due care this mode of treatment is better than those recommended in poultry works, and has given entire satisfaction.

Show "Points" of Light Brahmas.

A. J. Collins, Bergen Co., N. J., asks as to the "Points" of Light Brahma fowls, as regards markings, build and particularly whether white or yellow legs are considered the best.

ANS.—Yellow-colored legs are the only color admissible in the show pen. The feathers must be well down to the outer toe ends. The body should be broad and deep, heavy with fluff behind; breast full and carried well forward. Except in wings, tail and hackle, there should be no black. The backs, down from the hackle, should be clear white; the combs should be pea or tripple-shaped; that is, in three ridges, the middle ridge being the highest. Cocks should weigh twelve pounds; hens, ten; cockerels, ten pounds; pullets, eight, for the show pen.

Paradise and Doucin Stock.

H. M., Lexington, Mass., asks 1. is there a difference between the Paradise and Doucin stocks used for dwarfing Apples, and if so, what? 2. What, if any, is the botanical difference between a Crab and a common Apple. 3. Will cions of the former take on stocks of the latter?

ANS.—1. It is presumed that the apple is of Eastern origin, and that all of our present varieties sprang from the wild Crab. The wild Crab often exerts a dwarfing influence. The Paradise is naturally a small tree or shrub, and dwarfs whatever variety is worked upon it much more than the Doucin. 3. There is no botanical difference. 3. Yes.

Summer Savory.

S. B., Johnstown, N. Y., 1, sends specimens of leaf and root of plant for name; and 2, asks at what time Summer Savory should be gathered, and for what purpose should it be used.

ANS.—1. The specimens sent were imperfect, having no flower, while the leaf was pulverized; hence we cannot name it. 2. Summer Savory

should be gathered just before the plant is in full bloom, and put aside in a shady place to dry slowly. It is used for seasoning dishes.

Miscellaneous.

S. S. V C, Erieville, N. Y., has a horse that "interferes" badly. He cannot get any blacksmith to shoe the animal so as to prevent this fault, and he inquires whether the new horse shoe with continuous calk, advertised in the RURAL, would be likely to effect a cure, and whether it is really what it pretends to be.

ANS.—We cannot speak of our own knowledge, but we have seen very strong letters that have been sent to the company in which special reference is made to the fact that the use of the shoes not only prevents interfering, but eradicates the habit. We have found by actual trial on our horses at the Experimental Farm, that in other respects the shoes do what is claimed for them. As our horses did not interfere, the shoes of course, could not be tested on that point.

W. U. R., Hubbardsville, N. Y., asks 1. where the Herald's Almanac can be purchased and its price. 2. The name of some reliable commission house in Boston and Philadelphia. 3. Where can he get a horse-hoe adapted to hill land, which will do good work there.

ANS.—1. New York Herald office, this city. 2. We are not sufficiently acquainted with the commission houses of either of those cities, to guarantee the reliability of any of them. 3. Write to R. H. Allen & Co., New York City.

J. W. D., Grand Rapids, Mich., asks for instructions on the cultivation of Cranberries.

ANS.—A longthy article on this subject was published in our issue of Dec. 22, last, and a shorter one among Answers to Corrospondents in RURAL for July 6. A full account of the matter will again be given so soon as the present calls upon our columns shall have relaxed somewhat.

B. P. Moon, Oswego Co., N. Y., wishes to know where he can procure a kind of corn for field culture that we could mention.

ANS. —Try Chester Co. Mammoth, probably, of D. Landreth & Sons, Phila.

H. M. Stowe, Iola, Allen Co., Kansas, asks the name of some manufacturers of good windmills.

ANS.—U. S. Wind Engine and Pump Co., Batavia, Ill.; Eclipse Wind Mill Co., Beloit, Wis.

RURAL SPECIAL REPORTS.

GRAND RAPIDS, Mich., Nov. 4th, 1878.

IN the RURAL of Nov. 4, under the head of "Sanitary Arrangements for the Homestead," fixed tubs in the kitchen are described. I, too, believe that no kitchen should be without them, and have put in three sets by using wash-tubs for the purpose. Take as many tubs as you want of the size you may desire. Fasten to the bottom of each a board just thick enough to be flush with the rim, so that in placing the tubs on a bench the boards as well as the rims may touch it. This arrangement will cause the tubs to stand more firmly, give a greater thickness through which to screw them to the bench, and through which to make the outlet for refuse water. Let the tubs project over the bench in the rear, and through the part thus projecting bore a hole to let off the soiled water. For stopping this hole, I have used a plug and chain, such as plumbers use for the same purpose. If a wooden plug is used, the water should be drawn off from the front instead of from the rear of the tubs, so that the projecting end of the plug shall be out of the way of the washboard. I use a cover just like that described in the article referred to, but without hinges. Let the bench lie open underneath, for in truth "no sink should be closed in."

James Watson writes of the productiveness and other advantages of Arkansas. Before any man migrates there, however, he should inquire about the educational facilities — particularly what proportion of the children there attend school. Why do not papers give the P. O. addresses of their correspondents? [Because many correspondents prefer that they should not do so.—EDS.]

An "Old Subscribor" in "Notes from Central Illinois," recommends sweet corn as food for hogs. One of the milkmen of our city keeps 126 cows and feeds them largely with sweet corn, with such satisfactory results that he intends to increase the amount hereafter—he feeds stalks and corn together. S. L. F.

LARNED, Kansas, Nov. 7, 1878.

THREE years ago the buffalo and the Indians traversed these prairies; now I can stand at my door and count over 100 houses. I am located ten miles from Larned, the county seat of Pawnee Co., which is a R. R. station on the Atchison, Topeka & Santa Fe R. R. All the government land around here is taken and all R. R. land is sold. The wheat crop looks good. So far we are needing rain very badly. There is a heavy immigration to this part of Kansas this fall, as there was last spring. The people come from all over the country. Every State is represented here. I have neighbors from N. Y. City. The climate is healthy and the water good. It is a fine wheat country. Some raised 30 bushels to the acre on the wild sod, and they will do better when the land is cultivated. It is also a good stock country. M. F. R.

CHENANGO FALLS, Broome Co., N Y., Nov. 8th.

THE past season has been one of unusual prosperity for farmers in this part of the country. Though prices are low for what we have to sell, a little money will procure a great deal of what we have to buy. Corn is worth about 60c.; oats, 25c.; apples, 30c.; potatoes, 60c.; butter, 18@20c.; cheese, 6@12c.; eggs, 15c.; hay, $6@7, and everything else in proportion.

We pay from 8 to 10c. for sugar; and from 5 to 10c. for calico and the prices of sheeting, and other things which we have to buy, stand in about the same proportion.

October was a very fine month in which to harvest crops, and all within my knowledge are housed in good order; but November has come in cold and snowy. To-day it has snowed nearly all day, and there are about eight inches of snow on the ground. H. K.

INDIANA Co., Pa., Nov. 12, 1878.

THIS has been a beautiful fall for doing up work. It rained last night, but it is clear today. Corn is mostly up; it was a light crop owing to unfavorable weather. Oats proved a good crop; wheat was about half a crop. Potatoes were very small. The Fly is hurting the wheat that is sown. Wheat, 85c.; corn, 40c.; double bushel; oats, 30c.; rye, 45c.; flags, 2½@2¾c. per pound; cattle, $2.75 per 100 pounds; sheep, 3½c. and scarce. Butter, 17c. per pound; eggs, 16c. per dozen. Wages, thrashing, 75c. per day; other work, 60c.—Thrashing wheat, 4c. per bushel; thrashing oats, 2c. per bushel. J. GILMORE.

CLEARFIELD Co., Pa., Nov. 11, 1878.

CONSIDERABLY more attention has been given to agricultural pursuits in this county in the last two years than ever before in the same length of time. In former years nearly the whole attention of the county was turned to lumbering, but the Pine being nearly exhausted, the land is being cleared up for farms. We miss the good apples this county is famous for. The late frosts in the spring killed nearly everything in the fruit line. Wheat is selling at one dollar per bushel. Corn, 60c. Potatoes 60c. H. F. S.

GRIFFIN, Ga., Nov. 11, 1878.

WE have here, in middle Georgia, the best fruit country to be found east of the Rocky Mountains, with an altitude of 1,000 feet, pure air and pure water—at a distance of only two days' railroad travel from New York. But we want a few thousands of live Yankees to help us develop the resources and possibilities of the country. W. W. W.

WARREN Co., N. C., Nov. 11.

WE have lately had some cold weather hereabouts, causing the behind-class of farmers to hurry up cotton-picking, though the price is now so low—eight cents for lint—that it will not pay cost. The fields are almost as white as snow, and many a back-ache and cold set of fingers are in store for some folks. Corn and cotton excepted, crops are all secured. M. B. P.

PIEDMONT Co., Va., Nov. 13, 1878.

WHEAT is looking well here, and is worth 90c. per bushel; corn, 45c.; potatoes, 50c.; butter, 16¼c.; eggs, 15c.; hogs, gross, $3 per 100 lbs.; beef, gross, $3@3.25 per 100 lbs.—sales slow. We have had a good many heavy frosts here this fall and a little ice; but very few cold days up to this time. P.

A SUBSCRIBER writes us that having seen by the RURAL Special Reports that potatoes were considerably below the average yield, this year, he bargained for a large amount in his neighborhood, and since then the price has risen so much that he has cleared $100 on his surplus stock. Those reports are not only interesting and instructive, but may also be often easily made a source of profit to the intelligent reader. The number, published some weeks ago, containing special crop reports from a large number of different places in thirty-four out of the thirty-eight States in the Union, might well have been a source of as much profit as pleasure.

THE RURAL NEW-YORKER

from now until Jan. 1st, 1880, for $2.

A Four Dollar Weekly Journal for Two Dollars.

TO ALL OF OUR SUBSCRIBERS WHO APPLY, A **FREE** SEED DISTRIBUTION EQUAL IN VALUE TO THE YEARLY SUBSCRIPTION PRICE.

ONLY SEEDS OF RARE OR **NEW** VARIETIES FOR THE FARM AND GARDEN OFFERED.

Experimental Grounds of 82 Acres.

A New Era in Horticultural and Farm Journalism.

A COUNTRY HOME PAPER FOR EVERY SECTION.

ORIGINAL ENGRAVINGS---THE BEST WRITERS OF THE LAND.

A JOURNAL THAT IS HONESTLY DEVOTED TO THE WELFARE OF ITS READERS.

No progressive Farmer, Fruit-Grower or Gardener can afford to do without the RURAL for 1879.

THE following are among a few of the recent notices of the press of the United States.

THE RURAL NEW-YORKER has been enlarged and improved, if that be possible. It stands at the head of the strictly agricultural and horticultural periodicals of the country.—*Philadelphia Germantown Telegraph.*

THE RURAL NEW-YORKER, so long and favorably known, seems determined to give its readers the benefit of whatever increased prosperity it secures. It has now, the best list of contributors of any weekly agricultural paper in the country, and is doing a noble work—*Boston Scientific Farmer.*

The editors of the RURAL NEW-YORKER now use a portion of their farm for experimental purposes in raising seeds for their subscribers. Their farm, which by the way is one of the best on the Island, is admirably adapted for such experiments. The RURAL is one of the best of agricultural papers.—*S. S. Observer, Long Island.*

THE RURAL NEW-YORKER.—We are glad to note by an increase of size in the RURAL NEW-YORKER, substantial signs of prosperity. The Agricultural Press of the country has severely suffered by the general depression of the last few years, and it is pleasant to note this first step in prosperity, especially as the Rural New-Yorker deserves all the success it seems to gain.—*Gardener's Monthly.*

THE trouble is that if you take it one year you will like it so well that you will take it every year.—*North Missourian.*

WE regard the Rural New-Yorker as the champion weekly paper of America, for the farm and family circle. While it is especially intended for Rural Homes, there is no fireside that will not be greatly benefited by the Rural New-Yorker's weekly visits. It gives you more for your money than any agricultural publication of which we have knowledge.—*Democrat, Coshocton, Ohio.*

WE are glad to receive assurances from headquarters that this excellent paper was never in such a promising condition as it is now, either financially or editorially, since its removal from Rochester. "It does not owe a dollar, and has half a million at its back." Good enough! but not better than it deserves.—*Buffalo Weekly Express.*

OF our agricultural exchanges none presents such a clear, crisp appearance, typographically, as the RURAL NEW-YORKER. Speaking of its contents, we are led to use the most emphatic language. It is edited with a precision unusual in agricultural journals, and a glance over its interesting "Questions and Answers" columns discloses with what painstaking it responds to requests for practical information. It is more comprehensive than papers of its class, also, embracing a literary department that is again subdivided into minor departments, which furnish excellent short and continued stories, fashions and cutpaper patterns for the ladies. Religious intelligence, the news of the week, and a cozy nook for the young people.

Its practical departments embrace articles by the foremost writers on agriculture, horticulture and kindred sciences, accompanied by illustrations that increase the interest of the text. In short, the Rural is just such a paper as our people should subscribe to. It is broad and national in its treatment of topics, and more than any other journal, serves the farming and fruit growing interests of the whole country.—*Dispatch, Live Oak, Florida.*

THE RURAL NEW-YORKER.—This old and well-established weekly is one of our best agricultural and horticultural exchanges.—*Phrenological Journal.*

THE RURAL NEW-YORKER.—One of the oldest, most reliable, and most welcome of farm and household journals published in America has been enlarged and otherwise improved. Its name has become a household word throughout the land, and we have yet to learn where the Rural is not welcomed by the family to whom it is sent.—*Journal, Flint, Mich.*

THE RURAL NEW-YORKER is the best and most prominent agricultural and home journal in the country.—*Democrat, Davenport, Iowa.*

On receiving The Rural New-Yorker, we scarcely recognized it, so greatly has it been changed, for the better.—*Observer, Bowmanville, Ont.*

THE RURAL NEW-YORKER has been enlarged to the size of Harper's Weekly, and otherwise greatly improved. It is one of the oldest and best agricultural weeklies in the country. Terms, $2.00 a year.—*Record, Yorkville, Ills.*

THE RURAL NEW-YORKER, one of the best family and agricultural papers in the land, has recently been enlarged, and its publishers claim that it has also been improved; but we can't see it, for the reason, we suppose, that our vision is clouded with the long and fixed notion that there was no chance for bettering it.—*Home and Farm, Louisville (Ky.)*

THE RURAL NEW-YORKER, once published at Rochester, but latterly at New York, has been the most widely circulated of the agricultural papers.—*Times, Hartford, Ct.*

RURAL NEW-YORKER.—That old reliable agricultural journal, The Rural New-Yorker, renews its youth every year, and steadily improves with age.—*Western Homestead, Kansas.*

THE RURAL NEW-YORKER has no peer as a family and farm paper.—*Commercial, Mitchell, Ind.*

THE RURAL NEW-YORKER has been enlarged and improved, and is now the best agricultural paper issued in the U. S. We cordially recommend it to our farmers.—*Times, Port Hope, Ont.*

THE RURAL NEW-YORKER, so long and favorably known as a guide and representative of the agricultural interests of the country, has been much improved in its typographical "get up." It would be hard to improve it otherwise. The Rural New-Yorker is a mine of information for farmers, wherever located, and amply repays perusal.—*Am. Mail and Express Journal.*

THE RURAL NEW-YORKER, published at 78 Duane street, New York, is now the best agricultural weekly we have any knowledge of.—*Spectator, Ohio.*

THE RURAL NEW-YORKER.—This popular agricultural journal has recently been enlarged and typographically improved, all of which will commend it still more, if such a thing were possible, to its vast army of readers in all the walks of life. The Rural New-Yorker is the most popular agricultural paper published, and we commend it as the best to all wanting a paper devoted to that department.—*Insurance Herald.*

THE RURAL NEW-YORKER has made another enlargement, which makes the Rural the largest agricultural weekly published in this country.—*Western Agriculturist.*

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY NOV. 23, 1878.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

OUR readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

MANY of our friends continue to send us Two FIFTY instead of *Two* Dollars, the new price of RURAL. In such cases we will either refund the fifty cents or make the subscription term fifteen months, as may be preferred.

OUR new Premium Lists, specimen copies and agents' outfits will now be forwarded free to all who apply.

TO OUR READERS.—Please again read the postal terms of our free seed distribution. Many are sending us more stamps than are called for.

OUR Free Seed Distribution will remain open to all subscribers who may apply until further notice.

THE RURAL NEW YORKER *is invariably discontinued at the end of the subscription term.*

THANKSGIVING.

On twisting strings fat Turkeys fry;
In oven bakes the Chicken Pie;
The roasting Pig with butter swells,
And oh, how good Thanksgiving smells!

Let us read a page of the early history of New England:

The winter succeeding the landing of the Pilgrims was one of unusual severity, and during the following summer (1621) sickness prevailed to such an alarming extent that but little food was raised, while in the autumn more immigrants arrived, with whom that little was shared, compelling the colony for six months together to subsist on half allowance. Some fishermen off the coast kept them from famishing, by occasional gifts of fish. The little extra provisions on the ships were held at exorbitant prices, showing that then, as now, the necessities of one are made the opportunities of another. In the spring of 1623 victuals were so entirely spent that a famine seemed imminent. The little corn left was used for seed, and lobster, fish and muscles, without bread, were their only sustenance. After planting came a season of drought which promised to destroy the hoped-for crop, in view of which a day of fasting and prayer for rain was appointed. According to Cotton Mather, before the close of this day which began hot and cloudless, the clouds gathered, showers descended, and the crop was saved. In the autumn, after the abundant harvest was gathered, Gov. Bradford appointed a day for thanksgiving. A company was sent out for game, that they might have dainty and abundant materials for a feast, and rejoice together. "So they got their game and they cooked it, and they ate of it, and they feasted Massasoit and 90 of his Indians, and they thanked God with all their hearts for the good world and the good things in it." So they kept their first Thanksgiving.

The annual appointment of a day of thanksgiving early became one of the customs of New England and has been continued to the present time. It soon became a day for family gatherings and attendant frolics and festivities, and in later years, it was not seldom that three and even four generations were found under the roof of the ancestral home, making not only the day itself one of joy and gladness, but extending the merry-making through the week. Christmas was not recognized in the Puritan's calendar, and Thanksgiving came, in some measure, to fill its place.

There is no section of our broad land where the influence of early New England is not felt to this day. When her sons and daughters leave the stony hills and unproductive fields of their ancestors, to make their homes elsewhere, they take with them a love for many customs, that is not easily eradicated. Their children are taught to respect what the parents loved, and among the first duties of the Governor of a new State, in which the New England element was prominent, was that of issuing the annual proclamation for Thanksgiving Day—not now, however, as in our youth, to be read by the minister at the close of the sermon, on the morning of the Sunday preceding the appointed day, always closing with the declaration that on that day "all servile labor and vain recreation are by law forbidden."

Until recently the appointment of the day rested with the Governors, each choosing for himself, but always some Thursday in November. An opportunity was thus offered by which two or some times three Thanksgiving dinners could be secured by journeying from State to State, a practice the appointment of a National Thanksgiving Day by the President prevents. We are not positive that because some people could get advantage of others in this way, was the reason a President took the matter in hand, but it was that—or some other reason. The thing is done and no longer can more than one legal Thansgiving Day be observed in any year.

But why should not every day be one of thanksgiving? There are times when clouds arise, and the mists of sorrow and trouble enshroud us; when gladness is not ours; when days seem long and nights never-ending; when no words bring comfort, and hope seems to have departed; when we forget the blessings we have in grieving for those we have not. "Look up and not down." Man was not made to mourn. All nature repudiates the assertion.

Let us consider a moment, our situation as a people.

We have a Government that, in theory at least, is as good as the world has ever seen, and the growing intelligence of our citizens is warrant that it will be made so in practice.

We have a climate more various than that possessed by any other nation. Our soil is fertile and well adapted for the production of every crop grown in the temperate and semi-tropical zones. Our great Northwest alone is capable of producing sufficient food to support the entire population of the globe.

In manufacturing facilities no country is our superior. Our water-power is practically unlimited, and our coal-beds almost inexhaustible.

Our mineral wealth is beyond computation. One State alone has iron enough for the world, and thousands of acres beyond the Mississippi lie on foundations of silver.

Passing from the physical, we may be congratulated on our mental and moral advantages. We find the same spirit that built the New England school-houses two hundred years ago, permeates our entire country. Free Schools are the rule, and if any are uneducated, it is their own fault; while the statistics of crime show there is nowhere a more moral and law-sustaining population than ours.

The result of all these advantages is happy homes. Look, for instance, at the picture on our first page, in which the artist has shown one of the many thousands where the RURAL is welcomed every week. See three generations in one house, with the faithful dog to keep them company. The "Cricket" measures for them the passing time and the package of seeds from the RURAL office, gives promise of hours of pleasure during the coming summer, from which will result many things of beauty which will be joys forever. Look through the window and catch a glimpse of the surroundings and say if there can be any doubt this is a happy home, from which fervent thanksgivings will arise—and what shall we say for ourselves? What but that our past year has been crowded with causes for thankfulness. Our time has been spent in earnest endeavor to accomplish two results! One to make a more acceptable paper than we had before—both in appearance and matter; the other to increase its circulation that more might profit by our labors. That we have done the the last, we know, and believe we have not failed in the other. We are thankful for the kind words of approval and encouragement received from many friends, as well as for the co-operation and assistance of many others, all of which have served to make our labors less arduous and our path to success more free from thorns.

IN WHICH ALL OF OUR READERS ARE INTERESTED.

WE state what is pretty generally known, when we say that seeds (and very often those of very poor quality), have frequently been offered as premiums by weekly journals. So far as we are aware, they have always been those which might have been found in any one of the seedsmen's catalogues, such as Balsam, Zinnia, Portulaca, &c., &c. There are two points which we would like to impress upon our readers in regard to the seeds which the RURAL offers. First—They are not offered as premiums at all. We offer no premiums except as a compensation to those who get up clubs, and for this work they are as much entitled to compensation as for any other kind of labor. Our seeds are offered to subscribers only. If this offer induces many to subscribe who would not otherwise, we shall be glad; but if not, our subscribers are entitled to a choice of them all the same. Second—The seeds offered with the exception of Pearl Millet, Defiance Wheat and Acme Tomato, cannot be purchased of seedsmen, while the Beauty of Hebron potato has not passed out of the control of those who commenced its dissemination last year. Of the seeds of the Golden Rural Tomato, Bronze Ricinus, Hybrid Aquilegias, Seedling Deutzias, Weigelas and Voorhis Watermelon we have the entire stock; while seeds of the others, excepting Leavenworth's Eryngo, are not to be found in any of the advertised lists of the catalogues in our possession. All of them will grow readily from seeds, and, speaking for the perennial hardy plants, they will grow in one season to the size of those purchasable from nurseries at from twenty-five to fifty cents each, while from a single packet of the RURAL seeds, not less than half-a-dozen seedling plants may be counted on.

We have not the least desire to overestimate the value of the seeds we offer, but we are not the less disposed to make their value appreciated. It does not seem to be generally known that Deutzias, Weigelas, hardy Hibiscus, etc., may be obtained from seeds even more readily than from cuttings, while the amateur cultivator may be confident of variations in the flowers, if not in the foliage and habit, that will invest the seedling with an interest that purchased plants never could arouse. There are no better hardy shrubs than Weigelas, Deutzias, Hibiscus, &c., and we hope by our free seed distribution, to be instrumental in causing them to be cultivated in every garden in the country. If they are as desirable as we represent them to be, and if they may be procured for the trouble of sowing the seeds and caring for the young plants, then surely there will be no excuse for the neglect of the farmers' dooryards. We may excuse a farmer for a paucity of fine shrubs about his house if he is obliged to purchase them; but there is no excuse if he refuses to give them a place in his grounds when they are freely offered by those from whom he has a right to accept them in connection with the paper he helps to support.

Respecting Pearl Millet, we hope it may take a high and permanent place among fodder plants. We shall send out seeds enough to enable everyone to settle the question of its utility for himself. Defiance Wheat which has produced such remarkable yields in some places, is at least worthy of a trial wherever spring wheats will thrive, and the Beauty of Hebron potato we are in high hopes will take the first place among the favorite varieties of the day.

BREVITIES.

WE beg of our friends not to stick to their letters the stamps they may inclose in them.

MR. LAWES' experiments show that sheep utilize a greater proportion of their food than cattle.

DR. HOSKINS says that politicians as a class are the most stupid, as they are the most selfish and venal of men.

THE outbreak of the rinder-pest in England in 1865, when at its hight, carried off 17,000 head of cattle a week, and in eighteen months England lost by the plague fully $40,000,000.

WE wish that our farmer readers would write us what variety of field corn has produced with them the largest yield. If they have any distinct varieties which they have cultivated, we would be glad if they would send us a sample ear at our expense.

THOUGH early to speak of it now, we hope all of our subscribers who receive the Beauty of Hebron potato will plant it beside the early Rose, treating both in the same manner, and advise us of their comparative values. We will gladly publish such reports, whether for or against the Beauty of Hebron, having no interest in the potato except the desire to make its value known.

THE serious nature of the losses to which the thoroughbred live stock interests of this country would be liable to in the event of the occurrence here of some of the cattle plagues that ravage Europe, is shown by the havoc committed by the foot-and-mouth disease among the late T. C. Booth's Warlaby herd of Short-horns. Last year the owner testified before a Committee of the House of Commons, that in a few years he had lost from that pest alone, no less than £30,000 or $150,000.

SOVEREIGNS alone confer titles of nobility on illustrious scions of the human race, whereas the commonality mainly bestow such symbols of distinction on eminent members of the "lower creation." Judging by the power of the parents, in both of the honored classes, to transmit their excellencies to their descendants, the people seem better judges of true nobility than the monarchs, while the value of the progeny of original Short-horn Dukes, Duchesses, and Princesses far exceeds that of the offsprings of hundreds bearing similar titles among the peerage of the Old World.

THE island of Jersey, the original home of the cattle breed of that name, has a total area of only 28,000 acres, yet last year its export of early potatoes amounted to £230,000 or at the rate of about $40 per acre of the whole island, including roads, rocks, bye-ways and waste places. This year the breadth planted to potatoes was unusually great, but the potato disease appeared in May and the entire crop has turned out a failure. Many a fine Jersey cow, heifer and bull, that money could not have otherwise bought, will have to be sold this fall and winter to pay for rent, guano and advances.

A CAUTION TO BUYERS OF JERSEY CATTLE is needed from the fact that there are three Jersey Herd Books; namely, the Herd Register of the American Jersey Cattle Club, published at Newport, Rhode Island, and edited by Secretary Waring under the supervision of the Executive Committee of the Club; a State Herd Book published in Maine, and a Herd Book published in Massachusetts. The Jerseys entered in the first are alone authoritatively entitled to be considered pure-bred, and, as a rule, the animals entered in the others are not eligible to entry according to the rules of the Club. Before purchasing animals advertised for sale as entered in "Jersey herd book," it would be well, therefore, to find out which herd book is meant. It is estimated that there are about 10,000 Jerseys in this country entered or entitled to entry on the Register, and about as many more claimed to be pure-bred but not entitled to the entry, owing to the stringent rules of the Club.

THE HORNS OF CATTLE in south Africa are said to be longer than even those of our Texans and are often curiously bent and twisted. This is effected by scraping the horn on the side towards which it is desired that it should bend, and repeating the operation until the wished-for shape has been attained. The question of "horns or no horns," seems to be lately attracting considerable attention on both sides of the Atlantic. Here the Kentucky Live Stock Record sees preponderating advantages on the "no horns" side, but deprecates the introduction of polled cattle to bring about the change, as it can be readily done by searing with a hot iron the spot where the horn is to grow on the calf. On the other hand the National Live Stock Journal, while acknowledging, with us, that horns are no longer necessary as a means of protection against wild animals, and that they are sometimes used to inflict serious injury on other stock, is not prepared to sacrifice the elegant and graceful appearance of the heads of horned cattle for the homely heads of "muleys."

WE offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

DEAD.

A LILY broken by the rain,
Before a single earthly stain
Has on its velvet whiteness lain;

A snowy bird that close caressed
By the soft, brooding mother breast,
Dares yet forsake the sheltering nest,

And straight, before its silver wings
Have ever stooped to baser things,
Flies up to heaven, and flying sings.

These and all other pure and mild
And lovely objects undefiled
Are types of what thou wert, our child!

[*Detroit Free Press.*

POMEGRANATE BLOSSOM.

SAXE HOLM.

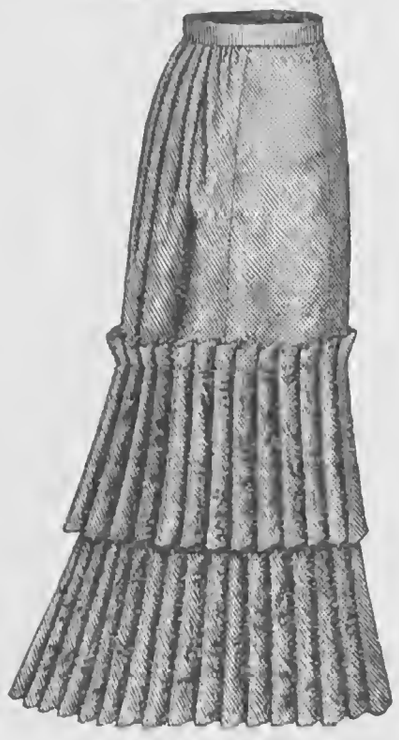
POMEGRANATE blossoms! heart of fire,
I dare to be thy death,
To slay thee while the summer sun
Is quickening thy breath,
To rob the autumn of thy wine,
Next year of all ripe seeds of thine,
That thou mayst bear one kiss of mine
To my dear love before my death.
For, heart of fire! I, too, am robbed,
Like thee, like thee, I die;
While yet my summer sun of love
Is near and warm and high,
The autumn will run red with wine,
The autumn fruits will swing and shine,
But in that little grave of mine
I shall not see them where I lie.

WHAT SHALL WE WEAR?

THE bewildering variety of materials displayed in the shop windows makes this problem rather difficult of solution. So many exquisite fabrics are to be had, that it is hard to make a selection

6343

unless one has started out with the fixed determination to confine her purchases to solid colors and standard materials. All the old-time favorites, —merinos, cashmeres and camel's-hair cloths—are to be had in all the fashionable shades, and many ladies content themselves with these fabrics, but the new, fancy goods are so seductive, that it requires considerable strength of mind on the part of a beauty-loving woman, to resist the temptation to invest in at least one of them.



6389

There is no question, however, but that for people who cannot afford to discard a costume after one season's wear, cashmere is a much better investment than Cheviot, or Brussels cloth and combined with velvet, brocade or satin, these plain goods make really elegant suits and their cost is infinitely less than that of the rich fancy goods. A new fancy fabric is a novel cloak pattern in basket-weaving. There are four colors worked in the manufacture, two being of rather

6343

bright silk and two of rich dark worsted. The silk is in hair lines; the wool in alternating blocks not over a half an inch long and wide, and the several combinations shown in this style of material are unique and rich.

Dress goods suitable for polonaises, coats or vestings are in raised plush stripes bordered by hair stripes of silk. The general effect is dark and it appears in handsome navy-blue, myrtle-green, olive, seal-brown, plum or garnet with the fine silk lines of pale-blue, gold, pink, red or white. Other novelties in heavy suitings are in mixtures of different shades of one color, sprinkled with silk to make the "silk stitch" effect.

Brussels cloth is woven with little loops projecting from its surface and comprises a great many varieties, the most pleasing of which is wool intermingled with fine silken bars, and also those with the looped pattern in narrow stripes or small figures.

6352

A peculiarity of the season is the odd and effective combination of shades. Entirely different browns, such as olive, *Havanne* and seal, are intermingled in a fabric, and myrtle, moss, olive and bottle-green are distributed in the same manner. Some of these goods are scattered over with indistinct checks or stripes, and some have scattered particles of cardinal, cream and other bright-tinted wools, woven among their somber colors Vestings of cashmere, brocaded with small figures of old-gold, pale-blue, Magenta, silver-gray, garnet, and a variety of shades are stylishly combined with French and India cashmeres.

Armure cloths are wool goods with a solid shade at the foundation, on which is a fine, close embossing, resembling lace chain-work. Large merino plaids are in scarlet and black, black and white, and blue, green and gold. The smaller varieties are in the newer colorings of old-gold, plum-color, bronze, silver, orange, and the several dark fashionable hues, cross-barred with narrow lines of rainbow tints.

Garnet is undoubtedly the most fashionable color of the season, but the darkest shades of other colors are extremely popular, and, as usual, black, in all materials, holds its own.

Cloakings come in many new and handsome materials. The large plaided-goods in wool are used in circulars and Ulsters. For cloaks a great variety of material is offered. Among them black camel's-hair, diagonal cloth, *damasse*, *matelasse*, Cheviot and plain black silk are the most popular. In trimmings, jet beading takes the lead; passementerie ornaments and gimps are plentifully besprinkled with it. Fringes are more elaborate than ever and are very much worn on handsome costumes. Pipings, bands, vests, *revers* and cuffs of corduroy, velvet, satin, brocade, or moire-antique, comprise most of the modish materials and styles of decoration.

Satin folds and chenille fringes make a charming finish for merino, camel's-hair and fancy cloth costumes, and silks are made very elegant by the addition of brocade, handsome passementerie and showy silk fringes. There is a disposition to use little ornamentation on street costumes; many ladies confining themselves to cordings and pipings.

In a future article I will give prices and widths of fashionable goods for dresses and cloaks. Any ladies who may desire samples of fashionable materials will be supplied, free of charge, by addressing me, care of RURAL NEW-YORKER. Please state explicitly the color and style of goods desired.

Description of Cuts.

THE Ulster, shown at 6343, is a new and stylish design. It is simple in structure, gives the wearer

6352

a very slender and graceful appearance, and the straps and buttons on the lower part of the skirt, relieve the back of the too severe simplicity which usually characterizes garments of this kind. This Ulster will be found exceedingly comfortable and dressy and it may be made of any kind of cloth—waterproof, camel's-hair or Ulster cloth—and decorated with braid, pipings or machine-stitching, and with smoke-pearl, bone or horn buttons. Price 30 cts.

The popularity of the "Washerwoman" costume has given rise to almost endless modifications of it, one of the prettiest of which we give at No. 6352. The skirt is kilt-plaited, and about the figure is artistically draped a wide scarf. The military-looking basque adds to the jaunty effect

6387

of the costume. It may be made of silk, cashmere or camel's-hair. The scarf may be of the same material as the skirt, ornamented with fringe and velvet, or it may be composed of plain or brocaded silk, velvet or satin. This costume looks well made up in plain and plaided woolen goods. Price of pattern, 35 cts.

No. 6389 is a model of a ladies' short walking-skirt. It is short and round and consists of a front gore, with two narrow gores at each side and a plain back-breadth. Two deep side-plaitings of the material from which the suit is constructed supply a handsome garniture for the

6387

bottom Box-plaitings may be employed instead of the side-plaitings, as may also knife-plaitings, gathered flounces, flat bands, galloons or braids. This skirt may be worn with any of the over-skirts or polonaises in vogue. Price of pattern, 35 cts.

The double-breasted cloak, No. 6387, is an economical and comfortable wrap. It requires but little trimming, and any material is suitable for its construction. The model given is made of heavy basket-cloth, finished with buttons and velvet. Price of pattern 35 cents.

The polonaise still holds its own, despite the popularity of basques, and the model we give at No. 6670, must commend itself to all on account of its simplicity and grace. Made of plain and brocaded goods, it would make an extremely handsome garment. A material closely resembling corduroy, is a novelty in this season's fabrics, and combines handsomely with silk or velvet in a polonaise of this description. Price of pattern, 35 cents.

No. 6362 illustrates a tasteful coat of tufted beaver cloth of a dark blue shade, ornamented with buttons and braid; diagonal, basket-cloth, silk velvet, or any of the fashionable dress or cloak goods may be made up in this model and decorated in any way to suit the taste.

6362

A stylish little mantle, an offshoot of the "Dolman," is illustrated at No. 6385. It is composed of only two pieces, and falls gracefully about the figure. It is adapted to any figure. It may be made of silk, trimmed with fur (as shown in the engraving), or of any of the fashionable cloths. Crape cloth, trimmed with tape fringe headed by a band of crape, forms an appropriate wrap to be worn over a mourning costume. Price of pattern, 25 cts.

No. 6,375 — Ladies' basque, is a sort of compromise between the old-fashioned basque and the dashing, masculine cutaway coat, so fashionable at present. This basque is jaunty, without being in the least loud, and as it is adapted to any figure, and combines handsomely with any gored or plaited skirt in vogue, it bids fair to be one of the popular models of the season. Price, 30c.

6362

A short walking skirt, box-plaited, is given at No. 6,365. It is made up in light and dark suit goods. The garment is made to present a unique

effect by constructing the plaits alternately of the dark and light colors and by the artistic disposition of a wide scarf composed of the dark goods. The front of the scarf is cut in deep, castellated scallops at the lower edge, and piped with the light goods, while the sash-like end at the back is decorated with a fine knife-plaiting of the same color. Any of the dress goods in vogue will be found available for its formation, and any pleasing method of trimming it may be adopted. Price of pattern, 35c.

6370

Patterns sent from this office on receipt of prices named. All patterns are accompanied by full directions, as to how they are to be put together, amount of material required, and all needful information. I have a number of other fashion cuts to publish, and as there is no room for them in this issue, I have decided to give them in the RURAL of December 14.

I have omitted all mention of circulars, and for the reason that they are so extremely common that it hardly pays to make new material up in that shape. Manufacturers made up great quantities of them in the early fall, and they retail as low as five dollars; and the result is that every chambermaid in town owns her long circular fastened with an elaborate oxydized clasp.

Literary Miscellany.

WEAKER THAN A WOMAN.

CHAPTER X.

UNDER one of the spreading elms on the Vicarage lawn, stood Violet Haye, talking to her lover. They were watching the contest for a silver

arrow, enjoying the failures and mistakes which were out of all proportion to the success. The sunlight fell on her, tinging the golden hair with deeper gold, making the fair flower-like face still more fair, brightening the white dress with golden gleams. As she stood there her crimson lips parted, smiling at the bright scene before her, she looked like a picture of something almost too fair and ethereal for earth. Her lover was near her. For him the *fete* held naught but Violet. He was supposed to be watching the archers—he was looking at Violet. The sunlight was not so fair to him as the light in her eyes. The harmony that came from the whispering wind, the silvery murmur of laughter, the notes of the air that the band was playing held not such music as her voice. Many eyes lingered on the handsome couple under the great elm. Men looked with envy. Many a man there would have given half he had in the world to stand by Violet's side as an accepted suitor. Women looked with jealous admiration; they could say just what they liked about her, they could criticise her dress and her manner, but each one knew she was simply the most beautiful woman present.

The *fete* was at its hight. From the meadow came the hearty shouts of the children at play. Suddenly there seemed to be a slight commotion amongst the guests, and Felix saw the Vicar standing with a gentleman who was certainly not remarkable for the handsomeness of his personal appearance, but the Vicar seemed to be impressed by his presence. Then Captain Hill joined them, and the Vicar went away, leaving the two men together.

The new-comer, Sir Owen Chevenix, turned to his friend with a smile.

"It is not bad," he said; "but I see nothing that repays me for the trouble of coming."

Captain Hill turned slowly, and motioned to the great elm-tree.

"That is the prettiest sight in the grounds," he remarked; and a curious light came over the heavy face of Sir Owen Chevenix as he gazed. At the same time a keen, subtle instinct which he could not understand told Captain Hill that he had acted cruelly.

"You are right," agreed Sir Owen Chevenix, looking intently at Violet—"that is by far the prettiest sight in the grounds. Who is that young lady?"

"Miss Violet Haye," replied the Captain. An honest impulse prompted him to add, "She is engaged to Felix Lonsdale," but a subtle sense that such a statement would be displeasing to Sir Owen restrained him.

6385

"Will you introduce me to Miss Haye?" asked the Baronet. The light in his eyes had grown lurid; the Captain did not like it.

"It would be better for Mrs. Hunter to do that," he replied. "I am not one of Miss Haye's friends."

Sir Owen walked quickly away. There was a look on his face as of earnest purpose when he saw Mrs. Hunter. She listened to his request, and she wondered at the strange light on his face.

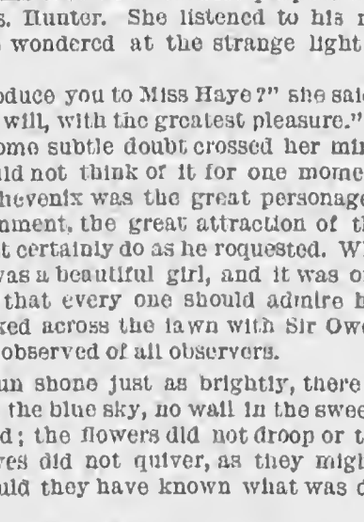
"Introduce you to Miss Haye?" she said. "Of course I will, with the greatest pleasure." Then, oddly, some subtle doubt crossed her mind; but she would not think of it for one moment. Sir Owen Chevenix was the great personage of the entertainment, the great attraction of the *fete*. She must certainly do as he requested. Why not? Violet was a beautiful girl, and it was only reasonable that every one should admire her. So she walked across the lawn with Sir Owen, who was the observed of all observers.

The sun shone just as brightly, there was no cloud in the blue sky, no wail in the sweet western wind; the flowers did not droop or tremble, the leaves did not quiver, as they might have done could they have known what was drawing near.

Neither Violet nor her lover saw the two until Mrs. Hunter spoke.

"Miss Haye," she said, "Sir Owen Chevenix has asked me to introduce him to you."

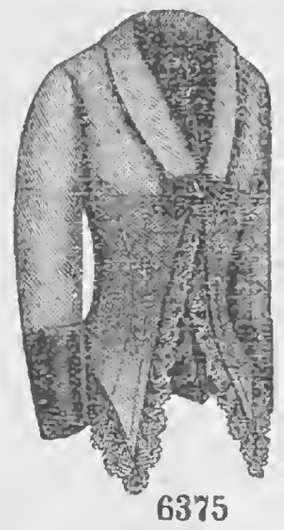
Violet's face flushed hotly—it was so sudden, it was such a surprise. This was the rich Baronet of whom so short a time before she had been speaking with such awe and wonder. She bowed, and murmured a few words—she never remembered what they were; then, as a matter of course,



6385

Mrs. Hunter was compelled to introduce Felix. Sir Owen acknowledged the introduction by a few careless words. The whole scene occurred in the radiant sunlight, in the midst of blooming flowers and happy faces—yet it was the prelude to a terrible tragedy.

"A beautiful day," said Sir Owen to Violet—"a charming scene too, quite rural, quite pastoral—the kind of thing I like."



6375

But Violet had not recovered her composure. She was quite unused to society; and the consciousness that she was talking to a rich young Baronet, the great man of the neighborhood, was for the moment too much for her. He liked her shy, pretty embarrassment. He had been accustomed to women whose eyes met his boldly, who gave him word for word, repartee for repartee; he liked the drooping eyes that showed the long fringed lashes, the downcast face, so attractive in its sweet confusion. Felix made some remark, and again the Baronet answered him with a careless word or two.

"I hear that we are to have quadrilles," said Sir Owen to Violet. "Will you favor me with the first, Miss Haye?"

She answerd "Yes," because she did not know how to refuse him.

"I had no idea that this kind of thing could be so well managed in a place like Lliford," said Sir Owen. "It inspires me with an idea—I must really give a *fete* at Garswood."

"That would be very pleasant," returned Violet shyly.

"It would if you were there," thought Sir Owen; "and there you shall be queen of the *fete* if I can manage it." Aloud he said—"Have you seen Garswood, Miss Haye?"

"I have been in the park," replied Violet, "but I have not seen the house."

"There is plenty of room for a *fete* there. I am quite in love with the place myself—it has such fine old trees, such grand oaks and elms, such ferns, and all that kind of thing."

Violet wondered for one moment whether it was fashionable to be always speaking of "that kind of thing," and why it was that the Baronet had such a dearth of ideas. She looked up at him so inquiringly that Sir Owen almost involuntarily said—

6375

"Were you going to ask me anything?"

Her face flushed again, remembering what she had thought. He thought her rich, lovely color going and coming the most attractive thing he had ever seen in his life. To give her time to recover herself he addressed some indifferent remark to Felix.

He was not gifted with any remarkable comeliness, this young Baronet to whom fortune had been so kind. He was tall and thin, without any dignity or ease of manner; his gait was awkward, his hands and arms always gave one the impression that that they were more than he could manage. His hair was black, his eyes were dark with a furtive expression; he had a dark heavy moustache, which drooped over cruel lips; his face was a strange mixture of moral weakness and brute force. His voice was unpleasant; there was no mellow ring in it, no music; it was high, clear, and shrill; but then he wore superb diamond rings, his dress was a marvel of the tailor's art, and he had an income of forty thousand a year. What was the grand beauty of Antinous, the grace of Apollo, compared with that?

"You will remember you have promised me the first quadrille, Miss Haye. I see Lady Rolfe. I must pay my *devoirs* to her; and with a low bow Sir Owen turned away.

"What splendid diamonds!" cried Violet.

"What a horrible man!" thought Felix.

Violet had been struck with the gems, Felix had been chiefly impressed by the awkward gait and ungainly carriage. He turned to Violet.

"My darling," he said, "why have you promised to dance with that horrible man?"

"Horrible!" cried Violet. "Do you know how rich and how great he is, Felix?"

"That makes him even more horrible—it is so many magnificent gifts wasted. You must not dance with him, Violet, but with me. You are mine—you belong to me. I cannot let you go even for one dance—even for five minutes."

Violet laughed.

"I must dance with him now that I have promised, Felix."

"I do not think that I shall be able to endure it, Violet. I am afraid, if I see his hand touching you, I shall strike it aside."

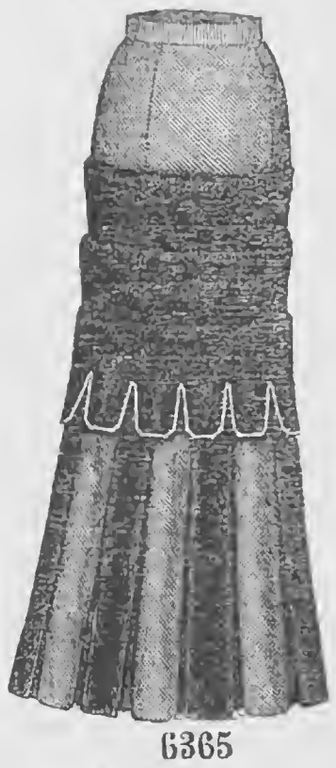
She laughed again as a child laughs who points a loaded gun for mischief, never dreaming that it may cause sudden death.

"I feel that I ought to have danced that quadrille with you, Felix," she said, "but really, I did not know how to refuse. I was quite embarrassed—you must have seen it. How jealous all the other girls will be! How Lady Rolfe will watch me! She said the other day that her daughter, that insipid-looking girl, was far more beautiful than I. She is not, is she, Felix?"

The lips that asked the question were of the loveliest crimson, the eyes that looked into his were like violets steeped in dew, the face smiling before him was like a blush-rose; that the words were foolish never occurred to him.

"My darling, you are more beautiful than any one else," he said. "Violet, you must dance this quadrille with Sir Owen, I suppose?"

"Yes, I must indeed," she replied.



6365

"It drives me half mad to think of it. Violet, do not look at him as you look at me—do not, do not let him know how sweet your smile is. Oh, Violet, I shall go mad if you do!"

Again she laughed. "You will have to go mad then, Felix, for I cannot dance with him like a Stoic, can I?"

"You are mine, Violet. If I had a lovely, rare, and precious lily, should I like every one to touch it and inhale its sweetness? You are my own—you belong to me."

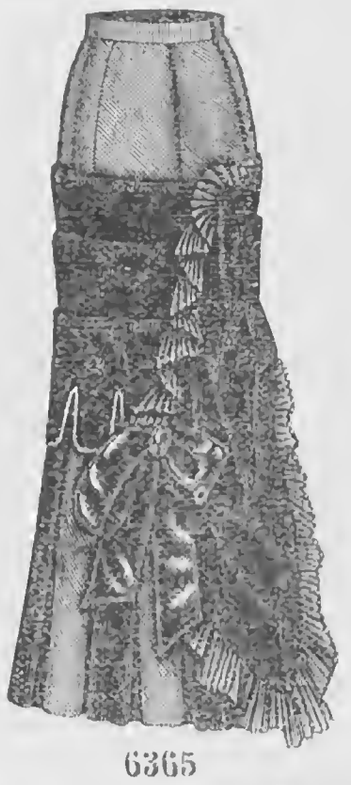
"Here comes Sir Owen," said Violet, cutting short the passionate words. "I shall not be long away from you, Felix;" and, laying her white hand on Sir Owen's arm, they went away together.

CHAPTER XI.

As Violet had foreseen, glances of wonder followed her and her companion. Lady Rolfe was bitterly annoyed; here was this girl chosen by Sir Owen, while her own daughters sat unnoticed. Mrs. Hunter did not know whether to be glad or sorry; of course it was a great thing to have Sir Owen there, and to see him enjoy himself and evidently feel so perfectly at home, but Sir Owen should have danced with Miss Rolfe, certainly not with Violet Haye.

Sir Owen however was grandly indifferent; a man possessed of forty thousand per annum is master of almost every situation, and he certainly was master of this. He enjoyed the quadrille very much.

"I had no idea *al fresco* dancing was so pleasant," he said; "but dancing anywhere with



6365

you, Miss Haye, would be the same, I should imagine. Who was that gentleman talking to you under the tree?"

"That is Mr. Felix Lonsdale," she replied

And he fancied the warm blush that came over her face was the result of his compliment

"Lonsdale! Is not that the name of the lawyer who forged a will, or something of that kind?" asked Sir Owen.

She looked up at him, horrified by the words.

"You are making a grave mistake, Sir Owen," she said. "Mr. Lonsdale was falsely accused of having influenced one of his clients to leave him money but it was not true."

"True or not, I wish that I were in his place," said Sir Owen.

"Why?" she asked in wonder.

"Because you defend him. I wonder, if you heard evil spoken of me whether you would defend me?"

"Do people speak evil of you?" she asked.

"I suppose so," was the careless reply; "not that I care. Why should I care? Nothing of that kind matters to me. But I know they tell queer stories about me. They say I drink and gamble—they say that I——But I forget—I must not repeat scandal to you. Now if you heard these things said of me, would you defend me?"

"How can I answer you? You forget that I have never seen you before."

"Yet you defend this Lonsdale. Do you know him?"

"The Mr. Lonsdale who has suffered so unjustly is the father of the gentleman to whom you saw me speaking," she replied. "and is one of the oldest friends I have in Lilford."

"I suppose," said the Baronet, "that Lonsdale's son imagines himself a very handsome man. That kind of man always thinks a great deal of himself."

"Do you not think him handsome?" asked Violet, who knew well that her lover had the statuesque beauty of a Greek god.

"I never waste one thought on a man's face," he replied.

But Violet's quick instinct told her the awkward Baronet was jealous of the young lawyer.

Then the quadrille was over, but he would not leave her. She must go with him to have some refreshments—he was sure she felt tired. If he had only known, he would have sent all kinds of choice fruits over for the *fete*, but how could he foresee that the queen of society herself was to be present?

It was all flattery, but very pleasant flattery, when offered by a man worth forty thousand per annum. It was pleasant too to know that every one was looking at her, every one was thinking and talking about her. She could not help contrasting her present position with that she had occupied half an hour previously.

Felix Lonsdale had been but coldly received. No one seemed to forget that he was the son of a man whose fair fame was darkened by a cloud. The *elite* had not recieved him very kindly. Lady Rolfe had passed him with a bow; Mrs. Brownson had held out two fingers for him to shake, and had drawn them back very quickly; Mrs. Boulders had shaken hands with him and then looked round very quickly to see if any one had observed her. He had not been "cut;" no one had been pointedly unciyil, but he had been coldly received, and Violet had observed it even more keenly than he had himself, when she stood talking to him. She had a strange feeling as though she were in some manner sharing his disgrace—as though she, too, were under a cloud.

Now it was so different. Sir Owen's glory seemed to be reflected on her; people who had never troubled themselves to speak to her before, now were fulsomely polite to her. It was but reflected glory, she knew; but still it was very pleasant.

Sir Owen insisted on her taking some refreshment; he waited upon her as though she had been a princess; she could not tell how it was, but she seemed suddenly to have left far behind her the world of sorrow, pain, and disgrace in which, through sympathy with Felix, she had been living so long.

"Here is your friend," said Sir Owen; and, looking up suddenly, she saw Felix at the entrance of the tent looking wistfully at her.

At first something like impatience vexed her. It was such a magnificent triumph for her, he might let her enjoy it—he might have waited a few minutes. It was not every day that she was waited upon by a rich baronet and envied by other women; she might never see Sir Owen again, while all her life was to be spent with Felix. Surely he might have waited a few minutes longer; but no, he was coming to her, and her triumph was ended; she had no idea of resisting his will, and rose from her seat. Sir Owen looked at her in amazement.

"Are you going?" he asked. "I was just about to presume to ask if you would go with me to see the flowers; they have some very fine ones here, I am told."

She looked helplessly from one to the other. She did not know how to refuse such a tempting offer from Sir Owen; it would be an unequaled triumph for all the guests to see her—to see how proud and pleased he was to escort her through the grounds; but it seemed equally impossible to leave Felix, who had looked forward with such delight to this holiday with her. So the beautiful eyes glanced first at the one and then at the other, while the white fingers toyed with the pretty flowers she held up until their scented leaves fell on the ground. Felix cut the Gordian knot for her.

"Pardon me for the interruption," he said. "Miss Hayo was kind enough to promise me that honor."

He took Violet's hand, placed it on his arm, and led her from the tent.

The Baronet stood looking after them with more than amazement in his face.

"What unequaled impertinence!" he said. "The father of such a man as that would be capable of forging half a dozen wills."

"Oh, Felix," said Violet, "I am afraid you have offended him!"

"I do not care if I have, Violet. You are mine. What right has he to monopolize you? I know we are not married; but it is almost the same thing. You are my promised wife, and no one shall take you away from me even for one hour. Come away from all these people—I want to talk to you. Come down this avenue of chestnuts."

He mastered her by his stronger will; she went without one word. They walked slowly down the avenue of chestnuts, the sunlight glancing on her golden hair and white dress.

"Let me look at you, Violet," he cried, with the passionate impatience of a young lover. "It seems to me that that man's presence near you must have dimmed your beauty as poisonous air kills a delicate flower. Let me look at you, my darling."

He held her hand and stood looking at her, watching the radiant face with such love in his eyes that a woman must have had a marble heart to resist him.

"No," he said; "you are just the same. You must humor my fancies, Violet. Does not some one say that 'great love is semi-madness?' It is true. You must humor my fancies, sweet. Stand here; let this cool breeze blow over you—it will purify you from even the very breath and echo of his words."

She laughed a low, tremulous laugh, but the words touched her. She stood quite still, and the western wind kissed her face, played with her golden hair, showered the chestnut-blossoms over her.

"You shall not even have the echo of another man's words hanging over you, sweet," he said. "Now the breeze has taken it all away."

"Oh, Felix, how much you love me! It makes me tremble to think of it."

"You do not understand it even yet," he replied.

As she walked by her lover's side she could not help feeling the contrast. Who would ever—who could ever love her as this man did? Who in the whole wide world, she thought, had ever been so loved except herself? The memory of his words thrilled her; they stirred the inmost depths of her soul. How he loved her, this handsome, noble-hearted man! His very heart, his soul and life, seemed wrapped in her.

Even as she felt these things she could not help noticing the difference. When she had crossed the lawn with Sir Owen she had met nothing but bows, smiles, glances of admiration, ill-concealed envy and wonder. Now that she was once again with Felix no one noticed her, no one spoke to her. It was like being in a different world.

Sir Owen had been asked to play croquet, and had refused. He had taken a bird's-eye view of the party—four old maids and a hopeless schoolgirl. It was not in his line, he assured Mrs. Hunter. He would not engage himself in any particular way; he would only linger and wait, watching for the next glimpse of the beautiful face that had set his heart and brain on fire.

He saw her at last, standing with Felix watching the players at lawn-tennis, and the next moment he was by her side. Lady Rolfe, eyeing him, whispered to Mrs. Hunter—

"Sir Owen seems to be infatuated with Violet Haye. Some one should tell him she is engaged. Dear Mrs. Hunter, would you mind saying that I should like to speak to him?" And she smiled a well-satisfied smile when she saw the Vicar's wife deliver her message.

"You wished to speak to me," said Sir Owen, approaching Lady Rolfe with an air of ill-concealed impatience.

She saw that he looked annoyed, and had recourse to her favorite weapon—flattery.

"If it be to an elderly lady like myself to feel jealous, I certainly am jealous. We are old friends of nearly two months' standing, yet you have not spent five minutes with me. Sit down here, and give me your views about the *fete*."

Ungraciously enough he took a seat by her side. She saw him look with angry eyes at Felix and Violet; but Lady Rolfe was a woman with a purpose. It took much to daunt her.

"I have no views," he declared angrily. "I am quite tired of people with views."

"Clever men are all alike," remarked her ladyship, and his face softened a little at the words. "At least we have had a beautiful day," she said, "and beautiful music."

He could not deny it, or he would have done so. She continued—

"This is the first time that you have met your new friends and neighbors together. Do you like them?"

"They are very much like other people," he sneered.—[To be continued.

THE AFTER-DINNER SPEECH OF THE BARONESS CONTALETTO.

LOUISE STOCKTON.

In one of the most salubrious sections of Alaska there exists—or did exist in December, 1876—a society named "The Irreparables." It was composed of women only. For this there were several reasons. The subjects discussed were not supposed to interest men, but this might have been remedied had not the men, already in a minority in the village, absolutely refused to have anything to do with a society in which they were sure to be voted down without any very promising power of appeal. It was at one time suggested that they could become associate members, but the notary, upon examining their prospective position in the club, declared that their taxes would be so many and their rights so few that it was an offer not to be considered. So the matter was dropped, and an "Irreparable" was always a creature of the gentler sex.

The most important event in the year to this society was its annual meeting and festive celebration in December. Upon this occasion the members reviewed their accounts, perhaps voted in a new member, acted upon delinquents, and, in a word, settled up the business of the year. The festivities sometimes took the shape of a mothers' meeting, a quilting-party or a cozy little tea. In 1876 they were, however, affected by the excitement that prevailed throughout the whole United States, and which fairly reached them in December. Alaska, it was true, was not one of the thirteen colonies, but neither was Ohio nor Colorado. It was much larger than Rhode Island or Delaware. It had great possibilities, and it had cost money, which was more than could be said of the original thirteen, leaving out Pennsylvania, which even then could not be counted as a very expensive investment on the part of Mr. Penn. These patriotic reasons fired the hearts of the "Irreparables," and they determined that Alaska should celebrate the Centennial of their country, and that the celebration should be theirs.

Then the question arose of what nature this celebration should be. An exposition was clearly out of the question, and even a school-fair was voted troublesome. Some of the younger members favored a dance, but this was objected to because of the absurdity of a roomful of women waltzing and treading the light, fantastic German by themselves. It would seem, said the Baroness Contaletto, like a burlesque of merriment; and so the dance fell through. A service of song, a tea-drum, a cream-cornet, and a pound-party met the same fate; and finally all minds gently but firmly centered upon a dinner-party; and so it *was* a dinner with courses.

Naturally enough, it was not at first easy to arrange, but the admirable spirit of organization pervading the society soon brought everything into shape. There was a committee upon the bill-of-fare, upon the toasts, upon invitations, upon the room and upon the general arrangements. It was true that the only room in the village that was suitable was the little hall back of the tavern, and the invitations were verbally given at the meeting when the matter was decided upon; but as one never knows what emergencies may arise, it is always well to have a committee ready to act.

The chairwoman of most of the committees was the Baroness Contaletto. This was not because of her rank, as, in fact, she had no claim to her title either from birthright or marriage. Her claim rested upon the fine sense the village had of the fitness of things. She looked like a baroness; she always made it a point to behave like one. In the course of time they called her so, and when she added the name of Contaletto, the village acknowledged the fitness of that, and very soon the Baroness Contaletto was universally accepted, and Thisba Lenowski forgotten. The reason of her being so many chairwomen also rested on her fitness. She was a woman of ideas and of deeds. The minister's plans might come to naught, the editor's predictions be falsified, and the schoolmaster's reforms die out; but the enterprises undertaken by the baroness went through to a swift success. Her ideas were both contagious and epidemic, and she was always a known quantity in the place.

And so when she pooh-poohed the dance, laughed at the tea-drum and shivered at the idea of the cream-cornet, declaring for the dinner, the matter was settled, and each of the younger members promptly decided whom she would ask to escort her and deliberated as to what she should wear.

Then the baroness arose. She glanced around. She read the thoughts of the members. She looked at two women. One was the sister of the county clerk: she was a woman of the most appreciative character, the clearest sense, and—she was the faithful echo of the baroness. The second was a pretty girl. She represented the other pretty girls. Then the baroness spoke. She said it was of the first importance to do this thing decorously and in order. When the men had suppers they never invited women. They wanted to have a good time, and women spoiled it. She was not in favor of an "invitation entertainment." She supposed that what they wanted was a society, an "Irreparable" dinner. Therefore, she did not propose to invite men.

"But," said the pretty girl, with a rosy color mounting to her cheeks and an ominous flash in her eyes, "when I was in New Moscow I was invited to the Hercules dinner."

"To the table?" asked the baroness.

"Well—no," replied the pretty girl.

"Did you get anything to eat?" pursued the baroness.

"Oh, no," answered the victim, as if this was something preposterous—"of course I didn't. We did not expect anything. But I had a splendid seat, and I heard all the toasts and everything."

"That *was* very nice," answered the baroness, grimly; "but I think we can do quite as well. We will invite the gentlemen to the gallery—fortunately, there is one—we will have toasts, and *we* will be very entertaining."

Of course the baroness had her way. Here, at once, was an advantage in the absence of associate members. Rosy cheeks and pretty eyes now counted in the society for nothing, and when the sister of the county clerk promptly moved that no gentleman be invited to the floor, the sexton's wife seconded the motion. It was carried, and on the night appointed the "Irreparables" had their dinner, and up in the gallery sat the minister, the sheriff, the county clerk, the editor of the Snow-Drift, the head-teacher and a dozen other gentlemen, all in strict evening—if still Alaskan—toilettes. At first it was funny. Then it wasn't funny. It became tiresome, and the sheriff went away. His boots creaked, the ladies looked up, and then not a married man but smiled delightedly and settled himself in his seat.

They paid much attention to the wine. It had been bought in New Moscow of the Hercules Club, and was of course all right. Yet it was over the wine that the county clerk grew restless. It was not that he wished for it particularly, but when the "Irreparables" drank champagne with their soup, sauterne with the meat, ate their nuts and made their toasts with sherry, his patience was put to a severe test. It was something to see that most of the glasses went away almost untasted, but the head-teacher found it best to keep a steady eye upon him and save him from doing more than mutter his opinions.

But when the toasts came the gallery visibly brightened up. The "Irreparables" toasted the country and its resources, the United States, Mrs. Seward, the Centennial, Mrs. Grant, and the widow the chief alderman was to marry. They drank to Queen Victoria, and, with a remembrance of past loyalty, to the czarina. To each toast a member responded in terms fitting and witty, and when the pretty girl arose and, with a glance at the gallery, gave "The gentlemen—God bless them!" the baroness stood up and made reply. She thanked the company in the name of the gentlemen. She spoke of them in high and eloquent terms. She alluded to their usefulness, their courage, their good looks. She did them full justice as resources in times of trouble, of war and of midnight burglaries.

The county clerk ran his fingers through his hair, the color came into the cheeks of the clergyman, and a subdued murmur as of pleasure ran through the little group in the gallery.

Then the baroness continued. She said she was not a woman-suffragist—at least she wasn't sure that she was. She had, she thanked her stars, her own opinion upon most matters, but while she had no positive objection to right-minded women having any real or fancied wrongs redressed, and in their own way, she had not yet thought clearly enough upon the subject to be sure that the ballot was the remedy. She knew there was a great deal of nonsense talked about the moral influence women would exert in politics: perhaps they would, but to her it seemed very much like watering potato-blossoms to get rid of the worms at the root.

Here the county clerk half rose, but the head-teacher held him with his disciplining eye, and he sat down again.

What was needed, said the baroness, was not mending, regenerating, giving freedom or doing justice. These things were all very good, but more was necessary. "There is no remedy," she said, with rising inflections and with emphasis—"no remedy but a total change. What we want is not an extension of the suffrage, but a *limitation!*"

She wished it, however, distinctly understood that she in no way meant to affirm that woman was man's superior; she did not think so. In his own place man could not be surpassed. The sciences, the arts, the industrial pursuits, religion, civilization, all owed a deep debt to a man, and it could not be ignored. She was the last person in the world to wish to ignore it. Properly governed, disciplined and educated, his development might outrun hope, defy prophecy. Out of his place he was a comet without an orbit. Drawn hither and thither by sinister stars, he was an eccentricity beyond calculation and full of harm. For this reason the interests of humanity demanded that the place of man in the conduct of affairs should be well defined and limited. It was well to look this matter in the face.

"Now," proceeded the baroness, "I leave it to any class of men, to any one man, to declare whether the world is, or ever has been, well governed. Is there any age, any country upon record, where justice has reigned, where the interests of every class have been consulted, and where the people have lived together in mutual esteem, in unity and in prosperity? If we look through the world to-day, we find but one country that is governed in anything like a satisfactory manner. It is loved by some classes of its people, and admired by very many foreigners. When we reflect that it is governed by a queen, and that history tells us that its most prosperous period in the past was under Queen Elizabeth, it is certainly safe to assume—No, no, my friends," she said, hastily, "do not applaud. That is not my point. It is possible that women may govern better than men, but that is yet to be tested. This illustration proves but one thing—*that a country is better for not being governed by a man.*"

Her point was this: she did not appear as an advocate of suffrage for women, but as an earnest petitioner against its being any longer held by men. The one thing a man could *not* do was—to govern! This was no assertion. It was a fact proved by all history. Since the beginning of the world men had the governing power in their hands, and what a mess they had always made of it! There had never been a decent government. Oppression, rebellion, anarchy, war, bloodshed, slavery and tyranny,—this was their record.

If women could do anything better, she was in favor of giving them the opportunity of proving it, but it was not her purpose to propose the after treatment. She was not a physician in charge, but the surgeon for the moment.

She had made suggestions: she freely confessed it. She had, for instance, proposed to their talented townsman, the editor of the Snow-Drift, a series of articles upon the existing Presidential contest. As far as she could learn, there was a great lack of unanimity regarding the vote, and it was not clear to the Hayes party that Tilden was elected. Now, she had suggested that there were certain classes concerned but *not* consulted in the election, and to them she proposed leaving the decision. The legal voters had blundered horribly in some way, and she would have been in favor of allowing the Indians, the Chinese, the convicts, the idiots *and* the women to decide the matter. It could not be made worse, and it might be made better.

But leaving all these questions of a past hour, she would put the axe where George Washington did not put it—at the root of the tree—near enough also, she would remark, to leave no stump, and so at once place politics upon a new basis by taking the governing power away from the gentlemen, God bless them!—*Lippincott's Magazine.*

Domestic Economy

CONDUCTED BY EMILY MAPLE

HOUSEHOLD CONVENIENCES.

"A PLACE for everything and everything in its place," is rather a hackneyed saying, but, after all, it perfectly describes the domain of a good housekeeper.

As much attention should be given to the kitchen as to any other part of the house. A busy housewife spends a large amount of time in that room, and she should strive to render it a pleasure and not a dread to enter it. A great convenience in the kitchen is a roomy wall pocket. It may be made very nicely of common, brown card-board, bound with scarlet braid, having three pockets—a large one at the bottom, and two smaller ones above. In the larger one may be put dusters, towels, etc.; in the others string, rag for ents, and other small articles. Another convenience is a bag for dirty towels and dusters, which may hang in a closet in the kitchen. It saves much time and labor on washing-day.

Always have a match safe and scraper in the kitchen. It saves much disfigurement of walls. Get your tinman to make you tin boxes with tight-fitting lids to hold yeast cakes, tea, coffee and spices. They preserve the flavor. A large apron made of oil cloth, and bound with braid, is useful when washing clothes or dishes. Squares of zinc or tin are useful in the kitchen for standing saucepans on. If you are without ice in the summer, keep drinking water in unglazed earthen-ware jars or pitchers. The evaporation and condensation of the water on the outside of the jar will keep its contents cold. "SARAH GAMP."

USES OF AMMONIA.

I DO not know of an agent that can be put to so many household uses, as ammonia, or hartshorn, as it is sometimes called. In cookory, there is no alkali that is equal to it. A small teaspoonful of sal volatile (carbonite of ammonia) in powder, and the same of alum, to one quart of a mixture—bread or cake—will rarely fail to make it light. Both must be dissolved, but separately, in as little warm water as possible and added just before baking. Many recipes in cookory books written thirty years ago and even later, call for sal volatile instead of salaratus, or bi-carbonate of soda.

A large spoonful of liquid ammonia to each gallon of suds, in which woolen fabrics are to be washed, will make them clean and soft, with half the labor necessary for washing in the ordinary way. Hartshorn, sufficiently reduced with soft water, is unequaled for cleaning silver and gold, mirrors, window glass and all painted surfaces. A little ammonia, so little as to be hardly perceptible in the water used for plants in winter, will make them wonderfully thrifty. If the color is taken out of cloth, either cotton or woolen, by acids, it can generally be restored with hartshorn, slightly weakened. Applied in full strength to the bites and stings of insects it gives instant relief. Both liquid and powdered ammonia should be kept in bottles, with glass stoppers. The odor of hartshorn is agreeable to most persons, and it is strange that any housekeeper who understands its properties, will ever be without it. M. G. R.

Iowa.

RAG-CARPETS.

I FULLY endorse May Maple's statement respecting rag carpets. I know there are so many now-a-days who say:

"Oh! you had better throw away your rags and buy a carpet than to fuss to make one." I have not kept house but a few years and have not, as yet, made a carpet, but am saving all my rags to make one within the next year. I bought a carpet the first year I went to housekeeping. Mother had just made one, and we counted up the cost of hers and found it cost more than mine. She said, "Well, I shall never make another rag carpet." A year from that time her carpet was good, while mine was faded considerably, for I disliked to keep the curtains down and the sun out. As mother had a family of growing girls, she soon collected a lot of worn, bright-colored dresses. She said, "it seemed a pity to put them in the paper rags," and the result was she made fifty yards of very pretty carpeting, while her other carpet is good yet. I have noticed as a general thing, that it is the warp and not the rags which wears out first. If one would therefore take pains in buying the warp, I believe a rag carpet will outlast two which are boughton. I have a friend living in town who has a rag carpet upon her parlor floor, and I wish that every woman who objects to rag carpets could see it. I know if it were mine, I should rather have it than any carpet I could buy for a dollar a yard. My sister just remarked, "That even an old rag carpet, if it is clean, looks better and is much to be preferred to a bare floor." Again, a rag carpet shows that a woman is industrious and not afraid of work. ELLEN.

Clymer, N. Y.

BED-QUILT PATTERN.

IN reply to Mrs. Mary Olin, I will say that if she examines honey-comb work of bees, and cuts a piece exactly like one of the cells, she may have a pattern which will suit her for a variety quilt. Before piecing, cut quite a number and lay them down in forms, arranging according to her fancy. In my quilt like this, I put them together so that the pieces ran crosswise, corner to corner,—first a light and then a dark stripe. This kind of work looks well in rugs, made of thick cloth, with each piece corded with some bright color and then sewed together. I use the best parts of old coats and pants, with now and then a piece of bright woolen. These pieces are quite difficult to set together, as one must not sew within a seam of each side before joining on another piece. I had to put mine together two or three times before I could get them to suit me.

LIBBIE E. JONES.

CHEAP CARPETING.

I KNOW of a cheap kind of carpeting which I would like to make known to my rural sisters and all those who find it necessary or wise to economize on floors, as well as in other matters. After all, it may not be so new as I think, but I am going to tell what I know about it. Buy wall paper, that which comes in stripes or diamond-shaped patterns, is prefered; paste to a lining of old cloth of almost any kind, fitted to your floor, and cover with coats of varnish. For halls and chambers, or any floor which is not constantly under the tread of feet, this is a cheap and pretty carpetting, looking like oil cloth, but being very much cheaper. It will last two years with careful using. AUNT EM.

DOMESTIC RECIPES.

Cabbage Toast.

ONE medium-sized cabbage chopped fine and cooked tender in a little water; add two or three quarts of sweet milk and season with plenty of butter, pepper and salt. Prepare the toast in the usual way and pour over it the above mixture. Serve at once.

Force Meat.

One and one-half pounds of cold boiled ham, about one pound lean and the remainder fat; chop very fine and while chopping add three fresh eggs; season highly with pepper and salt. A few onions might be added if you are fond of them. Mix thoroughly and make into little round cakes. To be eaten with bread and butter.

Onion Dressing.

Take pieces of dry bread and pour over them boiling water; let soak until soft, then mix with the hand and season with butter, pepper, salt and a few onions chopped fine. Heat the dressing but not enough to cook the onion. I usually add the onions after the dressing is warmed through—mixing thoroughly.

MRS. E. H. SARGENT.

Oswego Co.

Oyster Soup.

Take one quart of liquid oysters; drain the liquor from them and add as much more water; a teaspoonful of butter, and a teaspoonful of rolled crackers to each person; put on the stove and let it come to a boil; the moment it boils pour in your oysters, having ten, or at least six, to each person; watch carefully and the moment it boils, count just thirty seconds by your watch and then take them from the stove; have the soup tureen or large dish ready with two tablespoons of rich, cold milk or sweet cream for each person; pour in your stew, adding salt and pepper to taste. Never boil an oyster in milk if you want it good. Salt should always be put in the last thing in any soup, fricassee or stew where milk is used, as it is apt to curdle the milk. MRS. MARY OLIN.

Yates Co.

News of the Week.

Monday, Nov. 18th, 1878.

POLITICAL.

The republicans boast that they have only to carry, in 1880, the States which in October and November, this year, have gone republican, to elect their President, despite the solid South. The republican States and their electoral votes are: Colorado, 3; Connecticut, 6; Illinois, 21; Iowa, 11; Kansas, 5; Maine, 7; Massachusetts, 13; Michigan, 11; Minnesota, 5; Nebraska, 3; Nevada, 3; New Hampshire, 5; New Jersey, 9; New York, 35; Ohio, 22; Pennsylvania, 29; Rhode Island, 4; Vermont, 5; Wisconsin, 10; total, 207; necessary to elect, 185. In the next Congress the democrats will have 43 Senators, counting David Davis, and the republicans 33, counting two from Nevada. Eighteen States will send two democratic Senators each, and thirteen States will send two republican Senators each. The seven whose representation will be divided are: California, Connecticut, Illinois, Louisiana, Mississippi, New York and Pennsylvania. The latest returns from the congressional districts show republicans 133, democrats, 141, greenbackers, 15. Among the greenbackers are four republicans. Later returns from Missouri and Florida may show three more republicans. It is also claimed that one independent in Alabama is a republican. Should the California election result in favor of the republicans, they and the democrats will be very close in the House, and in any event, the greenbackers will hold the balance of power.

MISCELLANEOUS.

Despite the hard times the number of immigrants for the year ending last June was 138,469, of whom Germany furnished the largest number—29,313, though Great Britain and her colonies sent us about 65,000, 16,000 of whom were Irishmen and 25,000 Canadians. There were 9,000 of the Chinese Kearney wants to drive out; 10,000 sturdy Northmen, about 4000 each from Italy, France and Hungary, but only 11 representatives from the whole of Africa.

While Gov. Hampton of South Carolina, with some friends, was hunting deer near Columbia, last week, a mule he was riding became frightened, and the bridle breaking, the governor leaped from the saddle, and his right leg was broken in two places below the knee, so that the bones protruded, and the ankle was badly hurt.

James Murray has taken his family from Gilbertville, N. Y., to his South African farm of 37,000 acres, which is stocked with 1000 ostriches and 300 mares of rare blood and pedigree. Murray was a classmate of the prince of Wales at Oxford, and now finds ostrich raising so profitable that he recently sold 60 birds at Cape Town for $27,000 and a pound of feathers for $860, or $8 a feather.

A T. Stewart's body has not yet been discovered despite the best efforts of private detectives, official detectives and the host of amateur detectives whom the hope of the $25,000 reward has urged on in the search. Numerous letters have been written to the newspapers and to Judge Hilton, Stewart's business man formerly and now Mr. Stewarts business representative, offering to disclose the whereabouts of the corpse for various sums, ranging from $10,000 to $500,000, but nothing has hitherto come of them. While all classes are bitter in their denunciations of the scoundrels who desecrated the grave of so prominent a citizen, and, as it were, sympathize with his remains, there is among many very little sympathy with the real or affected grief of those who, in the opinion of these callous-hearted worthies, pettifogged the poor working girls of this city out of the $3,000,000 the dead merchant left invested for their benefit.

FOREIGN.

The sum of $450,000 has already been subscribed by British generosity for the relief of the impoverished stockholders of the City of Glasgow Bank, and efforts are being made in their behalf to induce the depositors in the bank and other creditors to accept seventy-five per cent. of their money, so as to bear a little more lightly on the stockholders, whom the law forces to pay up to the uttermost farthing. With regard to the new tangle about the Fishery Award, between Great Britain and this country, Lord Salisbury, the English Minister of Foreign Affairs, yields to Mr. Evarts' arguments that local laws made in Newfoundland after the completion of the treaty by which our fishermen gained the right to fish in adjacent waters, could not be made to operate so as to lessen the rights guaranteed by that treaty. This conceded, the award of $5,500,000 will doubtless be paid to the British Treasury on or before the date on which it falls due—Nov. 23; and afterwards demands will be made by us for compensation for the losses inflicted last January on our fishermen by the irate, pious and jealous Newfoundlanders.

Prince Hadji Abdullah Singh has arrived at Vienna on his way to London. He is *de jure* sovereign of Oude, from which kingdom he was banished in 1860, at the close of the campaign which resulted in merging that province into England's Indian empire. The object of his journey is to solicit permission from Queen Victoria to return to his native land. As a guarantee of his loyalty and future good behavior he offers to deposit $150,000,000 in the Bank of England. Princess Thyra, of Denmark, lately said to have been betrothed to the Prince Imperial of France, turns out to be so related to the Duke of Cumberland, one of Queen Victoria's sons. She is exceedingly tall, and 25. He is of medium-size, and 33. They are said to have met about three years ago in Rome, and to have become greatly attached to each other there. It is said further that the Princess of Wales espoused the cause of her sister, and that to her is due, in no small measure, the present result which promises a happy future to the young Princess, who with her husband will live the greater part of the year in England. It's not improbable that there will soon be a gold fever in British India. Sir Andrew Clarke, a member of the vice-regal council, has examined the Wynaad district in Madras, and declared it highly auriferous. Miners have been brought from Australia, and great results are anticipated. Within an area of twenty-five by thirteen miles ninety outcrops were discovered of auriferous quartz from two to four feet thick, yielding from a few pennyweights to 200 ounces per ton. The richer stone shows, when broken, fine and coarse seams and jagged pieces the size of a pea. In some reefs much of the stone will probably not pay for working, but it is believed that, on the whole, a very large and profitable industry will be insured with the aid of capital and good management. Wynaad is healthy and pleasant for Europeans nine months of the year, but fevers prevail during three.

Poverty in Germany is to-day greater than it has been for years. For instance, since the year 1875 indigence has constantly increased in the capital of Germany. In that year the city gave regular pecuniary relief to one inhabitant out of ninety-two; in 1876, to one in eighty; and in 1877, to one in seventy-four. According to calculations already made, the number of poor has again increased during the present year. These figures only concern what is called public assistance, that is to say, the help Berlin is bound to furnish to the indigent persons who have their legitimate domicile in the city. In the above calculation are not included the people who are suffering from poverty, but who are ashamed to ask for help. Although the funds for benevolent purpose in Berlin are considerable (they amounted to 6,736,000 marks—1 fr 23c. each—in 1877), that city occupies, as far as regards public assistance, a rank much inferior to that of other places in Germany, such as Hamburg, Bremen, etc. The municipal hospital in the capital is insufficient for all the patients who require succor, and the city is obliged to pay for the sick it places in the royal asylum called "Charity" a monthly subvention of about 60,000 marks.

The Russian papers announce the return of the river Amu Daria to its original bed. The Moscow Gazette thinks all that is now necessary is to make this change definite, and thus create a new route to India, the shortest and easiest, to secure the connection of the Russian possessions in Central Asia with the rest of the empire. A Berlin special says it seems certain that several thousands of former Russian soldiers and officers have been permitted to volunteer and start for Afghanistan. Telegrams from northern and eastern Europe announce heavy falls of snow. The Appenines and Black Forest are covered and the Swiss passes are blocked. In France the rivers are very high, and the Seine threatens inundation. In Italy the waters of the Tiber are rising and have already overflowed the river's banks at Rome. The lower part of the city is inundated, and it was expected that during last night the flood would become nearly as widespread as the disastrous one of 1870. There have been violent storms throughout Central Italy. The damage caused by them is almost unparalleled. Travel on all the railways between Rome and the North is interrupted.

The cost of the Austrian occupation of Bosnia, up to the middle of October, has been reckoned by the Vienna Press to have reached 85,000,000 of florins, or equal (at the par of exchange) to $42,500,000. Should it be necessary to maintain the occupying force at so large a number as 200,000 men, the additional expense, from the middle of October to the close of 1878, would not be less than 75,000,000 of florins, or say, $37,500,000. It is difficult to see in what manner Austria is getting any material compensation at all equal to this expenditure.

The prospects of working people in Great Britain during the coming winter are anything but cheerful. The season promises to be unusually cold and severe there and throughout Europe. Snow-storms of exceptional severity for this time of the year have occurred in the North and Northwest of England and throughout Scotland, while labor troubles and business depression were never so alarming. Eighteen iron firms of Ashton, Hyde, Stalebridge, Newton and Guidebridge have given notice of their intention to reduce the wages of skilled workmen two shillings a week and of unskilled workmen one shilling a week, after November 14. Donner & Co., East India merchants, have failed. Their liabilities are $500,000. The cotton manufacturers at Glasgow have resolved to reduce the working hours in their establishments one-third. This will affect 8,000 employes. The Bolton cotton spinners have decided to make a reduction of five per cent. in the wages of their employes. The enforcement of the Bolton masters' resolution is dependent on the concurrence of the masters owning two-thirds of the spindles in the district which includes Bolton, Leigh, Tyldesley and Atherton. Eight thousand operatives in Blackburn, who are out of employment, are organizing a meeting to express indignation at the paucity of the parish relief.

Two attempts on the life of the Emperor of Germany and one on that of the King of Spain, all three within a few months, have just been supplemented by a determined attempt to assassinate King Humbert, of Italy. During a grand entry into Naples between two and three o'clock yesterday afternoon, an ill-clad man rushed to the royal carriage containing the king, queen, and prime minister, Cairoli, and attempted to poinard King Humbert. The latter received a slight scratch on the arm, but drew his sword and struck the would-be assassin on the head, while Cairoli caught him by the hair, receiving a wound in the thigh. The guards then rushed in and secured the fellow. His name is Giovanni Passanante, 29 years old, a cook, belonging, he says, to no society, poor, and therefore a hater of kings.

PUBLISHERS' NOTICES.

WE confidently refer our readers to the card of Dr. C. R. Sykes, in our issue of Nov. 9. Mr. F. W Jones of the Chicago Farmers' Review says: "Dr. Sykes is an old resident of Chicago, a regular graduate, honest, honorable and responsible, and as a physician takes first rank in his chosen specialty of catarrh and its complications."

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 16, 1878.

BEANS AND PEAS.—The bean market obtains some strength through the firmness in potatoes, the effect noticed locally. Exporters are using a good share of stock, Cuba, South America and Spain now taking considerable quantities. Low grade quality of any sort are dull, the run being chiefly for best priced hand-picked. Mediums, choice, $1 60@1 65; fair to good, $1 50@1 55; marrow, choice, delivered to vessel $1 70; fair to good, $1 50@$1 60. Pea beans and white kidney are a shade higher, ranging $1 65@1 85. Red kidney in demand for deep colored at $2@2 10; pale parcels, $1 75@1 90. Black or turtle soup, $1 65@2 00. Canadian field peas, bulk and bond,

Green peas easier, $1 25. Southern B. E. peas, per 2 bush. bag, $2 40@2 60.

Receipts of beans for the week, 9,440 bush., exports, 585 bbl.

BUTTER.—There is no special variation in the style of trade to be noted; fine grades are active and low neglected. Supplies of best quality have kept steadily liberal, and free access to lines and lots gives a shade of easier prices to State. The market has dropped 1c. from our last outside rates. Dairies are in demand when fine. The West latterly has shipped quite heavily but a good deal misses sale owing to inferior quality. Western creamery is

working into its cold weather position of leading the demand for extra. Recent good rates for both State and Western have started a good deal of butter this way, and if supplies keep the rate of the past two or three days sellers will be forced to humor buyers to a greater extent than the noted decline.

Welsh dairy, pails and half tubs, choice, 21@23c.; dairies, 17@19c.; selected full, 21c.; other, 15@18c.; good, 19@20c.; creamery, choice, 25@27c.; good to prime, 22@24c.; early packed, 18@20c.; low grades of State, 10@14c. and dull. Western makes good prices when fine but the bulk of the offering is cheap. Creamery ranges 22@26c. good to fancy; 17@20 early packed. Selected dairy, 15@17c.; good to prime dairy and nice ladle-packed factory, 12@14c.; other factory including milled, 6@10c.; rolls, prime, 18@20c.; other, 10@16c.

Receipts for week, 34,000 pkgs.; exports, 7,176 pkgs.

CHEESE.—The shipments for the week have been 33,989 boxes. The grade most wanted has been fancy factories, which has brought 9c, promptly, and special lots 9¼c.; these figures showing no change from last week. The good grades and under are easy in price and move out slowly. The receipts have been much larger this week, and they have chiefly gone in store.

Quotations are at 9c. for fancy, and special lots at 9¼c.; 8¾@8¾c. for fine lots; 7@8c. for good and prime; 6@7c. for fair to good; 3@5½c, for skimmed. State, farm dairy at 8@9c. for good to choice, 6@7½c. for fair to good. Wisconsin factory, fine to fancy, 8¾@9c.; do. good to prime, 7@8¼c.; do. fair to good, 6@7c. Western factory, fine and fancy, 8¼@8¾c.; good and prime, 6@7½c.; fair, 5@6c.

Receipts past week, 71,637 boxes.
Exports past week, 33,901 boxes,
Gold closes at 100¾.
Liverpool cable 47s.

COTTON.—There has been a fair degree of activity, but prices fluctuating in sympathy with the Liverpool advices, generally to a lower basis; latest prices are at 9.37@9.37c. for November; 9.40@9.41c. for December; 9.53@9.54c. for January; 9.65@9.66c. for February; 9.77@9.78c. for March; 9.89@9.90c. for April; 10c. for May; 10.09@10.11c. for June, and 10.17@10.19c. for July,

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade bove or below the grade quoted:

	Uplands.		*Ala.*		*Orleans*		*Texas.*	
Ordinary	7	¼	7	⅛	7	⅛	7	⅛
Strict ordinary	7	15-16	7	15-16	8	3-16	8	3-16

Stained.

Good ordinary	7⅝	Strict good ordinary	8⅛
Low middling	8⅝	Middling	9

DRIED FRUITS.—Apples are easy and unsettled in price, with moderate operations. In peeled peaches fancy lots are higher and in considerable demand, with light supplies. Blackberries and small fruits generally are better.

Southern Plums, 13@13½c.; State plums, 15@16c. Blackberries are quoted at 5¾@5¾c. Peaches—Peeled Georgia, at 6c. for poor; 8@9c. for fair to good; 10@10½c. for prime; choice North Carolina, 11½@12½c.; good do., 8@9c.; unpeeled new halves, 3@3½c.; quarters, 3@3½c. Pitted cherries, 20@22c. Apples—Old State quarters, 2½@3c. New apples, 2½@3c. for southern quarters in bbls.; 4½@5½c. for prime sliced, and 6@7c. for fancy; State at 4½@6c. for prime sliced; western at 3@3½c. for new quarters. New raspberries, 30c.

Exports, past week, 400 bbls. apples.

EGGS.—A few days of high prices checked the grocery trade, and that demand should soon become a feature. A good many limed are in the receipts, and when they are prime their comparatively low price brings them trade. Near points 27@28c.; State and Penn., 26@26½c.; fresh Western and Canadian and Southern, 25@25½c.; poor fresh, 24c. Limed N. Y. and Canada, 17@18c.; Western, 16@17c.

Receipts for the week, 11,231 bbls.; do. last week, 6,888 do.

FLOUR.—There has been a fair degree of activity, largely on local trade wants—the exports demand having fallen off, and prices ruled steady.

Latest prices are: $3.15@3.75 for very inferior to choice superfine State; $3.75@3.25 for poor to good extra do., odd lots and lines; $3.25@4.25 for good to very choice do., strictly choice and fancy lots above this; $3.15@3.75 for very inferior to choice superfine Indiana, Iowa, Michigan, &c.; $3.75@3.95 for ordinary to good shipping extra do. and $3.95@4.25 for good to choice extra do.; common to about choice white wheat extras, $4.00@5.00; choice to strictly fancy do. at $5.00@5.85; red and amber winter wheat, very inferior to choice trade and family at $3.85@5.50; round hoop Ohio at $3.80@4.15, and trade and family brands of do. at $4.20@5.65, the latter rate for very choice; St. Louis, $4.00@4.75 for very poor to good extra, and $4.75@5.75 for good to very choice; Minnesota clear, very inferior to very choice, $3.75@5.15; few brands going above $4.65; Minnesota "straight," inferior to very choice at $4.65@5.75; and patent fair to fancy at $5.25@8.50; unsound stock at from $2@4.75; city mill extra at $4.75@5.00 for West Indies (the latter rate for fancy in new packages); do. for England, $3.75@3.90; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.60 for fair to very choice; No. 2 at $2.35@3.00 for very inferior to choice.

CORN-MEAL.—Sales at $2.85 for Brandywine and $2.15 to $2.65 for yellow Western.

FRESH FRUITS.—A good grade of winter apples has arrived latterly, and dealers begin to store safe sorts liberally. There is, however, an abundance to supply a fair local and shipping demand, at very easy prices, quality considered. A few extras quoted $2 and $2.25, but choice Spitz. will not command above $1.50@1.75 in a load way. Greenings Spys and Baldwins, $1.12@1.25; a few of the last, $1.50. Some common stock quoted 75c.@$1. Exports for week. bbls. Catawba grapes are the only quotable ones, 6@7c., all pkgs. Quinces gone. Fla. oranges, $3@5 per ½ bbl. box; quality not extra. Cranberries are weak, the grocery demand of the latter part of this month, however, may help them. Cape, bbls., $6@7; N. J. do., $4@5; crates, prime, hard, high-colored, $1.75@2; fair to good, $1@1.50. Chestnuts, $3.75@4 per bush., including Southern. Hickory nuts, choice, $2.25@2.50; common, $1.25@1.50. Peanuts slow at easy rates. Hand-picked Va., $1.15@1.20; other, 90c.@$1.05. Cal. pears, E. Beurre, Glout Morceau, W. Nellis, $4@4.50 per box. Pounds and Vicars, $3@4. Tokay grapes, $7@8, 40 ℔ case; Muscat, 6@7; Black Morocco, $7. Quinces, $3 box.

Exports, apples, past week, 14,400 bbls.

FURS AND SKINS.—The catch of some sorts is said to be early, and quotations will soon be given.

GRAIN.—Wheat has had less export demand and has ruled easier.

Latest sales are, of No. 1 red at $1 07@1 07½; No. 2 red, at $1 06¾@1 06¾; do. steamer grade at $1 04@1 05; No. 3 red at $1 02@103; ungraded red at $1 02@1 07; No. 2 amber at $1 03¾@1 04; ungraded amber at $1 05@1 08; extra white at $1 10¾@1 11; white State at $1 09@1 10; No. 1 white at $1 06¾@1 08, mainly at $1 07¾@1 08; ungraded white at $1 06@$1 11; No. 1 white, steamer grade, at $1 08; No. 2 white in lots at $1 03@1 04¾; No. 3 white, steamer, 97½c.; ungraded spring at 83¾@89c.; No. 2 spring at 86@88c.; No. 1 red, to arrive, at $1 07¾; No. 2 red, November option, at $1 06¾@1 07; do., December option, at $1 06¾@1 07; do., January option, at $1 07¾@107¾; No. 2 amber, November option, at $1 04@1 04¾; do., to arrive last ten days in November, at $1 04; do., December option, at $1 04¾; No. 1 white, to arrive, at $1 07¾@1 08. Rye at 58@59 for No. 2 Western, and 60@61c. for State. Corn is offering lower on larger supplies and a fair trade; latest sales are of steamer mixed at 45@46¾c.; New York No 2 at 46¾@46¾c.; New York No. 3 at 43¾@44c.; New York No. 2 white at 52c.; ungraded mixed at 43@45¾c.; New York No. 3 at 43¾@44c.; New York No. 2, York No. 2, November option, at 46¾@46¾c.; do., December option, at 46¾@47c.; do., January option, at 47¾c.; steamer mixed, November option, at 45¾@46¾c.; do., December option, at 45¾@45¾c.; do., January option, at 45¾@45¾c. Oats are higher on light receipts and a fair trade demand; latest sales of New York No. 1 at 31¾c.; New York No. 2 at 31¾c.; New York No. 2 white at 33¾c.; New York No. 3 at 30¾c.; New York No. 3 white at 31¾@32c.; white western at 32@36¾c.; mixed do., at 30¾@32c.; white State at 32@37c.; mixed do. at 31@32c.; No. 2 Chicago quoted at 31¾@32c.; New York extra white quoted at 40c.; New York No. 1 white at 34¾@35c.; New York rejected at 29@29½c. Barley and barley malt dull at old prices, four rowed 94@96c.; late sales representing lots to arrive.

HONEY.—Although the season is ripe for use the market is dull and really good comb is offered lower. Single-comb boxes, 15@16c.; two do., 13@14c.; buckwheat, 10@12c.; strained, 6@12c., as to purity.

Exports, 596 boxes.

HAY AND STRAW.—The lower grades are in ample supply and easy in price; the better qualities are wanted at steady prices. Sales at 35@40c. for shipping, and 65@75c. for retail qualities. Straw quoted at 35@45c. for long rye, and 30@35c. for short rye.

HOPS.—Emmet Wells, in his weekly circular, says: "The call for nearly 1,300 bales for export to London this week has given impetus to the trade and caused a much better feeling Prices remain steady at late quotations, though it is believed that if the present lively export movement continues more money will soon be asked for choice hops, which are anything but plenty. Holders of low and medium grades, we think, will do well to take advantage of the present activity, and not hold for an advance, for this class of goods largely predominates, both here and abroad, and there is little or no chance of doing better by holding. Holders of choice export hops, on the other hand, stand a good show of getting more money than the present currency, and can afford to be a little independent and not force their hops upon the market now. The scarcity of fine hops, the world over, is sufficient to insure better prices than now rule. Consumers who can't see it in this light now probably will see it as the season advances, for late advices from London fully confirm the early reports of a shortage of prime hops of English growth, and the high prices asked for German hops preclude the possibility of England getting enough from that country to make up her own deficiency. America, therefore, must come to the rescue. New Pacific coast hops have changed hands this week at from 12 to 15c. ₱ ℔.

Quotations are for New Yorks, new crop, choice to fancy, 13@15; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, low to fair, 8@10; Eastern, new crop, 10@12; Wisconsin, new crop, 10@12; Yearlings, growth 1877 (nominal) 5@7; Olds, all growths, 2@4; Pacific coast, 12@15.

POULTRY AND GAME.—Quotations for cooped poultry ought to indicate how little is wanted. Chickens are unprecedentedly cheap; Western, 5@6c.; others, 7@8c.; fowls, quoted 6@8c.; roosters, 4@5c.; turkeys, 6@8c'; ducks, 40@90c., pair; geese, $1@1.50.

Dressed poultry is assuming seasonable activity. With low prices for prime, it is difficult to dispose of inferior or even bad-looking stock. Careful dressing is of great help to sales and new shippers should inform themselves as to the desirable style of this market. By all means avoid pin-feathers and over-scalding. It will be seen that prices are low, but a rough end of the crop is apt to come here this part of the month. To those whom this paper will reach timely, we repeat that stock intended for Thanksgiving market should be here two or three days before the 28th. Small turkeys are mostly wanted for that festival. Turkeys, choice, 11@12c; good, 9@10c.; poor, 7@8c., the latter mostly for western. A few dry picked, 13c.; fowls and chickens bear about the above quotations. Ducks, near points, 12@13c.; other, 8@11c; geese, choice, 12c.; other, 8@11c.

Game arrives rather faster than it can be used, and prices are decidedly in buyers' favor: a good many poor quail are included in the receipts; selected quail, doz., $1@1,25; soft do., 50@75c.; grouse, drawn pair, 40@50c.; undrawn 60@70c.; partridges, State 65@75c.; other, 40@50c.; woodcock, 35@50c.; tame squab, doz., $1.75; plover, 95c.; English snipe, $1@1.25; canvas-back ducks, Havre de Grace pair, $1.25; western, 75c.@$1; red head, 30@40c.; H. de G. do., 40@50c.; Mallard, 35@40c.; Teal, 25@30c.; common, 20@25c.; hares, pair, 25@30c.; rabbits, 20@25c.; Venison, whole deer, 8@9c.; short saddles, 14@16c.; long do., 13@14c.

OIL-CAKE quoted at $23 for Western, with fair supplies.

PROVISIONS.—Hog products have generally fluctuated, and closed easy, but a more active export demand. Mess pork quoted at $7.60@7.65 for spot lots; $7.55@7.60 for November $7.50@7.55 December and $8.80@8.85 for new for January. Bacon at 4¾ for long clear and 4¾c. for short clear. Lard at $6.27½ for Western steam on spot; $6.25 for November and December; $6.32½ bid for January and 6.40 for February. Tallow at 6¼ for prime. Stearine at 6¾@6¾. Beef Hams at $15@15.50. Beef—Extra India mess, $20@21 for city brands; do. Philadelphia, $18.50@19; packet at $11@11.50; new plain mess at $9.50@10; new extra mess at $10.50@11.

SEEDS.—Grass are in better demand; clover at 7@7¾c. for best lots; timothy at $1.20, for prime. Flaxseed at $1,40 bid.

TOBACCO.—Seedleaf is especially active on local trade account and at firm prices. Kentucky leaf has a fair sale and is not changed. Quotations are

LIVE STOCK MARKETS

Saturday, Nov. 16, 1878.

BEEVES.—Receipts for the week, 10,432 head do. last week, 10,468 do. The market has been dull and pointless; at the close it was difficult to hold last Wednesday's prices. The range was 6¾@8¾c. to dress 55@56 lbs., sales mainly at 7¾@8c., same dress.

SHEEP AND LAMBS.—Receipts for the week, 23,775 head; do. last week, 28,000 do. N. J. Sheep, 4@4¾c.; western, 3¾@4¾c.; ewes, 3¾@3¾c.; lambs, 4@4¾c. These low rates are mainly attributable to the medium quality of stock.

SWINE.—Receipts for the week, 39,190 head; do., last week, 51,402 do. Market steady for live, at $3.20@3.35 per cwt. W. J. dressed hogs, heavy to pigs, 4@4¾c.; city, 4@4¾c.

VEAL CALVES.—A fair trade has ruled at 6¼c. for extra N. J. milk. State, 6¼c. do.; other, including 200 and 300 lbs. weight, 5@6c.; fed calves, 3@4c; grassers, 2¾@2¾c. Hay dressed calves, 7¾@9c.

COWS AND CALVES.—Receipts have included a number of strippers, quoted at $20@30. Fresh cows quoted at a range of $45@60, with some Penn, at $55@65 per head.]

SPECIAL NOTICES.

STRANGE, BUT TRUE.

KINGSTON, N. J., Oct. 1, 1878.

Messrs. Charles R. Allen & Co., Hartford, Conn.:

GENTS:—Your favor, asking me if I would make affidavit to the facts set forth in the letter I wrote you a few days ago, came to hand, and I herewith inclose my sworn statement.

Last May I went to Mr. Van Duny's store, in this place, to get some powders for my chickens, which were dying off, and he induced me to try a package of your *Imperial Egg Food*. I took it home and fed to my chicks with very good effect, but the strangest part of the story I have yet to relate. I have an old black hen which I brought with me when I moved here in April, 1868. She was then a pullet, having been hatched the June previous, 1867, consequently is now nearly 12 years old, almost blind, and crippled, having lost the use of one foot. She had been sick some time, and was around under foot; but being an old family pet I did not want to kill her, and thinking the Egg Food might help her, I put her upon the grass in the back yard and mixed it in her feed a few days, and she soon began to pick up, her comb turned red, she commenced to sing and cackle, and shortly to lay, and has laid *twenty-five eggs* this season.

Her new feathers have come out black and glossy, and she looks remarkably well, though crippled and almost blind. SARAH LEONARD.

STATE OF NEW JERSEY,
MIDDLESEX COUNTY, SS.

Personally appeared Sarah Leonard, and upon her oath saith the above statement is true and correct

Sworn and subscribed before me this first day of October, A. D. 1878.

CHARLES L. STOUT,
Justice of the Peace.

The New Drying Process invented by Mr. Geo. Woods, the ingenious Organ and Piano maker of Cambridgeport, Mass., is proving of much advantage to all who dry materials of any kind (particularly lumber), and has lately been introduced into cotton factories with great success. It is very simple and inexpensive; can be used in any form of dry-room, and not only accomplishes the work in one-fourth the time, but greatly improves the quality of the material. The tendency to fires in the dry-room is also very much lessened.

A PAPER FOR YOUNG PEOPLE.—The YOUTH'S COMPANION of Boston employs the same writers as the best English and American magazines, and no other publication for the family furnishes so much entertainment and instruction of a superior order for so low a price. Among its contributors are DINAH MULOCH CRAIK, Miss YONGE, J. T. TROWBRIDGE, LOUISA M. ALCOTT, HENRY W. LONGFELLOW, JAS. T. FIELD, JOHN G. WHITTIER, and nearly fifty of the best story-writers.

DIAMONDS
IN SOLID GOLD MOUNTINGS.
ONE DOLLAR ONE DOLLAR

Lefevre Ring, $1. Set of Studs, $1. [The Shank] Stud, $1. Lefevre Ear Drops, $1.

THE ONLY PERFECT FAC-SIMILE OF THE REAL DIAMOND IN THE WORLD.

Pronounced by the Academy of France that *M. Lefevre has really obtained artificially the true diamond.* The basis of these gems are pure crystals found in the Sierra Nevadas, from whence they are exported to the Lefevre Laboratory in Paris, France, where they are submitted to a chemical and voltaic process,

BY WHICH THEIR SURFACES ARE COVERED WITH A COATING OF PURE DIAMONDS,

Imparting to them all the BRILLIANCY, HARDNESS, and refractive qualities of the natural diamond, and making them as desirable for Wear, Brilliancy, and Beauty, as the veritable gems themselves. The Ring, Studs, and Ear Drops, as displayed in this announcement, are accurate engravings of SOLID GOLD MOUNTINGS, CONTAINING THE WONDERFUL LEFEVRE DIAMOND, warranted by certificate U. S. Mint assay.

ON RECEIPT OF ONE DOLLAR we will send free, by REGISTERED MAIL, to any address in America, either article as above represented. Our "Book on Diamonds," with illustrations of artistic Diamond Jewelry in solid (14 k.) gold, mailed free.

I have seen many imitations of diamonds, but never any that could equal the Lefevre Brilliant.—M. ELLROY, Stamford, Conn.

I am in receipt of a pair of the Wonderful Lefevre Ear Drops for one dollar, to say that I am pleased with them hardly fills the bill, they are simply elegant.—ANDREW MORRIS, Hornellsville, N. Y.

The Wonderful Lefevre Diamond Ring, for one dollar, came to hand this morning. It is really elegant, giving entire satisfaction, and eliciting wonder and admiration from all who see it.—W. H. REEDY, Martinsburg, W. Va.

The Lefevre Diamonds, mounted in solid gold, are truly marvelous.—B. F. AVERY & SONS, Home and Farm, Louisville, Ky.

The eminently successful experiments of M. Lefevre silences all doubt of the true artificial reproduction of the true diamond.—M. DU FRENOY, the great French Scientist.

The Lefevre Diamond most effectually disturbs the slumbers of the possessors of costly gems.—Journal of Science.

☞ We guarantee the Wonderful Lefevre Diamonds for One Dollar to be mounted in Solid Gold, and will cheerfully refund the money if found unsatisfactory. Address all orders to the

AMERICAN JEWELRY COMPANY, 5 Arcade, CINCINNATI, O.

Sabbath Reading.

FORWARD.

SHALL this life of mine be wasted?
Shall this vineyard lie untilled?
Shall true joy pass by untasted,
And the soul remain unfilled?

Shall the God-given hours be scattered,
Like the leaves upon the plain?
Shall the blossoms die, unwatered
By the drops of heavenly rain?

Shall I see each fair sun waking,
And not feel it wake for me?
Each glad morning brightly breaking,
And not feel it break for me?

Shall I see the roses blowing,
And not wish to bloom as they;
Holy fragrance round me throwing,
Lure others on the way?

Shall I hear the free bird singing
In the Summer's stainless sky,
Far aloft its glad flight winging,
And not seek to soar as high?

Shall this heart still spend its treasures
On the things that fade and die;
Shall it court the hollow pleasures
Of bewildering vanity?

Shall these lips of mine be idle;
Shall I open them in vain?
Shall I not, with God's own bridle,
Their frivolity restrain?

Shall these eyes of mine still wan er—
Or no longer turned afar,
Fix a firmer gaze and fonder
On the bright and morning Star?

Shall these feet of mine, delaying,
Still in ways of sin be found,
Braving snares, and madly straying
On the world's bewitching ground?

No, I was not born to trifle
Life away in dreams or sin;
No, I must not, dare not stifle
Longings such as these within!

Swiftly moving upward, onward,
Let my soul in faith be borne;
Calmly gazing, skyward, sunward,
Let my eye unshrinking turn!

Where the Cross, God's love revealing,
Sets the fettered spirit free,
Where it sheds its wondrous healing,
There, my soul, Thy rest shall be!

Then no longer idly dreaming
Shall I fling my years away;
But, each precious hour redeeming,
Wait for the eternity. [*Bonar*

THE MOUNTAINS OF GOD.

SOME of the most sublime events in sacred history are associated with the mountain scenery of Palestine. From the peaks and table-lands of these everlasting hills, these lofty sentinels of nature, many of the Divine laws were imparted.

On mount Ararat the ark rested after the waters subsided, and on it Noah builded an altar unto the Lord, and there the blessing of Elohim rested upon the patriarch.

On Mount Moriah Abraham offered his son in sacrifice, a striking type of the great offering beyond the *pomœrium* of the Holy City. He dedicated the place, and called it Jehovah-jireh, "The Lord will provide."

From the rocky summits of Sinai Moses received the tables of the testimony, tables of stone written with the finger of God.

Beyond the plains of Moab rises the mountain of Nebo, the top of which is known as Pisgah. Here the great lawgiver was permitted to view the land of Canaan, even unto the utmost sea, including the valley of palm-trees in the plain of Jericho, a land figuratively flowing with milk and honey; and in a valley beneath this mountain, over against Beth-peor, this holy man was buried, "but his sepulchre is not known to this day."

Mount Carmel, which stands some two thousand feet above the Mediterranean Sea, was the theatre of Elijah's triumph over the false prophets, when the cry was elicited, "The Lord is the God; Jehovah is God."

Lebanon, with its cedars and fir-trees and luxurious vineyards, is famous in sacred story. It is called "the good land beyond Jordan," where the Lord promised "to make the place of His feet glorious."

In the midst of the Holy City mount Zion rears its eternal head, known in the song of Asaph as the dwelling-place of the Most High, where in after days it was ordained that He should cut off the spirit of princes, and become terrible to the kings of the earth, for before His Son "all gates should be open; before Him the iron bolts be broken, and the folding doors of brass move."

Most beautiful for situation is this mountain, the joy of the whole earth; for God is known in her palaces for a sure refuge.

Zion is also the picture of paradise, the final home of the traveler, the delight of the redeemed, the refuge after the great storm.

On the plains of Esdraelon, some few miles from Nazareth, in a rich country covered with trees and odoriferous plants, is the Tabor of the gospel, where Jesus is said to have been transfigured, His face beaming as the sun, and His garments becoming white as light. A golden cloud soared above Him, and out of this heavenly canopy came the everlasting testimony, "This is My Son, well beloved; hear Him."

A short distance east of Jerusalem is the edge of Olivet, the mountain being separated from the city by the valley of Johoshaphat and the brook of Kedron. From its top is a fine view of Jerusalem and the Dead Sea. The Redeemer often withdrew to this place for retirement and repose. Here He wept over the doom of the city, and here it is supposed He ascended to heaven in the presence of his disciples.

Northwest of Jerusalem, on the north side of mount Zion, is the elevation of Golgotha, the place of skulls, so called from its resemblance to the form of a man's head, or more likely because it was the place of state executions.

Here the great scene of human history was enacted, when at midday the sun refused to impart light, the veil of the temple was rent in twain from the top to the bottom, the earth trembled, the stone slabs of the tombs were unseated, and the sleeping dead came forth and on the third day appeared in the Holy City.

Here the "*Jah*," "*Shua*" of Hebrew prophecy ("I shall be the powerful") rendered up His life a ransom for many; and here for ever concentres the story of Divine glory and human happiness.

These mountains of Palestine may be called the mountains of God, for on their summits Moses received the law, and Christ made the sacrifice. Their soil is hallowed, not as the walls of a temple that must crumble into ruins, not as the enclosure of the beloved dead, the boundary lines of which time will remove, but as the enduring places where God communed with man as friend speaketh to friend, and where the monuments of His mercy and His love have been immovably reared, "which the decays of mortal nature cannot vary, nor time vary with oblivion." Holy spots are these, dear both to the devout Jew and to the pious Christian, for ever set apart to all those who love God and cherish His commandments. R.

Reading for the Young.

THE HANDLESS MAIDEN.

A CERTAIN Miller had fallen by degrees into great poverty, until he had nothing left but his mill and a large apple tree. One day, when he was going into the forest to cut wood, an old man, whom he had never seen before, stepped up to him, and said, "Why do you trouble yourself with chopping wood? I will make you rich, if you will promise me what stands behind your mill."

The Miller thought to himself that it could be nothing but his apple-tree, so he said "Yes," and concluded the bargain with the strange man. The other, however, laughed derisively, and said "After three years I will come and fetch what belongs to me;" and then he went away.

As soon as the Miller reached home, his wife came to him, and said, "Tell me, husband, whence comes this sudden flow of gold into our house? All at once every chest and cupboard is filled, and yet no man has brought any in. I cannot tell how it has happened."

The Miller in reply, told her, "It comes from a strange lord, whom I met in the forest, who offered me great treasure, and I promised him, in return, what stands behind the mill, for we can very well spare the great apple tree."

"Ah, my husband," exclaimed his wife, "it is the Evil Spirit whom you have seen; he did not mean the apple-tree, but our daughter, who was behind the mill sweeping the yard."

This Miller's daughter was a beautiful and pious maiden, and during all the three years lived in the fear of God without sin. When the time was up, and the day came when the Evil One was to fetch her, she washed herself quite clean, and made a circle around herself with chalk. Quite early came the Evil One, but he could not approach her; so, in a rage, he said to the Miller, "Take away from her all water, that she may not be able to wash herself, else have I no power over her." The Miller did so, for he was afraid. The next morning came the Evil One again; but she had wept upon her hands, so that they were quite clean. Then he was baffled again, and in his anger said to the miller, "Cut off both her hands, or else I cannot now obtain her." The Miller was horrified, and said. "How can I cut off the hands of my own child?" But the Evil One pressed him, saying "If you do not you are mine, and I will take you yourself away!" At last the Miller promised, and he went to the maiden, and said, "My child, if I do not cut off both your hands, the Evil One will carry me away, and in my terror I have promised him. Now help me in my trouble, and forgive me for the wickedness I am about to do you."

She replied, "Dear father, do with me what you will; I am your daughter."

Thereupon she laid down both her hands, and her father cut them off. For the third time now the Evil One came; but the maiden had let fall so many tears upon her arms, that they were both quite clean. So he was obliged to give her up, and after this lost all power over her.

The Miller now said to her, "I have received so much good through you, my daughter, that I will care for you most dearly all your life long,"

But she answered, "Here I cannot remain; I will wander forth into the world, where compassionate men will give me as much as I require."

Then she had her arms bound behind her back, and at sunrise departed on her journey, and walked the whole day long till night fell. At that time she arrived at a royal garden, and by the light of the moon she saw a tree standing there bearing most beautiful fruits, but she could not enter, for there was water all round. Since, however she had walked the whole day without tasting a morsel, she was tormented by hunger, and said to herself, "Ah, would I were there, that I might eat of the fruit, else shall I perish with hunger," so she knelt and prayed to God, and all at once an angel came down, who made a passage through the water, so that the ground was dry for her to pass over. Then she went into the garden, and the angel with her. There she saw a tree full of beautiful pears, but they were all numbered; so she stepped up and ate one to appease her hunger, but no more. The gardener perceived her do it, but because the angel stood by he was afraid, and thought the maiden was a spirit; so he remained quiet and did not address her. As soon as she had eaten the pear she was satisfied, and went and hid herself under the bushes.

The next morning the King to whom the garden belonged came down, and, counting the pears, found that one was missing; and he asked the gardener whither it was gone. The gardener replied, "Last night a spirit came, who had no hands, and ate the pear with her mouth." The King then asked, "How did the spirit come through the water? and whither did it go after it had eaten the pear?"

The gardener answered, "One clothed in snow-white garments came down from heaven and made a passage through the waters, so that the spirit walked through on dry land. And because it must have been an angel, I was afraid, and neither called out nor questioned it; and as soon as the spirit had finished the fruit, she returned as she came."

The King said, "If it be as you say, I will this night watch with you."

As soon as it was dark the King came into the garden, bringing with him a priest, who was to address the spirit, and all three sat down under the tree. About midnight the maiden crept out from under the bushes, and again ate with her mouth a pear off the tree, whilst the angel clothed in white stood by her. Then the priest went towards her, and said, "Art thou come from God or from earth? Art thou a spirit or a human being?" She replied, "I am no spirit, but a poor maiden, deserted by all, save God alone."

The King said, "If you are forsaken by all the world, yet will I not forsake you." And he took her with him to his royal palace, and, because she was so beautiful and pious, he loved her with all his heart, and ordered silver hands to be made for her, and made her his bride.

After a year had passed by, the King was obliged to go to war, so he commended the young Queen to the care of his mother, and told her to write him word if the crown should have an heir. Soon afterwards the old mother wrote a letter to her son, containing the joyful news. The messenger, however, rested on his way by a brook, and, being weary with his long journey, fell asleep. Then came the Evil One, who had always been trying to do some evil to the Queen, and changed the letter for another, wherein it was said that the heir was a changeling. As soon as the King had read this letter, he was frightened and much troubled; nevertheless, he wrote an answer to his mother, that she should take great care of the Queen until his arrival. The messenger went back with this letter, but on his way rested at the same spot, and went to sleep. Then the Evil One came a second time, and put another letter in his pocket, wherein it was said the Queen and her child should be killed. When the old mother received this letter, she was struck with horror, and could not believe it; so she wrote another letter to the King; but she received no other answer, for the Evil One again placed a false letter in the messenger's pocket; and in his last it said that she should preserve the tongue and eyes of the Queen for a sign that she had fulfilled the order.

The old mother was sorely grieved to shed innocent blood, so she caused a calf to be fetched by night, and cut out its tongue and eyes. Then she said to the Queen, "I cannot let you be killed, as the King commands; but you must remain here no longer. Go forth with your child into the wide world, and never return here again."

Thus saying, she bound the child upon the young Queen's back, and the poor wife went away weeping bitterly. Soon she entered a large wild forest, and there she fell upon her knees and prayed to God; and the angel appeared, and led her to a little cottage, and over the door was a shield inscribed with the words, "Here may every one live freely." Out of the house came a snow-white maiden, who said, "Welcome, Lady Queen;" and led her in. Then she took the little child from the Queen's back, and gave it some nourishment, and laid it on a beautifully covered bed. Presently the Queen asked, "How do you know that I am a Queen?" and the maiden answered, "I am an angel sent from God to tend to you and your child." And in this cottage she lived seven years, and was well cared for, and through God's mercy to her, on account of her piety, her hands grew again as before.

Meanwhile the King had come home again, and his first thought was to see his wife and child. Then his mother began to weep, and said, "You wicked husband, why did you write to me that I should put to death two innocent souls?" and, showing him the two letters which the Evil One had forged, she continued, "I have done as you commanded." And she brought him the tokens, the two eyes and the tongue. Then the King began to weep so bitterly for his dear wife and son that the old mother pitied him, and said, "Be comforted, she lives yet! I caused a calf to be slain, from which I took these tokens; but the child I bound on your wife's back, and I bade them go forth into the wide world; and she promised never to return here, because you were so wrathful against her."

"So far as heaven is blue," exclaimed the King, "I will go; and neither will I eat nor drink until I have found again my dear wife and child, if they have not perished of hunger by this time."

Thereupon the King set out, and for seven long years sought his wife in every stony cleft and rocky cave, but found her not; and he began to think she must have perished. And all this time he neither ate nor drank, but God sustained him.

At last he came into a large forest, and found there the little cottage whereon the shield was with the words, "Here may every one live freely." Out of the house came the white maiden, and she took him by the hand; and, leading him in, said, "Be welcome, great King! Whence comest thou?"

He replied, "For seven long years have I sought everywhere for my wife and child; but I have not succeeded."

Then the angel offered him meat and drink, but he refused both, and would only rest a little while. So he laid down to sleep and covered his face with a napkin.

Now went the angel into the chamber where sat the Queen, with her son, whom she usually called "Sorrowful," and said to her, "Come down with your child: your husband is here." So she went to where he lay, and the napkin fell from off his face; so the Queen said, "Sorrowful, pick up the napkin, and cover again your father's face." The child did as he was bid; and the King, who heard in his slumber what passed, let the napkin again fall from off his face. At this the boy became impatient, and said, "Dear mother, how can I cover my father's face? Have I indeed a father on the earth? I have learnt the prayer, 'Our Father which art in heaven;' and you have told me my father was in heaven,—the good God: how can I talk to this wild man? he is not my father."

As the King heard this he raised himself up, and asked the Queen who she was. The Queen replied: "I am your wife, and this is your son, Sorrowful." But when he saw her human hands, he said, "My wife had silver hands." "The merciful God," said the Queen, "has caused my hands to grow again." And the angel, going into the chamber, brought out the silver hands, and showed them to him.

Now he perceived that they were certainly his dear wife and child; and he kissed them gladly, saying, "A heavy stone is taken from my heart." And, after eating a meal together with the angel, they went home to the King's mother.

Their arrival caused great rejoicings everywhere: and the King and Queen celebrated their marriage again, and ever afterwards lived happily together to the end of their lives.

THE SINGING BONE.

ONCE upon a time great complaints were made in a certain country of a Wild Boar, which laid waste the fields of the peasants, killed the cattle, and often tore to pieces the inhabitants. The King promised a great reward to whomever should free the land of this plague; but the beast was so big and strong that no one durst venture in the neighborhood of the forest where it raged. At last the King allowed it to be proclaimed that whoever should take or kill the Wild Boar should have his only daughter in marriage.

Now, there lived in this country two brothers, the sons of a poor man, and they each wished to undertake the adventure; the elder, who was bold and brave, out of pride; the younger, who was innocent and ignorant from a good heart. They agreed that they might the sooner find the Boar, that they should enter the forest on opposite sides; so the elder departed in the evening, and the other on the following morning. When the younger had gone a short way, a little Dwarf stepped up to him, holding a black spear in his hand, and said, "I give you this spear, because your heart is innocent and good; with it you may boldly attack the Boar, who can do you no harm."

He thanked the Dwarf, and, taking the spear, went forward bravely. In a little while he perceived the Wild Boar, which ran straight at him; but he held the spear in front of his body, so that, in its blind fury, it rushed on so rashly that its heart was pierced quite through. Then he took the beast upon his shoulder, and went home to show it to the King.

However, just as he came out on the other side of the forest, there stood on the outskirts a house, where the people were making merry, dancing and drinking. His elder brother was amongst them, exciting his courage by wine, and never thinking at all that the Boar might be killed by any other than himself. As soon, therefore, as he saw his younger brother coming out of the forest laden with his booty, his envious and ill-natured heart had no rest. Still he called to him, "Come in here, my dear brother, and rest, and strengthen yourself with a cup of wine." The younger brother, suspecting no evil, went in and related his story of the good little Dwarf, who had given him the spear wherewith he had killed the boar. The elder brother detained him till evening, and then they went away together. But when they came in the darkness to a bridge over the stream, the elder, letting his brother pass on before till he came to the middle of the bridge, gave him a blow which felled him dead. Then he buried him in the sand below the bridge, and taking the Boar brought it to the King, representing that he had killed it, and so received in marriage the Princess. He declared, moreover, that the Boar had torn in pieces the body of his younger brother, and as he did not come back, everyone believed the tale to be true.

But, since nothing is hidden from God's sight, so also this black deed at last came to light. Many years after, as a peasant was driving his herd across the brook, he saw lying in the sand below, a snow-white bone, which he thought would make a good mouth-piece. So he stepped down, took it up, and fashioned it into a mouth-piece for his horn. But as soon as he blew through it for the first time, to the great astonishment of the herdsman, the bone began to sing of itself:

"My brother slew me, and buried my bones,
Under the sand and under the stones:
I killed the Boar as he came from his lair,
But *he* won the prize of the lady fair."

"What a wonderful little bone!" exclaimed the herdsman; "it sings of itself! I must take it to the King."

As soon as he came before the King it began again to repeat its song, and the King understood it perfectly. So he caused the earth below the bridge to be dug up, and there all the bones of the younger brother came to light. The wicked brother could not deny the deed, and, for his punishment, he was sewed up in a sack and drowned.

And the bones of the other brother were placed in a splendid tomb in the churchyard. GRIMM.

PERSONAL ITEMS.

The King of Holland, in justification of his marriage, says: "Time will equalize us. To-day, when I am sixty and my betrothed twenty, I am, of course, three times as old as she is; in twenty years, however, when we shall be respectively eighty and forty, I shall be only twice as old; and, if we live long enough, we shall one day be a very good match."

Ben Butler, according to a Western newspaper, was once engaged to a young lady of Waterville, Me., and to break off the match, which for some reason displeased him, he hit upon the notable expedient of going upon a feigned spree and jamming an inoffensive citizen's hat over his eyes. The reckless inebriate was promptly arrested and fined. The girl wrote a letter repudiating him; her father threatened to kick him out of the house, and the wily young man chuckled greatly at the success of his innocent stratagem.

The present Sultan has a grave and anxious face, a sallow complexion and a quiet voice. He dresses in European fashion—with the one exception of the fez—and wears no jewelry but plain pearl studs in his shirt front. He wears no orders or riband, except upon State occasions. As he talks a melancholy smile frequently crosses his features; he has a weary, somewhat sad air. He leans his head a little forward habitually, as though thinking, and while talking he has a habit, when not smoking, of playing with some article or other which may chance to lie on the table.

Madame Marie Dumas, daughter and sister of the celebrated French novelists—Dumas, Sr., and Dumas, Jr.—is described as a person of even more eccentricity of character than her father. Having been divorced from her husband, she returned to her maiden patronymic, and besides acting as secretary to her father, "published books that nobody read and painted pictures in crayon and oil that nobody looked at." She was of very robust physique, and inherited her father's Ethiopian features. While she lost no opportunity to inveigh against luxury and extravagance, her every-day toilet seems to have been a simple, unpretentious yellow and black satin dress with red scarf and yellow silk turban.

In accordance with a custom which every President has observed of presenting to friendly Indian chiefs a "peace medal," President Hayes has caused such a medal to be designed. It is to be of bronze. On the obverse side will be a medallion head of the President, around which will run the words, "Rutherford B. Hayes, President of the United States." On the reverse the word "Peace" and date, "1877," will be above a cut representing civilization. To the left of the cut will be a frontiersman's cottage and a man plowing; to the right a farmer will extend to an Indian in war feathers an invitation to come and plant too. Below the cut will be emblems of peace—a crossed pipe and a tomahawk.

Mr. Smalley, in a recent letter to the New York Tribune, says that "In sending him to Canada as Governor-General, Lord Beaconsfield has really done Lord Lorne the greatest favor he could do him. He has relieved him from the burdens of the iron-bound etiquette which weighed him down at home. As Governor-General he is the personal representative of the crown, and takes rank at last—so I am told—above his wife. At the same time, her royalty makes the appointment a more brilliant one, and more welcome to that loyal people, the Canadians. All the good things that have been said of the Princess Louise have been well said. She is a woman of unusual force of character—as her story, to those who know it, proves—pretty, accomplished, and amiable. In no sense is she responsible for whatever irksomeness may have accrued to her husband from his marriage. He too is credited with good abilities, and though he has to follow Lord Dufferin, his friends believe that he will prove himself equal to the task laid upon him. Imperialism is just now in fashion. The Marquis of Lorne and his Princess may make it not only fashionable but popular to one of the most important dominions of the crown."

Implements and Machinery.

A NEW HORSE SHOE,

WITH CONTINUOUS CALK. MADE OF CRUCIBLE STEEL AND IRON, ROLLED INTO BARS.

Acknowledged by VETERINARY SURGEONS, PROMINENT HORSEMEN, and ALL who have used it, to be THE BEST SHOE IN THE WORLD. HELP!
FOR THE WEAK, NERVOUS AND DEBILITATED!

The afflicted can now be restored to perfect health and bodily energy, at home, without the use of medicine of any kind.

PULVERMACHER'S
ELECTRIC BELTS
AND BANDS,

For self-application to any part of the body, meet every requirement.

The most learned physicians and scientific men of Europe and this country indorse them.

These noted Curative appliances have now stood the test for upward of thirty years, and are protected by Letters-Patent in all the principal countries of the world. They were decreed the only Award of Merit for Electric Appliances at the great World's Exhibitions—Paris, Philadelphia, and elsewhere—and have been found the most valuable, safe, simple, and efficient known treatment for the cure of disease.

READER, ARE YOU AFFLICTED?

and wish to recover the same degree of health, strength, and energy as experienced in former years? Do any of the following symptoms or class of symptoms meet your diseased condition? Are you suffering from ill-health in any of its many and multifarious forms, consequent upon a lingering, nervous, chronic or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, or blood, in a disordered condition? Do you suffer from rheumatism, neuralgia or aches and pains? Have you been indiscreet in early years and find yourself harassed with a multitude of gloomy symptoms? Are you timid, nervous, and forgetful, and your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to any of the following symptoms: Restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? Thousands of young men, the middle-aged, and even the old, suffer from nervous and physical debility. Thousands of females, too, are broken down in health and spirits from disorders peculiar to their sex, and who, from false modesty or neglect prolong their sufferings. Why, then, further neglect a subject so productive of health and happiness when there is at hand a means of restoration?

PULVERMACHER'S
ELECTRIC BELTS AND BANDS

cure these various diseased conditions, after all other means fail, and we offer the most convincing testimony direct from the afflicted themselves, who have been restored to

HEALTH, STRENGTH, AND ENERGY,

after drugging in vain for months and years.

SOME THINGS TO BE THANKFUL FOR.

The Primary Cause of a Distant Symptom.

Nervousness is rarely a disease in itself inherent, but is the lineal offspring of dyspepsia, in a majority of cases. The nervous disturbance is at first trifling, but ultimately its parent so undermines the general health, as to produce consequences very threatening to that great nervous center, the brain. Hostetter's Stomach Bitters is the most powerful medicinal opponent of the ravages of indigestion, and protects the nervous system from them. The tremors, the unnatural anxiety, the headaches, the sleeplessness and loss of appetite which characterizes digestive irregularity and weakness, and which are almost invariably accompanied by an uncertain condition of the bowels and inactivity of the liver, are all eradicated by this matchless corrective, and when nervousness does not proceed from the cause designated, it affords most grateful relief.

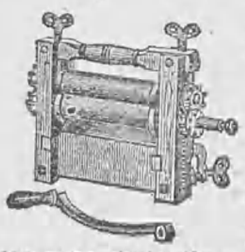
Keystone Wringer



Has Greater Capacity, Is More Durable, and Is better finished
Than any other wringer now made.
THE ROLLS
Are made of **White Rubber** clear to the shaft. No twine or wire or fibrous material, or anything else but rubber being used. The rubber *is vulcanized upon the shaft and cannot be taken off except by cutting it off*. They are more elastic than other rolls because there is nothing but rubber on the shaft, and more durable because there is no twine or fibrous material to rot out or wire to cut the rubber. They are greatly superior to any other kind of roll now known.

It is an excellent Gargle for Sore Throat, and Wash for Sore Mouth. Cleanses the Teeth, Hardens the Gums, and Purifies the Breath. All its properties are SOOTHING, CLEANSING, and HEALING. It never fails to give relief in the most obstinate cases of *Dry Catarrh.*

"A most wonderful effect."
LAW OFFICE OF SCOTT & OESTERREICH, 55 LIBERTY ST., NEW YORK, JULY 27 1878.
N. B. PHELPS, Esq., —My Dear Sir: I have the most sincere pleasure in acknowledging my deep obligation to you for the most signal relief I have experienced from the use of the NORWEGIAN BALM. I have suffered constantly for eight years from Catarrh, which year by year grew worse in spite of all the remedies, which during this period I have unremittingly applied.
At times my affliction has been so severe, that I have been almost entirely unfitted for mental labor, and have seriously meditated abandonment of business and removal to a milder climate.
Fortunately, four months ago I was induced to try the NORWEGIAN BALM, as I had been induced scores of times before to try other remedies by advice of friends, but I feel free to say with but little confidence in finding any essential relief.
Now Sir, I am very glad, and I feel it is due to you to say, *that the Balm has had a most wonderful effect.* ITS BENEFICIAL EFFECT WAS APPARENT FROM THE START, and to-day, I am almost free from the distressing and loathsome disease.
I use the Balm daily and it is a luxury that I should be very unwilling to dispense with.
Yours very truly, LIVINGSTON SCOTT.

Immediate Relief Guaranteed.
Sample Bottle Twenty-five Cents.

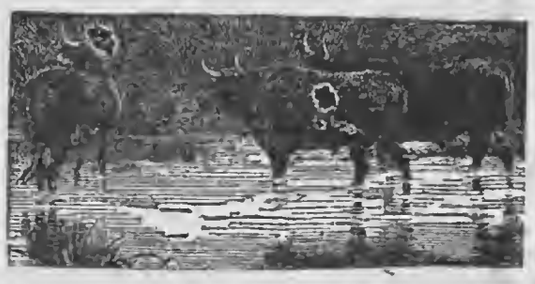
WHOLE No. 1505.

NEW YOK CITY, NOV. 30, 1878.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1878, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

The Herdsman.



A CONVENIENT DAIRY BARN.

THERE has been no more propitious time for making improvements upon the farm than the present. There is no more profitable investment upon a dairy farm than a well appointed and comfortable stable for the cows. Putting this and that together, the inference may be drawn that those who have not a really good cow stable and feel their need of one, should set about getting it as soon as possible before the opportunity passes away. For the benefit of such persons the following description of a dairy stable for 14 cows is here given. The stable is now in actual use and is found convenient and comfortable for the cows and those who attend them. Of the

REQUISITES IN A COW STABLE,

room is the first. Perfect cleanliness cannot be maintained unless there is ample room. The second is comfort for the cows; this includes warmth and cleanliness. Then follow security, convenience of arrangement so that the necessary work can be done with the least labor and in the least time, and a method of safely and easily making and saving the manure.

In this especial case, the making of manure is considered as the greatest source of profit, the chief business of the farm being growing truck for a city market, and in this business manure is usually purchased every year to the amount of several hundred dollars' worth. By good management one cow can be made to yield 25 loads of the best quality of manure in a year and, at the usual value of purchased manure, this is equal to about $65 annually. This being the case, a stable well calculated for the winter and summer feeding of the cows, under a system of complete or partial soiling, is a source of great profit upon any farm.

THE BARN HERE DESCRIBED.

is 50 feet long, 24 feet wide and 16 feet high from sill to eaves. It is built wholly of hemlock and spruce, except the sills which are of oak, and the heaviest timbers in the frame are 6x8, for the corner posts. The floor is of two-inch spruce plank; the sides are of dressed fine box boards, battened up and down; the upper floor is of dressed spruce, tongue and grooved flooring seven inches wide; the roof is of sawed pine shingles and has a ventilating cupola in the center. The building is painted with mineral paint of a dark-brown color, with the trimming of light-brown stone color.

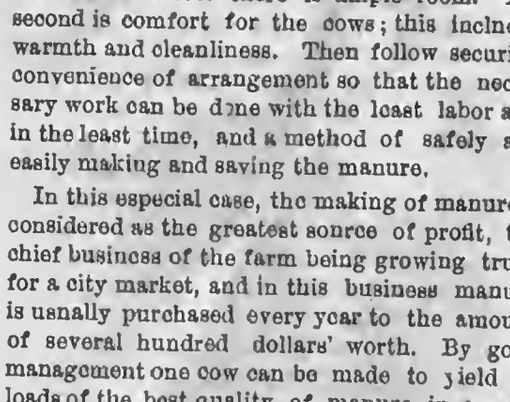


FIG. 1.

THE BASEMENT,

or cellar, is walled with stone and is divided as follows: at one end is the pig-pen 8x16 feet, divided into two compartments opening in a yard into which manure is dropped through a trap-door in the gutter above. In the middle is a winter poultry roost, having a lathed partition and opening into the manure cellar under a second trap-door in the floor above. At the other end is a root-cellar, with a place in front of it for tools and odds and ends of things which do not need more careful storage. At one corner, outside, is a cistern of brick and hydraulic cement, eight feet in diameter and ten feet deep, holding 120 barrels of water, and taking the rain from the roof by gutters and spouts. This basement is seven feet deep and the plan is shown at fig 1.

THE MAIN FLOOR.

is divided into two parts by a row of stanchions of 5x5 timber, which assist to support the upper floor by sustaining a beam upon which the middles of the upper floor joists rest. These stanchions are 3½ feet apart from center to center. The cows are fastened to these by means of chains attached to rings which slide up and down upon staples driven into the stanchions (see fig 3). The staples are 16 inches long and the lower ends are 10 inches from the floor. The cows are fastened by means of a snap-hook attached to the central ring in the chain, which hooks to a ring in a stout leather strap around each cow's neck. The cows thus fastened, are very quickly secured and loosened; they are held safely; can move with much freedom, and are kept free from filth by the gutter behind them on the edge of which their hind feet stand. The standing floor is 4 feet 10 inches wide; the gutter 16 inches, and the floor outside of the gutter is 5 feet in width, giving ample room for the passage of the cows and for the dairymen to work in. The gutter is eight inches deep and has two trap-doors as shown in the engraving, through which the manure is dropped into the cellar below.

The method of making the gutter is as follows: The lower floor beams are 16 inches apart in the clear where the gutter is made; iron straps made in form of a double hook, are suspended upon the beams on each side of the gutter; in the lower hooks, 4x4 scantlings are laid and the planks which make the floor of the gutter are laid and secured upon these. This is shown at fig. 4.

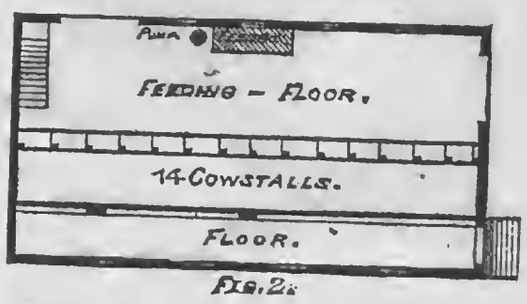

FIG. 2.

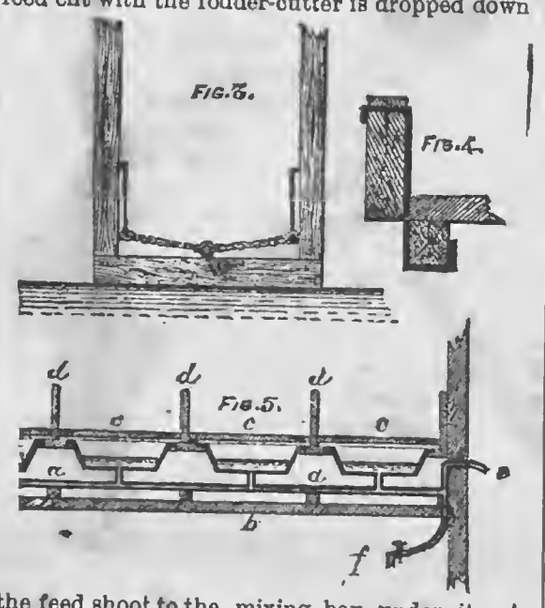
The feed boxes, in front of the stanchions are 22 inches wide and 8 inches deep. An arrangement for watering the cows in their stalls is made under the feed boxes. This is shown at fig 5. An iron water pipe (*a*) rests upon blocks upon the floor (*b*). The pipe is connected with water-boxes which consist of cast-iron kitchen sinks, 16½ inches long, 12 inches wide and 5 inches deep, costing $1.25 each. These are let into a false bottom of the trough as shown, and are covered with the true bottom in which are hinged flaps to cover them. The flaps are shown at *c*, *c*, and the sides of the feed boxes *d*, *d*, *d*. The water when let into the pipe *a*, fills the boxes, and is prevented from overflowing by the outlet *e*, which is placed at a proper hight. The water boxes are emptied, when necessary, by means of the cock (*f*) in the cellar, and the waste-water may be used for the pigs or poultry, or may run on to the manure piles. The cover for the water boxes (shown at fig. 6) is provided with a wire staple, driven in flush with the surface, and a hollow is gouged out under it, so that a hook may be inserted to lift it up. Thus there is nothing in the way of the cows feeding from it, as it makes the bottom of the feed box. The water boxes are provided with a grated screen over the pipe such as is used in kitchen sinks, an arrangement by which solid matter is prevented from getting into the pipes.

The remainder of the main floor is devoted to the feeding room. There are two spacious doors through which a cart may be driven through this floor, with fodder in the summer time or roots in the winter. The feed box is used for mixing the feed, and there is a pump near by connected with the cistern. The stairs at the end lead to the

UPPER FLOOR.

This is laid out as shown at fig. 7. The feed bins are for storing ground feed and spouts lead down to below the stairs on the lower floor, from which what is needed may be drawn. The feed cut with the fodder-cutter is dropped down



the feed shoot to the mixing box under it. A crib for storing several hundred bushels of corn, is at one corner and a quantity of hay or fodder may be stored in the opposite corner. There are two doors in the upper floor for taking in hay or feed, and a hoist wheel is placed at the door near the feed bins, for drawing up bags of feed. A Big Giant feed-mill is kept outside the stable, below this door, for grinding grain.

LIGHT AND VENTILATION.

The building is well lighted by five large windows on the south side on the main floor and four smaller ones on the north side. These are all protected with close shutters to completely darken the stable in the fly season. The upper floor has four large windows on the south. Ventilation is secured by the openings leading from the lower to the upper floor, which are closed when needed by trap doors, and by a large cupola on the roof with slatted sides.

THE COST OF THIS STABLE

was $396 for lumber, oil and paint; $86 for water pipes, nails, and hardware, and $100 for carpenter work. The cost for the mason work for the cellar is not yet ascertained, but will be in the neighborhood of $100. The cistern cost $32. The whole cost will be a little over $700.

Field Crops.

LARGE CROPS OF CORN.

THE ELEMENTS OF SUCCESS.

THE skillful dairyman understands that the secret of profit is to get a cow that *can* give a good mess, and then to feed and care for her so that she *will* give a good mess. The same principle extends to plants as well as to animals. Good seed, sown in good soil, and good cultivation, are the elements of success, and all are equally necessary to that success.

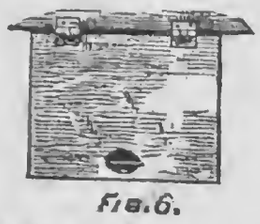


FIG. 6.

The seed saved from crops that receive inferior or even ordinary cultivation through a series of years, is not the seed to be used where the aim is to secure large crops. Such seed can be improved by years of high culture and selection so as to possess the requisite productiveness, but seed taken, as remarked, from poorly grown crops will not, at first, give maximum results when planted in even the best soil, and receiving the most careful culture.

LESSONS FROM THE PAST YEAR'S EXPERIENCE.

The past year has been one unusually favorable to the corn crop, and this favorable condition of the soil and season has been coincident with a much larger breadth of planting, especially in the East. In New York and New England, the demand for Western grain will be far less than usual during the coming winter, and were it not for the extraordinary foreign demand, it is hard to imagine what profitable disposition could be made of the product of the western corn-lands. This greater area under cultivation and the generally abundant yield, have given Eastern farmers an excellent opportunity to judge of the comparative value of good seed with good culture contrasted with the results got where good seed has received but poor culture, ordinary seed the best culture, and—as is far more common—where poor seed and poor cultivation have gone together.

The average of our corn-yields in the various States, is quite significant, and the study of the statistics is capable of affording valuable instruction. One thing is evident from them—it must have taken a large number of very poor crops to pull down the average to where it stands. An average of twenty-five to thirty-two bushels, proves to the most careless observer that crops of from fifteen to twenty bushels must be extremely frequent, since there are a goodly number of farms where the average is seldom lower than forty bushels and where, in such years as the present, it exceeds fifty bushels to the acre. Now, it may be set down as a reasonably close approximation to truth, to say that one good, full ear to the stalk, will give a total yield of 100 bushels of shelled corn to the acre. This is without regard to the kind of corn planted, because the taller kinds with larger ears must be planted farther apart in proportion. This yield of 100 bushels is within the possible result by at least 25 bushels, when one full ear is reckoned to the stalk; but this allowance is made for defects in the stand, which

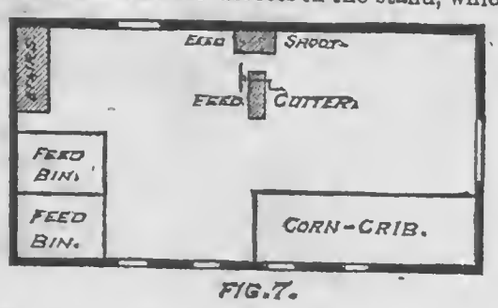

FIG. 7.

will always occur from the depredations of insects and birds, and the accidents of cultivation. Now, we wish to inquire, not what reduces the average actual results to the neighborhood of 30 bushels, for *that* is plainly attributable to bad farming, but why even our best farmers in the best years can rarely show an average crop of over 60 bushels to the acre. We have just been examining the details of

A CAREFULLY FERTILIZED AND CULTIVATED CORN CROP,

the yield of which has been submitted to a careful examination and analysis. The field was planted with a thoroughbred variety—*i. e.*, one carefully selected through a series of years—with the view of raising as much seed corn as possible. It was a variety of rather less than medium hight for the New England farm where it grew, and was planted in drills four feet apart, the seed being dropped on one-third, five inches, and on the remainder, 10 inches asunder in the drills.

There was hardly a stalk in the field that did not produce its ear, but the total yield was equal to but 80 bushels of shelled corn to the acre. Thirty bushels of this were selected at husking as being suitable in all respects for seed corn. Besides this, there were about 20 bushels of full ears, but each was in some respect unsuited for seed. The remainder—within a fraction of 30 bushels—consisted of

short ears and nubbins, and the larger part of this grew upon that portion of the field where the seed was dropped five inches apart. Most of the ears of this sort which grew on the rest of the field, were from the suckers, or were second ears on stalks where one perfect ear grew, and on this part of the field a large proportion (about 25 per cent.) of all the stalks produced twin ears. It was estimated that if the whole field had produced in proportion to this part, the entire yield would have been about 100 bushels to the acre, or, in other words, that the close planting of one-third of the field reduced the yield of the whole by 20 bushels per acre. This reduction was caused by the shortening of the ears where thick planting was done, for the variety was so thoroughbred that, as observed above, some sort of an ear was found on nearly every stalk.

These facts, and they may be relied upon *as* facts, are, we think, full of instruction to those who aim at growing large average crops of corn.

POTATOES AS A FARM CROP.

WM. J. FOWLER.

The use of potatoes as a common article of food is little more than a hundred years old, and it is probable that their cultivation and use are yearly increasing. It is quite certain that the business of growing them extensively is far more common than formerly. The increased proportion of urban population would alone insure this. The amount of potatoes required for large cities, like New York, Philadelphia or Brooklyn, is vastly greater than can be grown by market gardeners in their vicinities. Years ago, potatoes were largely grown in market gardens; but they were found less profitable than other crops and abandoned to the cheaper lands of the general farmer. What the market gardener has rejected, has proved one of the most profitable crops that we grow. Many farmers in this section plant yearly from five to thirty or forty acres of potatoes, and, on an average of seasons, they return more money per acre than any other crop grown. It is true they require a good deal of work, but this is true of all crops that pay. Grains, like buckwheat and oats, which cost least labor, are almost always a glut in the market.

In my practice of growing potatoes I have not found them an exhausting crop. I never plant more than one-eight or one-tenth of the cultivated land, and alternate with grains and clover, feeding stock and making large quantities of manure. Some years ago, farmers on sandy soil in this section did exhaust their fields by repeatedly cropping with potatoes. The temptation was a strong one, as in some years the crop was worth more than the price of the land on which it grew. Of late years fewer potatoes are grown on the sand. Some of the new varieties are quite as good or better when grown on heavy soil. Where we have land in potatoes not oftener than once in eight or ten years, and in the meantime manure it twice and turn under at least two clover sods, there is little danger of starving the soil. The exhaustion of sandy soils consists in the removal of their potash and lime, in which such soils are deficient. It is marked by the failure of clover after repeated croppings of potatoes. Our heavy loamy or calcareous soils are usually rich in all mineral elements of plant food. Clover, in my experience, catches better with grain sown after potatoes than after any other crop. This is probably due to the fact that a potato crop pulverizes and cleans the soil better than any other.

The ravages of the potato beetle are likely to make an unexpected revolution in the cultivation of the potato. The crop will be grown and used as formerly, perhaps not quite so freely; but it does not follow that farmers all over the country will grow them as they have done. Probably three fourths of all the potatoes grown have been in small patches, to supply the families of the growers. It is likely that this will be less the fact in future. Small patches of potatoes, grown by general farmers, do not pay. Very few can give them the care they need, and without this the crop is a certain loss. High as the price of potatoes is this year, those which many farmers have grown on their own land have cost more than it would to buy them. With equal care in fertilizing and cultivating, a large field can be planted, tended and harvested at from ten to fifty per cent. less expense than a small one. In a potato-growing section, as many beetles will visit a half-acre patch as a ten or twenty-acre field. I do not mean that it is possible to plant so largely as to get rid of the labor of fighting the beetles. The rapidity with which they increase makes diligence always necessary. What I do say is that on a large field the labor of fighting the enemy is proportionately lessened. The large growers of potatoes can afford to sell at prices which would leave no profit to those who only grow a few.

We are learning something new every year about growing potatoes. Large fields have been grown which, in ordinary seasons, yielded 200 to 350 bushels per acre, at a cost of less than fifteen cents per bushel. Those who grow such crops need only care about the market, to learn how large are their profits. It is probable that for years to come the price of potatoes will not rule as low as it has done. The potato beetle is a steady factor in all calculations of the cost of growing. Practically the small growers of potatoes are out of the market. An increasing proportion of farmers who do not make a business of growing potatoes for market, will not grow enough for their own use. This may restrict consumption to some extent; but potatoes will still be always largely used at higher prices than heretofore.

Monroe Co., N. Y.

SOME MISTAKEN IDEAS.

A New England agricultural journal, in referring to the difference in the chemical constituents of grains, and especially of corn, mistakes somewhat the essential value of the same. For instance, a comparative analysis of different varieties of corn was made for the first annual fair of the Farmers' Club of Massachusetts. The following table shows the results, which, we must say, should be received with caution, for the reason that the amount of cellulose, or woody fiber, is remarkably small.

VARIETIES.	Water.	Fat.	Albuminoids or Flesh-formers.	Carbo-hydrates. Starch, Sugar, Gum, etc.	Woody Fiber.	Minerals or ash.
8-rowed Golden (Mass.)	11.51	4.94	10.25	69.37	1.35	1.58
Mason Co. (Ill.)	13.61	5.62	9.79	66.10	3.13	1.35
Kansas	11.34	4.69	8.81	73.99	1.78	1.07
White (Mass.)	10.22	5.40	9.22	74.25	1.47	1.41
Red flint (Mass.)	11.68	5.40	12.06	69.47	2.02	1.10
Burr's Sweet	10.68	7.77	11.09	62.70	4.91	2.22

From this the idea is evolved that each section should, on the discovery of the most valuable variety of corn, grow only that; and thus make a market for the product as a valuable merchantable article, as well as for seed to be used in other localities where the corn grown is less valuable. Now, here is a grand mistake. The seed alone is insufficient to produce the crop; soil, fertilizers, and, above all, climate, influence the product of the seed immensely, so that a seed rich in fat or gluten, grown in New England soils, may be sown in a warmer climate upon rich alluvial soils and will produce a crop rich in starch and woody fiber. It is the soil first; the climate second; the fertility of the soil third; and the seed lastly, which influence the character of the product. Do not we find this abundantly shown every day in our experience and in the history of agriculture? Are there not dairy districts, the grasses of which give aroma and quality to butter and cheese produced there? Is it not thus with oats, barley, wheat, potatoes and fruits of all kinds? There are Delaware peaches, Norway and Nova Scotia oats, Canada barley, Colorado wheat, Michigan and other apples, not to forget the showy Kansas fruit and the brilliant specimens from California. Indeed, it is useless to extend the list because everybody can add to it from his own knowledge, so that, to use the words of the journal referred to "If it costs more to raise corn in New England than in the West, the idea that the farmers in the first section must raise better corn and conduct their business on a more careful and intelligent plan than is customary on the prairies," will be found delusive, if the attempt is made only to grow superior kinds of grain. That is not the point. Eastern farmers must grow larger crops to meet their less favorable soil and climate, and must not depend wholly upon their more favorable locality to help them in their competition with the corn, wheat, pork, butter and cheese of the West.

It will lead us into costly error to take a narrow or one-sided view of things, and "to teach men so"; we must look broadly and in a comprehensive manner on these things, to gather the "true inwardness" of them. And, first of all, we should learn that in this regard, it is soil, climate and method of culture that produce varieties, and that these, with careful selection of our own seed year by year and patient watching and waiting, will finally help us to grow larger and more profitable crops.

PEARL MILLET.

A letter from a correspondent in Florida tells of a small experiment made there with the above forage plant. The seed was sown about the middle of June on new and poor ground, and a little fertilizer was put with it into the drill. It was cut four times. The first time, it measured over seven feet in hight. The other cuttings were shorter, but none of them was under four feet. For the quantity of seed sown and the quality of the land which received it, the yield of forage is stated to have been enormous.

Another correspondent, writing from Birdsville, Ga., says that he has cultivated "Pearl" Millet as a forage and soiling plant for twenty-five years, and esteems it highly. It is a sure crop thereabouts until the advent of a killing frost, and its yield is always in proportion to the fertility of the soil. It has never yet developed either an enemy to itself or a pest to neighboring plants. It withstands droughts well, and readily recovers from any temporary disaster.

THE BEAUTY OF HEBRON POTATO.

The following extract from a letter shows how the Beauty of Hebron behaved herself under moderate care last year. "I got a single tuber of the Beauty last spring and from it I have gathered 142 tubers, together with about as many small ones as could be held on the palm of the hand. This must be considered a very large yield. The culture was flat; that is, no earth was drawn to the plants. The quality of the Beauty is excellent, and I have no doubt that she will take her place among "the fairest of the fair." P B Mead.

Farm Topics.

MOISTURE-RETAINING POWER OF THE SOIL.

EFFECTS OF STIRRING THE SOIL.

The experiments related in "Notes from the Rural Grounds," in the Rural New-Yorker of Oct. 19th, are remarkably interesting. The results are not in the least surprising. Indeed, they might have been foreseen by a careful consideration of the behavior of water held in suspension by porous bodies. A sponge or a mass of loose, fine soil offers an exceedingly favorable opportunity for the absorption of water, because there is a very large number of particles of matter contained in these, the surface of each of which exerts a powerful attraction for water. It is a well-known fact that the finer the particles of a porous mass, the more rapid and the greater is the power of absorbing water that is exerted by these particles. Another well-known fact is that the more rapidly water is absorbed by a soil, the sooner it is evaporated from it. So, a soil that absorbs water slowly, holds more of it at the point of saturation and parts with it slowly.

But these experiments do not, to my mind, include the whole question involved in the practice universally followed by good farmers, and recommended by well-informed agricultural writers, viz., the frequent stirring of the soil in dry weather, for the avowed purpose of aiding the growing crop to better supply its roots with moisture. If they did, there would be a conflict of fact with fact. For it is a fact that the stirring of the soil during dry, hot weather *does* prevent a corn crop from curling its leaves, turning yellow or wilting; also that pulverizing the surface of a clay soil in dry weather *does* prevent it from cracking deeply, as a compact soil will do; and lastly it *is* a fact, known very well to many farmers this very season, that unplowed stubbles have been so dry that it was impossible to plow them for fall crops, while those that had been once plowed could be cross-plowed without difficulty.

It is not a simple question whether or not a loose soil evaporates water more quickly than any other; but, does a loose soil supply more water to a growing crop in dry weather, when evaporation is active, than a compact soil? In the experiments referred to, *the pot containing loose soil became saturated with water in the least time.* This is a vital point, and actually proves the practice of "stirring the soil," "loosening it," pulverizing it, to be really "the farmer's best method of protecting his crops during seasons of drought." For if a pulverized soil has an increased power of absorbing moisture, that is the very thing that is wanted. Suppose the moisture is evaporated quickly, what then? Do not the roots get their share? How do we know what small proportion of the moisture escapes the roots and is wasted on the dry atmosphere? In the experiments in question, there were no growing plants and the action of the roots of a crop did not enter into the result. But in practice this is of the greatest importance.

Again, this very soil that loses the moisture most rapidly, most quickly regains a new supply, and this new supply may come from the subsoil or from the condensation in the cooler atmosphere during the night, when the warmer soil will receive greedily a large quantity of the precipitated moisture. Besides, this very quickened circulation of moisture, this rapid absorption and quick evaporation, will tend to bring to the roots of the plant a much larger supply of food contained in solution in the water and deposited in the surface soil by the process of evaporation, or actually carried into the roots in the increased supply of moisture. It seems clear to me that the conclusion "that this advice (to stir the soil,) is wrong in theory and wrong in practice," is itself wrong, and the reverse is actually proved to be right, by these very experiments; and that in this instance the complainant has positively proved the defendant's case. Henry Stewart.

CULTURE AS AFFECTING THE MOISTURE OF THE SOIL.

Under the above heading, the Country Gentleman says:—"A writer in the Rural New-Yorker has made the curious discovery that it is a great mistake to keep the soil mellow with a view to retain in it a supply of moisture for growing crops. He is surprised to find that stirring and loosening and pulverizing the soil—its culture, in point of fact—facilitates instead of retarding the evaporation of moisture, and as he does "not take into consideration at all the amount of moisture a loose soil may take from the air more than the compact soil," or the difference between them in shedding or absorbing rains, or some other attendant questions, the conclusion he reaches is quite adverse to any such laborious operations. He expresses this conclusion in the following somewhat positive language:

"From experiments which we have been conducting for the past three years, we have been forced to the conclusion that this advice [to stir the soil] is entirely erroneous—wrong in theory—wrong in practice. Stirring the soil *does not* disconnect the capillary tubes—does *not* act as a mulch; does not preserve the moisture either in seasons of droughts or in any other seasons, and that, consequently, in so far as *this* principle is concerned, the incalculable amount of labor performed to this end, has not only been performed to no purpose, but to the accomplishment of results precisely the reverse of those intended."

If stirring the soil as compared with leaving it hard and compact, does not enable a crop, either in farm or garden, better to withstand drought,—if it does not, in other words, increase the available store of moisture for the growth of plants—an incalculable amount of labor has indeed been wasted, as our contemporary remarks, and many practical farmers and gardeners have been sadly misled in trusting to the evidence of their senses. The more rapid the evaporation the greater the absorptive power, whether from subsoil below, or atmosphere above. In one of the experiments here narrated, a foot of compact soil required nearly three times as long to absorb a certain amount of moisture, as one in which the soil was loosely sifted. Place the two between a comparatively never-failing store of moisture beneath, and an intermittent supply from above, and which would best sustain the constant drafts upon its moisture from the immense demands of a heavy crop, as well as the action of the rain and wind upon its own surface?

As we write, an associate states that once in cutting a culvert four feet in depth from a cultivated field across a country road, in a very dry time, he found the soil in the field moist up to within twelve inches of the surface, while that under the closely compacted road was dry down to the full depth of digging. And yet we do not doubt that evaporation took place much more rapidly in the field than in the road.

A NOTE FROM PROFESSOR S. W. JOHNSON.

We have received from Professor S. W. Johnson, of the Connecticut Agricultural Experiment Station, a note in which he says:

"I read with much interest in the Rural of Oct. 19, the article in 'Moisture-retaining Power of Soils' and am desirous of obtaining a sample of soil exactly similar to that there used, for making some comparison in the apparatus used here in similar trials. Our results (see report for 1877, p 79, *note*,) show or indicate that the greatest power of capillary transmission of water occurs in soil, or soil-like media, of a certain grade of fineness of particle and pore, and that either coarser or finer pores transmit water more slowly.

FARMING IN KANSAS.

L. J. TEMPLIN.

This State has lately attracted a great deal of attention as an agricultural region, and people in great numbers have been flocking here, not only from all the States east of the Mississippi River, but from every country in Europe. The equable and healthy climate, and the generally fertile soil, make it probably the most desirable place for the emigrant to be found on the globe. But it should not be forgotten that there are

DRAWBACKS IN KANSAS.

Many come here apparently under the conviction that if they can but reach this land, all their troubles will be over; their "bread and their water will be sure," whether they work or not. Some have an idea that if they can but get a title to a piece of land, their fortunes are made. Now, it should be borne in mind that this country, like all other parts of this continent, is liable to an occasional drought, and with our hot sunshine and drying winds, these droughts are apt to prove quite damaging to crops. Again, an occasional visitation of the Rocky Mountain Locusts causes a wide discrepancy between the expectations of spring and the realizations of the autumn.

Nor is all the land of this State first class agricultural land. An occasional bluff or hill is found so full of rock and so steep that it cannot be brought into cultivation. Then, a ridge of sand-hills will be seen extending for miles. These are only fit for grazing. In some few localities salt marshes will be found that are utterly useless, except for the manufacture of salt. But all of these together do not occupy probably more than one acre to a hundred of rich, tillable soil. People come here to engage in farming, and the State has a fine climate and

PLENTY OF LAND FOR NEW-COMERS,

of a good, rich nature, to meet their wants

There are now in cultivation, or inclosed for pasture in this State, 6,538,727 acres. This is an actual net increase of 943,422 acres over the area inclosed last year, or 16 86 per cent. Yet the amount of uncultivated land in the State is 45,504,793 acres. The State is filling up with people who, for enterprise and intelligence, will compare favorably with those of any State in the country.

THE METHODS OF FARMING

introduced into the State are as widely different as the localities from which the people have come. Doubtless some of these methods were the best where those people came from, while others were not. But in coming to the West and attempting to follow those old methods, disappointment is too often the result. Many have an idea that the soil is so rich and mellow here that about all that is needed is to get the seed into the ground, and a crop is sure. It is true that the ground is of such a friable nature that it is much easier put in good condition for crops than most of the soils in States farther east, but my observations have led me to the conclusion that there is no soil in which thorough cultivation is of more benefit than in the rich soils of Kansas. Though our soils do not "bake" or dry out with ordinary weather, yet the difference between a well tilled field of corn and one that has been carelessly run through once or twice, will be often found one-half or more in favor of thorough cultivation. A man with the same appliances will generally cultivate a much larger area here than in any other country I have seen, and yet, as a rule, people here undertake more than they can do well, which is bad economy here or elsewhere.

One of the great evils under which agriculture labors in this State and almost everywhere else, is

SHALLOW PLOWING.

This, doubtless, results everywhere from shallow thinking. Men whose minds have been stirred with deep thoughts and improved with thorough culture, will seldom be satisfied with the skinning process, so often called farming. In breaking sod, which is the first step in opening a farm here, the correct idea is to break as shallowly as possible, provided the plow goes below the crown of the grass roots. This causes the grass to dry out and die so that it rots the first season, while if broken deeply it will often turn and grow, thus keeping the sod green and making trouble the second year. But many imagine that because two inches is deep enough for sod, four inches is deep enough for ordinary soil, which is a mistake of from 100 to 200 per cent.

The man who is a routine farmer, following a certain course just because he has seen the work he has in hand done in that way, or because some one else does it in that manner, is not the one to make a success of the business, especially under new and strange conditions. It is the man who has studied the science of agriculture, who understands the first principles of the business, that most readily adapts himself to his surroundings and makes a success of his business. The "book-farmer," in his first efforts to apply his principles to practice, will make mistakes, but his acquired knowledge of general principles will soon enable him to discover the cause of his failures and avoid them in the future, while the routine farmer will continue to blunder without knowing the cause of his failures.

THE USE OF FARM MACHINERY

in Kansas is almost universal. The labor is principally done by horse-power, while the farmer rides at nearly all his work. He breaks his sod, stirs his fallow, drills his wheat, reaps and binds the same, plants and plows his corn, mows and rakes his hay—all with machinery upon which he rides, and over which he can, if he so desires, spread a canvass for shade. Our broad, rich prairies without stone or stump, afford a splendid field for the employment of the improved farm machinery of the day, and the farmers have not been slow to avail themselves of their benefits. Farming is losing much of its drudgery and becoming a much more intellectual pursuit than in our grandfathers' or even in our fathers' days.

THE APPLE ORCHARD.—No. 2.

BY CLINTON.

THE PROPER DISTANCE FOR PLANTING APPLE TREES.

was spoken of in my former article as being two rods, or 33 feet. This I adopt as an average rule, but in special cases, the rule may be deviated from somewhat. For instance, in case the trees are upright growers, like the Northern Spy and Baldwin, they will admit of somewhat closer planting; but if the branches are spreading, like those of the Rhode Island Greening and the Talman Sweeting, a greater distance may be required. I name these varieties as being such as are familiar to most cultivators. The distance should be such that when the trees are well grown, there will be no danger of their interfering with each other by the interlocking of branches, which increases the inconvenience of gathering, and by preventing a free circulation of air, tends to diminish the value of the fruit, not only in color and flavor, but in quantity. Of course, this objection to close planting is not apparent while the trees are small, but as they advance in size, it becomes more and more manifest. I have just measured an apple tree standing in my garden, which, at 20 years of age, I find is extending its branches eighteen feet in each direction from its trunk; thus covering a space thirty-six feet in diameter. This may be considered by some as an exceptional case, but I think it not unusual in a suitable soil and favorable locality. I have recently read, in a New York paper, a description of the orchard of Mr. Richard McKinstry, of Columbia County, in which it is stated that the boundary line, of over four miles in length, is marked by more than "2,600 apple trees, standing each ten feet apart." Trees planted thus closely may be useful in defining the boundary, and in serving as a wind-break for the orchard, but cannot be the most profitable for fruit-growing, for the reasons I have stated.

PRUNING.

is an important matter which should never be neglected. If properly attended to from the first, the top may be so shaped that there will rarely be any necessity for lopping off large branches at any subsequent period, and thus may be avoided the sudden shock to the tree which always results from the removal of a large branch, and from which it does not speedily recover, if indeed it ever fully does. I have witnessed many instances in which trees have been seriously weakened and permanently injured by over-pruning, and the cutting away of large branches. In one case, the owner of a fine orchard which had been somewhat neglected, let out the job of pruning it to a poor neighbor, giving him, as a remuneration for his labor, all the branches he might think it necessary to cut out. Of course, the poor man found it convenient to provide himself with a good supply of fire wood for future use, to the great damage af the orchard, as soon because apparent to the owner.

An orchard properly attended to, will require but a moderate pruning in any one year. To begin with, encourage a low growth of top. This is important for several reasons, among which are: first, the much greater convenience in gathering the fruit, and, second, the less danger of the fruit being blown off in case of high winds. Some farmers advocate high training, so that the branches will not be in the way of the team in plowing. But to plow an orchard after the trees are well grown, is, in my opinion, a very questionable policy; and while the trees are small, there will be no trouble arising from the low growth of the branches, if proper care is observed.

If the tree is forked when received, remove one of the main branches, as a forked tree is quite liable to split in the trunk and thus be ruined. If, from any oversight, the matter has been neglected until the top becomes large, the difficulty may be remedied, in a great measure, by boring through the two parts with a half-inch auger, and inserting through the hole an iron rod, or bolt, with a head at one end and a screw and nut at the other, thus binding the two parts firmly together. If the tree is vigorous, all will soon become imbedded in the new growth of wood, and the remedy will become permanent. I have spoken of encouraging an open top to the tree; but judgment is requisite in regard to the matter. A tree which naturally inclines to have a low, spreading top, will need but little attention in this direction; for after a few seasons of bearing, the top will spread out, owing to the weight of fruit, and thus it usually becomes sufficiently open. But those of more upright growth of top, will need some thinning out from the center. In all cases, remove all dead or dying branches, as a matter of course, and in all cases where branches are likely to interfere with each other by crossing or otherwise, remove one of them, while they are yet small. Prompt attention to all such matters is essential to success.

If the branch removed is of any considerable size, it is well to cover the wound either with grafting wax, or a preparation of gum shellac dissolved in alcohol, or with a coat of thick paint. In removing a limb of any material size, the rings in the bark at the base of the branch, will indicate where amputation should be made.

As to the best time to prune the trees, authorities differ somewhat, some advocating the fall, some midwinter, and others the spring, and still others, a little before midsummer. These various opinions may be affected in some degree by the locality and climate. My own experience induces me to believe that, for central New York, there is no more suitable time than in early spring, before the sap commences to circulate. There will be no injurious loss of sap by bleeding if done at that time, and the healing process will commence very soon, and the wood will remain in a sound condition until covered by the growth of bark.

I will not occupy space by giving extensive instructions on

GRAFTING.

Every fruit grower should be competent to do his own grafting. The process is so very simple that any one possessed of common ingenuity should be able to perform it, after having once seen it done. For the most satisfactory results, it should be attended to while the tree is young and vigorous. If the tree is of considerable size, it is best to graft only a portion of the top in a single year, as in this way the orchardist to some extent avoids the injury that may result from removing a large portion of the top at once. If he does the grafting himself, he *ought* to know what kinds of fruit he will get as the result. If he employs others to do it, or purchases his trees of traveling agents, he will, too often, be disappointed in this respect. If he cannot see to the matter personally, in procuring his trees direct from good, reliable nurserymen, I would recommend him to procure seedling trees from his own vicinity, if possible, and graft them himself while they are small—say the second or third year after transplanting. He will thus avoid being imposed upon as to the varieties, and have trees accustomed to his climate and soil, and which have not been forced into early and rapid growth in the highly cultivated grounds of the nursery.

The orchardist should make a regular map of his orchard, on which he should carefully mark, legibly and plainly, the names of the several varieties, in their proper places. This is better than to rely on labels, which are so liable to be changed or lost. It is well to have trees of the same variety planted near each other, and not scattered promiscuously through the orchard. There should be some system about it.

SUBSEQUENT CARE.

Keep the soil clean and well worked under and around the trees while they are small. Plant what you please between the rows, but never disturb the roots with the plow, or rob them, by planting over or too near them. The first season, a good mulch, covering the ground as far as the roots extend, will be highly beneficial to the trees, and in a dry season may prevent serious losses. To guard against the depredations of mice, which in winters of deep snow are often quite disastrous, form a little mound of earth about the trunk, to the hight of a foot, before the snow falls, and level it off again when the spring fairly opens. Coal ashes may be profitably utilized for the same purpose, and will furnish some protection also against that pest—the borer. Examine the young trees carefully every spring, to see if they have been loosened by the winds and frosts of winter and spring, and if so, press the earth firmly about the roots, and stake the trees only when necessary. Search carefully, at the same time, for the eggs of the Tent, or other caterpillars, which may then be easily removed and destroyed, and much subsequent labor, and perhaps injury, guarded against.

Never allow cattle or horses to run in your orchard, unless the trees have become so large that they cannot injure them. Sheep and hogs may be pastured there to advantage, as by eating the wormy fallen fruit they will check, in some degree, the increase of the Codling-moth. But no kind of stock should be allowed to run in young orchards until the trees have become fully and firmly established. Do not anticipate much profit from any other crop which may be attempted to be grown in the orchard after the trees have attained a good bearing size. Let the trees themselves be the main objects of consideration. Whatever else is grown in the orchard should be considered as but a secondary matter. But in all these particulars, the novice will frequently find himself obliged to rely very much on his own judgment, coupled with that experience which, after all, is usually the best teacher.

Oneida Co., N. Y.

FACTS ABOUT THE JAPANESE PERSIMMON

The Japanese Persimmon is a dark-stemmed tree with large glossy leaves. It seems to somewhat resemble, in its method of growth, an Angiers quince tree, but the leaves are larger, and the tree is handsomer. It buds and grafts readily. The fruit is produced on the new wood of spring growth, blossoms appearing in April, the fruit not being fit to gather until after the leaves fall. The fruit is not usually good until it has lain in the dark for some months, and has become soft. The trees are hard to transplant, unless great care is taken. It appears probable that the Persimmon prefers a rather moist location. It promises to be an immense bearer. One orchard of 1,200 trees, planted for market, lies near San Jose. CHAS. H. SHINN.

Alameda Co., Cal.

TESTS OF GARDEN SEEDS.

Prof. Beal's experiments with seeds in a green-house are altogether too favorable. It is well known to all gardeners, and his experiments prove it, that the shelter together with the regular care and attention possible in an artificial soil and climate, affords no proof of the vitality of seeds. His tests in the open soil, out-of-doors, subject to the weather, and all casualties, are the only true tests, and just the ones which farmers and others must put these very seeds to. Hence seeds can only be fairly tried in situations similar to those in which it is natural for the people at large to place them; that is, in their gardens.

An expert gardener can take a lot of seeds known to be old and of doubtful vitality, and by giving them green-house shelter and a due amount of nursing, produce germination, when open-air culture would not give a single live plant. After all, the proper germination of seeds in gardens, depends fully as much upon the one who puts them in, as upon the quality of the seeds. As an evidence, place a lot of portulaca or of tobacco, or of celery seed in the hands of an inexperienced person to sow, and not one in a thousand will ever show, unless it may be those accidentally spilled upon the borders of the patch. The true way to test garden seeds is to plant them properly, at the proper time, in the average soil and under the average conditions which farmers have at command. S. RUFUS MASON.

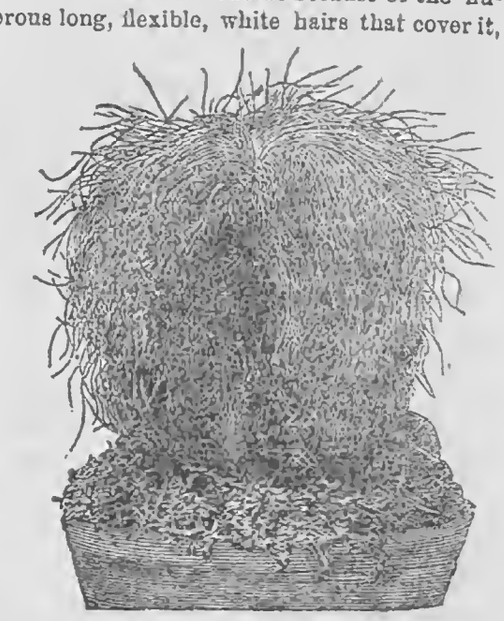
Floricultural.

THE OLD MAN CACTUS.

Just look at this funny little Cactus with its shaggy head, as white as the driven snow. It is called the Old Man Cactus because of the numerous long, flexible, white hairs that cover it,



and which resemble the gray hairs of an old man's head. But old men are often bald-headed, which is not the case with this Cactus, for its crown is the whitest and hairiest. A-down its body—it is hairy from head to foot—by reason of age and handling, the hairs are less numerous and of a duller color. This Old Man Cactus is an irresistible temptation to the ladies; we never knew them pass him by without stroking down his pate or wanting to—just to see if he is good-natured He shows no great aversion to this fondness, but when they ruffle his temper by stroking his locks upwards instead of downwards, the many tufts of white spines that are thickly set along the ridges of his body and hidden by his silvery hair, chastise such undue familiarity.

Botanically he is known as Pilocereus senilis. He is at home in Mexico, where he attains immense columnar proportions—some 20 feet high, by eight or ten inches in thickness. Little fellows are not uncommon in our greenhouses, where, though they grow slowly, they are very tenacious of life. And they are good window plants too. They do not like dusty apartments, and are averse to having much water spilt on their heads. During the winter season they want but very little anyway, and even in summer time, great moderation should be exercised. They like a gritty, loamy soil, despise peat, and though a little very rotten manure is relishable to vigorous specimens, its use had better be dispensed with; so should that of all artificial manures. These old men Cactuses like warmish winter quarters, and for all the room they occupy should get a winter seat in the window and not in the cellar.

EULALIA JAPONICA VARIEGATA

It is surprising how few people as yet appear to know anything of this beautiful, hardy grass. We have a row of plants which have been in full beauty for the last six weeks, on the sight of which every visitor exclaims "How charming!" but the full beauty is scarcely seen outside; although in this fine, dry, bright autumn weather the flower plumes show much of their true character. We had plumes of this grass in the house in full beauty from last year until the plumes of this year were ready for the same purpose, and they looked about the same as when cut last year.

I have noticed that, in a few cases, people have bleached this grass, but I consider it looks unnaturally white, and I have no doubt some of our European friends will soon begin to dye it green and probably magenta, just as they already do with the Pampas grass plumes and also the very pretty Feather grass and Briza;

a more vile taste I cannot imagine, unless it be manifested in some of the floral designs displayed in florists' windows, and also in some cases thought worthy of prizes at some of our horticultural shows. Is it that the American people have no taste in these things and cannot appreciate any light and elegant design, but must run in the groove cut by an ignorant and uncultured flower-seller? I cannot think it is the former with many American ladies, having seen a few common flowers and leaves put up with the best taste, both as parlor ornaments and also for funeral purposes.

We often see a criticism on the bad taste of floral designs in general, and people usually agree with the critic; but yet we see no alteration afterwards, so that it amounts to nothing; but I believe if any florist of taste would get up basket and other pieces in good taste, it would be appreciated and he would make money.

JAMES TAPLIN.

CATALPA SPECIOSA. (?)

MR. MEEHAN, of the Gardener's Monthly, seems to doubt the existence of this distinct species of Catalpa. No person seeing this and C. bignonioides—the common Catalpa—side by side, can fail to notice the marked and uniform difference, a difference as well marked as that habitually noticeable between the Northern Spy and R. I. Greening apple tree, the Vicar of Winkfield and Buffum Pear, or the Kilmarnock and Babylonian Weeping Willow.

C. speciosa is uniformly upright and pyramidal. If trees of the two varieties are planted contiguous, when eight to ten years old the Speciosa will average about twice as high a growth as Bignonioides, with a far larger, longer and straighter trunk. The bark of Speciosa is rough, like that of the Ash or Walnut, while that of Bignonipides pulls off like that of the Birch or Sycamore. The foliage, flowers and seed pods of Speciosa are also much larger than those of the common variety, and the flowers are nearly pure white. It is also said to be much hardier, flourishing in northern Illinois and Iowa, where the common variety will not stand the severity of ordinary winters. The origin of C. speciosa is as yet unknown. Dr. WARDER first described it in his Western Horticultural Review in, 1853.

Dunreith, Ind., Oct. 7. E. Y. T.

Miscellaneous.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

NEW HAVEN, NOV. 12, 1878.

BULLETIN NO. 20.—FERTILIZER ANALYSES.

208 Ground Bone. Sampled Oct. 5, 1878.

209 Bone Sawings. Bone sawed in water, dried and sold in dry state. Sampled Aug. 30.

The above are sold by the Rogers and Hubbard Co., of Middletown. The samples were drawn and sent by CHARLES FAIRCHILD, Esq., Middletown.

210 Muriate of Potash 80 per cent. standard.

211 No. 1 Peruvian Guano. "Lobos." Gnarantee: 6 per cent. Ammonia, 15-20 per cent. Phosphoric Acid, 3-5 per cent. Potash.

210 and 211 are from the stock of CHAPMAN & VAN WYCK, 170 Front St., N. Y. The samples were taken Oct. 8, by G. M. BARBER, Esq., New Britain.

	208	209	210	211
Nitrogen	4.00	3.02	.....	5.14†
Sol. Phos. Acid	.....	.....	.....	5.19
Rev't'd Phos. Acid	.....	.....	.....	5.73
Insoluble Phos. do.	24.13	26.97	.....	8.69
Potash	.....	.....	55.01*	3.75
Cal'ted val. per ton	$36.13	$48.63	$49.51	$59.40
Cost	30.00	30.00	40.00‡	51.00

* Equivalent to 87.2 per cent. of Muriate of Potash.
† Equivalent to 6.24 per cent of Ammonia.
‡ The potash actually costs 5¾ cents per pound.

W. H. BOWKER & Co. note several errors in 19th Bulletin and furnish the subjoined corrections.

a. The articles made by W. H. B. & Co. are designated the "*Stockbridge Manures*" (not Stockbridge Fertilizers).

b. 175, for Strawberries and 193, for Kitchen Garden, contain *sulphate* and not muriate of potash. This would raise the valuation several dollars per ton.

c. 181 is *Bowker's* (not Stockbridge's) *Lawn Dressing*, price $65 per ton (not $130.) Contains Muriate of potash.

d. 193, Kitchen Garden Manure, price $50 per ton (not $60.)

e. 195, Corn Manure, price $50 per ton (not $56.)

f. 197 *Grass Manure*, top dressing (not Hay Fertilizer).

In reference to these errors it may be said—

a, *c*, and *f*. The Bulletin gave the names that were furnished with the samples.

b. 175 contains sulphate and but little muriate of potash. Its estimated value is therefore $48.24 per ton. 193, however, contains 6.8 per cent. of chlorine or 2.9 per cent. more than the amount necessary (3.9 per cent.) to form muriate with the potash present. The advantage, if any, of buying a sulphate is avoidance of chlorine compounds. This advantage is not offered by 193. The potash used in 193 can, at the most, be credited as that of a low-grade sulphate worth 6 cents per lb., and the valuation corrected accordingly, is $40.68.

c. 181 The selling price named to the Station was 65 cents per bag of 10 lbs. From this was computed the ton-price reported, which is evidently unjust to the manufacturer.

d. 193 Selling price was $3.00 per 100 lbs.

e. 195 Selling price was $5.00 per 200 lbs. The ton-price was misprinted $56, should be $50.

f. 197 Selling price was $5.00 per 150 lbs.

In all cases the Stockbridge Manures were sold by Olds & Whipple, with "freight added."

Here follow the amended names, valuations, and prices.

175 Stockbridge Strawberry Manure. Sent by P. M. Augur, Middlefield.

181 Bowker's Lawn Dressing.

193 Stockbridge Manure for Kitchen Garden.

195 Stockbridge Manure for Corn.

196 Stockbridge Manure for Squashes, Cucumbers and Tomatoes.

197 Stockbridge Grass Manure, top-dressing.

181, 193, 195, 196 and 197 were sold by Olds & Whipple, Hartford, Ct. Samples were taken May 1, 1878, by J. J. Webb.

	175 Pr. ct.	181 Pr. ct.	193 Pr. ct.	195 Pr. ct.	196 Pr. ct.	197 Pr. ct.

Potash,	....	....	....	6.95	....	....
Estimated Value per ton,	$48.24	$58.01	$40.68	$45.31	$43.02	$56.28
Cost per ton,	$53.33	$65.00	$50.00	$50.00	$55.00	$56.57
Cost, per bag,	{ 150 lbs. $4.00	10 lbs. $0.65	100 lbs. $3.00	200 lbs. $5.00	200 lbs. $5.50	150 lbs. $5.00

*As Sulphate, valued at 7¼ cents per pound. In the others, †As low-grade Sulphate, valued at 6 cents per pound. potash as muriate, is valued at 4½ cents.

The station in now ready to test Sugar Beets as to their Sugar value. Send 6 to 10 roots representing an average of the crop. Send as soon as possible, but so that the roots will not freeze. Give also answers to the questions found on p. 104 of Report of Station for 1877.

S. W. JOHNSON, Director.

NOTES OF CURRENT EVENTS.

VALUE OF LAND.

A GOOD index of the actual value of land is the amount realized at public sales for cash in the best agricultural localities. Recent sales in the Blue-grass region of Kentucky, have been made at $75 per acre for farms of superior quality. In that portion of the garden of Pennsylvania, Montgomery Co., sales have been made at $125 an acre. This shows a reduction of 50 per cent from the prices of five to seven years ago. At these rates there is no surer or more profitable investment than land.

LOW PRICES.

As to prices, we are now down to what is called "hard-pan." Pork at 2½c. per pound in the West and at 4 to 5c. in the East, and wheat at from 75c. to $1 a bushel, are surely low enough to stimulate business and industry into a healthful activity. But then, after all, the farmer has his equivalent in the low prices of what he purchases. A good pair of boots can be procured for $3, which used to cost from $7 to $9. Cotton goods are selling for six cents a yard and a good suit of woolen clothing for $15. Wages of labor are reasonable, except for domestic female help, and, on the whole, there is really nothing to grumble about, unless it be that our "pile" of savings is not so bulky as it used to be in years past. But then, one cannot always be laying up a pile.

THE VERY BEST INVESTMENT.

Just now there is no better way for the farmer to add to his savings than to improve his farm. The tide of events is on the turn. One dollar now will do as much in the way of clearing land, draining, building, as two would a few years ago, and undoubtedly as much as they will do in a year or two hence. When the tide has fully flowed, every dollar thus spent will be worth two or more. But at any rate, *every dollar thus spent is safe*, and is in a position to return good interest every year. Money judiciously spent in farm improvements, can be made to pay 25 to 100 per cent. and, in this case, the big interest does not measure the risk of the investment.

BIG CROPS.

A person in Chester Co., Pa., would have us believe that there never was a crop of wheat raised that measured over 35 bushels per acre.

Now is all the evidence of hundreds of English farmers who return their crops as 7, 8 and 8½ quarters of 8 bushels each to the acre, to go for naught? Are all these men knaves and liars? Is John Johnston's record of 45 bushels per acre, or Joseph Harris's of 40 bushels and over, and an unsatisfactory crop at that, to be disbelieved? The time was when we believed 100 bushels of corn per acre to be an innocent guess of some enthusiastic farmer. But the present season, the writer has taken with his own hands 43 baskets of ears of corn weighing 40 lb each, from a piece of land measuring 108 feet long, 48 feet wide at one end, and 96 feet wide at the other, being thus what is known in geometry as a trapezoid in form, and containing 7,776 square feet, or not quite 18-100 of an acre. By simple figuring, this can be seen to amount to 9,525 lbs. of ears to an acre, and if 95 lbs of green corn when husked, are allowed to be one bushel, there are over 100 bushels per acre. It is true that this is a very prolific kind of corn, averaging three ears to each stalk but there was but one stalk to a hill, and there is no difficulty in growing corn of common kinds which shall bear one ear to a stalk, with 3 stalks to a hill. The fact is we have not yet nearly learned what can be the full capability of a good soil well cultivated.

A TEXAS HOMESTEAD.

WE have received a brief but interesting sketch of his homestead from a new friend of the RURAL living in Texas. Those whose lot has been cast among the fixed surronndings of the long-settled parts of the country, can learn a good deal about the better kind of life in our frontier States from just such a description of the farm homes to be met with here and there in them. He has a farm of 140 acres on prairie land in northeastern Texas, one mile from the city of Corsicana, a place located on the Texas Central Railroad and containing a population of about 10,000. His farm, like those up North here, is divided into pastures and cultivated land; but, unlike too many of our farms, there are on his place orchards of Apples, Pears, Peaches, besides Cherries and other small fruit, such as Grapes, Blackberries, Raspberries, Strawberries, etc. His house is situated on rising ground and overlooks the whole farm, in the center of which it was built, as nearly as possible. On the northwest of it stretches the orchard, which comes right up to the yard in that direction. On the other sides of the house are upwards of a thousand trees, consisting of a few exotics, but mainly of those of native growth, and of between 400 and 500 Cedars, which he has planted, as that kind of tree does not grow naturally on the prairie. On the farm he also has had, for the last four years, a fish pond, not wholly unlike that pictured in the RURAL of October 19th.

Another feature of his homestead is far too often wanting about the farm houses in States whose inhabitants are supposed to be much wiser in agricultural matters than the rough denizens of the Lone Star State. What is it? Well; he has 57 stands of Italian bees, from which he has derived more profit than from anything else on the farm, taking into account the amount of capital invested. He has always felt a very praiseworthy sort of pride in having his stock at least a little better cared for and of somewhat better blood than those of his neighbors; and pride of this kind is always profitable to the man blessed with it, and a source of gain to the neighboring farmers owing to the emulation it is likely to engender. On a thrifty, well-kept farm of this kind, of course, flowers are not forgotten. These are the ornamentation, the embroidery, the trimmings, that beautify and brighten the somewhat somber aspect of farm life, and are no more absent from a really well-kept homestead than the ornaments to which they have been here compared, are absent from a handsome dress. In view, therefore, of the foregoing sketch of this Texas homestead, our friend very appropriately finishes his description by declaring that his wife's garden is a perfect Eden of flowers, to which she wishes to add other beauties, by availing herself of the RURAL free seed distribution.

THE MANAGEMENT AND DISEASES OF THE DOG.

THIS is a work of 383 pages, by John Woodroffe Hall, of England, Fellow of the Royal College of Veterinary Surgeons, and already very favorably known to the public as the author of Essays on "Parturient Apoplexy in the Cow," "Some Diseases in Farm Stock," "Diseased Meat as an article of Food," "The Actual Cautery," "Canine Distemper," and several other valuable treaties on kindred topics. The present work will certainly not detract from the reputation won by its predecessors. Its scope embraces full accounts of the ailments to which man's faithful canine friends are liable together with clear statements of the latest veterinary practice for alleviating and curing them. The work is fully illustrated, a feature that materially aids the ordinary reader to obtain a clear understanding of the nature of the diseases described in the text, and of the treatment recommended to remedy them. To such of our readers as are interested in fine dogs, we can strongly recommend this work as an embodiment of the latest pathological and therapeutical knowledge on the subject of which it treats. Published by Albert Cogswell, 24 Bond street, New York city; price $2.

WHAT OTHERS SAY.

POLLED CATTLE FOR SHIPMENT.—From an interesting and well-considered article under this heading by the veteran John H. Wallace, we extract a few remarks: "In a trip across the ocean last summer I had an opportunity of studying this question from a standpoint that was eminently practical. On the same steamer there were 70 or 80 head of very fine cattle for the English market. Those on the main deck were packed, two and two, in boxes, with just room enough to stand up, but no room for either to lie down. If by any means one succeeded in getting down, it required a terrible struggle to rise again, for his fellow was compelled to stand over him. These struggles would have been comparatively harmless if there had been no great horns in the way. But the horns were not only unintentional sources of injury and pain, but they were at the same time the causes of entangling the halters in such a way that it was impossible to avoid injury and pain. * * * If this question were merely one of commiseration for the suffering of dumb brutes, we might have some doubts as to its commending itself to cattle breeders in this age of money-making and greed, but every one knows, whether he is a novice or man of the widest experience, that every hour of suffering on the way detracts from the health, appearance and condition of the animal when he reaches his destination. * * * If a carload each of horned and polled cattle were shipped from beyond the Mississippi to this market, I am fully satisfied that the difference in condition and the difference in shrinkage would make a percentage of advantage on the latter over the former that would tell largely in the profits of the producer. Unfortunately, however, the test cannot be made, for the polled cattle with which to make it cannot be found. * * * A question of a very practical nature presents itself here. How are we to produce polled cattle without a breed of that kind? The answer is that we must have a breed of polled cattle. Then another question follows, Shall we throw away all the improvement we have made in Short-horns, for example, and go back to first principles again in founding a good beef-producing race? There is no need of taking a single step backward, for there are three races of polled cattle in England and Scotland that have been carefully bred for many generations—the polled reds of Norfolk, the Galloways of southwestern Scotland, and the Angus or Aberdeen cattle of northeastern Scotland."

Mr. Wallace proceeds to speak of the polled Angus: "It is now eighty years since Mr. Watson, of Keillor in Forfarshire, founded his herd. This takes us back to a period contemporaneous with the early improvers of the Short-horn. As a race they are probably nearly as old and well established in their characteristics as the Short-horn. * * *

It is claimed for the breed and I am disposed to think the claim is just, that the beef itself is better than the beef of any other breed, and brings more in the markets of the great cities.

Like all the Scotch cattle, this breed have hardy, vigorous constitutions, and are very prolific. They are gentle in disposition, and mature very early. As milkers they are not distinguished, for they have not been bred for that purpose. They are generally jet-black, with fine, glossy coats and plenty of hair. They grow to a large size, and are easily fatted at almost any age. It is claimed for them, also, that they weigh heavier than any other breed to their measurement, which makes them attractive to buyers for the fat market. * * *

It is conceded on all hands that, as a beef-producer, the well-fatted Short-horn ox is very near perfection. For many generations he has been bred for perfection of form—the greatest amount of beef with the smallest amount of offal. Now, all we want is this same ox without the horns. * * * A distinguished Scotch authority says: "Of all the varieties of cross-bred cattle, there is none more satisfactory and remunerative to the feeder than the cross between the polled Angus, or Aberdeen, and the Short-horn. It grows to a large size, shows great aptitude to fatten, and when killed, the fat and lean are found to be distributed over its carcass in most desirable proportions. * * * At the exposition in Paris recently, there was a prize of $500 for the best herd of cattle bred outside of France by one exhibitor. For this prize a herd of Angus polls took the first, a herd of Angus polls took the second and a herd of Short-horns from England took the third. As a still greater triumph, there was a prize of $500 for the best beef-producing group, embracing animals from all countries, and the Angus polls were again the winners.

As beef-makers they are certainly in quantity equal, and in quality superior, to our Short-horns; as breeders they are more prolific, and to withstand our wintry blasts, they are more hardy. With a cargo of hornless cattle for either railroad or ocean travel, and whether for one mile or a thousand, the danger of accidents is greatly reduced, the suffering of the animals

is greatly ameliorated, tho facilities and convenience of the keepers are greatly improvod, the animals reach their destination not fevered with suffering and torn with the unwilling horns of of their neighbors, but comparativoly fresh and in good condition.

WHEAT SOWING.—THE Agricultural Gazette of London, says that no crop is planted in a greater varioty of ways than wheat. It is broadcasted, drilled and dibblod, plowed in, pressed, and cart-wheelod, thick sown and thin sown, wide drilled and narrow drilled. The advocates of many of these methods have been known to become exoitedly attached to their own particular systems to an extent which has rendered them somewhat troublesome to their friends and neighbors, and they have been known to make themselves unhappy because tho rest of the world would not look through or could not see through their spectacles.

It is the privilege of well-balanced, or as they might be called, philosophic minds to look at questions in a quiet and imperturbed manner, and to acknowledge that there is "much to be said upon both sides." With regard to wheat planting, we aro certainly inclined to address tho disputants in the words of the poet, "You aro all right and all wrong." Circumstances alter cases, and what is good practice in ono locality may be bad and impracticablo in another. Above all things, let amateurs and gentlemen farmers beware of what they read in agricultural jonrnals and papers. An article is best written by an enthusiast. If a gentleman becomes prominent as an advocate for thick or thin seeding of wheat, prickly comfroy, lucerne, or any other hobby, what is more natural and proper than that he should be roquested to commit his views to writing and publish them to the world. To the man whose eyes are opened, snch litorature is interesting and harmless; but to the man who is all agape for something new, and but little versed in the old ways, it is dangerous.

RECIPE FOR CURING MEAT.—Major FREAS thinks that if the following recipe be strictly followed, it will requiro but a single trial to prove its superiority over the common or most ways of "putting down" meat: To one gallon of water, take 1½ lbs. of salt; ½ lb. of sugar; ½ ounce of saltpeter, and ½ ounce of potash.

In this ratio the pickle can be increased to any quantity desired. Let these be boiled together until the dirt from the sugar rises to tho top and is skimmed off. Then throw into a tub to cool, and when cold, pour it over the beef or pork. The meat must be well-covered with pickle, and should not be put down for at least two days aftor killing, during which time it should be slightly sprinkled with powdered saltpeter, which removes all the surface-blood, etc., leaving the moat fresh and olean. Some omit boiling the pickle, and find it to answer well, though the operation of boiling purifies the pickle by throwing off the dirt always to be found in salt and sugar. The moat is unsurpassed for sweetness, delicacy and freshness of color.

SINGULAR CAUSE OF A COW'S DEATH.—JAMES MCCANN says, in the Elmira Husbandman, that he reported some weeks ago a sick cow. She could retain no food upon her stomach. Even water was vomited soon after swallowing it. Afterward by the use of Croton oil she had seemed to improve. A short time ago she died. She had no passage after her first difficulty except as Croton oil was given her. On cutting open the carcass the source of trouble was easily found. In the first stomach there were three eight-penny nails, several pieces of nails, one screw and several gravel stones. All these had worn smooth by the action of the stomach.

WHAT STOCK NEEDS.—A writer in the Farm and Fireside remarks: "the requirements of success in stock feeding for profit, are well-bred stock, olean, warm quarters, pure water, sufficient salt, a stall for each, having rope and chain fastening instead of stanchions, gentle exercise daily, when the weather is not stormy, sufficent sweet olover hay, cured in the cock, to supply their wants, and a uniform supply of finoly ground corn meal. Whatever method of feeding may be adopted, the question in which the progressive, practical farmer is the most interested is "how can I produce the most tender, juicy beef in the shortest time, at the least possible expense!"

CIDER APPLES,—The Mass. Ploughman says, as for cider apples, it pays to take more pains with them than used to be the case. The editor well recollects the time when it was customary to let all sorts of apples go in together, and if half of them were rotten and the other half full of worms, it was not thought to make any difference. Those who aim to make good cider now-a-days take far more care to select good apples, and he thinks it pays.

GAMBLING AT FAIRS.—If agricultural fairs cannot be conducted on a good, healthy, moral basis, it were far better that they be entirely abolished, and the youth of our rural districts remain in quiet obscurity and away from contaminating influences.—*Indiana Farmer.*

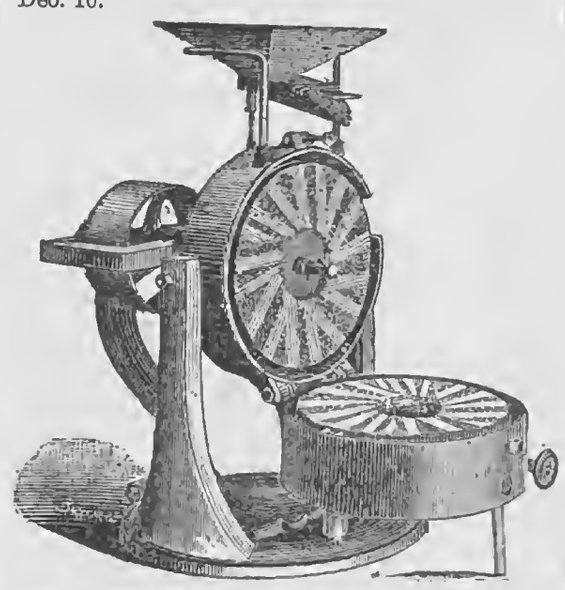
HOW TO TELL.—By six qnalities may a fool be known, says the Journal of Health: Anger without cause, speed without profit, change without motive, inquiry without an object, putting trust in a strangor, and wanting capacity to discriminate between a friend and a foe.

CURE FOR HOG CHOLERA.—Dutch papers say that vigorous rubbing in mustard on the first appearance of the disease, will curo hog-cholera.

CATALOGUES, &c., RECEIVED.

PRICE-LIST of Franklin Squaro Nurseries, New Lisbon, Ohio. H. Guy, Prop'r. Fruit treos.

ILLINOIS STATE HORTICULTURAL SOCIETY—Twenty-Third Annual Meeting, Springfield, Dec. 10.



NEW CONVERTIBLE MILL.

LIST AND AWARDS by the New Jersey State Agricultural Society at the twentieth annual exhibition at Waverly.

HANDSOME LITHOGRAPH of Edward L. Coy's Ayrshire Stock Farm and Seed Gardens, West Hebron, Washington Co., N. Y.

HOW TO DESTROY INSECTS on Plants and Flowers in the garden and house. Published by H. T. Williams, N. Y. Price 30 cents.

THIRTEENTH ANNUAL MEETING of the Ohio State Hort. Society, to be held at Dayton, Dec. 4th to 6th. M. B. Bateham, Sec'y. Excellent topics are selected for discussion.

DESCRIPTIVE Catalogue of Fruit Trees and Ornamental Plants grown and for sale at Shinn's Nurseries, Niles California. Shinn & Co., Proprietors. Colored plate of Japan Persimmon.

PAMPHLET.—Discussion on Hortionltural Education in Michigan and Experimental horticulture at the Agricultural College at the June meeting of the Michigan State Pomological Society.

ILLUSTRATED CATALOGUE of Bronze Turkeys, Pekin Ducks, and Light Brahmas, owned by Chas. H. Mattocks, Riverside Farm, East Baldwin, Me. Also, Illustrated Catalogue of Berkshire Swine and Cotswold Sheep on the same farm.

THE MICHIGAN HOMESTEAD.—This is the first number of a new agricultural paper issued at Detroit, Michigan, by J. P. Thompson, Ex-Secretary of the State Agricultural Society, and also Ex-Secretary of the State Pomological Society. One number only is to be issued in November; another in December; and on the 2d of January the regular weekly publication commences. From the first number of a journal little can be learnt of its permanent character, except its general appearance. This contains 36 columns, on large paper, and promises fairly. We heartily wish this new venture in agricultural literature all the success it may deserve.

THE NEW BEE-KEEPER'S TEXT BOOK by A. J., King, editor of the Bee-keeper's Magazine. The foundation of this is a thorough revision of the well-known Text Book by N. H. and H. A. King. Much new matter has been added, however, as shown by the fact that while the old Text Book contained only 140 pages, the new one runs up to 229. Many handsome illustrations have also been added to those in the former work, and all discoveries down to to-day in the science and practice of bee-keeping, are clearly detailed. Nor has the present work been improved by merely adding fresh matter, for the old one has been carefully pruned, and only that which experience has proved to be good, has been retained. We do not know any way in which the novice or adept in apiculture could more profitably invest one dollar, than in purchasing this handsome, cloth-bonnd volume.

Industrial Implements.

A NEW CONVERTIBLE MILL.

THIS mill is a novol, complote, inexpensive piece of mechanism that is very useful to farmers because it grinds equally well cement, tobacco, bone-dust, salt, feed, or re-grinds bran, coarse flour or anything of the kind.

It is convertible because it may be made to assnme a horizontal or vertioal position in a few minutes' time, at no expense of money, and without requiring mechanical skill on the part of the operator. It is operated by steam-, wind-, water-, or horse-power. Its construotion is very simple. The buhrs run in a cast-iron oase, and the entire rnnning machinery is supported by a strong iron frame, all cast in one piece. It requires no bolts or screws to keep it in position, except such as fasten its frame to a firm foundation.

Whenever it becomes necessary to pick the stones the millor requires no crane, tackle or other assistance to put them in perfect position for this process. He has merely to remove a nut, a bolt or two, and the stones turn on their trunnions and open as simply and as easily as a large well-bound ledger in the hands of a competent bookkeeper. Without any extraneous props or machinery the stones are at once thus placed in position to be picked and prepared for fresh work. In this process neither the journals, spindle, nor any other part that requires oil, is exposed to dnst, dirt or grit. Indeed all these parts are so cased and covered, running in self-oiling boxes, that there is no waste of oil, and tho bearings are such that friction is reduced to a minimum.

The face of the stationary stone can be adjusted actnally parallel from the outside of the casing, and tho means of always keeping the faces of the stones perfectly parallel have never yet been excelled or equaled. In opening them for picking or in readjusting them, none of the principal parts of the mill are in any mannor deranged or affected so as to require the skill or labor of the machinist to put them in perfect running ordor again.

No extra skill is required to set it up or to keep it in running order, and when in operation but little friction is generated, because the machinery is so true to its adjustment; which insures durability and long wear.

Our illnstration shows this mill, which is made by Messrs. Oglesby & Co., Chicago, Ill., who are scrupnlously careful to maintain its excellencies by using only the best materials in its manufacture.

THE MULAY SAW-MILL.

IT has often been a subject of speculation with us why farmers do not more generally evince that many-sidedness of brain not uncommon among successful business men? That they are not strangers to it is domonstrated by the fact that they do show it if they change their circumstances and calling. It is only as farmers that they have an eye single to agriculture.

The opportunities for engrafting small commercial enterprises on the business proper of the farm are plentiful and may be made to supplement gains in good, or repair losses in bad seasons.

The large sales of farm steam-engines reported by manufacturers of them, seem to point to the very general introduction of this motor. To yield a fair return on the investment the engine should not remain idle for lengthy periods, and in calling attention to a good use for the engine we may, perhaps, be imparting a seasonable hint. There are many localities where timber exists, which, though it might not justify the erection of a very extensive saw-mill, might yet be made to yield a very generous profit, if it could be made into lumber without too great an expenditure for machinery and help. In these regions, a mill of moderate capacity, requiring light power and few hands, might not only be made profitable to the owner but would be a source of great accommodation to the inhabitants of such localities. Almost any neighborhood would supply the sawyer with logs, to be sawed on shares, or at a stipulated price per thousand feet, and there would therefore be no investment required beyond the mere mill and power.

We illustrate a small saw-mill operated by a farm-engine. Where an engine is owned by a neighbor this Mulay mill would be a good investment to be worked on shares, or if the engine is already a part of the farm equipment, the mill will prove the means of profitably employing the engine after tho close of the thrashing season.

The main frame of the mill is made entirely of iron, cast in one piece, and is faced off true, to form proper bearings for the sides, track and other attachments; all the working parts are attached to this frame, and are therefore always in proper position for either working or transportation. The head blocks are similar to those used upon circular saw-mills, and are provided with suitable arrangements holding the log until it is all cut up, leaving an inch board upon tho knee. The thickness of tho plank is regulated by moving the pin in the radius iron, each hole making a variation of one-sixteenth inch. The knees move forward simultaneously by a lever. The carriage is made in sections so as to be conveniently handled, and tho track is fastened together with wooden keys, making the whole mill complete in itself.

Tho capacity of the mill is from one thonsand eight hundred to four thousand feet per day, varying with the size and quality of logs.

The mill is made by Chandler & Taylor, Indianapolis, Ind., who will supply further information.

SOAPSTONE AS A LUBRICANT.

A WRITER in one of the foreign technical journals expresses a decided preference for soapstone powder, in the form of dust, as a lubricant for the axles of machines. For this purpose it is first reduced to very fine powder, then washed to remove all gritty particles, then steeped for a short period in dilute muriatic acid, in which it is stirred until all the particles of iron which it contains are dissolved. The powder is then washed in pure water to remove all traces of acid, after which it is dried, and is the purified steatite powder used for lubrication. It is not used alone, but is mixed with oils and fats, in the proportion of abont 35 per cent. of tho powder added to paraffine, rape, or other oil—or, the powder may be mixed with any other of the soapy compounds employed in the lubrication of heavy machinery.—*Imp. Mch. Review.*

ANOTHER PARIS EXHIBITION.

IT is stated with some authority that an international exhibition of machinery will be held next year in the Palais de l'Industrie, Paris. The space available for this purpose is very considerable, but it will, nevertheless, be so circumscribed that a rigorous selection must be made, and it is said that nothing will be admitted which is not nearly perfect of its kind.

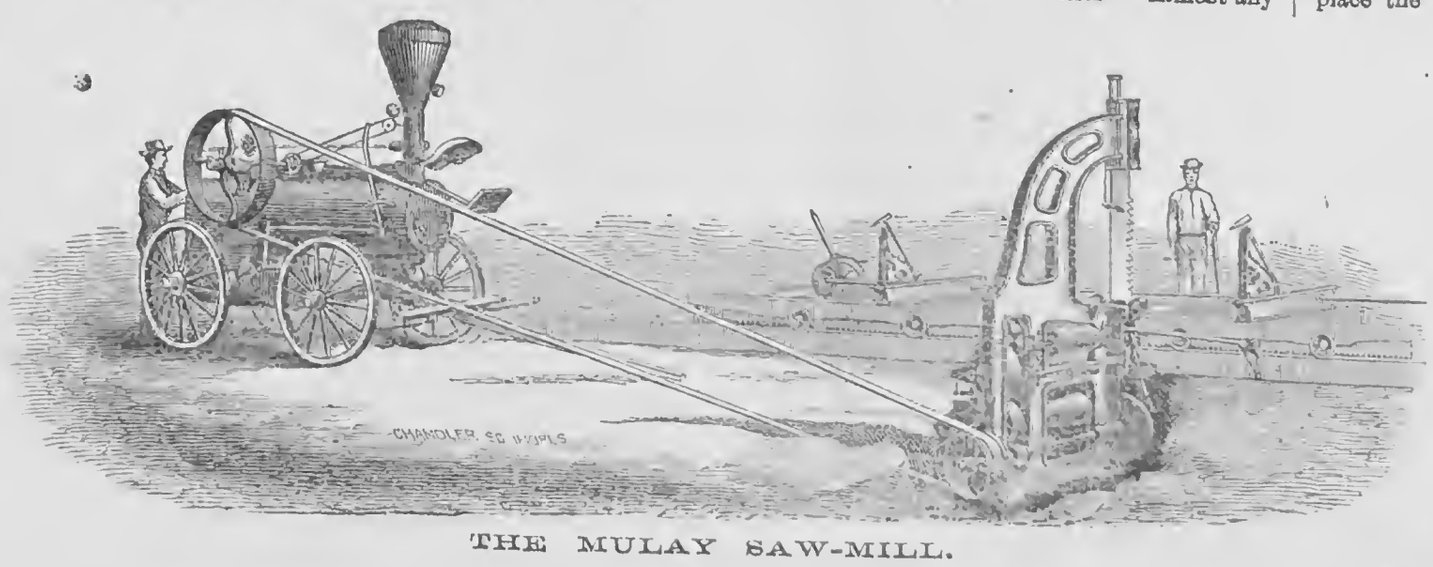
THE people of Australia have an idea that a machine that shall be at once a combined reaper, binder, thrasher and cleaner will abont meet requirements, and the Government of Australia offers a bonus of $20,000 for snch a machine. It is to be sanctioned by five judges, who will consider strength, durability, draft, cost and effectiveness of work. The trials to take place in December, 1879, and the first of that month is the limit fixed for notice of intention to compete. Here is a chance for our inventors.

Armington & Sims, of Lawrence, Mass.,—lately of the late J. C. Hoadly Co.,—have opened very extensive and complete machine shops, in which their new farm engine, the "Lawrence," is being built in numbers, to fill orders already received. Their system of direct dealing with the consumer at the lowest cash price is meeting favor and success. In the near future we may have occasion to briefly enumerate the points of excellence possessed by this steamer.

THE Russian agriculturists will assemble at Odessa, Dec. 5–20, to take part in their fifth great general congress. At the same time and place the Agricultural Society of South Russia will improve the occasion to celebrate its fiftieth anniversary. Here is an opportunity for our implement dealers to be represented through their agents, at the most important meeting of its kind held in Russia.

THE Challenge Mill Co., of Batavia, Ill., has just filled a foreign order of importance, having shipped to Honolulu, Sandwich Islands, one 14 foot, two 12 foot, and one nine foot "Nichols" windmills; also, one 10-foot mill of the same description, to New Zealand.

CENTRAL ASIA should be looked after by our implement trade. There is to be a grand industrial exhibition at Tashkend, and agricultural implements are in special demand.



THE MULAY SAW-MILL.

Dairy Husbandry.

THE INTERNATIONAL FAIR—AN OPPORTUNITY FOR CHEESE-MAKERS.

PROFESSOR L. B. ARNOLD.

AMERICAN dairymen have a just right to feel proud of the merit accorded to American and Canadian cheese at the recent Dairy Fair in London. To have our cheese declared superior to English cheese by English judges, a verdict confirmed by the opinion of the English press, when placed in competition on so large a scale as at the London Show, is to establish, beyond dispute, a high comparative merit for our cheese, even if, as some of the English journals claim, the English cheese fell behind by default. But American cheese-makers should not become so elated by this success as to lose sight of the star of progress which has been their guide in marching to the high position now accorded them. Our finest cheese is some distance from perfection. It is capable of being improved and made more desirable. The best cheese-makers I meet with, realize this most fully, and are the most ardent and persistent in their efforts to advance still further the quality of their goods. With their modest claims and the acknowledged imperfections in their best productions, what must be the light in which the great bulk of factory cheese appears to them. It cannot be otherwise than very faulty, and it is, in fact, so. It is a fact generally recognized by consumers, both at home and abroad, and by dealers and by all classes of experts, that, while a few factories make cheese of very fine quality, the great bulk of American and Canadian cheese does not come up to the wants of the trade, and that it goes at an inferior price and at a loss to all concerned. With the numerous dairy organizations and their frequent conventions for discussions, which are ample and full, and with the large space in agricultural journals devoted to the dairy interest, it seems somewhat strange that such wide differences should exist as are everywhere seen, and often in factories near each other.

But there is a plain cause for this, and it lies chiefly in the minds of the cheese-makers. This remark does not mean that the army of cheese-makers in this country have no desire to improve. There is no class of men connected with the dairy, more earnest and anxious to do the best they possibly can in their art, and to at least turn out as good a product as their neighbors. They are indeed sensitive in regard to the reputation which their cheese shall have, as determined by the test of sales. The point is, they have not in their mind's eye just what qualities are desired, and they have no adequate means of gaining this important information. Very few see much cheese besides their own. Samples of perfect cheese, or cheese of highest merit, seldom fall under their vision, if it happens not to be found in their own factories. Men who know little of cheese and less of cheese-making, tell them their cheese is not right; that they should put on more acid, or perhaps not so much; or that the salting is too little or too great; or the scalding is too low or too high, etc., etc., all of which only tends to confusion if any regard is paid to the advice of such advisers. Directions from persons not conversant with an art, however well intended, will never carry that art to its highest perfection, and are generally worse than useless.

Cheese-makers who desire to get a clear idea of the goods most desired, can best acquire such a knowledge by personal inspection of samples of such cheese, and by examining their characteristics carefully with the aid of all the senses they can bring to bear upon them—sight, touch, taste and smell. As the cheeses which draw the highest prizes at the great International Dairy Fair to be held in New York during the first week in December next, are to be be donated for public inspection, there will be the best opportunity for studying the peculiarities of first-class cheese, ever offered to the manufacturers of the country. That the occasion will bring together a large collection of cheeses of superior merit, is certain, and the privilege of testing the best of such a collection will be a rare advantage—such an one as has never been enjoyed by the cheese-makers of the country, and the opportunity ought not to be allowed to pass without their availing themselves of its advantages. Cheeses from different parts of the United States, Canada and Europe will be there in greater variety than has ever been seen in the States before, making the entertainment novel as well as profitable. It is to be hoped that no manufacturer who can possibly do so, will fail to give a few days' time for studying the lessons this great show will afford him.

A MILK RECORD.

MR. GEORGE HUTCHINSON of Chautauqua Co., N. Y., an old friend of the RURAL engaged in the dairy business, spurred on by the example of Mr. Wickham's record of the milk yield of his Jerseys, in RURAL of Nov. 16, sends us the record of two of his cows—the imported Holstein cow, Mary (Holstein Herd Book, Vol. 2, No. 187), and a native cow of no particular breed:

MARY dropped her calf April 15.

Gave in May	1,542	lbs. of milk.
" June	1,456	" "
" July	1,247	" "
" August	1,075	" "
" September	822	" "
" October	610	" "
Total in six months	6,792	" "

The native cow dropped her calf May 10.

Gave in 16 days of May	765	lbs. of milk.
" June	1,396	" "
" July	1,200	" "
" August	935	" "
" September	804	" "
" October	650	" "
Amount in five months, sixteen days	5,750	" "

Mr. H. says that for amount of milk other breeds will beat the Jerseys, but then it is for the quality rather than for the quantity of their milk that this little breed has become famous. He thinks it would be a good thing for dairymen generally, and all interested in deep-milking cows, to record carefully and publish the milk yields of exceptionally good animals. We also think that such a measure would tend to beget a healthful spirit of emulation with regard to the possession of the best kinds of animals, and a closer regard to the kind of care, feed and general attention which would be most conducive to the largest production of milk, and consequently to the best condition of the milk-producers.

Everywhere.

CALIFORNIA NOTES.

BY "SPECS."

THE VINTAGE IN CALIFORNIA.

THE vintage in California is nearly over. All the foreign sorts of grapes have been worked, and the season is winding up with the Missions. Few RURAL readers have ever seen a wine-press, or cellar. Well, the process of wine-making does not much differ from thrashing grain. De Turks' winery is crushing forty tons of grapes daily, at Santa Rosa. It requires two men with scoop shovels to feed the machine, which is something like the cylinder of a thrasher. The juice pours out into the receiving tub below, in the form of a stream as large as a man's wrist. Thence it is pumped into great tanks, holding, usually, two thousand gallons. The husks are placed in other tanks where they ferment. There is a very decided smell of sour mash about the establishment. But each night the place is scrubbed and washed as clean as water can make it. There is no truth whatever in Harper's Weekly's cartoon, which represents Chinamen treading grapes. That process would be as absurd as to attempt the thrashing of our vast crop of wheat with the old-fashioned flail.

There was a fire at Lachman & Co.'s winery at Sacramento recently. Some small buildings were destroyed because the engines could not get water, and the main building caught fire. It was saved by a happy thought. Somebody with lucky presence of mind, ordered the firemen to drop their supply pipe into a five-thousand-gallon tank of wine, when the flames were easily extinguished. Here, where grapes are rated by car-loads and ship-loads, wine is not very precious. That tankful was only worth, on the spot, one thousand dollars.

REDWOODS.

Our redwood trees are fast going the way of the earth. Only a few days since some vandals cut a Sequoia 27 feet across the stump, intending to travel with a section for exhibition. Sawmills, the axe of the woodman, and forest fires are reducing the limits of these big woods. There are no others on the globe, and the annual destruction of these is estimated at six hundred millions of feet. That big tree showed 4,860 rings of annular growth. It was eight hundred years old when the great pyramid was built, and would have made a huge battering ram for the Greeks at the seige of Troy. I own five hundred acres of monster Redwoods, which posterity can safely count on, unless some of my descendants got stricken with a love for fast horses, or go to gambling in mining shares. One standing dead tree burned down to the roots, leaving a hole ten feet in diameter and fifteen feet deep, to the water, showing the slow accumulation of silt and soil for ages after its planting.

California is peculiarly adapted to the business of

GOAT RAISING.

The mohair is in demand even here in San Francisco. Having noticed paragraphs in the newspapers referring to this industry, I may be able to throw a little light on the subject from my own observations and the experience of others engaged in the business. With this object in view I recently talked with S. H. Rendall, of Santa Rosa, a well known goat raiser. He started in 1869, with one hundred common California goats, females, worth one dollar and fifty cents each, and three Angoras, one male and two females. His yearly increase in numbers averaged over 100 per cent., until the breeding reached three-quarters pure, when it declined to about 100. As the flock grew, he sold off his surplus at the rate of five dollars for half-breeds, and ten to twenty dollars for the better sorts.

The wool on half-breeds is short staple, and worthless, except that on males which is worked into mats and robes. Three-quarter-bred fleeces weigh from one and a half to two pounds of low-grade mohair, worth in this market 40 to 60 cents per pound. The fleeces of better bred goats are worth all the way from 60 cents to one dollar a pound. This includes the fifteen-sixteenths and thirty-one thirty-second grades, which are practically as valuable as the pure-bred, though some are not quite as glossy. The length of the staple is from eight to twelve inches.

It is Mr. Rendall's opinion that a flock of 250 Angoras is as profitable as one of 500 Spanish Merino sheep. The advantage in keeping goats is that they are browsing animals, and the most inaccessible mountains and foot hills afford them food when covered, as is common, with chemisal and other scrub growth. There are millions of acres of this kind of government land, unsurveyed, forming free pasturage for all comers. It is valueless for other uses, and never will be sold. Kids and wethers are good food. A two-year-old will weigh, dressed, sixty or seventy pounds. If not shorn, they shed off in February. They are very hardy, and singularly exempt from diseases. Some newly imported have scab, but the climate seems to eradicate it.

I have known this flock several years. They are very little trouble to herd or drive, and will easily make twenty miles a day. The owner lately moved his flock of 500 from Lakeport across the Coast Range, sixty miles to Santa Rosa, in two days and a half. He drove behind in a buggy, and only had the assistance of his shepherd dog. I remember when once descending the mountains through the Squaw Creek Gap, several years ago, encountering this man and his goats. They were miles away from the settlements, in the midst of the wildest and most romantic scenery of the Coast Range. I had started at peep of day from Tyler's. There were a cold, grey sky overhead, and a smooth toll road under foot. The mountain air was fragrant with the perfume of Pines and Laurels, and inspiring with its purity. The road descended rapidly between tall cliffs fringed in places, and overhung with trees. We were skirting around the face of a precipice, opening out into another and deeper canon, where there was a cloud of smoke from a fire far below. Yellow bars of the morning sunshine rested on it, and splashed through the green leaves in the tops of the Live Oaks. Rendall was encamped in the bottom, and the opposite side of the mountain was white with his goats. They had spread out and upwards, feeding a thousand feet aloft, and some of the patriarchs of the flock, with long beards, had climbed to the edge of the dizziest hight and were gravely looking down at us.

They are certainly intelligent animals, and most assuredly care for themselves in providing their own food the whole year around, on this coast, as they are not at all choice in their provender. Sometimes it is grass, at other times they turn to and strip a Scrub Oak of its branches and bark. If nothing else offers, they will cheerfully demolish a thorn-bush or Cactus. They have been seen taking airy walks on the top of the redwood fence after breakfasting on parts of the lower panels.

HOGS.

While on the subject of domestic animals it may be worth while to mention the arrival of half a dozen Magie hogs from Butler county, Ohio, on their way to Australia. They go out by the next steamer. We have some good hogs here. But there are many of the long-legged, long-snouted elm-peelers, half-wild in the hills, such as grew on the frontier when I was a boy. Who that does not remember how willing one of the slab-sided, razor-backed brutes always was to make a race with the boy and horse overtaking him in the road? Though there might be plenty of room to turn out, the gaunt creature seemed to be lying in wait for some boy on horseback, when he would raise his bristles, give a loud "booh," and starting sidewise, like a ship falling off before the wind, was off down the road in a cloud of dust, scorning to turn out under a quarter of a mile, while the pursuer, with whoop and hallo, and hat brim flapping, and bare legs urging on the old plow-horse, always got left behind.

San Francisco, Nov. 4, 1878.

NOTES FROM CHAUTAUQUA CO., N. Y.

THE past season in Chautauqua has been one of abundant harvests in nearly all the various products of farm industry, and the Lord has seemed to smile upon the pathway of the farmer another season.

The hay crop has been more than an average one; butter has brought as high a price as could be expected, considering the low price of nearly everything that the farmer has to purchase for his use; cheese averaged about medium prices; eggs brought low prices, and as a consequence were all the more used in the farmer's family; corn was more than an average crop; apples have not been so plentiful as last season; oats were a very good crop in some sections; potatoes turned out small and there were but a few of them. In fact, nearly every crop raised on the farm was good and some larger than for years before, save potatoes and fruit.

Thus the farmer has little or no reason to complain of the quantity of his products or of the prices they brought in market; and as the day for Thanksgiving and prayer draws nigh, let all lift up their hearts in praise to Almighty God for his loving kindness and bountiful mercies!

Chautauqua county has generally taken the lead in the art of producing fine butter; but we have this season heard for the first time that some commission merchants in New York City say that of late they do not get hold of so fine an article of "Chautauqua gilt-edge" as they used to. Perhaps the reason for this is that some dairymen are trying to produce a larger quantity and at the same time an article of the second grade. It is to be hoped that no Chautauqua dairyman will do this, but that Chautauqua County will ever "hold her own" in the art of fine butter making.

Some people, after having "gone West," and remained a few years, come back fully satisfied that they can live as cheaply and as easily in "old Chautauqua" as they can elsewhere. Fruit growing could be made a valuable branch of industry here, if more would take hold of the matter. Apples, Pears, Plums and Strawberries (and Peaches in some parts of the county) grow as readily here, and with as little care, as in any of the counties of New York State. Now that nearly all kinds of nursery stock can be purchased so cheaply, we hope to see more interest taken in the matter. The raising of more fine poultry and blooded stock could also be made a source of pleasure and profit to the enterprising agriculturist. M. S. DORMAN.

CROP NOTES FROM NORTHEASTERN NEW YORK.

POTATOES.—The most important crop and the one most remunerative to the farmers in this section, is the potato crop. Washington County annually yields as many as, if not more, of this valuable esculent, than any county in the State, although Saratoga, Warren and Rensselaer may also be counted among the great potato-growing counties of the State. Most of our farmers had their potatoes dug by the 20th of October, but some were dug later. The crop this year was about up to the average, though not as good as it was last year. Some pieces yielded 100 bushels to the acre, but this was above the average.

CORN is with us this year a good crop, and is about all husked. There was a good growth of fodder, and it eared well.

APPLES are a more abundant crop than for a number of years, although they fell off badly and show signs of early decay.

HAY is made an important crop by some of our farmers, who bale and ship it to the city.

G. F. T.

RURAL SPECIAL REPORTS.

ST. MARKS, Florida, Nov. 17.

THE main products of this portion of the State are corn, peas, pindars, potatoes, sugar-cane, cotton and oats. Crops are good this year; cane unusually so. It is now being converted into sugar and syrup, and it is a merry-making time for everybody. Corn has been housed and hogs have been brought up from the hummocks and turned into the pindar fields to fatten. In some instances they are almost fat enough for killing when driven from the hummocks, not having cost the owner anything except the trouble of an occasional count. Potatoes are still growing. Caterpillars have done very little damage to cotton this year; the yield is generally seven to eight hundred pounds of seed cotton per acre. Rice is grown to a limited extent; it yields fifty bushels of rough rice per acre. Fruit culture is receiving more attention here than formerly. I have quite a variety of fruits growing, but my Grapes are my special pets. G. S. W.

HENRICO CO., Va, Nov. 24.

THE wheat crop was light for this section; yielding, on an average, only 10 bushels per acre. Winter oats were a fair crop; spring oats, light. Corn is what the native Southern would call "tolerable;" the ears are short owing to a severe drought through August, September and a part of October. On that account also wheat sowing has been late: but, I think, there is a larger area sown this year than last. Potatoes were an extra crop, and when sold at the time the crop was gathered, in July, they were worth only from 75c to $1.00 per barrel. Late potatoes are very small; sweet potatoes are a good crop. Richmond, our market, is, I think, as good a one as New York. Wheat is worth from 75c to $1 per bushel; oats, 35c. to 40c; Irish potatoes, $1.50 to $2 per barrel; sweet potatoes, $1 per barrel; corn 50c per bushel; pork, dressed, $3.50 to $4 per hundred; cows are worth $30; horses $50 to $100. W. B. H.

ST. JOSEPH, Mich., Nov. 14, 1878.

WE have had splendid weather for fall work and our farmers have improved it. We had no frost until the end of October. That snow storm mentioned some time back by a RURAL correspondent from Jackson, in this State, did not reach us. Wheat was a light crop. A good breadth of it has been sown this fall and it is looking well. Corn was an excellent crop and it has been mostly secured in good shape. Of small fruits we had an abundance, except on low ground where the May frosts hurt them. Peaches we have discontinued raising for the present owing to the Yellows. Apples are abundant, but prices range so low that people hardly know what to do with them—although they have managed to get rid of most of them in some way. Grapes have been a light crop, owing to May frosts. M. W.

ROSELLE, N. J., Nov. 24th, 1878.

MR. MARVIN wants us to tell about our Grapes; so I would say that the Rogers's No. 1 and 53 seem scalded and the 44 mildewed badly. Of two No. 15 vines, standing side by side, and in all respects equal, one failed to ripen well. The Dianas rotted and the Marthas were small. The RURAL does not think much of the Concord, but they do better than anything else around here, and with them we are always sure of a crop.

Some of my pear trees which were apparently all right six weeks ago, now show the blight badly in the body of the tree. I concur with Col. Curtis in hoping that we have seen the end of it for thirty years to come, but this does not look very much like a realization of that hope. J. R.

FLORENCE, Benton Co., Ia., Nov, 18.

WE are having splendid weather, warm and bright. The ground has not been frozen any this fall. Many farmers have finished gathering corn and are now plowing. All kinds of crops were good except potatoes and wheat. Prices are low: wheat, 50c. per bushel; oats, 15c.; corn, 12½c.; potatoes, 25c.; apples from 60c. to 75c. The highest price for hogs is $2 35 per cwt.; butter from 8c. to 12½c. per lb. Rather a poor prospect, isn't it, for farmers who are in debt? S. T. S.

MARSHALLTOWN, Marshall Co., Ia., Nov. 9th.

WE are having splendid weather here—real Indian summer, since the first of this month. October was very changeable—very hot and very cold. The farmers are now in the midst of corn harvest; the quality of the grain is good, but the yield is not what appearance indicated, as the ears are rather small. Corn now sells for 18c.; wheat, 30 to 55c.; oats, 10c.; barley, 20 to 30c.; rye, 30c.; potatoes, 30c.; butter, 12 to 15c.; eggs, 15c: hogs, $2 30 to $2.50 per cwt.; cows are from $2 50 to $3 50. N. L. C.

IOLA, Allen Co., Kans., Nov. 14, 1878.

IT makes me home-sick to read about luscious raspberries and strawberries in the RURAL. The native strawberries here have been destroyed by fire, and the only raspberries and blackberries to be seen are a few that folks have bought. It is a fine country, nevertheless, for small fruits. We have hitherto had only three or four light frosts this season. H. M. S.

GRANVILLE, Washington Co., N. Y., Nov. 12.

THE first snow to whiten the ground fell on the 8th inst. We have been having cold weather for a week, but are hoping for more warm weather yet. Fall work is nearly all done, except that now and then there is a little corn to husk.

Potatoes are selling for 70c. per bushel; corn, 60c.; oats, 40c.; apples, $1 per bbl.; butter, 20c., cheese, 8@9c. G. F. T.

STARKE Co., Florida, Nov 11, 1878.

IN this part of the State crops have been almost a failure, especially with newcomers, owing principally to the excessive rains, but we hope for much better times the coming season. Newcomers are still arriving and settling fast all around us. Last summer was the wettest known here in 40 or 50 years. D. D.

BELLE PLAIN, Ia., Nov. 20, 1878.

WHEAT hereabouts was a poor crop; only from two to fourteen bushels per acre; nearly all marketed now for from 45 to 55c. Corn was a light crop, yet, sweet and ripe, it is only worth 16c. Hogs are worth 2½c., and at that price there is plenty of them. H. B.

HERNDON, Fairfax Co., Va., Nov. 17, 1878.

WE have had a very fine, warm fall. Crops of all kinds have been good. Corn never has been better hereabouts. Our farmers are improving their worn-out lands very fast. S. K.

DANVERS, McLean Co., Ill., Nov. 18, 1878.

WEATHER very fine; crops moderately good; corn very solid; produce low; times rather hard; money scarce. T. M'C.

EAST HAMILTON, N. Y., Nov. 15, 1878.

I RAISED 40 bushels per acre of Clawson wheat during the past season. B. C. A.

The Querist.

ANSWERS TO CORRESPONDENTS.

Salt as a Fertilizer on Sandy Soil.

D. D. N., Lawton, Mich., asks, whether an application of salt to sandy soil would be beneficial.

ANS.—From long before the Christian Era salt has been used as a fertilizer, yet there are not many kinds of fertilizers the precise effects of which are still more in dispute. So much depends on the constituents of the soils on which it is used, and on the degree of availability as plant food of those constituents, and also upon the crops to be grown on them, that experiment is the only test at all reliable as regards its value in each case. In many cases it has been found very beneficial, especially upon cereal crops, particularly in inland districts, while in other cases its action has been neutral or injurious. On looking over our record of experiments in this connection, we find that Mr. C. Johnson found salt to answer extremely well on light, gravelly soil at Great Totham, Essex, England. The produce of wheat per acre on a part of his land that had not been manured for four years was found to be, without salt 17 bushels, 26 pounds; with 5 bushels of salt per acre, 26 bushels 12 pounds. Of barley, the land yielded without salt 30 bushels per acre; with 16 bushels of salt to the acre, it gave 51 bushels; for oats, no salt, 51 bushels; with three cwt. of salt per acre, 53 bushels. An article giving a condensed account of the best experience of salt as a fertilizer, was published in this department of the RURAL on April 20 last, page 250.

Thoroughbreds and Grades.

S. Cary, Barton, N. Y., asks 1, what is meant by a thoroughbred animal; 2, what by a grade; 3, what are the requirements to have animals registered in the Herd Books.

ANS.—1. A thoroughbred animal is one whose pedigree can be traced back through the Herd Books of the breed to which it may belong, thus proving that it possesses the distinctive characteristics of that breed so firmly as to be able to transmit them with certainty to its pure-bred offspring and, to a great extent, when crossed either with another pure-bred or with a scrub animal of no particular breed.

2. The result of such a cross is a "grade" which takes its name from the breed to which its sire belongs; for instance, the offspring of a Short-horn bull and a "native" cow, is a Short-horn grade.

3. The conditions of entry to the Herd Books of the different breeds of cattle and of other animals, vary considerably, so that unless the particular breed is mentioned, it would be impossible to give detailed information. In all cases, however, the rules are designed to exclude from the Herd Books all but thoroughbred animals.

Large Yield of Hungarian-grass Seed.

I. H. Spofford of Genesee Co., N. Y., asks how much is considered a good yield for Hungarian grass. He thrashed from one and a half acre fifty-two bushels of seed, which he considers an enormous yield.

ANS.—Probably the average yield of seed to the acre of this grass would be about from 23 to 25 bushels, although a yield of from 25 to 30 bushels is by no means uncommon. From our own observation and the records in this connection, we are disposed to consider our friend's yield of 31⅗ bushels per acre an unusually large one.

Keeping Celery in Winter.

Mrs. W. H. C., Springboro, Ohio, asks how Celery can be kept through the cold winter weather.

ANS.—We have already given instructions in recent numbers of RURAL. Briefly, trenches should be dug in dry places, the celery placed perpendicularly therein and covered with soil to the tops. Over the ridge place boards at such an angle as to shed rain, and then cover with hay, straw or any other like material. One end is left open so that the celery can be taken out as needed. Small quantities may be preserved in the cellar in deep boxes, the roots being covered with moist soil.

When and How to Plant Seeds of Rural Free Seed Distribution.

M. S. F., Kingston, asks whether it would be better to plant seeds from RURAL Free Seed Distribution when they come, or wait until spring; in the open ground, or in boxes.

ANS.—The hardy shrub seeds, may be planted at once in boxes or pots with advantage, but they may all be sown in the open ground in the spring.

Miscellaneous.

S. E. Richardson, Matthews Co., Va., referring to a new invention for applying paper bottoms to ships, described in RURAL of Aug. 17th, asks what composition would fasten the *papier-mache* to the hulls, and whether common roofing felt would not do as a coating for ordinary sail boats.

ANS.—The account referred to was an extract from the columns of an English paper, which gave no details of the adhesive composition, which is probably either a chemical secret or covered by a patent. The object of coating vessels with copper, copper paint, or *papier-mache* is to preserve the timber from injury by boring marine animals or to prevent the vessel's speed from being slackened by the accumulation of barnacles and other pests on her bottom. Roofing felt would afford little resistance to animals that readily honeycomb hackmatack or oak, would afford a comfortable resting-place for the barnacle family, and, moreover, its rough surface would materially increase the friction of the water on the boat's bottom and consequently lessen her speed.

L. P., Danville, Pa., asks whether the Cahoon broadcast, Hand seed-sower is of practical value, and whether it would pay a farmer having from 25 to 50 acres of small grain to sow by hand, to purchase one of them, not being able to get a drill.

ANS.—The Cahoon Broadcast Hand-sower is a good implement, and does its work satisfactorily, but as there is a marked difference between broadcasting and drilling, we cannot say which it would pay you best to buy. If you think it cheaper to broadcast, the Cahoon Sower is what you want. We send you our Premium List by mail, and in it you will find both the Cahoon Seed-sower, and the Matthews' drill offered as premiums. You could procure either by sending us a club, and have your choice whithout paying anything for either.

Mrs. D. C. H., Homer, N. Y., asks 1. the name of a fern a description of which she gives. 2. The name of a Cactus, a flower which she sends. 3. Are Deutzia crenata, and Wistaria hardy for out-of-door culture as far North as central New York.

ANS.—(1). We cannot tell the name of the plant from the description given.

(2). Cereus flagelliformis.

(3). Yes, Epiphyllum truncatum. Deutzia is perfectly hardy. The Wistaria will suffer unless covered up for winter.

M. B. R., New Smyra, Fla., asks: 1. where "Pearl" millet seed can be procured. 2. Also that of common millet.

ANS.—1. Through the RURAL Free Seed Distribution. 2. From any prominent seedsman.

D. J. R., Sardis, Pa., asks the name of the plant a leaf of which he incloses.

ANS.—It seems to be Mesembryanthemum cordifolium variegatum, and a very pretty plant it is for vases, baskets or rockeries.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, NOVEMBER 23D:

M. B. R.—E. M. C.—V. D. C.—W. J. F.—G. F. T.—G. H., such practical notes always welcome—C. H. S.—H. S.—R. L. H.—E. B.—R G.—D. K., Jr.—W. G. W., Sr.—B.—N. T. C.—D. S. M.—W. H. I.—D. E. S.—H. H. R.—L. Various.

MANDRAKE.

J. STAUFFER.

THE May Apple—Podophyllum peltatum—has active purgative properties, and was used among the Indians as a cathartic before the country was settled by the whites. It has different local names, such as Mandrake, "Wild lemon," "Raccoon-berry," "Indian apple," etc. This is another instance of the necessity of a universal term for a specific thing, in medicine at least.

The Atropa Mandragora or Mandragora officinalis, however, is the real Mandrake and has been known by that name for ages, as a powerful narcotic poison. But this latter grows in rich soil and is a native of the countries bordering on the Mediterranean. It is mentioned by old authors, as Hippocrates, Galen and Celsus, as having some wonderful powers, and is said to have been the drug which Hannibal infused in the wine left in his camp, when he feigned a retreat, and thus rendered his enemies who partook of it, unable to withstand his subsequent attack. Its use, however, is almost abandoned in Medicine.

Many were the superstitious notions about this plant that prevailed in early times. That half-doctor and magician, Albertus Magnus, asserted that the most potent roots grow under a gibbet. Again, it is stated that it must be collected with magic rites; a circle was traced three times around it with a naked sword, and as the person who plucked it from the ground was considered in danger of his life, a cord was attached to a dog and fastened to the plant to tear it out. The dog was beaten till, by his effort to escape, the thing was accomplished; the result was—the death of the dog. Griffith, in his Medical Botany, mentions this. He also states that it was said to be eminently aphrodisiac, and was much used for the purpose of exciting love, hence the name of Mandragontis bestowed on Venus.

In our Bible we find, Genesis xxx chapter, 14th verse:—"And Reuben went in the days of wheat-harvest and found mandrakes in the field, and brought them unto his mother Leah. Then Rachel said to Leah, Give me, I pray thee, of thy son's mandrakes. And she said unto her, Is it a small matter that thou has taken my husband? and wouldest thou take away my son's mandrakes also?" Again, in the Songs of Solomon, vii., verse 13, the word occurs:—"The mandrakes give a smell, and at our gates are all manner of pleasant fruits, new and old, which I have laid up for thee, O my beloved." Now there is no pleasant smell connected with the mandrake or mandragora, which is rather nauseous and offensive. Scholars have discussed the matter, and think different plants are meant by the word translated mandrake. The Hebrew word is Dudaim, from Dadim, breasts, or Dodin, friends, twins, to signify something double, as the mandrake root, which is bifurcate and used to promote love. But in the Talmud it is also called Siglin, which was referred to as a Jasmine or Lily, and hence it must have a pleasant smell. Perhaps, after all, a fruit of the Plantain or Banana may have been meant. This latter idea, however, hardly meets the first case, in Genesis, nor does it signify much whether it was mentioned at all; only we find it a very ancient name—in use before the May Apple of America was discovered or even the country known.

The fact is, the charlatans of our later superstitious ages, before employing the mandragora root, gave it a human form either by growing it in a mold or by cutting it into that shape after it became dry, and pretended this to be its natural manner of growth—hence it was also known among the ancients by the name of Anthropomorphas. We find in the old botanical works figures of this plant, true in leaf and flower, while their embellished roots present a male or female form, which were sold to propitiate the birth of a son or daughter, as might be desired.

Adanson, in his work, has the following curious passage:—"Every plant, although without sensation, being animate, possesses a soul, which is not solo nor fixed in any part, but equally spread through all, and divisible, since every one of its integrant parts which participate in a common life, possesses in itself an isolated vitality, and because, when separated and detached from them, it grows and fructifies, finally enjoying all the properties and faculties which it possessed before its separation." I mention this here as an old phase of vegetable psychology, upheld by two of the most celebrated savants of studious Germany—von Martius and Theodore Fechner—who considered a plant a sentient being, endowed with an individual soul. But such fanciful notions are exploded; modern scientists consider even animals, including man, as being only simple automatons, set going and accomplishing their round by a blind material force. They set aside all spirituality or influence as coming from or under certain creative laws founded in wisdom to accomplish certain ends. Nevertheless, all naturalists who have treated the question seriously as physiologists, maintain that plants enjoy quite as active a life as many animals (for instance, compare the Mimosa or "Sensitive plant" with an oyster), and they also possess traces of sensibility and contractility.

Lancaster, Pa., Oct. 10, 1878.

HAND LABOR AND MACHINERY.

A VALUED correspondent writes us: "The writer of the article Hand Labor and Machinery is in error, I think, in his idea that the dissatisfied class of laborers object to machinery *per se*. They are in favor of as much of it as possible, provided they may share the benefits of the abundant increase of production secured by it. They claim that under the present state of things, capitalists secure the lion's share. The method of righting the wrong, pursued by the more ignorant among them in "smashing," is simply an ignorant and helpless man's protest against what he feels to be a wrong. The remedy is for the intelligent portion of society to help him to right the wrong. He will be docile enough as soon as he feels that he has influential friends. His violent acts are acts of blind despair. To call for troops and the police—except to arrest actual wrong-doing at the moment—is only the spirit of the "shot-gun" policy said to prevail among the aristocracy of some parts of the country. *Fiat justitia* is the only basis for a Republic, and the only safe basis for any government."

THE Husbandman, which publishes each week a full report of the interesting discussions of the Elmira Farmers' Club, announces that it will be sent to any address the remaining weeks of 1878 for ten cents. Certainly every farmer can afford to make the acquaintance of our vigorous young contemporary on such terms. Those of our readers who wish to avail themselves of the offer mentioned above, will address, The Husbandman, Elmira, N. Y.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY NOV. 30, 1878.

OUR readers are particularly requested to read the particulars of our free seed distribution on p. 769, under publisher's notices, before ordering seeds. We thought we had made the postage particulars very plain—but many are sending us too many stamps. A one-cent stamp suffices for all except *three*—the Beauty of Hebron requires a two-cent extra stamp, and the Defiance Wheat and Pearl Millet, *together*, require a two-cent extra stamp.

OUR readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

OUR new Premium Lists, specimen copies and agents' outfits will now be forwarded free to all who apply.

OUR Free Seed Distribution will remain open to all subscribers who may apply until further notice.

THE RURAL NEW YORKER *is invariably discontinued at the end of the subscription term.*

DRUGS, AS FOOD AND DRINK.

WHEN the tomato was beginning to be introduced as an article of diet, many years ago, it was extolled, not so much as a wholesome fruit, but as an excellent alterative medicine, "acting on the liver like calomel," and, strange as it may seem, there is no doubt that this recommendation had a powerful effect in introducing the tomato into the gardens of the people. So general did the idea of its medicinal virtues become that the patent-medicine men took it up, and for a while tomato syrups and bitters were for sale in all the apothecary shops. But familiarity soon bred contempt, and for a long time we have heard nothing of the medicinal virtues of the tomato. But recently the poor tomato has been cried down as much as it was once cried up, and all the country papers have heralded the ridiculous statement that the use of the tomato caused cancer! And as the fools are by no means all dead yet, a good many believed the story! The simple truth is, that the tomato is no more a medicine, or a drug, than apples and pears. If it were, that is, if it had any disturbing action upon any of the functions of the body—which is the true mark of a medicine—it ought to be rejected from every garden, and used only under medical advice, in suitable cases.

There is no instance where any drug has come into common use, that injury, and often great injury, has not resulted. To say nothing of alcohol and opium, the popular use of nervines, like tobacco, tea and coffee, has been most baneful to the public health, and the noteworthy increase of insanity and nervous diseases is justly attributable to them more than to any other cause.

And now another harmless garden vegetable is being pushed as of a wonderful medicinal value. Celery, that delicate adjunct of the dinner-table, is heralded to us as a cure for "nervousness" and "palpitation of the heart." One wiseacre tells us that he has known many men and women who, from various causes, had become so much affected by nervousness that when they stretched out their hands they shook like aspen leaves on a windy day, and by a moderate daily use of the blanched footstalks of celery as a salad, they became as strong and steady in limbs as other people. He has known others so nervous that the least annoyance put them in a state of agitation, and they were in constant perplexity and fear, who were also effectually cured by a moderate use of blanched celery as a salad at meal time. He has also known others to be cured of palpitation of the heart. Everybody engaged in labor weakening to the nerves should, according to his opinion, use celery daily in the season, and onions in its stead when not in season.

Onions, too! How the *materia medica* is being enriched!

Now, if there is any region of the country where "many" men and women can be found diseased as this person describes, it is probably the result of their already excessive use of drugs affecting the nervous system, and the cure is not to add another to the list, but to leave off those they are already using. They need not, on that account, forbear the flavorous celery, or the still more flavorous onion. These are good victuals, and for that reason they cannot serve as medicines. They will neither harm nor cure; but they will gratify and nourish, and, with the tomato and all other good fruits and vegetables, will prove as promotive of health as fresh air and pure water—because *they will not act upon any of the organs of the body to disturb their functions*, as all drugs and medicines will.

OBSERVATION THE KEY TO SUCCESS.

IN looking over the broad fields of agriculture, its successes, difficulties and failures, the first thing that strikes the investigator is the want of observation—*accurate observation*—in the farming class. It is as if the traveler should never learn the road over which he is traveling every week of his life. In every walk of life we often attribute to genius what is merely the result of observation. The law of gravitation exhibited itself to all mankind before Newton, yet his eye took in the whole philosophy on observing the fall of an apple. To the mind of Watt the forcible ejection of steam from a tea-kettle suggested that embodiment of power—the steam engine. Yet this action of steam had been before the eyes of all men for thousands of years.

A German workman in a gypsum stone quarry traveled across a meadow in going to and returning from his work; a clergyman of the name of Meyer, who saw this field every day, observed the greater luxuriance of grass on each side of this path than elsewhere in the field. This simple observation laid the foundation for the extensive use of plaster as a fertilizer for the last hundred years. But how many thousands of farmers travel the same road year after year, like the German workman in the gypsum quarry, without seeing anything on either side, leaving all practical instructions to be drawn by outside observers?

What an immense field for observation agriculture presents! and what an overwhelming corps of observers the six million of farmers ought to make! Why, by a proper system of observation, they ought to settle, in a few years, most of the vexed questions that now distract our agriculturists. Yet we know that twenty farmers in discussing any question in agriculture, will give about as many opinions as there are persons in the discussion, and this arises from a want of accurate observation—taking in all the circumstances and giving proper weight to all the points of variation.

But we see that whenever the same acute observation is brought to bear upon the facts of agriculture as upon mechanical inventions, results equally important are obtained. Let us refer to the breeding of Short-horns by the Collings and Bates, of Long-horns and Leicester sheep by Bakewell. Their success beyond the breeders before them was the result of closer observation of the facts concerning animal growth, and they followed these hints by experiments which settled the accuracy of their judgment. Rarey subdued the wildest passions of the horse that no other had been able to curb or guide, by putting in practice the simplest observations.

The habit of accurate observation, to be developed among the mass of farmers, is really the one thing now most needful to the future progress of agriculture. Every farmer is surely capable of adding something to the general stock of knowledge belonging to his occupation. We should be very glad to be the means of inducing some thousands of farmers to begin a system of close observation of all the facts established in their practice. The agricultural journal must be the chronicler of the best practice of its time. Its highest aim can only aspire to be the medium of communication between those who know and those who want to know. We are extremely anxious to increase the number of both these classes.

THE RURAL NEW-YORKER takes in the whole field of agriculture, and wishes to instruct its readers in all departments. There is, therefore, no fact or experiment in the wide range of agricultural activity that does not interest its readers. We wish every reader to take a special interest in all the other readers of this paper, and show his interest by communicating some fact or experiment that has come under his own observation, or been worked out by his own hand. He need not be particular about the phraseology in which he states his facts—let him give them to us in the simplest and plainest words that convey his meaning. We are only anxious that the facts necessary to a full understanding of the case should be given.

Soils are almost infinite in variety of texture and situation, and an account of an experiment with a given crop, to be of any value to the distant reader, must give a description of the soil, the fertilizer used, the latitude or temperature, the aspect, the prevailing wind, &c. If he is writing about tests in feeding animals, let him state the age, the food—kind and quantity—the time fed, and the result in gain, &c. We wish to turn all farmers into observers and reporters—into agricultural scientists, who shall quite understand the management of their own business.

THE MOVEMENT OF GRAIN.

THE receipts of grain at the chief ports for the past two years for the ten months ending Nov. 2, 1878, were as follows:

Cities.	1877.	1878.
New York.	61,923,455 bu.	107,971,411 bu.
Boston.	11,525,427	15,691,430
Port'and.	889,843	1,603,933
Montreal.	11,875,728	12,427,420
Philadelphia.	17,621,959	33,235,761
Baltimore.	23,656,384	34,167,600
New Orleans.	6,245,327	9,152,961
Total:	134,038,123.	214,250,515.

The increase of 1878 over 1867 is 60 per cent and equal to more than 80 millions of bushels. The vastness of the business of transporting and shipping all this grain is almost beyond our comprehension. An aggregate of 700,000 carloads or 2,300 every day of the year, goes to make up the grand total which represents a line of cars which placed end to end would reach from Chicago to London or Paris, or a distance of more than 4000 miles.

The result of all the labor and industry involved in the production and disposal of this quantity of grain, reaches into the midst of every family in the land; there are none so low and none so high, but their interest have been favorably affected by it. That this beneficial influence has been enlarged 60 per cent the past year, will go a great way towards accounting for the improved condition of affairs; the more so, as it is true that the fact we are considering relates to but a small fragment of the whole business of the country, which begins with agriculture, which rests upon it, and which is supported by it. For many years there has not been so auspicious a prospect for the closing year, nor for the opening of a coming one; and at this season of thankfulness when men's hearts bound with gratitude for favors received, it is something even for the stony-hearted Gradgrinds, that we can give them figures whereon to rejoice.

Our Plant and Seed Exchange.—Last year and the year before we offered the use of our columns to our friends for the purpose of facilitating the reciprocal interchange of plants, bulbs and seeds.

If A. had more than he needed of certain sorts and wished to exchange his surplus stock for others of which he was deficient or destitute, the announcement of the nature of the kinds of which he had a superabundance, and of those in which he was lacking, put him into communication with those whose means and desires would lead to an exchange of floral and other treasures. After a trial, however, we are regretfully obliged to discontinue this "Exchange." Of course, if the announcement is made for one, it must be made for another. Now, we have discovered that the multitude of names thus made public were used for improper purposes, while others, in making announcements, had business axes to grind, etc. Accordingly, we are forced to put an end to this business, although there are upwards of one hundred announcements laying in our pigeon-holes.

Effects of Manures.—A Tribune correspondent says that certain parts which were manured heavily with stable manure thirty years ago, now yield far more wheat than the other parts of the same field. This is an important fact. It will be remembered that Mr. J. B. Lawes wrote us that the difficulty of comparing the effects of commercial fertilizers with those of stable manures was owing to the slow action of the latter.

BREVITIES.

CLAWSON beats Fultz in Michigan.

WE have not heard much this year about Indian Summer.

WELL shaped potatoes of *medium* size are the best to save for seed.

A. L. MURDOCK, of Mass., says, "Two-thirds of our potatoes are Early Rose and mostly diseased.

THE distinctions made between the results of scientific training and practical skill are hard to understand.

WE are working at our seeds as hard as ever we can, so as to be ready to begin the distribution this year.

THE pomological article by "Clinton" tells nothing new. But it tells all that needs to be told, in a plain, forcible way.

Mr. Taylor, of London, says that American potatoes do not retain their good qualities long after leaving their native country.

THE members of the Appropriate Committee of the Mich. State Agricultural Society are convinced that Michigan is second to no State in the Union in making good butter and cheese.

WE state an impression only when we say that we believe the Seckel pear has paid those who have sent it to the New York market the past season better than any other variety, or, excluding Bartlett, better than any other two varieties.

MANY of our subscribers are asking us to give instructions as to the planting and culture of the seeds we offer. We will do so after they are distributed. But really all of them will germinate and grow so easily that "instructions" are scarcely needed.

How to keep plants in the house is a subject about which many persons inquire every year. The advice given too often makes a mountain out of a mole-hill. The whole story may, we think, be told in a few words. Use sandy loam—keep the pots clean; give them sun and fresh air. For the mealy-bug use alcohol, for green lice (aphides), tobacco fumigations.

PRUNINGS from desirable sorts of Grapes may now be easily obtained. Make cuttings a foot in length, set them in trenches a foot in depth, six inches apart, and fill in with loam, pressing it firmly from time to time, then cover the trench with some light material, such as straw or leaves. Many of these will form roots next spring and may be transplanted in the fall. Thus everybody having land, may have grapevines at a small cost.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

WE offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

THE CHILDREN.

THE children! ah the children!
Your innocent, joyous ones:
Your daughters, with souls of sunshine;
Your buoyant and laughing sons.

Look long in their happy faces,
Drink love from their sparkling eyes,
For the wonderful charm of childhood,
How soon it withers and dies!

A few fast-vanishing summers,
A season or twain of frost,
And you suddenly ask, bewildered,
"What is it my heart hath lost?"

Perchance you see by the hearth-stone
Some Juno, stately and proud,
Or a Hebe, whose softly ambushed eyes
Flash out from the golden cloud.

Of lavish and beautiful tresses
That, wantonly floating, stray
O'er the white of a throat and bosom
More fair than blossoms in May.

And perchance you mark their brothers—
Young heroes who spurn the sod
With the fervor of antique knighthood,
And the air of a Grecian god.

But where, ah, where are the children,
Your household fairies of yore?
Alack! they are dead, and their grace has fled
For ever and evermore!

Paul Hayne, in Harper's Magazine for December.

FANCY ARTICLES FOR CHRISTMAS GIFTS.

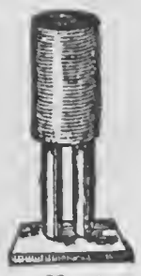
No. 1 WINTER GARDEN, IN PLACE OF A CHRISTMAS TREE.

A large cardboard box will do well for the foundation of the garden. This must be inverted, and covered with a sheet of good white wadding. The box must be 24 inches long and 14 inches wide. The fence which incloses the garden is composed of pieces of stick 4½ inches long taken from a blackthorn tree. These are placed about 1 inch apart, and a fir-cone of about the same length is placed after every fourth piece of stick. A little glue will be best to fix the fence to the foundation, as it is stronger than gum. Paint the fir-cones and sticks with gum, and when wet, sprinkle some ground glass or alum over them, and also over the wadding, to give it a frosted appearance. The little flags at the gate are shown in No. 2. They are made of scarlet paper, or silk, fastened on wire. The wire is covered with gold paper. The presents are scattered about inside the garden. Some may be rolled up in cotton wool, to look like snowballs, and others left uncovered. The snow man shown in No. 3. stands as sentinel at the gate. The winter garden may, of course, be increased to any size at the pleasure of the maker.

NO. 3.—SNOW MAN TO HOLD SWEETS.

No. 4, shows the top part of cylinder, in a reduced size. No. 5, the bottom. A small round

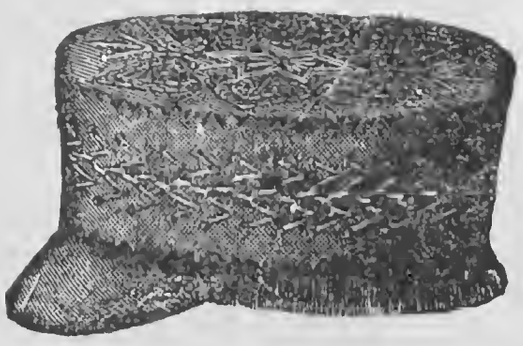
No. 2.



No. 5.

No. 4.

box would be most convenient for the foundation or cylinder to hold the sweets, or if this is not easily obtained, one can be made of cardboard. Cut a piece of cardboard 1¼ inch wide and 4 inches long: lay one end a little over the other and sew them together; cut the same piece of cardboard for the bottom, the same size as the cylinder is round; sew it firmly in the bottom. The top piece or lid of the cylinder is made exactly the same way, allowing the cardboard of a little larger size, so that it may easily be taken on and off the under part.



No. 8.

A round or oval box, such as hair-pins are sometimes sold in, will answer as well as making the cylinders, if easy to obtain it.

For the head, take a wooden skewer 1½ inch long, make a hole through the top of the box, put the end of the skewer through, leaving 1¼ inch out at the top, glue this to the top of the box. The legs are made of skewers, but they must be smaller than for the head, they should be about 3½ inches long; make two holes in the bottom of the box, just put the skewers through them and glue them fast. The stand for this foundation should be made of a small flat box, also to contain sweets, make two holes in the lid, and put the legs through them, as you did into the bottom of the cylinder, glue them very firmly. A sheet of the best white cotton wool, or jeweler's cotton is now required. Paint the skewer for the head with some strong gum, lay some of the wool over it, taking care to keep the head a nice round shape. Now cut a piece for the coat 4½ inches wide and 6 inches long. This must be gummed to the top of the cylinder. The foundations for the legs and the stand are also covered with cotton wool. For the arms, take a piece of wire six inches long, run it through the wool, above the cylinder; leave an equal length at each side, cover with wool, and bend as shown in the engraving. Take a fine camel-hair brush filled with gum, and with small pieces of wool fill up all the little places that have become disarranged. The moustache and beard may be made of a small piece of black or brown wool, frayed out, and gummed to the face. The eyes, eyebrows and nose must be painted with a fine brush and India ink; and dots of India ink may also be put down the front to simulate buttons. The pipe is made of a small piece of wood, such as you can gather from a hawthorne tree. The broom is also made of wood, with a little brown wool tied to the end. The crown of the hat is made in the same way as the cylinder; the cardboard must be about ¾ of an inch deep, and two inches wide. For the brim cut a piece of cardboard about the size of a penny, make a hole in the center to fit the crown, and gum them together. They must be painted black, and gummed to the head.

No. 3.

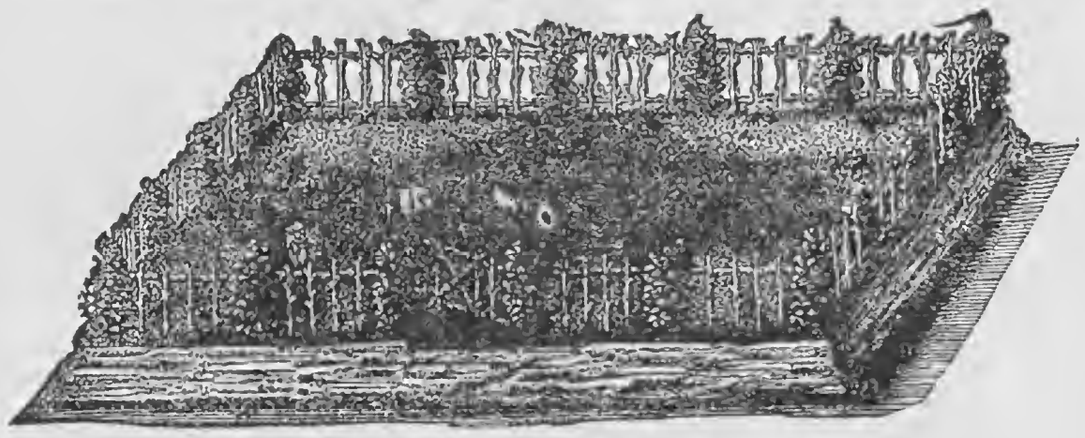
NO. 6.—BRACKET: CONE-WORK.

A wood bracket must be made for the foundation, which is covered with velvet at the top. The center of front of bracket is a circle of embroidered velvet or satin.

The wood bracket measures 11½ inches across the back, which is straight. The width of the middle is 5½ inches. It is sloped at the sides to a semi-circle. The cardboard for the front measures 17 inches in length; it is 10 inches in depth in the front, and is sloped at each end to 5 inches (see design). The embroidered medallion is edged with small scallops of button-hole stitch. Bows of ribbon ornament the top.

NO. 7.—LETTER-RACK; CONE-WORK.

The foundation is made of cardboard, 15 inches long and 12 inches deep. This is covered with brown glazed paper. The straps to hold the letters are neatly gummed to the back; these measure 13 inches long and two inches deep; they are covered with the petals of the cones, which must be arranged and sewn on as shown in the illustration.

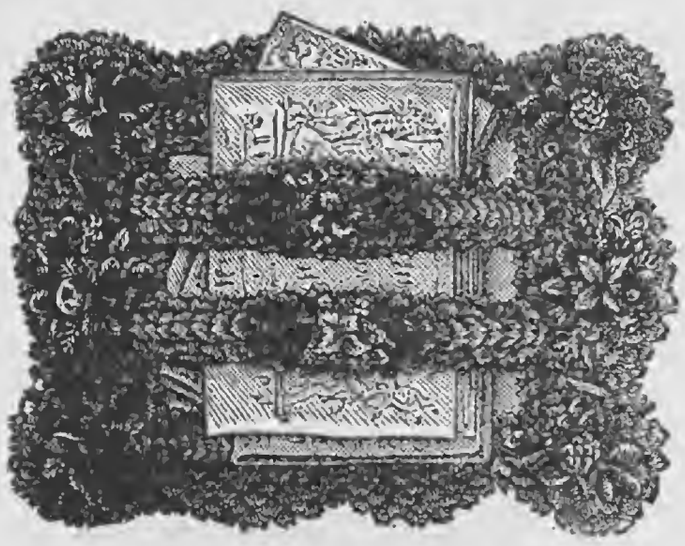


No. 1.

The bouquets on the border and in the ends of the straps are composed of oak-galls, cones of different sorts, small acorns, and some of the larger ornaments can be fastened with glue to the foundation. The seeds of the cones must be well soaked in water, so that they can be sewn on to the foundation with a cambric needle and cotton. The back must be covered with colored paper after the cone-work is finished. When all are quite dry, brush over with good copal varnish.

NO. 8.—CAP FOR PEN-WIPER.

The foundation of the cap is cardboard. The

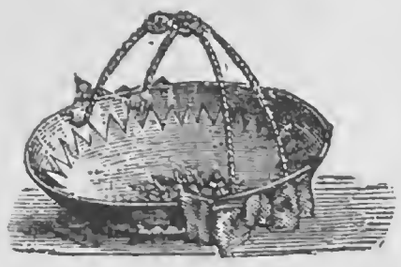


No. 7.

No. 21.

embroidered covering may be of velvet, silk or cloth. The border is in feather-stitch, with beads at the outer stitches. The cardboard for the top should measure 10 inches in circumference. The band is 1¾ inch in depth; this measures 10 inches at the top, and it should be shaped into nine inches at the bottom. The peak is cut in proportion, and is covered and lined. Black cloth cut into a sort of fringe, and bound closely together, is fitted into the crown of the cap to form a pen-wiper. A pin-cushion stuffed with bran may take the place of the pen-wiper, if preferred.

No. 15.



No. 17.

NO. 9.—DUSTING-WING.

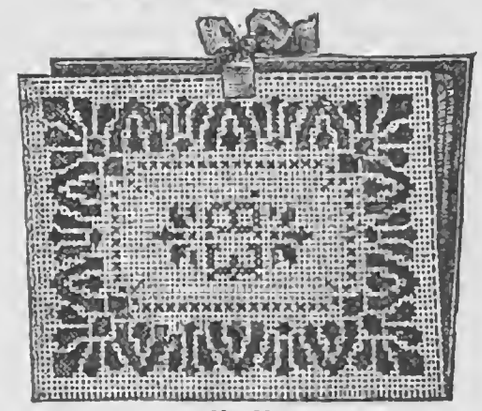
The wing of a goose or other bird is always considered useful for dusting corners with. After properly drying the wing in a cool oven, it is made neat at the top by a ruche of scarlet cloth, which may be plaited at the edges or bound with ribbon, and separating the ruche is an embroidered band. A loop of braid or ribbon is put on to hang the wing up by.

Nos. 11.—CARD TRAY.

The stand, which is shown in No. 11, may be bought at any fancy repository. The tray is of some smooth white wood, mounted on a gipsy stand of gilt bamboo, and ornamented with cord and tassels. The tray is ornamented with spray-work, the leaves and flowers being arranged as shown in reduced size No. 12. The mat, on which the card-tray is placed, is of crimson cloth, ornamented with acorn-cups, varnished.

NO. 13.—NEEDLE-BOOK.

For the cover, cut two pieces of perforated cardboard three inches long, and two-and-a-half wide. Embroider these with blue silk, according

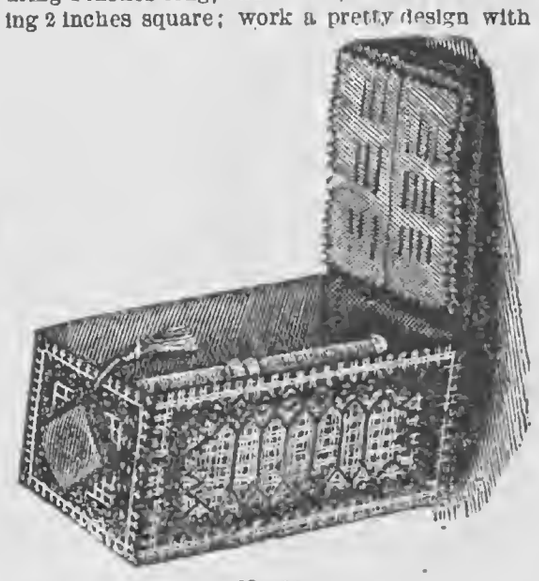


No. 13.

to the design, with initials or monogram in the center. Line the covers with silk, and sew them together up the back. Fasten in four leaves of white cashmere, and tie the covers together with narrow ribbon.

NO. 14.—NEEDLE-CASE.

Cut four pieces of perforated cardboard, measuring 4 inches long, and 2 wide, and two measuring 2 inches square; work a pretty design with

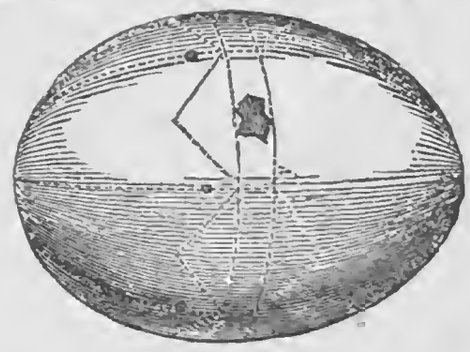


No. 14.

silk on three of the largest pieces, and the two squares; line all the pieces with silk, to match the embroidery; sew them together to the shape of the design, leaving one of the larger pieces for the lid, which must only be sewn at one end. Make two little leaves of white flannel, and sew them to the lid; to put the needles on, a little button must be sewn to the end of the lid and a loop on the corresponding end of the box to fasten them together.

NO. 15.—EASTER EGG.

No. 15 shows the ornamented shell; No. 16 the diagram for ornamenting and cutting it. A hen's, goose's, or duck's egg may be used. Make a small hole in the center, and empty the contents; then lay the shell in vinegar for five minutes;



No. 16.

this gives it a delicate whiteness. Take a fine pencil and draw the lines shown in No. 16; then, with a very fine saw, separate the egg-shell, cutting the inside skin with a sharp penknife. The shell is lined inside with gold paper, and ornamented with either painted designs, or small pictures may be gummed on. Pierce small holes in the top and bottom for the purse-silk (which forms the cord) to pass through.

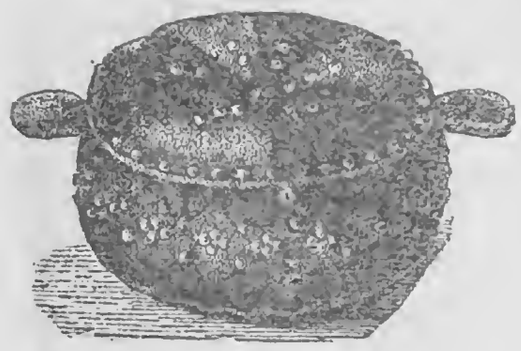
NOS. 17 AND 18.—EGG-SHELL BASKET.

The shell is prepared the same as for No. 16. One half of the shell is cut plainly round the edges to make the basket shown in No. 17. This may be ornamented with a narrow gold paper border, and a bunch of painted flowers or monogram. The handles are of fine flower wire, covered with colored silk, and finished with small bows of gold paper gummed to the side of the basket. No. 18 is made from the other half of the egg-shell, which must be cut into vandykes at the edge. These may be painted or covered with fancy paper. The handles are the same as No. 17, finished with small silk tassels.

No. 18.

NO. 19.—PIN-CUSHION.

Make a small, round pin cushion, measuring seven inches in circumference, and fill it with bran, or emery-powder may be used, if preferred. This must be covered with scarlet-and-black cloth; six sections of cloth cut as shown in the design, are required to cover the top; these must be neatly sewn together and fastened to the cushion. For the sides, a strip of black cloth, seven inches in length, and one in depth, is needed. This must be embroidered with scarlet silk and ornamented with gold beads, and afterwards neatly sewn to the cushion. To make the work neat where the side is sewn to the top, a narrow gold or scarlet braid may be sewn over



No. 19.

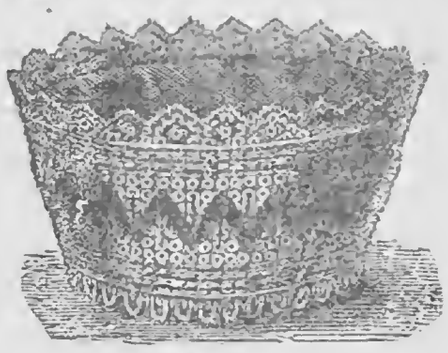
the stitches, or put in as a piping. The little handles, which are sewn to the cushion before the side-piece, are kept in shape by means of a a very fine wire, which is fixed in between the double cloth of which they are composed; they are also ornamented with the narrow braid. The center of the cushion is ornamented with a fancy button and beads like those on the sides.

NOS. 20 AND 21.—WORK CASE.

The case is made of American cloth, lined with blue silk or cashmere. The bottom is cut in one piece, measuring twelve inches in length, and seven in width. Two pockets, ornamented with embroidery, are sewn to the bottom, and a strap of ribbon stitched at intervals, to hold scissors, thimbles, etc. The sides and ends are cut separately; they measure three inches in depth, and are bound with blue ribbon, they are seamed neatly to the ribbon which binds the bottom. Two bands of blue cashmere, ornamented with a design in cross-stitch, are fixed to the back; a buttonhole is worked at the corner. The closed case is shown in No. 21; it is fastened by means of buttons: the buttonholes are worked in the embroidered bands.

NO. 22.—COTTON BASKET

composed of perforated cardboard, and embroidered with blue silk, or fine chenille. The card measures two and a half inches high, and ten



No. 22.

and a half inches in circumference; each edge is cut in scallops to form a border; this must be fixed to a bottom of plain cardboard, and lined with blue silk.

NO. 23.—HANDKERCHIEF SACHET.

The two sides of the sachet are formed of blue silk, each measuring seven and a half inches square. The blue silk is lined with white silk, quilted and well padded. The four corners of the outer side are embroidered with the spray, shown in No. 24, the flowers are worked in shades of amber silk, and the leaves and buds in green and brown. The center of the cover is bouillonnee and finished with silk cord. A ruching of ribbon is placed round the edge, and a bow of ribbon at each corner. The sachet should be perfumed with scent powder, which can be purchased at any chemist's or perfumer's. The two sides are tied together with bows of blue ribbon.

Literary Miscellany.

WEAKER THAN A WOMAN.

CHAPTER XI.

(Continued from page 751.)

"You are sarcastic," cried her ladyship. "It is very wrong, but I really adore sarcasm."

His face relaxed just a trifle more. She watched him intently. He was worth some trouble; for as soon as he had entered the neighborhood she had resolved upon marrying her daughter to him.

"There are some nice girls here," said her ladyship—"some very pretty girls—Violet Haye for one."

Then his face brightened. She had touched on a happy theme at last.

"Violet Haye is quite the queen of the *ete*," she continued. "There are few, any, who can compare with her."

"There is not one," he said and in her heart her ladyship disliked him or the words.

"Perhaps you are right," she allowed calmly. "I do not know who could really be said to be like her. She is a fortunate girl, too. She has no great fortune and no connections, yet she is engaged to be married to that handsome young Mr. Lonsdale."

"Engaged to marry him!" cried Sir Owen, with an angry scowl. "A girl like that engaged to marry the son of a man who has been tried for perjury, or forgery, or something of the kind!"

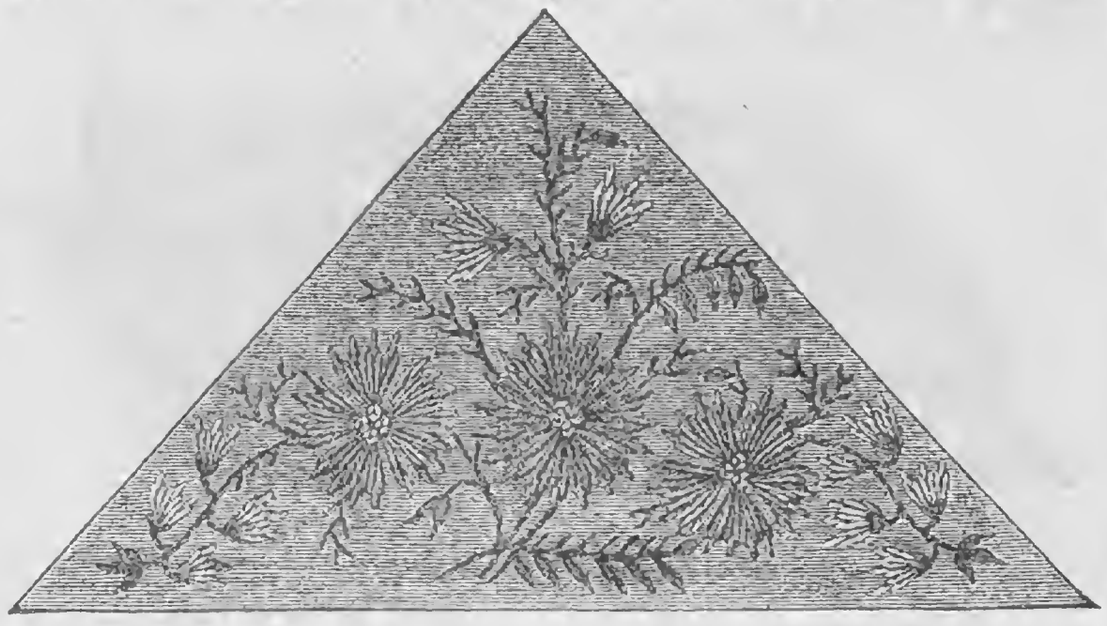
Lady Rolfe laughed lightly, and touched him on the arm with her fan.

"Nay, nay; it was not so bad as that. Poor Mr. Lonsdale was innocent enough; but she is to marry his son—the wedding-day is fixed, and they will be a very handsome pair. She will marry him, I hear, in the spring."

"That accounts for it," he said, and the heavy black moustache drooped over as cruel lips as were ever seen on a man's face.

"Accounts for what?" asked Lady Rolfe, with a great assumption of innocence.

"Oh, nothing in particular! but I thought he seemed to consider that he had some kind of right to her,"



No. 24.

.—MINIATURE OF FERN-WORK FOR CARD-TRAY.

No. 11. No. 12.

And then, looking at him, Lady Rolfe saw a stern, cruel, set expression settle on his face.

"So they are to be married in the spring, are they?" he asked slowly. "I suppose this young Lonsdale is very proud of her?"

"What a question to ask me, Sir Owen! He is a man, and has eyes. I should not think it would be possible to tell how much he loved her."

"Does she care for him?" he asked quickly.

"Dear me, yes. Care for him! Why, it is a love-match *pur et simple*. She cares very much for him and for no one else besides."

Lady Rolfe had unconsciously done the very thing to defeat her own purpose. The fact which would have made Violet sacred to another man, simply urged him on. It would be a triumph to win her, because so many others admired her; but it would be a double triumph if she was engaged to another man. Sir Owen often congratulated himself on his perfect freedom from what he was pleased to call "affected nonsense;" and he was never more free from it than in this case. If, besides winning Miss Haye for himself, he could add to that the triumph of making her

No. 20.

No. 6.

No. 9.

He asked no more questions, but Lady Rolfe, still watching him intently, saw that the set, firm look deepened every moment on his face. She could not tell whether she had done right or wrong. She had told him that the girl was engaged and that it was quite useless for him to think of her; but what did that look mean? Like any one else who had any part in naming Violet Haye to Sir Owen that day, she had an uneasy feeling about it.

Sir Owen seemed to think that he had done all that was required of him. He rose from his seat, and left her ladyship with a bow.

"He will go to Lavinia now," thought Lady Rolfe. "He will waste no more time over Violet Haye."

But Lavinia beamed upon him in her superb costume of mauve silk all in vain—he passed her with a careless bow. The moments seemed to him hours before he should be near Violet Haye again.

It was well for his popularity that no one saw the lowering, angry expression of his face as he crossed the croquet-lawn.

"I would have her if I wanted her," he said to himself, "if every other man on earth laid claim to her, and if I had to fight them all." Such men talk boldly of fighting in anticipation.

break an engagement to another, it would be the greatest success of his life.

"She is beautiful enough to be a queen," he said, "and it would take a hundred lawyers to frighten me. A man with forty thousand a year ought to be able to do as he likes. If he cannot, what is the use of money?"

He went at once to Violet, and Felix, standing by her side, longed to lift him up in his strong arms and throw him over the bridge.

"Miss Haye," he said, quite ignoring the presence of her lover, "do you live here in Lilford?"

She appeared half frightened as she answered him—

"Yes—I live at the Limes."

His face cleared.

"I know it," he went on. "It is a pretty little place just outside Lilford. I have often admired it. Does your father hunt?"

"No—he is quite an invalid," replied Violet, half longing that Sir Owen would leave her, and half enjoying the distinction that his great notice of her brought.

"Ah, an invalid—very unfortunate! Not able to leave the house often, I suppose?"

"No—not often," replied the girl, looking at her lover's averted face.

"I shall be glad to see him sometimes," said Sir Owen; "he has no objection to visitors, suppose?"

"No," replied Violet; "he is pleased to receive any."

"Then, with your permission and his, I will ride over to-morrow," said Sir Owen.

He waited for her reply. Violet made none. She was frightened at the expression on her lover's face.

"You do not say that I shall be welcome, Miss Haye," he added impatiently;

She recovered herself. After all she was doing no wrong.

"We shall be pleased to see you, Sir Owen," she told him with quiet dignity; and then the Baronet, finding there was no chance of further conversation with her, went away.

"My darling," cried Felix, "do not be at home to-morrow when he comes! I do not like him, Violet—he has a cruel bad face, and there is an evil light in his eyes. I do not like him, sweet."

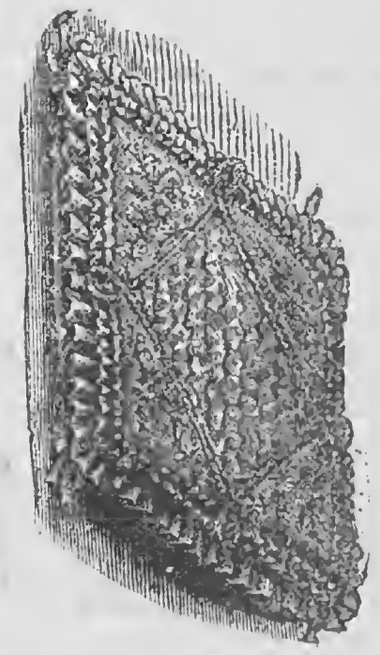
"I wonder why he has paid me so much attention," she said, "and why he is coming to see us?"

But Felix was too wise to answer that question. He only clasped the little hands in his own. To him this girl, in her beauty and innocence, was little less than an angel.

"My white dove," he said—"my pure sweet love, never mind him! Promise me that when he or any other man comes to you with flattering words, you will say—'I am pledged to Felix Lonsdale,' Will you say that, Violet?"

"Yes, I will," she replied.

"Would that I could take you away from them all and keep you safely under the shelter of my own great love, Violet! You will not be in to-morrow when he comes? Promise me, my darling—do you not see that I am half mad with jealousy?—promise me you will go out! If I knew that to-morrow he would sit by your side, touch your hand, look into your beautiful face, I think that I should shoot him to-night!"



No. 23.

"Oh, Felix, what a dreadful thing to say!"

"Jealousy is like fire—it destroys all things,' he said; "but I am foolish to be jealous. I have all faith in you, sweet—all faith. Say once again, 'I belong to you, Felix.'"

The sun shone on her fair face as she raised it to his; the wind stirred the leaves as she said—

"I belong to you, Felix,"

CHAPTER XII.

The *fete* was over, but people still talked of it—of the unexpected appearance of Sir Owen Chevenix and his admiration for beautiful Violet Haye. Violet had said but little at home; she had told her father that the Baronet intended to come to see him, and Francis Haye had looked up in bewilderment.

"Coming to see me!" he cried. "What is that for?"

He did not see the hot flush on his daughter's face. She knew well enough why he was coming.

"If it is about that right of road," he continued, "he may save himself the trouble, for I shall never give in—never."

"You will see what he is coming for when he comes," said Mrs. Haye; "there is nothing so absurd as guessing. I shall not believe it until I see him"

Then after talking eagerly of his boundless wealth, the beauty of his estate, the number of his horses, Francis Haye exclaimed—

"And to think that he should come to see us!"

Violet remembered her promise; she knew that Sir Owen would probably call about one o'clock. Soon after noon she put on her garden hat, and, without saying a word, went out into the woods where no one could see her, and no servant could be sent after her. She sat there thinking—thinking of how Felix loved her, and how sweet it was to be loved—telling herself that she would not exchange his love for the world.

Why did he dislike Sir Owen so much? Why was he so anxious for her to be away during the

Baronet's visit? She had never loved Felix better than she did that morning, as she sat thinking of him; her heart warmed to him—his great love had touched her at last. She would not go back home until after two; the Baronet could not prolong his visit beyond an hour, she thought.

As she entered the house she saw her mother watching eagerly for her at the dining-room window. She went to her at once. The moment she opened the door she heard the Baronet's voice.

"Good morning, Miss Haye. I was just saying that after my long ride over, I would not go away without seeing you, if I had to stop here until midnight."

She looked at him in simple surprise.

"I thought that it was my father you wanted to see, Sir Owen."

He laughed; he was somewhat disconcerted at her answer.

"Did you not see that that was my excuse for coming to see you?" he said.

Violet turned away, while Francis Haye and his wife looked at each other. The Baronet sat down again; nor did he leave until long after three. He talked of all kinds of things which he thought would interest Francis Haye. His least word was listened to with intense admiration by those children of Mammon. Then, after promising to send grapes and choice fruit, after offering all kinds of favors, he went away. Violet was compelled to go to the garden-gate with him. He asked her, and Mrs. Haye answered the question for her.

"What a very good friendly neighbor!" said Francis Haye, as he, with his wife, watched the Baronet mount his horse.

His wife turned to him with a face that quivered with agitation.

"He is worth forty thousand a year—forty thousand! If you are a wise man, you will not say one word; if you do, you will spoil it all."

So when Violet returned, half dreading the debate that she felt sure must follow, there was no reference made to the Baronet or his visit, save that, in general terms, her father expressed himself much gratified. The only perceptible difference was that the girl's parents treated her with even greater deference and affection than before.

That night—it was a lovely night in May—Violet, sitting with her parents, heard a signal that she knew well.

There was a quick beating of her heart, a thrill ran quickly through her veins—Felix was outside.

"How the leaves tap the window!" said Mrs. Haye. "It is growing late; we will have the shutters closed."

Violet hastened away, ostensibly to see that her mother's wishes were obeyed, but in reality to see if Felix were outside.

How lovely the night was! The world lay calm and smiling under the light of the moon; the soft breeze brought the scent of the pink hawthorn in the hedges, of the clover in the meadows, or the violets in the woods. Violet went quietly out, and there, by the great lilac bushes, stood Felix. She had no time to remonstrate, for he had clasped her in his arms as though nothing but death could part them.

"Did I frighten you, sweet? I hope not—I have but five minutes to spare."

"Will you not come into the house, Felix?" she asked.

"No. I have but five minutes, and I want to spend them with you. I ought not to have run over, but I could not help it—I could not rest. I want to know if you saw that man to-day, and what he said to you. Yes, I know," he continued, "that I am jealous. Never mind that, sweet. Jealousy is a consuming fire. I could not rest, I could not sleep. I have tasted no food—my very life has seemed to be leaving me. I felt that I must run over, that I must hold you in my arms, kiss your lips, hear you say that you love me, or the fire would destroy me."

Once more his great love mastered her, once more the mighty passion in him seemed to make her strong and noble by example.

"Tell me all about it, sweet," he said.

Looking into his handsome face, his loveliit eyes, she could not say many words which would hurt him.

"There is little to tell you, Felix," she replied. "I went out soon after twelve; I did not return until after two. Then he was still here. He went away soon afterwards."

"Did he talk much to you, Violet?"

"No; he talked to my father," she answered.

He drew her nearer to him.

"He has not taken one thought, one word, one look, one smile from me, has he, sweet? Oh, my darling, if I could but take you where your beauty could gladden no eyes but my own! It seems to me, Violet, that this fever of longing is burning my heart away. Will the longed-for time never come?"

"Yes," it will come," she replied; and this time she did not add her usual remark—"I have not quite promised, you know."

She was sorry for him. She could not quite understand his feelings, but she had some dim perception of what he suffered, of the torture of his love and jealousy, of the greatness of his love. She saw such pain in his face and in the trembling of his lips that she did what she had never voluntarily done before—she caressed him of her own free will; she laid her hand on the clustering hair, and drew his face down to hers. She turned her sweet lips to him.

"You need not fear, Felix," she whispered. "I love you—no one but you!"

"That was worth walking a hundred miles for," he said. "If you are so kind to me, Violet, I am afraid that I shall run over every night. I would walk all day and walk all night for the chance of hearing such words."

The dew was falling, and the fragrance of the lilac floated round them.—To be continued.

AN ESSAY ON FOODS.

The two great duties which food has to perform in the body are to maintain the heat of the body and to supply material for its growth and renewal. Hence foods are divided by writers on the subject into carbonaceous or heat-producers, and nitrogenous or muscle-makers. This division, however, is arbitrary and of only partial application, since nearly all carbonaceous foods contain nitrogen, and nearly all nitrogeneous foods contain carbon. In lean beef, which ranks with nitrogeneous foods, there is more or less fat or carbon, and in vegetables richest in nitrogen, as beans, peas, cabbage and onions, there are sugar and starch. So that all foods are more or less nitrogeneous, all foods are more or less carbonaceous, and those terms are used with relation to foods simply to indicate which quality they possess in the greater degree. The chief function of the three great carbonaceous foods—sugar, fat and starch—is to keep up the animal heat, and if more of these substances is used than is necessary for this purpose, it is stored up in the body and produces corpulence. Hence all foods containing large proportions of these elements must be avoided by those who do not wish to increase their weight. In the potato, for example, the composition is, for every hundred parts, water 75, nitrogen 2.1, starch 15.6, sugar 3.2, fat 0.2, salts 0.7. It will be seen that the proportion of starch is nine times as great as that of the nitrogen, and the sugar also largely exceeds the nitrogen.

Wheat flour contains in 100 parts, water 10.7, phosphate 0.96, nitrogen 2.4, albuminoids 15.4, starch 65.4, cellulose 0.3. Wheat flour, therefore, contains more starch in proportion than potato does but the conversion of a large part of the starch into dextrine by toasting bread, neutralizes, in a degree, the fat-producing quality. Then, as four-fifths of all we eat supports respiration, there must of necessity be in our food four times as much carbon as there is nitrogen. The wheat alone will supply this sufficiently for persons tending to fatness, so that the starch in the potato is surplus, and should, therefore, be declined. In new milk, though the constituents vary with the kind and quality of food given to the producer of the milk, there are in every hundred parts, water 86, nitrogeneous matter 5.5, sugar 3.5, fat 3.6, salts 0.66. So, adding the fat and sugar together, they exceed the nitrogeneous matter, and hence milks rank among carbonaceous foods. But from the lime it contains, milk is the growing food, and better for children than any other food, since its constituents are blended in just the proportions required by the growing child. Milk is also very grateful to men and women of large osseous development who are not inclined to corpulence, while small-boned and plump persons complain that it makes them "bilious." An egg weighing 1¾ ounces contains 15.25 per cent. of carbon and two per cent. of nitrogen. In the classification referred to, eggs would rank with carbonaceous foods, but they are so rich in the various salts required by the body that they are permitted, even in the diet of corpulent people. On the scale of nutrition beef has always been regarded as the kind of flesh which gives the best nutriment to the eater, while mutton and poultry are softer in texture and more delicate in flavor.

Fish is richer in phosphorus than flesh, but on the whole less nutritious. It is recommended, however, that fish form a part of one meal every day. Next to the fish in nutritive qualities, eggs deserve mention, and then comes caseine or curd, which is strained from milk, but exists also in seeds, as peas, beans, almonds. Of all vegetables, peas and beans rank highest in nutritive qualities, as they contain from twenty-three to twenty-five per cent. of nitrogeneous matter. Of the grains, oats are the richest in nitrogen; wheat comes next; then, in order, maize, millet, rye, barley and rice, the latter being the least nutritious seed in extensive use. Fruits are nutritious to a greater or less degree, but are valuable chiefly for their flavors, the relish they give to food, the acids they contain which promote digestion, and the various salts which render them peculiarly grateful, not to the palate alone, but to the whole body. It is impossible in the space at command to do more than outline the subject. What has been said is intended to answer inquiries already made and to stimulate research in those who read. In the preparation of this brief article, Edward Smith's book on "Foods," which is a volume in the International Science Series, has been consulted, also Pereira on "Food and Diet," and also the articles on various kindred topics in the cyclopædias. To these we refer those who wish to pursue these inquiries further. In all these books the chemical composition of articles treated of is given, and there are tables showing the comparative values of foods with respect to their power to produce heat in the body, to promote its growth, and to restore its wasted tissues.—[New York Tribune.

A RIVAL FOR EDISON.

During all the agitation of the woman question, which has so shaken society for the past dozen years, there has been one safe refuge for the opponent of woman's emancipation. Driven to admit that woman had climbed as high as a man in literature, in art and in government, compelled to confess her equality, if not superiority, in a social aspect, it has always heretofore been open to the scoffer to shelter himself behind the triumphant declaration that woman has never shown herself an inventor. But unless the London correspondent of the New York Evening Post has been deceived, or is deceiving that journal, this last stronghold of the foe to feminine progress has been invaded and his last defense beaten down. According to the correspondent, woman, in the person of Miss Harriet Hosmer, has shown herself not only an inventor, but a great inventor in a time which is peculiarly one of great inventions.

One of the inventions with which the account credits Miss Hosmer far exceeds in importance and value anything that Edison has discovered or pretends to be on the the point of discovering. It is the use of a permanent magnet as a motive power. Miss Hosmer claims to have discovered in the permanent magnet a property hitherto unknown and unsuspected, which can be turned to practical use in the driving of machinery; and she is now having constructed in London a machine of four-horse power to be run by the new motor. There is no battery, no electricity, no heat, no fuel. It is the magnet, and that alone, which is to move the machine.

The enormous possibilities underlying such an invention it is utterly impossible to estimate. The falling off in the price of coal alone is sufficient to revolutionize the trade of the world. It would diminish the cost of every manufacture under the sun by doing away with the necessity for transportation of raw material. It would in this way destroy half the manufacturing centers of the world, to rebuild them in the wildernesses and the mountain. It would relieve Niagara from the shameful possibility hinted at of late—of being given over to the drudgery of turning wheels and driving spindles; and it would enhance immensely the value of the latest Edisonian invention, the electric light, by furnishing a cheap means of generating the electricity. There is no end, in short, to the marvels which the new invention will perform if it answers the expectations of the inventor.

The very immensity of the discovery and of its possible consequences will serve, however, to make people incredulous, or, at the very least, skeptical concerning it. There is something in the story so suggestive of the will-o'-the-wisp, perpetual motion, that the world, both scientific and unscientific, will be cautious about committing itself to approval until Miss Hosmer's claim is established by the production of a working machine. The production of such a machine is promised in the near future, and will be awaited with a good deal of interest.—*Detroit Free Press.*

RECENT LITERATURE.

Marrying off a Daughter. By Henry Greville. T. B. Peterson & Bros. 75c.

There is a charming simplicity and freshness about the works of this author which have rendered her a very general favorite. The prominent characters in Marrying off a Daughter, are not intrinsically interesting, but are faithful portrayals of individuals or a class abounding in European society, of which we on this side of the water, happily know little or nothing. In point of delicacy and finish, this book will not compare favorably with some of her other stories. We cannot, however, help sympathising with the artless heroine, the victim of the persecutions of an unprincipled mother, nor can we help enjoying the quiet humor and general interest of the story.

Stock Breeding: A Practical Treatise on the applications of the laws of development and hereditary to the improvement and breeding of domestic animals. By Manly Miles, M. D. New York: D. Appleton & Co.

Prof. Miles has at last concluded to publish in book from the essence of his admirable lectures. It is the first successful attempt of which we are cognizant to present to both farmer and student, systematically and in convenient form the known facts and principles of improving and breeding domestic animals. The manner of classifying and arranging the facts is simple and easy of comprehension; the subject is treated as exhaustively as is necessary for a comprehensive outline, and as a text-book for students, or as a work of reference for farmers, it meets every requirement. We hope its introduction will be extensive, among farmers especially.

MAGAZINES.

Harper's Magazine for December opens with four old Christmas poems: by Ben Jonson, George Wither, S. T. Coleridge, and Giles Fletcher. Abbey illustrates these with three pictures: the Christmas Waits, the Shepherds, and the Madonna in the Stable.

An illustrated article on England's Great University, contributed by M. D. Conway, gives a satisfactorily comprehensive view of the various colleges of Oxford, the social life of the students, the most eminent of the professors, and the work accomplished by the University in promoting scholarship in England. The illustrations are picturesque and interesting.

The most interesting paper in the Number—because of its humor—is the fun-provoking narrative of B. Munn Chowson of Dedham, concerning the peculiar institutions of Knoware—an island upon which he is thrown by shipwreck. This article is by Rose Terry Cooke. The illustrations are as humorous as the letter-press.

The thrilling adventures of the Red River Colony belong to the early pioneer history of the West, and are told by General Chetlain, a descendant of one of the colonists. The article is effectively illustrated.

Lovers of music have a treat given them in the illustrated paper on Mendelssohn and Moscheles, covering a remarkably interesting era in the progress of music both in England and Germany.

An illustrated paper by Charles Barnard, describes the mining of silver in all its stages. The brief paper on storm signals by E. H. Knight is also very timely.

Ex-Governor Seymour, under the title Crime and Tramps, makes some important suggestions as to the punishment of minor crimes. Dr. Coan, in Some Peculiarities of Yellow Jack, presents very curious facts as to the migratory character of yellow-fever epidemics, and other features of the disease. A. A. Hayes, Jr., contributes an interesting and piquant description of the First Railroad in China, the Woosung Railway—recently demolished by the Chinese.

Besides Mrs. Cooke's Knoware, already, mentioned, there are three capital stories. Two Hundred and Two is contributed by Elizabeth Stuart Phelps; Helen, by Alice Perry; and A Rescue from Cannibals, by Mrs. Frank M'Carthy.

Poems are contributed by E. S. Phelps, Will Wallace Harney, Frances L. Mace, Paul Hayne, and W. H. Babcock.

The serial novels by Black and Hardy, continued in this Number, will be concluded in January, to be followed immediately.

Sunday Afternoon for December has in the way of fiction a story by Ellen W. Olney, The Story of Allie; there is another entitled Gallowses; an installment of Edward Everett Hale's serial, and of Fishers of Men, the latter bringing the story to its climax.

What a Radical Found in Water Street, gives the experience of one who, disgusted by the petty bickerings and jealousies which accompanied the worship of Culture in the Club of the True Brotherhood, was made glad by the cordial and genuine brotherly love found among the Christian workers in Jerry McAuley's Water Street Mission in New York. McAuley was formerly a noted bruiser, and a graphic account of his experience is given in his own words. Rev. Tryon Edwards solves the riddle, Why Michael Angelo put horns on his Moses. Mrs. C. T. Leonard discusses Destitute and Delinquent Children, and favors scattering them, rather than bringing them together in large institutions. The Art of Alms-giving is set forth by Rev. G. T. Lidd. Co-operation and Simplification should be read by all women overburdened with the cares of housekeeping and dressmaking.

Among the shorter contributions are the Bambino Santissimo, Temperance and the Laborer, Poor Relations and their Uses, and Poems by Caroline Leslie, Margaret J. Preston, and Julia C. R. Dorr.

In The Prophetic Conference the Editor reviews some of the reasons advanced at the late New York conference in proof of the second coming of Christ, taking a negative view. He writes also of What Dives Knows about Lazarus and The Flat Iniquity, besides the usual briefer paragraphs. A liberal installment of book reviews closes the number.

The possibly most interesting statement in Sunday Afternoon, for December, is that before January 1, 1879, yearly subscriptions may be made for $2.10, postage paid, the regular price being $3.00.

The Eclectic for December opens with an extremely interesting paper by Archibald Forbes, the distinguished correspondent, on the British Annexation of Cyprus. Another timely article is The Austrians in Bosnia, by A. J. Evans. Jas. Henderson in his article on England and America as Manufacturing Competitors, aims to convince Englishmen that so long as Americans cling to a protective tariff there is little danger that England will lose her supremacy as *the* manufacturing country of the world. As an Englishman's view of the situation, the paper is both instructive and interesting.

Animal Intelligence, The First Edinburgh Reviewers, Coven's Revenge, Slavery and Polygamy in Turkey, The Earth's Place in Nature, Hallucinations of the Senses, Fred: A Tale from Japan, Musical Poetry, Biographical Sketch of Beaconsfield, Literary Notices, Science and Art, and Varieties (a most interesting department) comprise the other prose contributions. A fine steel engraving of Beaconsfield adorns the first page.

The Descriptive Catalogue of Houghton, Osgood & Co.'s publications makes an octavo of 235 pages. It describes all of their books and periodicals in all external features, size, form, binding; and, besides giving the contents, either characterizes these so as to aid the reader in understanding their value, or, more frequently, quotes the estimate of the most competent critical authorities. The high literary standing of the persons and journals quoted is especially noteworthy.

This Catalogue contains quite a remarkable array of notable names in literature, such as Agassiz, Aldrich, Anderson, Bacon, Dr. John Brown, Robert Browning, Bryant, Carlyle, Dr. E. H. Clarke, James Freeman Clarke, Joseph Cooke, Cooper, Dana, De Quincey, Dickens, Emerson, Fields, Fiske, Goethe, Bret Harte, Hawthorne, Hillard, Holmes, Howells, Hughes, James, Mrs. Jamoson, Starr King, Miss Larcom, Lewes, Longfellow, Lowell, Macaulay, Harriett Martineau, Owen Meredith, Montaigne, Parton, Pascal, Miss Phelps, Miss Adelaide Proctor, Saxe, Scott, Scudder, Principal Sharp, Stedman, Stoddard, Mrs. Stowe, Bayard Taylor, Tennyson, Mrs. Thaxter, Dr. J. P. Thompson, Thoreau, Ticknor, Waring, Warner, Whipple, Mrs. Whitney, Whittier, and scores of others hardly less distinguished.

This Catalogue will be of great value to all libraries and to all who buy and read good books. It will be sent by Houghton, Osgood & Co., Boston, on receipt of ten cents.

Sunday Afternoon, for November, contains a most interesting article on the Woman's prison in Massachusetts, entitled Women in Prison. The author points out a way for the philanthropically inclined to exercise their reformatory proclivities, nearer home than India or Africa. How To Use The Bible, is a suggestive paper, by Washington Gladden. Fencing The Lord, contains some excellent hints, which, it is to be hoped, those who frown on diversions of every kind, will profit by. Who Are The Demarks? Is answered pleasantly and intelligently by H. K. Carroll. The Japanese Story of Creation, is a unique contribution to Magazine literature. Chips From a Northwestern Log, deals mainly with the Indian question, and as it is a record of the experiences and opinions of one who has lived among this race, it is at least worthy of respectful attention.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

THE DREADFUL DISH-WASHING.

MARY WAGER-FISHER.

A YOUNG lady who was visiting me a few days ago, after commenting upon an article in the RURAL NEW-YORKER concerning dish-washing, said, "Shall I tell you how I wash dishes?"

"Yes."

"Well, as a prelude, I must tell you that I think it the most abominable work under the sky! The smell of the dish water makes me sick, and my hands, they are under my face and eyes all the time, and I like to have them white and lady-like-looking; that is one of my vanities. But all this is neither here nor there, for since the 'hard times' struck us we have been much of the time without servants, and dish-washing falls to my lot. After a meal is cooked I fill all the gravy pans and skillets with water, place them on the top of the stove, and put a lump of washing soda into each, and by the time the meal is well over, these greasy vessels have actually cleansed themselves. For washing dishes I use a 'mop' and wear rubber gloves."

"How much do the gloves cost?"

"From $1.25 to $1.50, and they last me eighteen months."

WHAT CAN BE DONE SITTING DOWN.

Dish-washing.

Bread and pastry making.

Ironing.

Window cleaning.

I have been told that the house of Mr. Edison, the wonderful inventor, is a museum in its multitude of labor-saving contrivances; but Mr. Edison is not the inventor of a high stool for the kitchen, which humble piece of furniture, when properly introduced into the economy of the work, will prove to be a source of salvation to many a woman tired to death from being so much on her feet. One can do with ease all the above-enumerated tasks, which are usually done in a standing posture, and the facility in working while seated upon a stool is, of course, greatly increased by practice. With an ironing-board well adjusted at both ends, and high enough so that the knees will pass under it, one may do a large ironing, only rising to change the irons. And if one is too much of an invalid for that, she can have a small charcoal stove, which will heat the irons, placed at her hand. With such contrivances, ironing becomes "fancy-work," for a lady may do it in her parlor, with ease. The charcoal or kerosene stove is very nice for "doing up" fine and elaborate pieces that require much time and skill.

An improvement on the ordinary high stool, or low stool, is an adjustable top, connecting with the stool top by means of a strong screw, by which the second top may be lowered or raised at pleasure; in fact, something like a piano-stool, only it should have three or four legs and cross-pieces for the feet to rest upon. Such a stool is especially convenient in cleaning and polishing windows. The reason why very many tired women do not sit more at their kitchen work is because the ordinary chair is too low, and it is impracticable to bring tables and shelves down to the level of chairs. But the high stool and the adjustable stool, make the thing pleasant and practicable. Try the stools and save your health. Make your kitchen a Christmas gift of one!

Bryn Mawr, Pa.

BEHIND THE CURTAIN;
OR, THE OTHER SIDE OF THE QUESTION.

MUCH has been said in these columns concerning over-worked, weary, worn-out women, and the assertions are too sadly true to admit of any denial to the oft-repeated theme; but for this once let us look at the other side of the question. Let us lift the curtain of domestic life and see what is beyond. Let us ask ourselves if our homes are as bright, our firesides as dear, as it is our duty as women to make them; whether they are homes of our own, or homes of our loved ones, where we find a welcome. I know of a home,—at least it goes by that name, though to my mind "Home is not merely four square walls,"—which lacks, in fact, everything that makes a home a place of rest and joy; yet there are wealth enough, taste enough, and would be love enough if the sacred flame were ever replenished by a loving deed or thoughtful word. And here let me quote the words of a very dear friend: "Little acts of love are like adding fuel to a heavy flame, but if withheld, the flame is still, blacking over, and the warmth is beneath the surface—sleeping." How true! and in this way love is sleeping in this household, and I fear will sleep its life away for want of food.

We will enter first the kitchen; but we need go no farther, for this room will truthfully portray a woman's domestic qualifications. It ought to be neat, surely, for it is nearly noon, and there will hardly be time to arrange things in order and prepare the mid-day meal in season. Yet the wife sits composedly sewing. It is a lovely pattern in silk embroidery, and she gets so interested in her work that no thought of dinner enters her mind till she hears the clock striking. "Why, who could have thought it was so late!" and she bustles about, trying to do everything in a minute; but there is no time for cooking, so cold potatoes, bread and meat—remnants of the morning meal—are hustled upon the table. Then she sits down to her work as Hal enters—not, however, in the way I like to see husbands enter their homes, with a light, quick step, as if sure of comfort and welcome. He is annoyed at the looks of things in general, and sits down to the cold meal with a frown and an impatient word. She explains she is in a hurry to finish her work and does not feel hungry; so her husband eats in silence. He looks up once or twice, but it is not a pleasant picture; soiled wrapper, frouzy hair, slip-shod feet, and the room looking as if stirred up with a spoon, and he goes back to his work without a word.

A trifle, 'tis true, but many of them cause the flame to slumber. She is making a pair of slippers for his birthday. It is kind of her, and he appreciates it when she gives them to him; but what man would not rather go without slippers than wear them in a tumbled up, disorderly room, with an untidy wife for a companion, who thinks more of the last magazine stories than of her husband's conversation? If he should tire of all this negligence at last, and seek companionship elsewhere—at the store, "tavern," or at a neighbor's, she would complain of neglect, and declare herself misused. The flame would deadon; and where's the blame? She might not have been the first to withhold the answering smile, but many, many times a neglected wife can lay her heart-aches at her own door; and not many men can admire a careless, slovenly woman, whether wife or not.

A lady may appear as an ornament to society: she may have accomplishments, beauty or talents, while beyond the folds of the curtain which ought to shut out all discomfort, she may prove an idle, dissatisfied woman, an unloving helpmeet, and false friend! What ought woman's ambition to be; what more noble ought she to be, than to gladden and keep warm hearts which claim her as their own? Oh! let us keep these things fresh in our minds. They are our duties, our rights, which should never be forgotten; and let us keep our homes bright and cheerful, a white spot for our loved ones.

EVA E. E.

SCIENTIFIC COOKERY.

COOKING is the proper preparation of food for human consumption. Theoretically, the gauge of cookery should be the healthfulness of its results; practically, the standard is simply one of individual taste, and that in this country, where the majority are educated to relish compounds indigestible and worthless as brain and muscle producers, is fallible in the extreme.

It seems to be a general assumption among men that women are born cooks. This is a great mistake. Cookery is a science nearly akin to chemistry. A chemist must be carefully educated, yet we place the most foolish Hibernian virgins in our kitchens to prepare our food.

If cookery were reduced down to accurate rules, like chemistry, any one might make eatable dishes; but it is not so. Let the reader ask any successful cook how he or she makes any dish, and very likely no explanation will be given. "Practice" is probably stated as the reason, or "experience" or "luck." In most cookery-books the same inaccuracy prevails. What does a teaspoonful mean—heaped up, or level with the rim? Or a teacupful? What size of teacup? Or a pinch? There is no standard of measures conscientiously followed; and hence a woman will gauge her ingredients by the grab with the same unquestioning faith she reposes in the notion that the distance from the end of her nose to the tips of her fingers is just one yard.

The practical solution of the question whether people can be taught to cook their food properly is yet to be determined.

Make practical cookery a part of the education of every woman; and, above all, let us have recipes as accurate as physicians' prescriptions.

SAIREY GAMP.

DOMESTIC RECIPES.

Fried Pork-steaks.

These are much nicer to my taste if sprinkled with powdered sage before frying.

Sausage.

To twelve pounds of meat allow a teacupful of salt, two teacupfuls of powdered sage, eight teaspoonfuls of black pepper, and a tablespoonful of ginger. Mince finely, pack in jars, and pour over hot lard to the depth of an inch.

Hams.

These I find convenient kept as follows for summer use: After curing out them into thin slices as for cooking; trim off the rind and place as compactly as possible in stone jars; cover with hot lard to the depth of an inch or more.

When wanted for use, scrape off the lard, take out as much meat as required, but be careful to re-heat the lard and pour over the remaining slices at once.

MARY B.

Layer Cake.

Two teacupfuls of granulated sugar, one half teacupful of butter; one teacupful of sweet milk; three eggs; three teacupfuls of flour; beat all the ingredients together, reserving a little of the flour to add last with a teaspoonful of soda and two of cream-of-tartar. Bake in layers.

For Jelly.

Take the white of one egg; three-fourths of a cup of white sugar; a lump of butter the size of a hickory-nut; rub butter and sugar together and add to the beaten white with any flavoring desired; spread between the layers when they are slightly warm.

Will somebody please give a recipe for cleaning soiled buckskin gloves? MRS. W.

News of the Week.

Monday, Nov. 25th, 1878.

POLITICAL.

There is considerable doubt as yet as to the exact numbers of democrats, republicans and greenbackers in the next House of Representatives. Later official returns change somewhat former estimates, especially in some of the Southern States. Early reports sent some greenback republicans or independents from that quarter, but according to recent advices these have been generally "counted out." There is a world of complaint in republican organs and a good deal of it in independent newspapers about fraud and intimidation in the solid South, especially in South Carolina, Louisiana and Florida. The very peculiar electoral machinery devised by the republicans in these States, in spite of a good deal of alleged democratic bull-dozing, kept its originators in power for a considerable time, during which it incurred the bitterest democratic denunciation as outrageously fraudulent. Now, that it has at length fallen into the hands of these same democrats, or been seized upon by them, it seems to suit them mightily, while it is execrated by their opponents, who with their own petard have been hoisted completely away from the loaves and fishes. It makes a wonderful difference, whose ox is gored—yours or your neighbor's! It is to hoped, however, that the Southern democrats will at once see that with the Returning-Board machinery in their own control, the horrors of bull-dozing are really unnecessary, and that strong in their numbers, intelligence and principles, they will soon shame their opponents by abolishing the political machinery which has now been justly denounced as fraudulent by all parties. The President declares that all who can be proved guilty of having violated the electoral laws, shall be rigorously punished, a declaration which, strangely enough, makes many democratic and republican organs cry out that he has changed his southern policy; the former reproachfully, the latter contentedly. His friends, however, claim that he never had any policy as regards the South, and his non-friends add "or with regard to anything else." With a slur on his title, however, with few friends in either party and with several powerful opponents in both, he has had a "hard road to travel," and it should be acknowledged that he has hitherto managed to get along pretty well.

Since the elections there has been a good deal of speculation as to who will be the candidates for the Presidency in 1880. It seems generally acknowledged that Tilden has been "ciphered" out of the race, and that Bayard, Thurman and Hendricks are the most likely democratic champions. Among the republicans, Grant is undoubtedly the favorite of the bulk of the party all over the country, but there is against him a small but vigorous minority. Conkling and Blaine come next, the former highly respected everywhere, and the latter extremely popular in most places. The latest saying is that Grant or Conkling could carry New York, and that New York must be carried to secure a chance of republican victory. Butler, it seems, is by no means dead yet; in fact, the old man is reported extremely lively, and already preparing to capture the governorship of Massachusetts at the next election, preparatory to becoming the candidate of some party or faction for the presidency. Kearney has started for home without having hung a single "leecherous" bondholder or done any of the other terrible things he threatened on his arrival. He says he is going to make things hot for John Chinaman on the Pacific Slope, and as Ah Sin has few friends there and many foes, he may not fall in his efforts as ludicrously as he did East. Many of the "slimy editors" seem disposed to kick the fellow towards the setting sun, forgetting that shoe-leather has little effect upon brass, and Kearney must be brass all over. Though the greenbackers failed in electing many representatives either to the State or national legislatures, yet, for a brand-new party, they cast a pretty big vote here and there. In Pennsylvania it ran up to 81,000, and it is claimed to have been 80,000 in this State.

MISCELLANEOUS.

San Francisco is now suffering the customary reaction of a booming season in the stock market. Sierra Nevada, which has been the chief speculative stock, has collapsed this week to $65, after touching over $200 within the past month. Many operators, large and small, have been ruined by this break in the market, and the excitement at San Francisco is very great. The movement is thought to have been engineered by the people of the Nevada bank of San Francisco, and many experienced observers expect to see a reaction and a great rise very soon.

A stringent tramp law has been passed by the Legislature of Vermont. A party have been down the Mississippi, scooping up imprisioned fish from pools and setting them back into the river. About 3,000,000 fish have had their lives preserved thereby. Gov. Hartranft of Pennsylvania has decided in accordance with the opinion of the attorney-general, to issue a warrant for the execution, December 18, of the notorious Mollie Maguire, John Kehoe, and five others of the assassins. The murder for which Kehoe suffers was committed away back in 1862, but ever since he has been the leader of all the outrages committed in the Pennsylvania coal regions. At Philadelphia, Thomas H. Powers, of the drug manufacturing house of Powers & Weightman, died Wednesday morning, leaving property worth $10,000,000. The January half-yearly interest to be paid to foreign holders of United States 6 per cents of all classes, will probably fall below $4,500,000. Eight or nine years ago this interest was about $27,000,000 on $900,000,000.

The number of State banks in the country is 853, with an aggregate capital of $124,347,262 and deposits of $229,452,625; savings banks with capital 23, having an aggregate capital of $3,237,342, deposits $26,179,269; savings banks without capital 668, with deposits of $303,299,345; private bankers 2,856, capital $77,793,228, deposits $183,832,965: whole number of State banks, savings banks and private bankers 4,400, capital $205,380,000, deposits $1,242,790,000; national banks 2,056, capital $470,390,000, deposits $677,160,000; total number of banks and private bankers in the country 6,456, aggregate capital $675,776,000, deposits $1,919,954,000.

The joint commission appointed at the last session of Congress to examine into the question of transferring the Indian bureau to the War Department have completed their labors, and will meet at Washington in a few days to prepare their report. The committee report will probably be a majority and minority affair, with the weight of testimony against the proposed change.

There is no doubt that Sitting Bull has got over the defiant spirit with which he told Gen. Terry a year ago that he intended to stay where he was in British America, and that he now longs for his old hunting-grounds on this side of the line. Rev. Abbot Martin, the Benedictine missionary who visited the famous Sioux in his exile some time ago, has been interviewed at St. Louis, and says that Sitting Bull has given him the task of making terms with our government.

Yellow fever still lingers in New Orleans and a few other places in the South, though the fatal cases are almost invariably old ones or relapses. Last week there were about 29 deaths in the Crescent City, but it is very rarely that any new cases appear. There have been grave charges made about the manner in which the Howard Association has disbursed the vast fund which the charity of the North and the world at large has placed in their hands. Investigation, however, shows that the conduct of the Association has been blameless. After the fever began to abate, a notice was given through the press that the funds on hand were amply sufficient to meet all demands. The heavy surplus was divided among the doctors who had volunteered their services, at the rate of $25 per day. When the money was all expended in this way, it was found that some debts were still due, and moreover the Association also wishes to pay local doctors for their services in the same generous way. Accordingly another call has been issued, begging for money to enable them to be thus generous.

The report of the yellow fever commissioners, who have been investigating the epidemic at the South, attributes the origin of the fever to cases imported into New Orleans as early as May 23. The commissioners also comment on the general neglect and violation of the laws of health, neglect of drainage, inattention to deposits of fetid matter and refuse, and inattention to the purity of drinking water.

Tennessee bondholders have a sorry prospect of ever receiving any interest on their investments or recovering the principal. It's only occasionally that some extra-honest man talks about allowing the creditors of the State 50 cents on the dollar; others would favor paying 33⅓; but the majority prefer to pay nothing. Folks in Minnesota also object to pay what they owe. A proposition to devote about 500,000 acres of State lands to paying off old railroad bonds was voted down by an overwhelming majority at the late election. Nor is the objection to paying debts confined to such large communities exclusively; for all over the country there are scattered, here and there, counties, towns and villages which either have repudiated their indebtedness or are trying to do so; nay more, there are numerous individuals in these and other States, counties, towns and villages who, by hook or by crook, are following closely such public examples. These, however, are sometimes so far unfortunate as to be placed behind prison bars for their efforts at imitating their illustrious exemplars. Governor Emery of Utah recommends, first, that provision be made for the selection of jurors in that Territory in precisely the same manner as they are selected in the States. As matters now stand, the peculiar legislation by Congress is so hampered by Territorial legislation as to render conviction in certain causes almost impossible. He recommends, too, that woman suffrage in the Territory of Utah be abolished, and that polygamy be made by act of Congress a continuing offense, based on cohabitation rather than the marriage ceremony, as now provided by United States law. Stocks have been comparatively quiet at New York, and prices have kept up pretty well. The demand for United States 4 per cents is very large, beyond the ability of New York dealers to meet, and the price has risen a little. Money is perhaps a little stronger, though plenty is to be had on call for 3@4 per cent. Gold

has been bid at par at New York again, and the Government has actually made some purchases at 100 in the West. There have been some rumors of a corner in No. 2 spring wheat, engineered by John Keene, the big stock speculator, but no effect of such a movement is yet observable at the exchanges.

On Saturday evening last the Marquis of Lorne, the new governor-general of Canada, together with his wife, the Princess Louise, and their 25 servants, arrived on board the steamer Sarmatian in the port of Halifax, Nova Scotia, after a stormy voyage. Vast preparations have been made to give him a grand reception to-day, and all along the route on the way to Ottawa, the party will be the recipients of the most demonstrative welcome ever accorded to anyone in Canada, except perhaps that given to the present Prince of Wales—was it a hundred or a hundred and fifty years ago? Nothing has yet been discovered about A. T. Stewart's body, despite the increase of the reward to $50,000. Probably at least $100,000 and immunity will be demanded by the thieves. Neither is it known that anything has been found out about the two and a half million dollars stolen a few weeks ago from the Manhattan Bank in this city, though there is a rumor that the directors are compromising with the burglars for the return of their plunder. A poor show for the finest police in the world!!!

FOREIGN.

Manuel Pardo, ex-president of Peru, who is reported to have been assassinated in that country, was one of the most accomplished of Peruvians. He was a man of fortune and of education, who was called to the highest post in the government after the slaying of President Balta, and the brief but savage ursupation of the brothers Gutierrez in 1872.

Statistics compiled by the Paris police show that since May last only a little more than a quarter of a million of foreigners have entered that city. Of these about 13,000 were Americans, despite the common notion that forty or fifty thousand went over to the Exhibition. Paris shopkeepers say the Americans are not what they used to be. They ask the price of things, and grumble if too much is asked, very much like other people. The receipts of the exposition were $2,530,749, $400,000 more than when it was last held in that city, but almost $1,300,000 short of our Centennial success at Philadelphia.

There have been violent storms thoughout central Italy the past week, and the damage is almost unparalleled. At Rome all the lower streets of the city were overflowed by the Tiber. England has also suffered from floods, the city of Norwich in particular receiving great damage by the river's overflow.

The publication of 28 newspapers and 88 books has been prohibited since the promulgation of the anti-socialist law in Germany, and the dissolution of 102 societies ordered.

England began the threatened war with Afghanistan last Friday and has secured some small successes.

Across the Atlantic distress and discontent among the lower orders are growing more widespread every day. Strikes, lock-outs, want and starving turbulence prevail in Great Britain among the laboring classes to an almost unprecedented extent, while military oppression, wielded by the Man of Iron, cannot suppress the cries of distress and the execrations of discontent in broad Germany. Throughout monarchial Europe there is an ever-present dread of a vast socialistic conspiracy whose primary aim is the assassination of sovereigns, with the ultimate view of establishing some kind of Utopian republic, where everybody will be as good as everybody else, and a great deal better. HERMAN.

PUBLISHER'S NOTICES.

OUR readers are requested to read the following before making up their orders for seeds:

Any ten of the following require a one-cent postage stamp:

The Voorhis Water-melon.	Weigela.
Golden Rural Tomato.	Deutzia crenata fl. pl.
Acme Tomato.	Hibiscus militaris.
New Bronze Ricinus.	Eryngium Leavenworthii.
Hibiscus moscheutos.	Geranium sanguineum.
Callicarpa Americana.	Yucca filamentosa.
Chater's Lemon Hollyhock.	Vitis heterophylla.
	Rural hybrid Aquilegia.
	Grindelia squarrosa.

When the Beauty of Hebron Potato is included, a two-cent extra stamp.

When both Pearl Millet and Defiance Wheat are included, a two-cent extra stamp.

We request that our subscribers will write their addresses IN FULL and PLAINLY, and not *stick the stamps to their letters*. By so doing they will save us a deal of trouble and expense. For particulars, send stamp for RURAL of Nov. 9.

THE MASONIC BOOK AGENCY.—We have received several inquiries concerning the Masonic Book Agency. Their place of business is on the southwest corner of Broadway and Warren St., over Devlin's store. They are all right, and we have no hesitation in recommending the company and their books to our readers.—*New York Weekly Sun, Sept. 4.*

WE confidently refer our readers to the card of Dr. C. R. Sykes, in our issue of Nov. 9. Mr. F. W Jones of the Chicago Farmers' Review says: "Dr. Sykes is an old resident of Chicago, a regular graduate, honest, honorable and responsible, and as a physician takes first rank in his chosen specialty of catarrh and its complications."

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 23, 1878.

BEANS AND PEAS.—Beans hold a good position. Trade has not been specially active, but with the prospect of a steady local and export demand, all prime sorts are named with confidence. Peas quoted easy. Canadian field in bulk and bond 70@75c.; green $1.25@1.30; Southern B, K., 2-bush. bag $2.40@2.55; Medium beans, prime, $1.65@1.70; fair to good, $1.55@1.60; Marrow, prime (put on board), $1.75@1.80; fair to good, $1.55@1.65. Pea $1.65@1.85; White Kidney, $1.85@2.00; Red kidney, $1.75@2.10; Black or turtle soup, $1.60@2.10.

Receipts of beans for the week, 10,638 bush., exports, 775 bbl.

BUTTER.—There has been a lull in business which dealers dislike to see in November. The offering now contains a good many attractive small lines and dairies with liberal fall ends, and sellers count upon a brisk trade at good prices. For the past week good prices have been only obtainable in a small way, wholesale buyers when they attended having rather the best of the position, owing to an enlarged supply. Wet weather has tended to keep many away—a good deal of eastern trade being missed in consequence, and there is some accumulation of useful table to fine stock. The offering of State is better as a whole from late receipts than might be expected considering the unfavorably warm fall, yet there is a material quantity that will require help from cold weather and periodical scarcity of choice to get into real commercial motion. Dairies must be exceptionally light to make 2c. Western butter shows a better average quality and holders keep the tone of prices in unison with weaker sound in State.

Dairy, pails and half tubs, choice, 23@24c.; dairies, 17@19c.; selected full, 21c.; other, 16@18c.; good, 19@20c.; creamery, choice, 27@28c.; good to prime, 24@26c.; early packed, 18@20c.; low grades of State, 10@14c.; fair to prime half-tubs and pails 15@20c.; State Welsh pails, 21@23c.; other, 13@16c. Creamery ranges 23@27c. good to prime; 17@20 early packed, Selected dairy, 15@18c.; good to prime dairy and nice ladle-packed factory, 12@14c.; other factory incuding milled, 6@10c.; rolls, prime, 18@20c.; other, 10@15c.

Receipts for week, 35,800 pkgs.

BEESWAX.—Small lots are moving out at 26½@27 for Western and Southern.

Exports past week, 2,349 lbs.

CHEESE.—Shipments for the week have been 45,437 boxes. The export demand has been almost entirely for fancy lots, which have scarcely changed in price, and quoted at 9c.; grades only a trifle off are at least ½c. under this, and the general market is dull and depressed.

Quotations at 9c. for fancy, 8½@8¾c. for fine lots; 7@8c. for good and prime; 6@7c. for fair to good; 3@5½c. for skimmed. State, farm dairy at 8@9c. for good to choice; 6@7½c. for fair to good. Wisconsin factory, fine to fancy, 8¾@9c.; do. good to prime, 7@8¼c.; do. fair to good, 6@7c. Western factory, fine and fancy, 8¼@8¾c.; good and prime, 6@7½c.; fair, 5@6c.

Receipts past week, 92,420 boxes.

Gold closes at 100½.

Liverpool cable 47s.

COTTON.—The market has fluctuated sharply, closing steady and moderately active; latest prices are for November, 9.32@9.33c.; December, 9.33@9.34c.; January, 9.45; February, 9.57@9.58c.; March, 9.69@9.70c.; April, 9.81@9.82c.; May, 9.94@9.95c.; June, 10.02@10.03c.; July, 10.10@10.12c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*N. Orleans.*	*Texas*
Ordinary	7½	7¾	7¾
Strict ordinary	7 15-16	8 3-16	8 3-16
Good ordinary	8 7-16	8 11-16	8 11-16
Strict good do	8 13-16	9 1-16	9 1-16
Low middling	9 1-16	9 1-16	9 5-16
Strict low middling	9 3-16	9 7-16	9 7-16
Middling	9¾	9¾	9¾
Good middling	9¾	9¾	9¾
Strict good middling	9 15-16	10 3-16	10 3-16
Middling fair	10¾	10¾	10¾
Fair	11¾	11¾	11¾

Stained.

Good ordinary	7¾	Strict good ordinary	8¼
Low middling	8¾	Middling	9

DRIED FRUITS.—Apples have a better trade and rule steady in price. Peaches show no change. Small fruits generally strong.

Southern Plums, 14@14½c.; State plums, 15@16c. Blackberries are quoted at 5½c. Peaches—Peeled Georgia, at 6c. for poor; 8@9c. for fair to good; 10@10½c. for prime; choice North Carolina, 11½@12½c.; good do., 8@9c.; unpeeled halves, 3@3½c.; quarters, 3@3½c. Pitted cherries, 20@22c. Apples—Old State quarters, 2½@3c. New apples, 2½@3c. for southern quarters in bbls.; 4½@5½c. for prime sliced, and 6@7c. for fancy; State at 4½@6c. for new sliced; western at 3@3½c. for new quarters. New raspberries, 30c.

Exports, past week, 1,650 bbls. dried apples.

EGGS.—Fresh eggs are dearer than almost any of the food list, and when that is the case the market has not much snap. For cheap or mixing purposes good limed are in demand. Southern fresh will soon be wanted. Near points 28@29c.; State and Penn., 24½@25c.; Western, fresh, 23½@24c. Canadian, 23@23½c.; poor fresh, 20@22c. Limed, 16@17c. prime; 14@15c. fair to good.

Receipts for the week, 8,102 bbls.; do. last week, 11,231 do.

FLOUR.—There has been a good export movement and fair local trade, with prices well supported.

Latest prices are: $3.25@3.75 for inferior to fancy superfine State; $3.80@4.00 for poor to good extra do., odd lots and lines; $4.00@4.25 for good to very choice do., strictly choice and fancy lots above this; $3.25@3.75 for inferior to very fancy superfine Indiana, Iowa, Michigan, &c.; $3.50@4.00 for ordinary to good shipping extra do. and $3.85@4.25 for good to choice extra do.; common to about choice white wheat extras, $4.10@5.00; choice to strictly fancy do. at $5.00@5.85; red and amber winter wheat very inferior to choice trade and family at $4.00@5.65; round hoop Ohio at $3.85@4.25, and trade and family brands of do. at $4.25@5.65, the latter rate for very choice; St. Louis, $4.10@4.75 for very poor to good extra, and $4.75@5.75 for good to very choice; Minnesota clear, very inferior to very choice at $3.80@5.15; few brands going above $4.65@4.75; Minnesota "straight," inferior to very choice at $4.65@5.75; and patent fair to fancy at $5.25@8.50, few brands going above $7.50; unsound stock at from $2.00@4.75; city mill extra at $4.75@5.10 for West Indies (the latter rate in new packages); do. for England, $3.80@4.00; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.60 for fair to very choice; No. 2 at $2.50@3.10 for very inferior to choice.

CORN-MEAL.—Sales at $2.85 for Brandywine and $2.15 to $2.65 for yellow Western.

FRESH FRUITS.—Heavy owners of apples are not the most cheerful merchants of the period. Of course they have bought low, but the demand does not respond at a rate that uses up stock fast enough to brighten the future. Large quantities of apples have gone into store that will not come out again with any money in them. Choice Spits and Kings, $1.75@2 bbl.; good truck and boat stock, including Greenings and Baldwins, $1.25@1.50; poor to fair, 75c.@$1; Lady apples, choice, fine lot, $3@4. Cranberries feel the competition of cheap apples and are not quoted firm. Rather more stock is being distributed locally for Thanksgiving's feast. Fancy Capes, $7@8 bbl; other, bbl., $4@7; crates, choice $1.87@2; poor to good, $1@1.50. California reports only one-half a crop of shipping pears. At the moment a good many car-loads are arriving at once and prices are easy. Winter Nellis, Glout Morceau, Vicars, Pound and D'Aicon, $1@4.50 per box. Cal. grapes scarce and higher. Choice varieties are becoming quite popular among buyers who used to depend upon hot-house productions. Tukay and Muscat, $8@9 per box of 40 lbs. Hot-house grapes, Black Hamburg and Muscat, 60@75c. Catawba grapes have a long scale coming here in various qualities from the West, Phila. and Boston; loose, 2@6c.; cases, 5 lbs. in boxes $1.50@3.50. Florida oranges, $3@4.50 per standard box, viz.: 12x12x7 inches. Chestnuts, firm at $3.50@4 per bush. Hickory nuts, shellbarks, $2.25@2.50; B. Walnuts and Butternuts, 50c. There has been quite an active trade in peanuts, though prices are no better. Va., hand-picked, $1.15@1.20; other, 95c.@$1.05; shelled, 5@5½c.

Exports, apples, past week, 8,500 bbls.

GRAIN.—Wheat shows a good export movement, and with speculative manipulation as well, prices have advanced.

Latest sales are, of No. 2 spring, 90c.; ungraded spring at 97c.; No. 1 red at $1.08¾@1.08¾; No. 2 red, at $1.08@1.08¾; ungraded white at $1.06@1.11; extra white at $1.12½; white State at $1.09@1.10½; No. 1 white at $1.08¾@1.09¾; No. 2 white at $1.06@1.06¾; No. 2 red, steamer grade at $1.05¾@1.05¾; ungraded red at $1@1.08; No. 3 red at $1.04@1.04½; No. 2 amber at $1.05@1.05½; ungraded amber at $1.04@1.05¾; No. 2 red, Nov. option, at $1.05¾; do. for Dec. option, at $1.08@1.06½; do., January option, at $1.09; No. 2 amber, November option, at $1.05¾; do., December option, at $1.05@1.06; do., January option, at $1.09; New York No. 2 spring, December option, at 97c. Rye is easier; Western quoted 57@58, and State at 60@62. Corn is easier and in light export demand; latest sales are of steamer mixed at, 46@46¾c.; New York No 2 at 46¾@47c.; yellow Western at 49¾c.; yellow Jersey at 48c.; ungraded mixed at 44@47c.; New York No. 3 at 43¾@43¾c.; New York No. 2, November option, at 46½@46¾c.; do., December option, at 46½@47c.; do., January option, at 48¾c.; steamer mixed, November option, at 46¾c.; do., December option, at 45¾c; do., January option, at 45@c. Oats strong and active, with sales of New York No. 1 at 31c.; New York No. 2 at 30@30½c.; New York No. 2 white at 32¾@32¾c.; New York No. 3 quoted at 29@29¾c.; New York No. 3 white at 31¾@31¾c.; white western at 31@37c.; mixed do., at 29@31c.; white State at 32@37c.; mixed do. at 30@31c.; No. 2 Chicago quoted at 30¾@31¾c.; New York extra white quoted at 39¾c.; New York No. 1 white at 34¾c. New York selected at 29¾c. State 2 rowed barley, 90@95c.; do. 3 rowed, 75@80c.; Canadian, 95c.@$1 22½. Canada malt, 1 10@1 25; State, $1 05@1 10.

HAY AND STRAW.—Prime hay is wanted and rules firm in price; common grades plenty and easy.

Sales at 35@40c. for shipping, and 65@75c. for retail qualities. Straw quoted at 35@45c. for long rye, and 30@35c. for short rye.

Exports past week, 1,123 bales.

HOPS.—Emmet Wells says:

The improvement in the demand noted in our last continues, but the price stands the same as last week. The receipts for the week reach nearly 5,000 bales, some 1,600 bales of which have been taken for export. The shipments include 1,000 bales of California hops. We think our brewers will miss it letting these fine hops slip out of the country; the day may come when they will wish they had taken a few bales themselves.

Quotations are for New Yorks, new crop, choice to fancy, 13@15; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, low to fair, 8@10; Eastern, new crop, 10@12; Wisconsin, new crop, 10@12; Yearlings, growth 1877 (nominal) 5@7; Olds, all growths, 2@4; Pacific coast, 12@15.

OIL-CAKE.—Western quoted at $28 ₰ ton.

PROVISIONS.—Have tended easier, but closed firm with increased export demand. Mess pork quoted at $7.50@7.90 for spot lots; $7.45 for Nov.; $7.35@7.45 for Dec. Bacon at 4¾ for long clear and 5 for short clear. Lard at $6.20 spot lots; $6.20 for Dec., and $6.25 for Jan. Stearine at 6¾c. for Western. Beef Hams at $14.50@15. Beef—Extra India mess, $20@21 for city brands; do. Philadelphia, $18.50@19; packet at $11@11.50; new plain mess at $9.50@10; new extra mess at $10.50@11.

POULTRY AND GAME.—Live poultry still quoted unprofitably low. Chickens and fowls, 7@9c.; roosters, 4@5c. Turkeys, 8@9c. Ducks, pair, 45@85c. Geese, N. J., $1.25@1.50; other, $1@1.12. Pigeons, 20@25c.

Dressed poultry has fortunately arrived in moderate quantities, as the demand would have been light, owing to the soft weather.

Dry picked Phila. Turkeys, 13@15c.; choice, N. J., 13@14c.; other, 9@12c.; dry picked Phila. Chickens, 12@13c; other, 8@11c.; dry picked Phila. fowls, 10@11c.; N. J., choice, 10@11c.; other, 6@9c. Ducks, best, 12@13c.; other, 9@11c. Geese, prime, 10@11c.; other, 8@9c.

There is demand for game, but buyers are cautious, as quality is irregular through damp weather. Choice items bring the extreme. Venison has suffered most in condition.

Quail, doz., $1.25@1.50; Grouse, trapped, pair, 65@75c.; drawn, 40@50c.; Partridges, State, 60@70c.; other, 35@50c.; Woodcock, 40@50c.; Tame Squab, doz., $1.25@1.50; canvas back Ducks, $1.12@1.37 pair; red head, 50@75c.; Mallard, 40@50c.; Teal and common, 20@30c.; Hares, 30@35c.; Rabbits, 20@25c.; Venison, short saddles, 12@14c.; long saddles, 10@12c., whole deer, 8@9c.

SUNDRIES.—Honey offered easier, 15@16c. Single comb clover, 13@14c.; two, do. Buckwheat, 10@12c. Oil Peppermint, in tin, $1.40@1.50; in glass, $2@2.25; Sassafras, 48@50c.; Wintergreen, $1.90@2.

VEGETABLES.—A large supply of potatoes is offering, and the market is weak. Wholesale buyers can supply themselves at the inside range. We give the full list of sorts now in market. Nova Scotia E. Rose, bulk, $2.87 bbl.; Prolific and Chili red, $2.50; P. E. I. Jackson whites, $2.37; Marcers, $2@2.25; Eastern E. Rose, with bbl., $2.75@3; State, $2.50; fair to good, $2@2.37; do. Peach Blow, choice, $2.50@2.75; common, $2@2.25; Peerless, choice, $2.37@2.50; poor to good, $2@2.25. Sweet potatoes, Del., $2@2.25; Va., $1.50@1.75, which is higher. Onions slow at the advance. White, $2@3 25; red and yellow, $1.75@2; Chester, $1.25@1.62. Hubbard and marrow squash, $1.75@2. Cabbage, $3@4.50 per 100. Cauliflower, bbl., $1.50@3. R. Turnips, 75@87c. Beets, 75c. Carrots, 75c.@$1. Pumpkins, 100, $4@8 Celery, 75@90c. doz.

Exports, potatoes, past week, 8,050 bbls.; of onions, 600 do.

SEEDS.—Clover quoted at 6¼c.; 6½c for prime to 7¼c. for choice. Timothy at $1.20 for prime.

TOBACCO.—Prices have not varied; quoted essentially as last week, with a good export and local trade demand.

LIVE STOCK MARKETS

Saturday, Nov. 23, 1878.

BEEVES.—Receipts for the week, 9,596 head, do. last week, 10,432 do. The week has been dull one even with moderate offerings. Stormy, moist weather has caused a low, quiet, dressed beef market, and wholesale butchers have not been sharp purchasers. Still, quotations were thought in the average to be a shade higher than on Wednesday last for under grade stock. It should be understood that the Wednesday's market is a test for cattle. Fine steers did not hold up compared with that day. Very common, 7c. lb., dress 55 lbs.; ordinary to good steers, 7¾@8¼c., dress 55@56 lbs.; prime to extra, 8¾@9¾c., dress 56 lbs. No Texas or Colorado in market.

MILCH COWS.—Receipts are not heavy and the market is quiet, at a range of $35@65 per head. Sales mainly for Long Island.

VEAL CALVES.—Live calves have sold low, but at the close are working better. Choice N. J. & Buck's Co., 6@6¾c.; heavy IN. Y., 5@6c.; State, 5@6c.; fed calves, 3@4c.; grassers, 2@2½c. Hay dressed calves, 7¾@9c.

SHEEP AND LAMBS.—Receipts for the week, 23,372 head; do. last week, 23,775 do. Sheep have sold better as a rule. Western quoted, 4@4¾c.; N. J., 4@4¾c.; N. J. ewes, 3¾@4c.; fancy for export, 5¼c. Colorado have sold at 3c. Lambs, fair to extra, 4@5¾c.

During the week several car-loads of live Canadian were taken to England.

SWINE.—Receipts for the week, 45,193 head; do., last week, 39,190 do. No late sales, trains having been detained; recent rates for live; $3 20@3 50 N. J. dressed pork; 4@5c., heavy to light. City dressed, 3¾@4¾c.

SPECIAL NOTICES.

The Upright Piano is surely supplanting the square in this country. The tone is considered superior by most musicians, and when strongly made, so that it will remain well in tune, it is superior in all other respects. Mr. Geo. Woods, the ingenious Organ builder of Cambridge, Mass., who was formerly a piano maker, has patented a new frame for the upright, which secures for it a great degree of strength and solidity, and at the same time improves the quality of tone. It is claimed that the Pianos made on this principle will remain in tune longer than the squares, and the improvement is attracting much attention among musicians.

Electric Belts, &c., are manufactured by the PULVERMACHER GALVANIC CO., Cincinnati, O.

USE THE PERFECT BUTTER COLOR!

WELLS, RICHARDSON & CO.'S PERFECTED BUTTER COLOR is recommended by the agricultural press, and used by thousands of the very best Dairymen. It gives a perfect June color, and is harmless as salt. A 25-cent bottle colors 300 pounds, and adds 5 cents per pound to its value. Ask your Druggist or Merchant for it, or send for descriptive circulars. WELLS, RICHARDSON & CO., Prop'rs, Burlington, Vt.

THIS NEW

ELASTIC TRUSS

Has a Pad differing from all others, is cup-shape, with Self-Adjusting Ball in center, adapts itself to all positions of the body, while the BALL in the cup PRESSES BACK the INTESTINES JUST AS A PERSON WOULD WITH THE FINGER. With light pressure the Hernia is held securely day and night, and a radical cure certain. It is easy, durable and cheap. Sent by mail. Circulars free.

Eggleston Truss Co., Chicago, Ill.

Reading for the Young.

BABY HAS GONE TO SCHOOL.

THE baby has gone to school; ah me!
What will the mother do,
With never a call to button or pin,
Or tie a little shoe?
How can she keep herself busy all day,
With the little "hindering thing" away?

Another basket to fill with lunch,
Another "good-by" to say,
And the mother stands at the door to see
Her baby march away,
And turns with a sigh that is half relief,
And half a something akin to grief.

She thinks of a possible future morn,
When the children, one by one,
Will go from their home out into the world,
To battle with life alone;
And not even the baby be left to cheer
The desolate home of that future year.

She picks up garments here and there,
Thrown down in careless haste;
And tries to think how it would seem
If nothing were displaced;
If the house were always as still as this?
How could she bear the loneliness?

N. O. Picayune.

OUR SCHOOLS.

THE notable exhibit of Belgian school methods and equipments at the Centennial has had good effects in many of our States. It set us good examples in ingenuity of device as well as in thoroughness and exactitude of completion. They have contrived ways of grounding learners in the necessary fundamental arts of using letters, words, figures and maps, so early and so well as to save some time, even in the commonest schools, to impart something of the principles of science, and the processes of useful arts, and to imbue the mind with a desire to learn more. This last effect, although merely an inclination, almost assures a useful and therefore happy life. Who can measure the difference in the prospects of two youths, one of whom has acquired a love for knowledge, and has found the way to gain it, while the other has acquired a distaste or even a disgust against mental and moral culture, and therefore goes to meaner and debasing sources for subjects of thought and excitement.

In the schools of the country town (Tyrone, Pa.) from which I write, there has been gradually brought about a change in the school course, which seems to be worth telling of in a paper like the RURAL, which seems so acceptable to parents and teachers all over the land.

Some years ago—before the Centennial—the first step in a great change was taken by the appointment of the ablest teacher—the principal of the eight large schools or grades—to teach the little ones just entering school,—the six-year-olds. He entered upon this humble work not only with readiness, but with real zest, and developed methods which his successors have continued and improved upon; so that the infant school has become the pride of the place.

The little ones are not troubled with spelling before reading. They learn words and phrases that are familiar to them, and in which there are no silent letters. They utter the sounds in a word, and that is their rational guide to its pronunciation. They learn, as if by intuition, or by magic, and their reading has a naturalness of tone that is delightful, and in entire contrast with the stilted, drawling, falsetto tones that are too commonly heard where the learner is driven over the stumbling blocks and pitfalls of spelling by the letter names. Every step seems to enable the learner to make the next step longer. They advance with accelerating speed, in geometrical ratio. They feel their own progress, and are inspirited by it. No weather prevents their attendance. They are an earnest, aspiring, happy flock, and they do not lose this initial impulse.

They do much more than read. They copy the lesson on their slates, and they copy and sum up columns of figures, and do it well. They sing—march—drill—learn the clock-face, and many other things. A visitor declares that they were learning grammar! the teacher was correcting some one's error of speech, and rhetoric! (because they made a slight stop—a rhetorical pause—between the subject and predicate, as indicated on the chart by a distinguishable interspace). In three months a class will be not only through the Primer, but half-way through the First Reader; when they go into the next grade. There they begin to spell, with the pencil words that are placed before them on the board in homographic sound-signs, a method which seems to relieve spelling of its dullness as well as of its ineffectiveness. They begin to draw too, and these procedures, as well as the science-talks in the rooms above, are either derived from Belgian example, or in consonance with it.

Time is saved to teachers as well as to the scholars. The Principal has an hour after he dismisses the little beginners to give to classes from the High School, or to lectures there, or to talks in the intermediate rooms. These are on instructive subjects and nearly always illustrated by objects, specimens or apparatus. This is most acceptable, nourishing and stimulating food for inquiring young minds. The tone of the schools, and the processes followed, relieve the teachers of much worry and trouble, and they, under the stimulus of these talks, give much more oral instruction and use more practical illustration than formerly.

Writing with pen and ink is deferred until the fifth grade is reached;—ages mostly 10 to 12. By that time the fingers get some firmness, and have good control of the pencil in lines and directions and lengths of all sorts; and the management of the two-nibbed pen and the black fluid of the ink-well is then soon acquired. A handsome style of writing is soon taught when made a specialty at that age, and is not then likely to degenerate.

W.

A NEW DEPARTURE.

BOSTON school authorities have quite revolutionized the old system of teaching in the public schools, as the following description from the Traveller indicates:

To show what a departure it is from the beaten paths of the past, we present the main features of this new course of studies. In the primary schools the instruction is to be almost entirely oral. Scholars are to learn from objects, and from the teacher, instead of from the book. Oral lessons will be given upon pictures, plants, animals or whatever the ingenuity of the teacher may suggest, or order to accustom the scholars to express what they know in words. This exercise will be called "Language." Other oral instruction will be given upon form, color, measures, animals grouped by habits, traits or structure, vegetables, minerals, the human body and hygiene. Fables, anecdotes and simple poetry will receive proper attention. The metric system will be taught from the metric apparatus. Heretofore much time has been given to spelling and many hours spent over the primary speller; that book is to be entirely discarded, and "some easy, common words from the reading lessons" substituted in its place. Two new studies are introduced called "Recreation" and "Miscellaneous," to which an hour and a half a week is to be given. Whether this means work or play, teachers and scholars are yet to learn.

In the grammar grade, some equally important changes are indicated. Grammar is abolished, at least in name. How the eyes of the boys will glisten when they learn this fact! "Language" takes the place of grammar, which means less of technical grammar, such as parsing, etc., and more attention given to composition, structure of sentences, use of capitals, letter-writing and analysis. Spelling is to be from the reader and other text-books. The amount of writing in copy-books is reduced more than one-half, and more writing in blank-books and in other exercises required. The great amount of time previously devoted to geography is reduced and natural philosophy and physiology are to be taken up in the third class. Music and drawing receive the same attention as during previous years. The most important change here, as in the primary grade, is in reference to oral instruction. It is not to be, as in the old programme, merely mentioned and rarely attended to by the teachers for want of time, but a specified amount of time per week is to be allotted to it as well as to arithmetic or reading. In the two lowest classes the instruction will be almost entirely oral. In the fourth class it will be largely so, and in the other classes from one to two hours per week will be given to this exercise. In the lower classes the subjects for oral instruction will be natural history, plants from May to November, animals from November to May, trades, occupations, common phenomena, stories, anecdotes, mythology, metals and minerals. In the upper classes, physiology, life in the middle ages, biographical and historical sketches, and experiments in physics. Every study has its specified time assigned to it.

LETTERS FROM BOYS AND GIRLS.

Gaslight by Day.

FOR a long time I have thought I would enlist in the army of Rural Cousins, but from some cause, I have failed to do so, the cause most probably being that I did not possess the courage to stand the cross-fire from the batteries that support the Cousins' brigade. A few months ago they seemed to have their guns in such excellent condition, and handled them with such skill and precision, that raw recruits were compelled to succumb under the murderous fire; but now since the signs of peace are good, I will offer myself to the recruiting officer, and if I am admitted, we may become acquainted, providing peace and good-will prevail.

I have long been interested in the Cousins' columns, and am delighted when I find that page full of the sayings and doings of the little Rural brigade. I hail from the banks of the Ohio. I sing of the miniature city of Liverpool, situated on the banks of that river. The thing that appears strange, or unaccountable to a person entering the place for the first time, is the street lamps, all burning brightly through the entire day. Because of such a sight a person is almost led to believe, that day came on so suddenly, that no time was had to put the lights out; but on inquiry, we find that the place is lighted by gas furnished by a well or wells in the heart of the city, which supply enough gas to light a city of many thousand inhabitants. The reason the lamps are burning at all times is that it costs less to let them burn than to employ a man to extinguish the light.

Many buildings are not only lighted, but are also heated by gas. Many families use it in cooking as well as heating their houses. Most of the private houses are illuminated with it; no one doubts that the city will be heated as well as illuminated by gas before another year rolls around.

It is claimed to be less expensive than coal or wood; no ashes; no dust flying around; no stirring and poking at fires; no carrying of wood and coal; just turn on the gas and light, and your fire is made. You can keep your room the same temperature at all times, go away from home a week, and when you come back your house is still the same. You cannot possibly be bothered about getting up to stir the fire in the morning!

I might write more concerning the use of the gas, but I don't wish to crowd any out, and, besides, our examining surgeon may report me unfit for duty, and I should be bowed out before I had time to introduce myself as your Cousin.

ANNIE.

From Heliotrope.

DEAR UNCLE TRUE:—Seeing how cheerfully the new cousins are welcomed, I thought I might be allowed to claim relationship too. I am a dear lover of "THE RURAL" and always enjoy reading from the Cousins, and having never seen any from Delaware I thought I would try and represent our little State. If it is small it is of some importance, for what would you do without our delicious peaches and other fruits? How many of the Cousins like the country better than the city? for I find so many boys and girls living in the country that positively dislike it. I love the country and would be miserable if I had to live in the city all the time. There are so many things to interest one on a farm. What has become of our Swiss Cousin? His letters were instructive as well as entertaining. I hope the girls have not frightened all the boys away, for they are real nice animals when they don't tease.

HELIOTROPE.

His First Written Letter.

DEAR UNCLE TRUE:—I am but a little boy, eight years old, but I am going to try to write you a letter. I have printed a few. I go to school and study reading, spelling, writing, geography and arithmetic. I have two brothers older than myself; one of them you know by the name of Young Teetotaler. I have been fixing some autumn leaves for mamma; and I sign myself yours,

Coxsackie, N. Y. JAY BIRD.

The Puzzler.

GRAMMATICAL ENIGMA.

I AM composed of 62 letters:

My 1, 7, 17 a possessive neuter pronoun that did not exist in English until about 250 years ago.

My 2, 16, 61 a co-ordinate conjunction.

My 3, 13, 52, 35, 8, 19, 15, 5 not immediately dependent on the other parts of the sentence in government.

My 18, 41, 6, 4, 17 a noun used only in the plural.

My 12, 11, 62 an independent adverb.

My 22, 28, 61, 9, 14, 10, 32, 23, 44 harmony or correspondence of one word with another in gender, person, number or case.

My 20, 48 a verb often used incorrectly as a substitute for other verbs.

Most 26, 42, 17, 29, 61, 30, 56, 40, 27, 53, 29, 55, 52 have no plural.

My 49, 33, 31, 36, 61, 43, 17 are pluralized by adding "s."

My 25, 46, 24 a transitive verb.

My 38, 57, 54 should not be used before "that," or instead of it.

My 17, 44, 22, 60, 43 may be predicated of the subject.

My 47, 45, 53, 58, 37, 50, 39 what qualifying adjectives express.

My 59, 51, 12, 14, 18, 21 a numeral adjective.

My whole is a quotation from Locke.

☞ Answer in two weeks. ROSCOE BAILEY.

ACROSTIC.

1. A CROWD of persons. 2. To eject with force. 3. A spring flower. 4. Apart from. 5. A native of New England. 6. Part of a sewing machine. 7. A shout of joy. 8. The Lord's supper. 9. A finger-joint. 10. According to the Holy Gospel. 11. The cry of agony in a dog. 12. A prayer. 13. To render easy. 14. A ditch. 15. Eastern lands. 16. Greedy of gain. 17. Correct in doctrine. 18. A paltry wretch. 19 A sort of snuff. 20. Left to choice. 21. The trachea. Initials form a subject for a school composition set by my teacher.

☞ Answer in two weeks. LITTLE ONE.

DIAMOND PUZZLE.

1. A CONSONANT. 2. View. 3. The universal name for an Irish peasant. 4. Fathers and mothers. 5. A vest. 6. Shining with vivid brightness. 7. A sea. 8. Act of breathing. 9. Too much talk. 10. A farmer's place for grain. 11. Each one. 12. A cape of Spain. 13. A consonant. Centrals form a sea.

☞ Answer in two weeks. FLORIDIAN.

TRIPLE ACROSTIC.

1. THE whole money won at a race. 2. Manufacture. 3. A river of Europe. 4. A lady's name. 5. To divide member from member.

☞ Answer in two weeks. BALTO.

WORD-SQUARE ENIGMA.

1. ACID. 2. O! I see you. 3. You see, I see. 4. Ah, you see I!

☞ Answer in two weeks. MERMAID.

PUZZLER ANSWERS.—Nov. 16.

RIDDLE.—A Shadow.

FRACTIONAL PUZZLE.—Buttonwood.

CHARADE.—Head man.

DOUBLE ACROSTIC.—Initials, Madison; finals, Trenton.

TRANSPOSITION.—
How the wild wind whistles through yon maple tree,
And dry leaves are falling, falling;
And the night bird sitting alone on the lea,
To his mate is calling, calling.

Sabbath Reading.

THE ALTERED MOTTO.

OH! the bitter shame and sorrow,
That a time could ever be,
When I let the Saviour's pity
Plead in vain, and proudly answered:
"All of self, and none of thee."

Yet He found me; I beheld Him
Bleeding on the accursed tree,
Heard Him pray, "Forgive them, Father!"
And my wilful heart said faintly:
"Some of self, and some of thee."

Day by day His tender mercy,
Healing, helping, full and free,
Sweet and strong, and ah! so patient!
Brought me lower, while I whispered:
"Less of self, and more of thee."

Higher than the highest heavens,
Deeper than the deepest sea,
Lord, thy love at last hath conquered;
Grant me now my soul's desire:
None of self, and all of thee.

Th. Monod.

THE PROGRESS OF RELIGIOUS IDEAS THROUGH SUCCESSIVE AGES.*

A KNOWLEDGE of when, where or how the religious element of man's nature may have been brought into action, is hidden in the mist of remote ages. It must have been long before the sacred books of the Hindoos were composed, and that was so long ago that no tradition even exists of any people that used the language in which they were written. Since that time, wherever civilization has had an existence, although but a step removed from barbarism, religion has been her hand-maiden.

The volumes before us give a history, written in a plain, simple style, of the religions and beliefs of different leading nations, relative to the Creator, individual duty, and immortality, from the earliest Hindoos to the establishment of the Catholic Church. It is not a theological work—the difference between religion and theology is made as wide as possible. Neither is it a controversial book—no belief is commended and none condemned. The author seems to hold with Lowell, whose lines she quotes on her title-page:

"God sends his teachers unto every age,
To every clime, and every race of men,
With revelations fitted to their growth
And shape of mind; nor gives the realm of *truth*
Into the selfish rule of one sole race:
Therefore, each form of worship that hath swayed
The life of man, and given it to grasp
The master-key of knowledge, *reverence*,
Enfolds some germs of goodness and of right."

There is usually an obstacle, not easily overcome, in the way of all writers about religions not their own, and that is a theological bias—the result of study or early education. We find this book particularly exceptional in this respect, and and on that account the more readily commend it to all who may desire to know what the religions of other lands really are; and, indeed, we need not except Christianity for, strange as it may appear, there is a sad lack of knowledge even among Christians of the rise and progress of their faith. Mrs. Childs seems to have had an earnest desire to "nothing extenuate or set down aught in malice." In her preface she says: "I have treated all religions with reverence, and show no more favor to one than to another. I have exhibited each one in the light of its own sacred books. I have honestly tried never to exaggerate merits or conceal defects. I have not declared that any system was true, or that any one was false. I have tried to place each form of worship in its own light, that is, as it appeared to those who sincerely believed it to be of divine origin."

That the general ideas on which the Christian religion is founded, such as belief in a God who is at once Creator and Sustainer of all things, in the natural tendency of man to do evil, in Divine inspiration, in a Messiah, in immortality, in future rewards and punishments, belong not to Christianity alone, but are also the foundations of other religions, will probably be new to some but it is nevertheless true, as Mrs. Childs conclusively shows.

Different ages have had different forms of expressing truth, but the truth has ever existed and is always the same—although the power of the human mind to grasp it, to comprehend and understand it, is susceptible of growth. As the animal nature gives way to the spiritual, progress in religious knowledge is made, and the soul of man opens to the influx of spiritual truths at the present time to a far greater extent than in the days of Buddha and Confucius. Hence the difference between the religions of India and China and those of our own country.

The labor attending the preparation of this work must have been enormous. Only years of patient and attentive study and careful and conscientious analysis, could have produced it. No one would have undertaken it whose whole heart was not in the work, and the author deserves the thanks of the whole community for the contribution she has thus made to the religious literature of the age.

We hope the book will be widely read, for we know of nothing better calculated to do away with the bigotry that is so largely injurious to true Christianity.

* The Progress of Religious Ideas through Successive Ages. By L. MARIA CHILD. New York: Jas. Miller.

The Rev. Dr. Ingram, of the Free Church at Unst, Scotland, is probably the oldest clergyman in the world, being in his one-hundred-and-third year.

PERSONAL ITEMS.

Edison's great grandfather died at the early age of 103.

Robert L. Taylor, the Congressman-elect from the 1st Tennessee District, is only twenty-five years old.

Edward Kimball who saves churches by raising their debts, was a Sunday school teacher of Evangelist Moody, who saves souls.

Lydia Squlon, the last lineal descendant of the famous Indian King Phillip, is still living at Bedford, Mass., and although eighty-three years of age, she is still bright and vigorous.

Connecticut has two Barnums, Democrat and Republican, one a large manufacturer, and the other the famous showman. Every time this Barnum is elected to office, the other Barnum is defeated.

Queen Margaret of Italy, is said to be one of those happily constituted people who never feel fatigue. Her life full of traveling and public ceremonies, seems to suit her perfectly; she has always a sweet smile and bow and gracious manner.

That wheelbarrow idiot, Potter, hasn't gone to roost yet. We hear of him now as defendant in a suit before Justice Perrine, of San Francisco, one Ant Belener, who acted as umpire during the trans-continental jog, seeking to recover $294.50 cents for his services.

Joseph, Chief of the Nez Perces, is described as a man, who by his distinguished bearing, would attract, notice anywhere. He has a noble figure and a clean-cut, handsome face, with a bright, clear, expressive eye, and a quick, nervous manner, in a strong contrast with the Indian's usual stolidity.

Col. T. W. Higginson does not think Queen Victoria an attractive lady. She is short, stout, with a rather heavy and not altogether pleasing face, he says; but, in spite of all this, she has a dignity of bearing which amounts to grace, and which is the only personal charm that her subjects claim for her.

Alfonso of Spain, it is asserted, has written to the Pope, asking his advice on the subect of contracting a second marriage. The young King begins by lamenting the loss of Mercedes and asking prayers for her. He goes on to say that, personally, the thought of another marriage is distasteful to him, but that every influence is being used to convince him that the interests of the Spanish monarchy require him to take another royal partner.

There is a pretty story told of Alexandre Dumas *fils*. As he and one of his friends were returning from the theatre a few evenings ago, in Paris, they met a poor old woman who was holding out her hand for alms. As Dumas gave her something his friend remarked how often people were deceived, for most beggars were humbugs. "My dear fellow," said the author of "La Dame aux Camelias," "when an old woman holds out her hand to you for aid, you may give without fear, for it is almost always a proof that she has the misfortune to have no son."

Colonel Ingersoll was set upon at Owasso, Michigan, on Sunday night, by fifteen masked men, who flourished tar pots and bags full of feathers. A gallant hand-to-hand resistance and the timely arrival of Judge McCurdy drove the dastardly assailants away. Colonel Ingersoll caught and held the hat of one of the gang, and the hat has been recognized as the property of the County Clerk. By the way, this Colonel Ingersoll is not Robert, but J. N. Ingersoll, editor of the Corunna American, who made a hot fight in his county against the re-election of the County Clerk.

Mr. Leighton, the newly-elected president of the Royal Academy, a body composed of the 40 most celebrated artists of England, is described as a handsome man, well built, with deep gray eyes, a broad, white forehead, curly brown hair, just tinged with gray, a fine beard and a mouth about which, on greeting a friend, "a smile flickers in which is a strange mingling of a girl-like sweetness and manly power." He is an accomplished linguist and a musician; a thorough man of the world; a good comrade, and loves to encourage the talent of younger men. He lives in a gorgeous house in Kensington, which is full of pictures by celebrated men and costly and beautiful things from every country.

Implements and Machinery.

A NEW HORSE SHOE,

WITH CONTINUOUS CALK. MADE OF CRUCIBLE STEEL AND IRON, ROLLED INTO BARS.

Acknowledged by VETERINARY SURGEONS, PROMINENT HORSEMEN, and ALL who have used it, to be THE BEST SHOE IN THE WORLD. It is a continuation of the shell of the hoof, and gives an equal bearing all around. It PREVENTS INTERFERING, LAMENESS, and ALL EVILS resulting from the use of the ordinary shoe. Price, $4.00 each, sent by express, C.O.D. Manufactured by W. & B. DOUGLAS, Middletown, Ct., the oldest and most extensive manufacturers of Pumps in the world. Branch Warehouses, 53 and 57 John St., New York; 197 Lake St., Chicago, Ill.

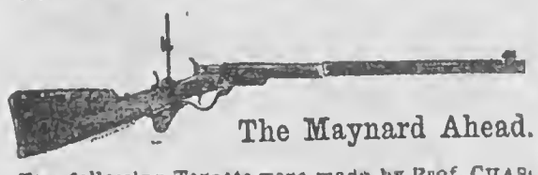
Implements and Machinery.

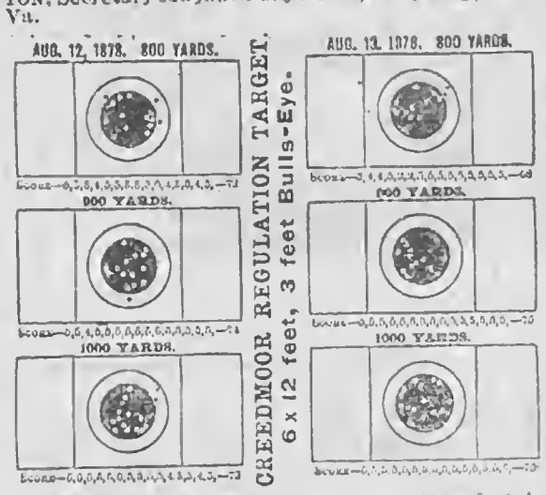
MAYNARD CREEDMOOR RIFLE.



The Maynard Ahead.

The following Targets were made by Prof. CHAS. E. DWIGHT of Wheeling, West Va., on Woodland Range, August 12th and 13th, 1878, with a *Maynard Long Range Rifle*, and are the MOST REMARKABLE ON RECORD. The grand total of 447 in a possible 450,—99 shots at the long ranges,—has never before been accomplished by any Rifleman, or Rifle, in the world.

These scores were made in the competition for position on the American team for 1878; open to all native-born citizens of the United States, and were shot under the rules of the N. R. A., Fulton position, no sighting shots at either distance. These scores were all witnessed and sworn to by JAMES D. STANTON, Secretary *Maynard Rifle Club*, Wheeling, West Va.



THE MAYNARD ARMS are the most perfect in workmanship as well as accuracy, of any make in the world, *particular attention being paid to the fine shooting as well as the mechanical qualities of the Arms.* For full particulars and price list, address

PATENTS.

In connection with the publication of the *Scientific American*, we continue to act as Solicitors for Patents, Caveats, Trade-Marks, Copyrights, etc., for the United States, Canada, Cuba, England, France, Germany, etc. In this line of business we have had *thirty-three years' experience.*

Patents obtained through us are noticed in the *Scientific American.* This large and splendidly illustrated weekly paper shows the current progress of Science, is very interesting, and has an enormous circulation. Subscriptions $3.20 a year, postpaid; single copies 10 cents. Sold at all Bookstores and News-offices.

Can I Obtain a Patent? The quickest and best way to obtain a satisfactory answer, without expense, is to write to us (Munn & Co.), describing the invention, with a small sketch. All we need is to get the idea. We will immediately answer, and give the necessary instructions. For this advice we make no charge.

We also send free our Hand Book about the Patent Laws, Patents, Caveats, Trade-Marks, their costs, and how procured, with hints for obtaining advances on inventions. Address MUNN & CO., Publishers of the *Scientific American*, 37 Park Row, New York.

AN IMPORTANT BOOK for STOCK-BREEDERS.

STOCK-BREEDING:

A Practical Treatise on the Application of the Laws of Development and Heredity to the Improvement and Breeding of Domestic Animals.

By MANLY MILES, M. D., late Professor of Agriculture in the Michigan State Agricultural College. 1 vol., 12mo. Cloth. With Illustrations. Price $1.50.

"It is somewhat remarkable in this book-making age, that there has no systematic work accessible to the student in which the known facts and principles of the art of improving and breeding domestic animals are presented, in convenient form, for study and reference, notwithstanding the importance of live-stock to the farmer, and the wonderful progress that has been made in its improvement since the time of Bakewell. The present attempt to supply this want has been made in response to the repeated solicitations of persons interested in stock-breeding, who have attended my lectures on this subject, in various places, for several years past."—*From Preface.*

For sale by all booksellers; or mailed, post-paid, to any address in the United States, on receipt of price.

THE YOUTH'S COMPANION
A WEEKLY PAPER FOR
YOUNG PEOPLE AND THE FAMILY

It aims to be a favorite in every family—looked eagerly by the young folks, and read with interest by the older. Its purpose is to interest while it amuses, to be judicious, practical, sensible, and to have real permanent worth, while it attracts for the hour.

It is handsomely illustrated, and has for contributors some of the most attractive writers in the country. Among these are:

J. T. Trowbridge,	Dinah Muloch Craik,
James T. Fields,	J. G. Whittier,
Rebecca H. Davis,	Louise C. Moulton,
Charlotte Mary Yonge,	C. A. Stephens,
Edward Everett Hale,	Harriet P. Spofford,
Rose Terry Cooke,	A. D. T. Whitney,
Louisa M. Alcott.	

Its reading is adapted to the old and young; is very comprehensive in its character. It gives

Stories of Adventure,	Stories of Home and
Letters of Travel,	School Life,
Editorials upon Current Topics,	Tales, Poetry,
Articles on Health,	Selections for Declamation,
Biograph'l Sketches,	Anecdotes, Puzzles,
Religious Articles,	Sports and Pastimes.

Subscription Price, $1.75. Specimen copies sent free. Please mention in what paper you read this advertisement.

PERRY MASON & CO.,
41 Temple Place, Boston.

ARTHUR'S Home Magazine for 1879.

For so many years a guest in the homes and hearts of the people, with whose household cares and duties, and social life, interests and pleasures it has so closely identified itself, the HOME MAGAZINE comes again, as the new year approaches, and asks for the old place among you, and the old cordial welcome.

VIRGINIA F. TOWNSEND so long a favorite with our readers will commence a new Serial Story in the January number, entitled "Lenox Dare: the Woman She Was." This will be followed by a Story by the author of "*His Dear Little Wife*," entitled "Tender and True."

ROSELLA RICE will contribute a series of articles on Western Pioneer Life, under the title of "Fading Footprints; or, the Lowly Lives of Long Ago."

PIPSEY POTTS under the title of "Our Neighborhood," is going to give a series of papers in her peculiar vein, which will be spicy and good, of course.

CHATTY BROOKS will talk to our young lady readers in her easy, sensible and pleasant way, under the title of "Wrinkles and Dimples; or, Myself and My Girls."

BUTTERICK'S PATTERNS for Ladies' and Children's Dresses appear in every number.

PREMIUMS We give our Club-Getters something more than an extra copy for their work in making up Clubs. See below.

TERMS FOR 1879.

1 Copy, 1 year...$2.25—3 Copies, 1 year, $5.50
5 Copies, and 1 to Club-Getter, $11.00

The Premium to Club-Getter for either of these two Clubs will be $1.00 worth of Butterick's Patterns for Ladies' and Children's Dresses.

LARGER CLUBS For these we offer as Premiums Ladies' Best Quality Kid Gloves and full Dress Patterns of elegant Black Silk or fine French Cashmere.

Full particulars in regard to these large and valuable Premiums will be found in our Special Circular to Club-Getters, which will be mailed on application to all who desire to make up Clubs for 1879.

Specimen Number, 10 Cents.

T. S. ARTHUR & SON, 227 S. Sixth St., Philadelphia.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *on the paper* and in Premiums to All.

Wit and Humor.

In Hindostan they call the paragrapher's labor the Punjaub.

An agricultural school—where thrashing is a regular exercise.

A sheep-shearing match is a barberous thing. —*Oil City Derrick.*

Travelers up the Nile say there isn't an Nile land in it worth mentioning.—*Post.*

The butcher who sells ox-tails for soup and calves' heads for dinners undoubtedly makes both ends meat.

How did Noah provision the ark? With fruit. How so? how with fruit? Why, don't you remember? he stocked it with pairs.

"Love is an infernal transport!" exclaimed an enthusiastic poet. "So is a canal boat," said a practical old forwarding merchant.

The right kind of a man will always have his life insured. It gives his wife's second husband a start.—*Louisville Courier-Journal.*

In these days the fly is less agile, but more persistent. We do not consider the change an improvement—from the bald-headed point of view.

Ten mills make one cent, say the arithmetics; but competition is so strong among the cotton factories down East that ten mills don't make a cent.—*Exchange.*

The lady and gentleman at Swampscott who received a portion of the shot intended for the pigeons can now know something of the excruciating delight the birds take in the manly sport.

John Iron is the steward of a Jersey beach hotel, and now that business is falling off, he sits at the range beside his brother Grid, and a pair of sad Irons are they.—*Lowell Courier.*

Why spend so much time and money on horse rearing? Put the animal in charge of the advertising young man who "understands taking care of horses," and he will rear himself at any time and at all times on the slightest provocation.

Here is an extract from a little boy's first composition: "W'en cats is a swearin' and a blasfemin' and a tryin' the gages of their steam b'ilers in the back yard at nite, it makes a feller offle frade, if he isn't a sleepin' with his big brother."

A lady with a fatal squint came once to a fashionable artist for her portrait. He looked at her, and she looked at him, and both were embarrassed. He spoke first, "Would your ladyship permit me," he said, "to take the portrait in profile? There is a certain shyness abont one of your eyes which is as difficult in art as it is fascinating in nature."

Sir Wilfrid Lawson, at an agricultural dinner in Cumberland recently, told a good story illnstrating the effect of hard times on farmers: "One Scotch farmer had determined, in spite of the bad times, to pay his rent if it were his last shilling, and saying to the factor who received it, 'It is my last shilling,' he threw down a roll of notes. The factor counted them and said, 'There is £50 too much,' 'Odds, man,' said the farmer, 'I put my hand in the wrong pouch.'"

In attempting to carve a fowl one day a gentleman found considerable difficulty in separating its joints, and exclaimed against the man who had sold him an old hen for a young chicken. "My dear," said the enraged man's wife, "don't talk so much about the aged and respectable Mr. B; he planted the first hill of corn that was planted in our town." "I know that," said the husband, "and I believe this hen scratched it up."

Little Johnny wanted to go to church. His mother was afraid he would make a noise, but his father said: "Johnny knows better than to make a noise in church." So he went. He kept very still till the last prayer. By that time he had grown tired of sitting still, and was standing on the pew cushion, with his back to the pulpit. When the lady in the next seat bowed her head for prayer, Johnny thought she was crying. He leaned over and said to the lady, in a tone that was meant for a whisper, but which was only too plainly heard: "Poor lady! What ee matter? Do oo stummut ache?"

The Physiology of the Liver.

The liver is the largest secreting organ in the human body, and the bile which it secretes is more liable to vitiation and misdirection from its proper channels than any other of the animal fluids. Luckily for the bilious, however, there is an unfailing source of relief from liver complaint, namely, Hostetter's Stomach Bitters, a medicine which for over a quarter of a century has been achieving thorough cures of the above-mentioned ailments, fever and ague, dyspepsia, bowel complaints, rheumatic and kidney affections, and disorders involving loss of nervous vigor. It is, moreover, a preventive of malarial disease, and affords protection to thousands of persons residing in districts of country where that dire scourge is prevalent. As a remedy adapted to the medicinal requirement of families, it is supremely desirable, and as a means of fortifying a debilitated stem, it is t ly to be depended upon.

A LATE CROP.

Farmer Briggs' neighbors take to raising Pumpkins in November.

DIAMONDS
IN SOLID GOLD MOUNTINGS.
ONE DOLLAR ONE DOLLAR
THE WONDERFUL LEFEVRE DIAMONDS TRADE MARK PAT'D

Lefevre Ring, $1. Set of Studs, $1. [The Shah] Stud, $1. Lefevre Ear Drops, $1.

THE ONLY PERFECT FAC-SIMILE OF THE REAL DIAMOND IN THE WORLD.

Pronounced by the Academy of France that *M. Lefevre has really obtained artificially the true diamond.* The basis of these gems are pure crystals found in the Sierra Nevadas, from whence they are exported to the Lefevre Laboratory in Paris, France, where they are submitted to a chemical and voltaic process,

BY WHICH THEIR SURFACES ARE COVERED WITH A COATING OF PURE DIAMONDS,

imparting to them all the Brilliancy, Hardness, and refractive qualities of the natural diamond, and making them as desirable for **Wear, Brilliancy,** and **Beauty,** as the veritable gems themselves. The Ring, Studs, and Ear Drops, as displayed in this announcement, are accurate engravings of SOLID GOLD MOUNTINGS, CONTAINING THE WONDERFUL LEFEVRE DIAMOND, warranted by certificate U. S. Mint assay.

ON RECEIPT OF ONE DOLLAR we will send free, by Registered Mail, to any address in America, either article as above represented. Our "Book on Diamonds," with illustrations of artistic Diamond Jewelry in solid (14 k.) gold, mailed free.

I have seen many imitations of diamonds, but never any that could equal the Lefevre Brilliant.—M. ELLROY, Stamford, Conn.
I am in receipt of a pair of the Wonderful Lefevre Ear Drops, for one dollar; to say that I am pleased with them hardly fills the bill, they are simply elegant.—ANDREW MORRIS, Hornellsville, N. Y.
The Wonderful Lefevre Diamond Ring, for one dollar, came to hand this morning. It is really elegant, giving entire satisfaction, and eliciting wonder and admiration from all who see it.—W. H. REEDY, Martinsburg, W. Va.
The Lefevre Diamonds, mounted in solid gold, are truly marvelous.—B. F. AVERY & SONS, Home and Farm, Louisville, Ky.
The eminently successful experiments of M. Lefevre silences all doubt of the artificial reproduction of the true diamond.—M. DU FRENOY, the great French Scientist.
The Lefevre Diamond most effectually disturbs the slumbers of the possessors of costly gems.—Journal of Science.

☞ We guarantee the Wonderful Lefevre Diamonds for **One Dollar** to be mounted in **Solid Gold,** and will cheerfully refund the money if found unsatisfactory. Address all orders to the

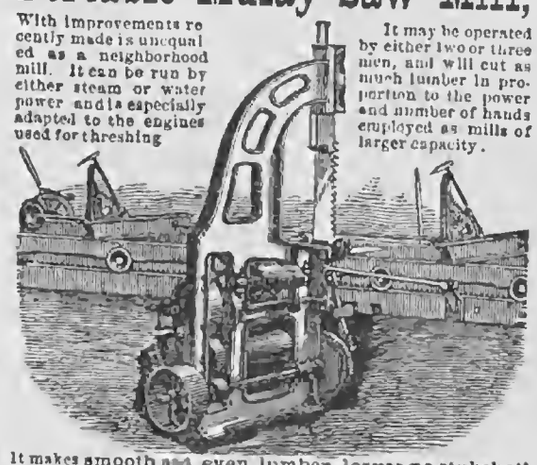
Portable Mills for Farmers, Saw Mill Owners, etc. Price from $80 up. Complete Mill and Sheller $96. A boy can grind and keep in order. Adapted to any kind of suitable power. Complete Flouring and Corn Mill very cheap.
NORDYKE & MARMON CO.
Indianapolis, Ind.

Portable Mulay Saw Mill,

With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power and is especially adapted to the engines used for threshing



It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.

It makes smooth and even lumber, leaves no stubshot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc. to CHANDLER & TAYLOR, Indianapolis, Ind.

59 So. Canal St., Chicago.

Keystone Wringer

Has Greater Capacity, Is More Durable, and Is better finished
Than any other wringer now made.
THE ROLLS
Are made of White Rubber clear to the shaft. No twine or wire or fibrous material, or anything else but rubber being used. The rubber is *vulcanized upon the shaft and cannot be taken off except by cutting it off.* They are more elastic than other rolls because there is nothing but rubber on the shaft, and more durable because there is no twine or fibrous material to rot out or wire to cut the rubber. They are greatly superior to any other kind of roll now known.

SUMMER COTTAGE, THOUSAND ISLANDS, NEW YORK.

PALLISER, PALLISER & CO., ARCHITECTS, BRIDGEPORT, CONN.

To those who are the happy possessors of a fair amount of wealth in these times of financial stringency, and who prize good health more than filthy lucre, this design will have an attractiveness which those in less favorable circumstances can hardly see or appreciate. The idea that has been prevalent in the past, that a summer visit to the country was a luxury that could be enjoyed only by the very rich, is fast melting away, and the time has come when all with moderately-filled purses, can enjoy the comforts of a home for the summer months in some healthy and pleasant neighborhood. While admitting that the beauties of many country places, sea-side resorts and watering-places are very numerous, yet for quiet picturesqueness and beauty, there are few places that can be compared with the numerous isles in the mouth of the St. Lawrence River, known as the Thousand Islands.

In the designing of this cottage, the aim has been to supply something in exterior picturesqueness in harmony and keeping with the scenery, also to produce something that is home-like and pleasant to look upon, yet not expensive—a house that the every-day carpenter can build, and the owner of which can feel that though the work may not be of the very finest description, yet that it is an artistic rendering of good things suited to the place, the times and the circumstances. Such a house always makes the mechanics feel that it is a pleasure to help to build it, and after years they will point to it with no small degree of gratification as having had a hand in its construction. Such a house as this is thoroughly practical in its appointments, convenient in its internal arrangements, economical and sound in construction, and gives the comforts of a permanent home together with a quaintness in exterior outline that forms as pleasant and pleasing a picture in the landscape as it is possible to obtain for a similar outlay.

The building is designed to stand on posts, and is inclosed under the base, as shown. The entire frame-work shows inside, being dressed, the exterior sheathing forming a face on both sides, which dispenses with any further covering. The floor joist is to be dressed and exposed with the floors above; the first story is to be laid double, with an air space of one-half inch thoroughly deadened, to stop the transmission of sound. The main entrance-hall containing the large open fire-place, with hardwood floor and border, answers as sitting and reception room, and, with its old-time fire-place, on which the logs are burning brightly, will make a center that all will love to gather around at eventide to recount the day's pleasures and doings. Of a truth, this hall carries us back to the primitive times of our forefathers in other and older lands, when dishonesty in building and the modern improvements in plaster walls and stucco-work were almost unknown.

The second floor speaks for itself, and to the family of culture and taste it is all that can be desired. The balconies connected with the two main chambers are desirable features in such a house, and cannot fail to recommend themselves, as the views obtained therefrom far more than compensate the owner for the few dollars additional expense needed to construct them. The attic will contain two good chambers, and the whole, when built, gives a very roomy and desirable residence for a very small outlay, there being but very little to expend outside of the cost of lumber and carpenter labor. This is very low now; in fact, it cannot well be lower. There is no frippery or unmeaning work in the construction; for everything serves a good purpose. The exterior of such a house should be made to harmonize in colors with the surroundings. The shingle work of roofs should be painted a warm Venetian red; the body of a light-brown, with dark trimmings for the frame-work, etc., while the whole interior should be finished in the natural wood with one coat of varnish.

A RAT-PROOF CRIB.

A neighbor of mine has just built a rat-proof crib that strikes me as being just the thing. It is constructed as follows: Lay down the sills, and on these lay a good oak floor. Set the studding one foot apart; line the crib with sheet iron two feet wide, nailing it to the studding both at the edges and in the middle of the sheets. Let this lining run from the floor up the studding and rafters to the comb, so that your crib will be completely lined with this sheet-iron, except the floor. Let the doors also be lined in the same way. Before putting up the iron, perforate it with a punch that will make a hole one half inch in diameter, putting a hole to each square of one and a half inch, to give proper ventilation. The cost of the iron for this crib, which holds 200 bushels of ears, is $7.

In this way a crib can be made perfectly rat-proof at a cost of very little more than that of a good wooden crib. T. M. H.

Farm Topics.

HINTS ABOUT AUTUMN WORK.

WM. J. FOWLER.

HAULING MANURE.

Farms are usually leased in April, and help for the farm is usually hired then, for the reason, I suppose, that the farm year then begins. But this is entirely too late. On many accounts the manager of a farm will be anxious to commence operations at least as early as January, and sometimes, during pleasant weather, in November and December. What manure has accumulated since wheat seeding should now be drawn out on sod land which is to be plowed next spring. If drawn on bare fields, something will be lost by washing away. But on grass land the leaves and roots prevent loss, while the better distribution of the manure adds largely to its availability for the next crop. Probably the best effect of manure is to be found on clover sod, when applied in the fall. I think two loads of stable manure on clover sod in the fall equal in value to three loads of the same quality applied the following spring, just before plowing. Of, course the larger part of our stable manure in northern localities, is made in winter, and

SUMMER COTTAGE, THOUSAND ISLANDS, N. Y.—(For Ground Plan, See page 775.

should be hauled out as early in the spring as possible. But there will be greater gain in hauling out all that is made before the first of January. Teams are less busy and help is cheaper at this season. It will pay to scrape scattering manure from by corners, left in the hurry of spring and fall seeding. Rich soil, well saturated with manure, may be gathered around barns and drawn on sod. In these and other ways the fertility of the farm may be improved.

REMOVAL OF STUMPS, STONES AND USELESS TREES.

Stumps and stones should be got out of the way now. A good stump-puller will do this work expeditiously and cheaply for large stones and stumps. Wherever a deep hole is made, it should be filled to within two feet of the surface with small stones, thus securing a double benefit—preventing a hole and removing an encumbrance. Small stones should be removed from mowing fields. It is best to defer rolling until spring, when the ground is soft and loose stones that have been missed will be pressed into the soil. Not much can be done to wheat fields, except to provide for the drainage of surface water. But this should have been attended to at the time of wheat seeding.

While removing stumps, it is worth while to consider whether a useless tree, bearing nothing and not needed for shade, is not equally a nuisance: in other words, whether a stump would be less injurious for having branches and leaves to shade the growing crops and millions of living roots to rob them of needed food and moisture. Many a farmer, during this past season, has lost from five to fifty dollars from superfluous trees in his cultivated fields. Of course, some regard may and should be had to beauty of landscape; but let those see to that who can afford to do so. For the millions of farmers worried by debts, working hard to make a living and pay up their interest semi-annually, many of them having to stint themselves for money to pay for an agricultural paper, it is the height of foolishness to cumber their cultivated fields with useless trees—the worst and rankest weeds for all hoed crops. In the hard struggle for existence and to keep their homes, which many farmers maintain, very often the useless trees on the farm turn the scale the wrong way, and the family homestead is sacrificed to an idle and silly sentiment.

CARE OF THE ORCHARD AND VINEYARD.

In almost all orchards the trees are altogether too close, preventing fruitfulness and injuring the quality of the fruit. It will pay to cut out every other tree, and manure those that are left. If no other manure can be had, leaf mold from the woods, or sods from the roadside where it has the wash of the track, will serve a good purpose. This is especially important if the trees are in grass. A good covering of earth sufficient to check the grass, will keep the soil loose, and make the trees vigorous. Every farmer knows that some of his apple trees are much more productive than others, even of the same varieties. These should be saved, manured and pruned, while the feeble and barren trees should be removed.

November and December are good months for pruning grape-vines. I prefer to do it in the fall—any time after the leaves are off. It is safer, after pruning, to lay down the canes on the ground, so as to save them from severe freezing. It is just as well, with tender varieties, to only partly prune in the fall, cutting out some after the buds have started in the spring, when the loss from winter killing can be better known.

Monroe Co., N. Y.

MOISTURE-RETAINING POWER OF THE SOIL.

STIRRING THE SOIL IN A DRY TIME—IS IT AN ADVANTAGE?

PROFESSOR G. C. CALDWELL, CORNELL UNIVERSITY.

From the Weekly Tribune.

The editor of the RURAL NEW-YORKER has given us in "Notes from the Rural Grounds" an account of some experiments of his own on the influence of loosening the surface of the soil on the rapidity with which it dries. Three flower pots with the drain-holes loosely covered were filled with sifted loam; in one case the loam was pressed down compactly quite to the top; in another it was compactly filled up to within an inch and a half of the top and the remaining space was filled loosely; in the third case the whole pot was loosely filled. Each pot was then set into a pail of water, and the excess of water was allowed to flow over the sides of the pail; all the pots and buckets being of the same size, the same quantity of water remained in all three cases. The water disappeared soonest in the bucket with the pot containing the loose soil, then in the pot with loosened surface soil, and last in the compact soil; the difference in time between the first and last was about four days. Hence the editor concludes that the teaching now so generally given by the masters to the effect that stirring the soil serves to retard its drying, may be erroneous.

I can hardly regard these results as leading to this conclusion, because they do not actually represent the ordinary condition of the soil, where the level of the bottom or standing water is usually a few feet instead of a few inches below the surface. In the soil we have two kinds of spaces between the solid particles—those that are too large to be capillary, and which cannot therefore hold the water above the level of the bottom water, and secondly, the capillary spaces that can hold the water above that level, the wider spaces only for a short distance, the narrower ones holding it up to a higher point. But even the narrowest do not appear to have the power to raise the water more than about six feet; and many writers on these subjects assert that if the level of the bottom water is even not more than two or three feet down, no capillary spaces will take it to the surface under ordinary circumstances. Furthermore, in a soil in its usual condition as to moisture, not only are the non-capillary spaces empty, but even the capillary spaces are to a great extent dry; soils in such a condition do not contain more than one-tenth to one-third of all the water that they can hold in their capillary spaces, and still plants show no evidence of suffering from drought.

In these experiments of the RURAL's editor, the level of the bottom water was, I infer, no further from the surface than the depth of an ordinary pail; all the capillary spaces were probably therefore filled with water quite up to the surface during the whole duration of the experiment, even in the pot with loose soil; it was simply a question of pumping up the water through these capillary spaces by a series of continuous columns reaching from top to bottom; as fast as the water was evaporated from the upper surfaces of the columns it was replaced from below, and the evaporation would be most rapid in that pot with the freest circulation of water. Some recent experiments by Von Klenze have shown that capillary spaces of a certain size conduct water more rapidly than those that are either larger or smaller. In the RURAL's experiments the pot with the loosest soil appears to have allowed the freest circulation; at least we can in this way, without doing any violence to the facts, account for the more rapid evaporation in that case.

In an ordinary soil, on the other hand, the desiccation is not a pumping up of bottom water through a multitude of minute pipes reaching down to it, but rather a drying out of that comparatively small proportion that remains nearer the surface and within reach of plants, after the water of the last rain has fallen to its level in or far below the subsoil; we have, instead of full capillary spaces throughout, only scattered full ones; and it is argued that the more we break up the connection between them by stirring the soil, the less rapidly the water will find its way to the surface where the evaporation goes on; the more we stir, the more the water is divided up into disconnected portions having no communication with the surface. Experiments with soils in their natural position in the field, appear to confirm this view. The record of one of these trials comes to us recently from France. Grandeau, of the experiment station at Nancy, by means of a new form of apparatus devised by him for measuring the evaporation from plants or from the soil, found that while from a soil that was beaten down 13.5 grams of water were evaporated from a square decimetre in twenty-four hours, only 8 grams were evaporated from another like area under the same exposure and in the same time, the surface of which was loosened up.

Finally, there is one point that does not, I think, get enough consideration in this respect. A soil that is well stirred has a far greater power of absorbing vapors and gases from the air and condensing them in its pores, than one that is compact. During the night the soil is exposed to an atmosphere that is often heavily charged with vapor of water. If the soil is loose at the surface this air circulates freely through it and there is large opportunity for condensation of water, which will offset a considerable amount of evaporation during the day. Even a thin crust of compact soil on the surface, and, much more, a thick layer of it, would greatly lessen this absorption. Therefore, while I have read with much interest the account of the RURAL's experiments, I am not yet convinced that its inferences are correct.

MOISTURE IN THE SOIL.

I am glad to see the question opened by the RURAL's experiments at River Edge, and hope it will result in ventilating the subject, if not the soil.

In the first place, the editor, and, as far as I can learn, all previous investigators, have given too much prominence to the idea of capillarity, and have not distinguished between evaporation and condensation. The extent of the capillarity of soils is quite limited under the most favorable circumstances, which are, that the earth shall be in a medium state of compactness. The capillary action can not take place if the earth is too compact, from being actually stopped as by any impervious substance, neither can it occur if the soil is too loose, because the attraction ceases for want of sufficiently close contact between the particles of earth. As to capillary tubes being found in the soil, I consider that a myth. The advantages of stirring the soil are self-evident, and the amount of moisture thus engendered in the loosened earth, is far greater than many suppose.

The fact, also, that evaporation carries off moisture, while condensation collects and retains it in the soil, is an important point in the matter, heretofore overlooked. A body of undisturbed soil is so compact as to nearly exclude the atmosphere; the water which falls upon it sinks but a little way, and is always within reach of the sun's heat, which quickly evaporates it; the earth dries up and bakes, and vegetation perishes. This soil is just compact enough to render the capillary attraction active, and owing to the joint action of this and the sun's heat, evaporation is rapid. But if we stir the soil, we make it so loose that its capillarity is totally destroyed to that depth; we force the water in the soil down just that far from the surface, and interpose between it and the sun a blanket so open as to admit the atmosphere freely. At once evaporation is checked, the vapor rising from the water below, and that contained in the atmosphere above meet here upon neutral ground and are both condensed, because the temperature of the open soil is intermediate between that of the hard-pan and that of the atmosphere. Evaporation is totally checked, the loose soil is moistened, and the moisture is retained until the soil resumes its compactness, when stirring becomes necessary again. And this explains why stirring the soil immediately after a heavy, soaking rain, is so important.

To arrive at the amount of moisture condensed in the foregoing manner and held in the soil, take a delicate pair of scales, on a hot day weigh a tumblerful of cold water to a perfect balance, watch the condensation taking place upon its surface, and notice how soon the basin holding the tumbler sinks. Measure the surface of the glass, and from the increased weight calculate the amount of moisture taken from the air. This will represent, probably, one-tenth of the quantity which the same surface of earth would absorb. Every little particle of earth, every little grain of sand, is a condenser, as any one may prove by turning up a half-buried stone on the hottest day in summer, and noting the moisture beneath it. The RURAL's experiments produced evaporation and prevented condensation, and have so far opened the subject but not the soil.

S. RUFUS MASON.

Dodge Co., Neb.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

We cannot agree with Mary Wager-Fisher in prefering black-walnuts to English walnuts, although we thought enough of the former to bring some nuts from Bryn Mawr in the Centennial year, which are now growing nicely in the nut grove. The English walnut is our favorite nut; and we do not know of any, except our own, growing north of Westchester Co., New York. We are 260 miles north of Bryn Mawr, hence our "anxiety" in regard to their growth. We have a dozen young trees from nuts which grew in Newark, N. J., 175 miles south. Two trees purchased of Mr. Hoopes, near Philadelphia, went through last winter without injury, and have made a vigorous growth this year and have ripened their wood well. When in Washington last winter, we gathered, in one of the public parks, a few Catalpa seeds which we planted in the spring, and we now have seventeen thrifty young trees, some of them three feet high, with strong and stocky bodies. The Catalpa tree is quite common in the parks of Washington, and we have also seen it about the parks and streets in New York and Brooklyn. It grows crooked and has a stunted appearance in these places, and unless it will grow larger when cultivated for timber, it will not be very profitable, on account of its diminutive size.

Mr. Conde thought there was nearly ten dollars' worth of feed in the tops of the Swedish turnips. There were sixteen loads of turnips as big as the horse could draw. We expended ten dollars for labor, all told, not counting the use of the team or horse for cultivating. The piece of ground was just about a quarter of an acre in size. When we take into the account that a heavy crop of the large kind of clover was taken off of the same ground before the turnips were put in, the yield from the quarter acre is very satisfactory. The fine growth of turnips is due to the rough and clean cultivation, stimulated by a dressing, broadcast, of hen manure and ashes, which was immediately cultivated in, and a light dressing of 50 pounds of Manhattan Blood Guano a couple of weeks previously, when the turnips were quite small. The turnips were not put in until the very last of July, and they were harvested the first week in November. The crop was such a success that next year we intend to increase it to several acres. As we have remarked before, the excessive growth of summer grass this year, nearly doubled the cost of taking care of this crop. We used ashes with the hen manure, because the plaster was all gone; but for immediate use and to be mixed with the soil, ashes may be used without any loss of ammonia, of any account.

An ingenious neighbor thrashes his corn and husks it at the same time. He runs the stalks with the ears on, at the rate of a half stook at a time, through his three-horse thrasher, which husks the corn, shells it, separates the cob and delivers the shelled corn in the measure, clean and fit for market. He can average a bushel a minute of clean, shelled corn. The corn is drawn from the field as fast as required. The stalks and husks are torn into shreds and put into good condition to be economically fed, doing away with the necessity of any cutting machine, as they are thoroughly broken up, and the stalks particularly are crushed and broken into pieces. The corn has to be spread or kiln-dried, as it is liable to mold if put into bins or stored in any considerable bulk. This is the only serious objection to his new plan of husking. He uses a common thrasher, a cylinder with spikes running against a concave, also spiked. He can husk and shell corn faster than another neighbor can husk with an improved corn husker.

We have butchered a four-year-old Jersey bull, and have the testimony of the butcher that he never killed a steer which had a hide so soft, thin and fine. A velvety skin is an important prerequisite in a good cow, and in a dairy breed is an essential point in a bull. A good cow always has a mellow hide, and a poor cow one that is thick and harsh to the touch; hence in a stock bull the breeder cannot be too particular in regard to the character of the skin. Common bulls usually have very harsh and thick hides. Breeding for a purpose, as in the case of the Jerseys, will produce certain results, and it is those which make pure-bred stock more valuable. The skin of this four-year-old bull only weighed seventy pounds—thirty to fifty pounds less than that of a native animal of the same age would have weighed.

Mr. Stewart, in his excellent article on fruit, left Spitzenbergs out of his list of apples. They sell the best in market and are deservedly popular. They will produce well on new or rich land. He also placed Flemish Beauties among the winter sorts of pears. In this latitude they ripen a week or two after the Bartletts, which he classes as a summer variety. I would recommend leaving Flemish Beauty out altogether, as the fruit cracks badly and has lost caste in market, and I would put Beurre Bosc in its place. The latter is a November pear, bears heavily, and sells with the best.

VAN'S VIEWS.

CORN.

I am satisfied that the farmers in this region whose land is of a lightish character, give altogether too little attention to this crop. On my heavy, unsuitable soil, if not planted in a place where its roots are wet, corn is a very good crop. I have raised of the eight-rowed Yellow Flint, sixty bushels per acre, and a neighbor, last year, had between eighty and eighty-five bushels per acre of a twelve rowed variety, and this on a heavy clay.

A farmer in this county has been experimenting with corn, beginning with improved King Philip and Ohio 24 rowed Dent, and he has now a corn which will ripen in ninety days from seed, and has from 16 to 24 rows well filled out to the end of the cob. A farmer who has seen the best corn region in this country, having resided for some time in the corn region of Ohio, said that he never saw a finer-looking field of corn than that in this variety, and estimated its yield at 100 bushels of shelled corn per acre.

I had some of his earlier cross of corn this year, which ripened in seventy-four days from the time of planting, and as I write, there lies an ear before me containing 16 rows of long kernels, which grow over the end of the cob, which is ten inches long. There were many longer ears, some thirteen inches; but this was a fair sample of its yield through the field.

Another crop that is too much neglected is fodder corn. I had a small patch last summer, and from its yield, I am sure I could grow seven tons to the acre, and it beats everything as a food for milch cows, makes a good pig feed, will keep a team in good order if they are at light work. The variety I used was Pratt's Early Sweet Corn. It should be cut with a reaper when it tassels; tie up the bundles and let it stand till wanted for use. If cut with a mower, the chances are that it will never get cured, but will rot on the ground.

At the November meeting of the Brown County Society, there was a discussion on

SWINE AND THEIR MANAGEMENT.

Mr. Van Auken opened the subject by reading a paper on the "Pig, from the beginning to the barrel," after which the matter was discussed by the members present.

Mr. H. P. Campbell, of Scott, said that he had tried feeding hogs in the mud and on a floor, and one year ago he had built a good pen, dry and warm, and he believed it was the best investment he had ever made. It paid in the growth, as well as in the looks of his pigs, and it gave him satisfaction every time he looked at it.

Mr. Bonuet, of Green Bay, said that he was not now in the pork-raising business, but in his business he bought considerable pork. He was satisfied that farmers sold their pork at the

wrong time of the year. It was a mistake to rush it in in November and December, when prices were *always* very low, while from March to October prices were much higher. He said that wheat middlings cooked made fine fat hogs, and for making pork were worth more, ton for ton, than corn-meal.

President Smith said that he thought the manure from his pigs was worth more than the pork; that they paid for themselves in working up garden waste into excellent manure. He was now feeding his pigs boiled potatoes with a little corn-meal on them, and asked if he could use turnips in the place of potatoes.

Mr. Van Auken, of Ashwaubenon, said he could, and that the best and most satisfactory pig and chicken-feed he had ever seen was made by boiling a kettle of potatoes or turnips, and, while hot, mashing them and mixing with them one-half bushel of corn and oat-meal and one-and a half bushel of wheat bran to each barrel of potatoes.

Mr. Bennet said that when he was a boy his work was feeding the pigs; his folks boiled a kettle of roots or potatoes and put some pumpkins in with them; when boiled soft those were emptied into a trough and mashed. When they first began to feed in the fall, but little meal was used, but as they drew near the end it was increased, and each hog had eaten during fattening perhaps three or four bushels of corn-meal.

Mr. Lyon, of Ft. Howard, said that in his younger days he had charge of a large flouring-mill in Penna., and it was with some difficulty that they disposed of the bran. One spring when they had a large amount on their hands, the proprietor asked him if hogs could be fattened on bran; he said they could, and some time in May they bought six good, fair shoats which were put in a grass plot of about one-eighth acre in extent, which had a spring brook running through it. At a point where the fence crossed the brook he set seven barrels; into each barrel he emptied a bag of bran, and on Monday filled one with water; on Tuesday he filled another, and so on. He found his six pigs would eat or drink one barrel per day, and that it would reach the sweet stage of fermentation in about seven days. This was all the feed they had, wheat bran and spring water, and when killed in December they were fat, and were a very nice lot, weighing from 275 to 325 pounds. This, at that time (1845), was considered a very heavy weight for hogs.

Messrs. Smith, Burden, Campbell and Van Auken agreed with Mr. Bennet as to the proper time of selling pigs, and cited several instances in support of their view.

Mr. Potter, of Pittsfield, asked about the comparative value of corn-meal and meal of the corn and cob ground together.

President Smith replied that when corn was new, it paid to have cob and corn ground together, but when it was dry, the corn had drawn all the nutriment out of the cob.

Stephen Burden, of Howard, said that for three years he had not had a pig on his place, but had bought his pork in the city, believing that was the cheapest way he could get pork.

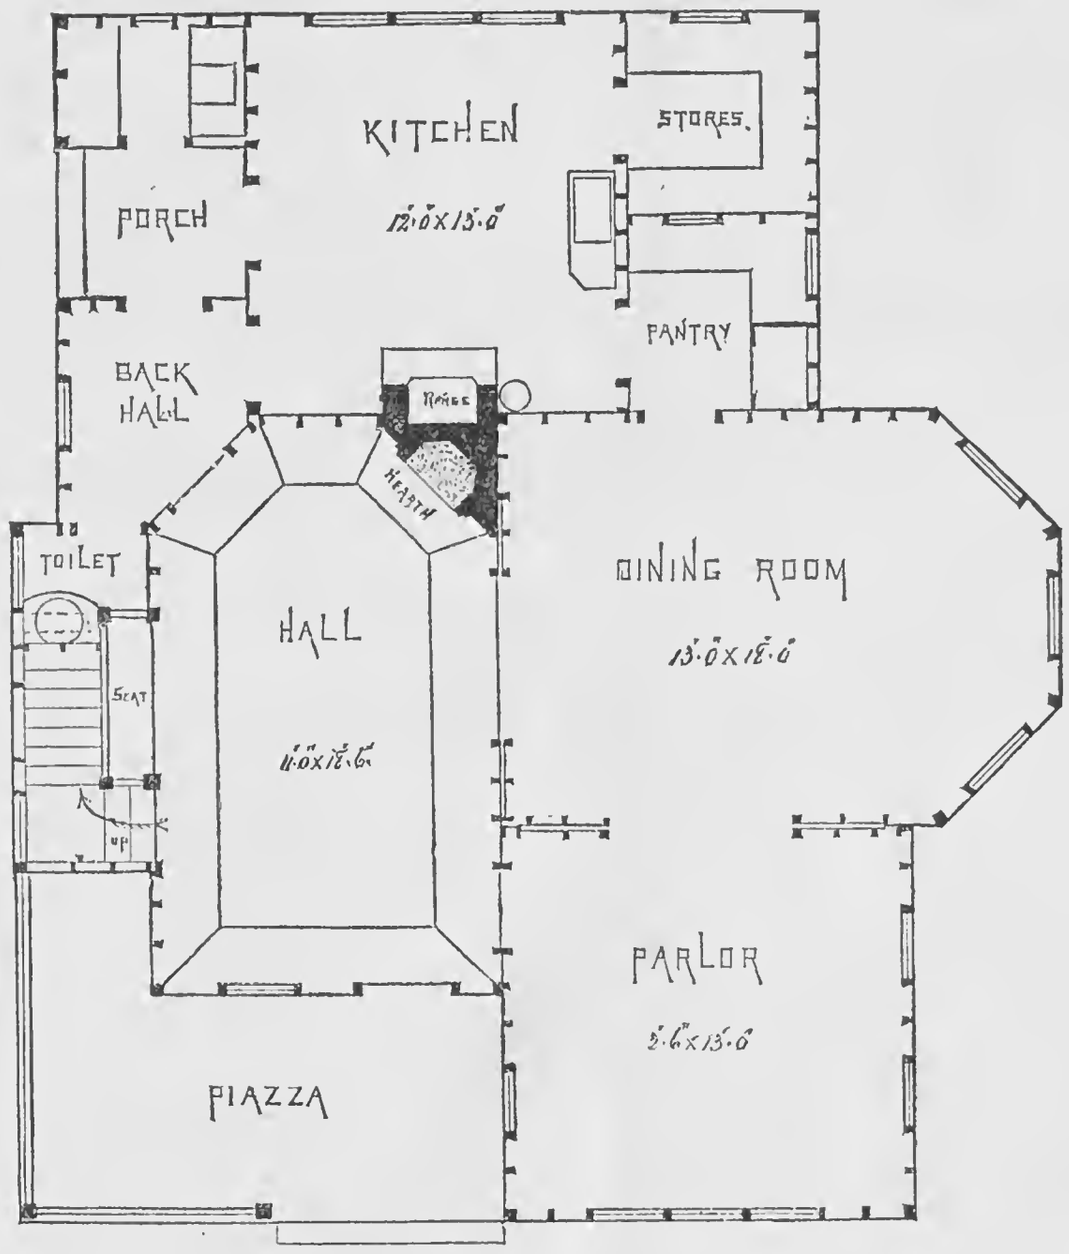
Field Crops.

HOW NINETY-SEVEN BUSHELS OF CORN PER ACRE WERE RAISED.

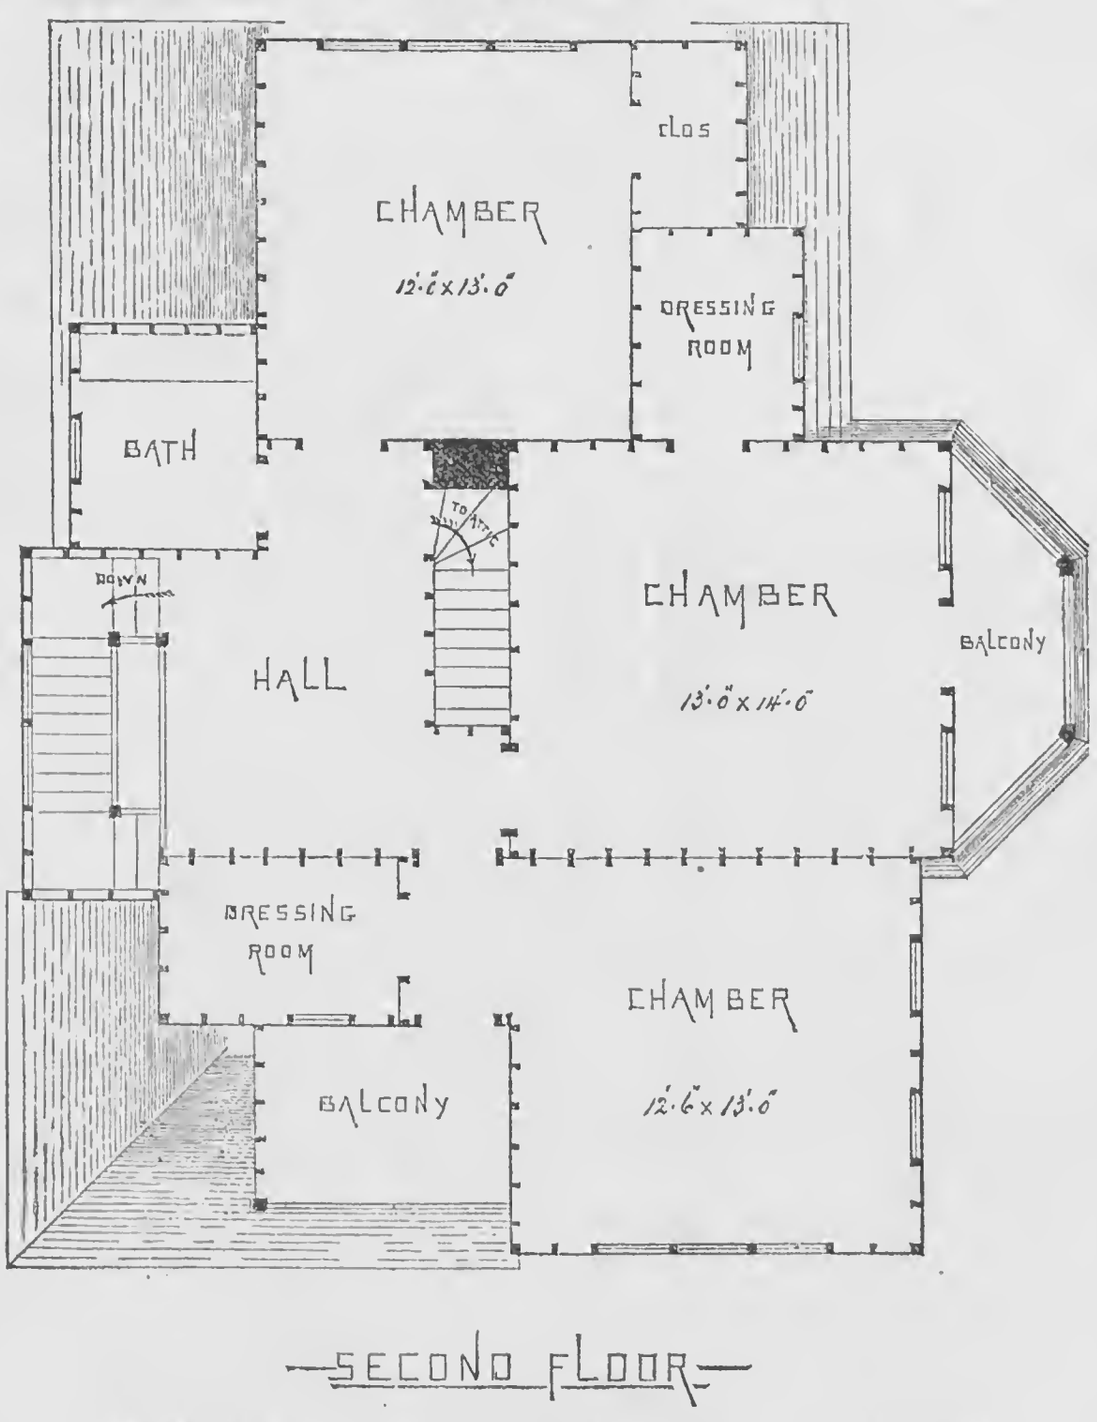
During the week before last I finished gathering my crop of ten acres of Reuno's New White Field Corn. The yield was 1,457 bushels of ears, and as three half-bushels of ears shell one bushel of corn, the product is 97 bushels of shelled corn per acre. The past summer has been so dry and otherwise unfavorable to the growth of corn in this part of our State, that not more than a half crop of this cereal has been produced; and, notwithstanding all this, I think I have succeeded in getting the largest yield ever made in Lycoming County.

The soil on which this crop was grown is a sandy loam, resting on creek gravel. In the summer of 1877, three tons per acre of clover hay were cut from this ten-acre field. In the autumn two and one-half bushels per acre of clover-seed were gathered from the same. As soon as the clover-seed was removed—which was done by the last of September—I commenced hauling barnyard manure, and spread it on the surface as fast as hauled at the rate of ten two-horse loads per acre. No stock was allowed to pasture on the field and poach the life out of the soil during the wet autumn months. The land was plowed about ten inches deep from the middle to the last of April. It was harrowed three times between the first and tenth of May; on the 11th it was marked out one way, three and one-half feet apart; on the 14th it was marked across, the same distance apart, and two kernels—*no more and no less*, according to my instructions to the droppers—were dropped and covered about one and one-half inches deep at each intersection. The corn was cultivated four times between the first and last of June.

At the beginning of July it was plowed with a double corn plow, and the ground between the furrows was loosened with a narrow cultivator. This was intended to be "the finishing touch," but a few days afterwards a heavy rain and hail storm beat down the soil so solid that I concluded it would be better, as soon as dry enough, to run through both ways with a cultivator and loosen the surface once more. The result of this operation was to pull down the furrows that had been thrown against the corn with the plow, and leave the surface nearly flat. By this time the corn had grown nearly as high as the horse's back, and its shade, together with the loosened surface of the soil, contributed to keep the ground in fair condition for the growing crop, though but little rain fell during the remainder of the summer.



FIRST FLOOR



SECOND FLOOR

The ears are not quite so large this season as last, I suppose owing to the unfavorable corn weather. Last season many of the ears shelled one full quart each; three-quarters of a quart is about the most the best will make this year. The grains are about as deep, but the ears have not grown quite so long. Many ears have grains three-quarters of an inch deep.

Experiments in 1877 on different distances apart, with one to four kernels in a hill, showed that three and one-half feet each way, with two kernels in the hill, gave the most satisfactory returns.

DANIEL STECK.

Lycoming Co., Pa.

LOST NATION SPRING WHEAT.

With regard to this variety of wheat, Dr. Hoskins, of Orleans Co., Vt., writes us: "I was one of the very first to plant it in Vermont, having, with three others in different parts of the State, four years ago, received a quart of it from Rev. Marcus R. Keep, of Dalton, Aroostook Co., Me. I got a bushel from that quart, sowed it all, and distributed the twenty-six bushels that grew from it among my neighbors, and now it is the principal wheat grown in this vicinity. It has spread equally fast in Orange, Washington and Essex counties, where the other packages from Mr. Keep went. Crops have been reported of from twenty-five to fifty bushels from one sown. Of course, like all new things, it has probably had extra care, but all agree as to its hardiness, its productiveness, the excellence of its flour, and its quality of giving a full crop even when sown as late as June 1. As I am not a grain farmer, having got it started, I have not sown any the past season, but I continue to receive favorable accounts.

Pomological.

A FEW WORDS ABOUT PEARS.

GEN. WM. H. NOBLE, BRIDGEPORT, CONN.

DIFFICULTY OF CONDENSING THE SUBJECT.

It is always hard work to cramp a large subject into a little space. It is no easy task to write a brief article on pears. I am such a zealot about the fruit that when once my pen or tongue gets running on its kinds, qualities or culture, I hardly know when to put down the brakes. Then it needs a pretty cool head to steer through the "many men of many minds," such unlike tastes, such a host of kinds. How are you going to make an article brief about so many varieties of real excellence; so many only kept on the lists or in the garden, because no one is bold enough to doubt their merits? There are so many finer than the old list-keepers, to which we are accustomed and therefore plant; so many, which though superb in your ground, are good for nothing in some near-by county or State; so many that crack and wither in the Eastern States, or New England, that in Pennsylvania's deep clays, and other places, are joyous companions at the dessert. Then so many are puffed as "great acquisitions" which, after you plant them and pick their fruit, you find to be very tame and insipid. How are you to pack the essence of all this into the space of a very "few words?"

I have often tried earnestly to tell briefly what the public ought to know about the choice and care of fruits. But I fail every time. What may be very plain to one, those not used to kind and their culture take in but slowly. No short-hand method will do; your dwarf, in spite of you, will swell into full stature and bulk. Besides, you have to combat from the start all sorts of tastes, whims, and old-time notions, both among those who know little, and those posted about fruit.

THE BARTLETT PEAR.

Right here, the RURAL NEW-YORKER, which is supposed to speak from a large trial of kinds in its Experimental Grounds, offers a case in point. A while since, in one of those "brief articles" struck out from the editorial mind, the RURAL sentenced the Bartlett into outer darkness as insipid, and suggested that it should give place to its betters. This banishment accords neither with the public sense, nor with the taste of the most of those who are familiar with a large range of fine pears, nor with a just assay of the merits of the Bartlett. Now the Bartlett is the most popular of pears. If the great Public could have but one pear, and vote their choice, the Bartlett would beat the crowd. There are lots of good reasons to back their ballots, though the pear is not one that I fancy. I suppose, as with the RURAL, that its spicy, musky, vinous flavor and lack of sweetness, do not suit my taste.

But I speak for the masses. With them it's the choice, because it is of uniform and reliable quality. It has no "off" years, but puts in a crop to every harvest. It is always fair, and of good size. It stands hard usage, and answers quickly and largely to good, high culture. It ripens into eatableness, all the way from wind falls to its plumpest growth. It keeps well, and "does up" well. It's flesh is melting and juicy. When grown in the full sunlight, and ripened carefully in the house, it colors into the golden glory of the dessert—the very "form and fashion of a pear."

Then the Bartlett markets a large, juicy, buttery pear, which fills the bill and stomachs of the mass. Nor does it meet with much neglect from those who know pears. At my table, which, during the season of this fruit, gets a taste of some hundred and fifty of its varieties, no pear vanishes more quickly than prime Bartletts. Besides all, it is not like some, a local pear. It is cosmopolitan. Throughout the sea-board, all through the South, where the pear will grow, and along to and at the golden gates of the Pacific, the Bartlett holds loving friends, and repays wide culture. It's not going to vanish right off into dim distance with the "innumerable caravan" of old-choke, worthless and insipid pears. It will hold on to, and be held close by, the friends throughout the land, whom it has won by solid and lasting traits of excellence.

Look, now, at the space that the Bartlett's

fair defence has taken. Is it not plain that no short article can mete out justice to pears, and define their management, or name the qualities and seasons of the best?

GUIDES TO SELECTION OF VARIETIES.

One of the first questions asked about the fruit is: "What kinds do you prefer for each season?" Of course, no one can answer for every taste or section; for, though some pears, like the Bartlett, are at home and thrive wherever the fruit will grow, others are only good in certain localities, States or latitudes. These local fruits can only be told by trial, made by one's self or his neighbors. The best one can do is to give a list, to fit the purpose and the room for planting. There are some varieties, which, by their high quality, suit the home supply, that are thrown away if planted for market. There are, indeed, some few small pears, of such luscious texture and flavor, that they are welcome at the family table or the stalls. But, as a rule, the market, while eager for high quality, seeks it in the largest pears.

Another guide to making out a list to plant, is the home space that can be spared for the fruit. Many in confined city grounds, can only indulge in a single tree. Some who enjoy a warm wall side, or the shelter of a fence, seek the right kinds to train on trellises. Then, as the home enlarges its area, two or three and more trees will find space to spread themselves. On large grounds, a good crop for every season, to delight your table and friends, can spare to the market quite an item from each, to swell your cash. I find all ready to make gain out of their over-stock of fine fruits. I have known a good many rich men to stint their families, in order to get but a pittance for their ill and ignorantly picked and managed fruits.

CHOICE VARIETIES.

First, then, if you can enjoy but one tree, plant a Bartlett. It will give as sure comfort and good regimen to you and the little ones, as any in the whole round of kinds. If two are all your space will take, in the fair treatment of other fruits, put in a Barlett and a Sheldon; or if you want one a litttle earlier, a Beurre Giffard and a Sheldon; and if your soil is deep and rich, a Bartlett or Giffard and a Seckel. In such places the Seckel swells to a glorious size, for that queen of pears. If you would try three: say Giffard, Hull and Lawrence. These will carry your pear supply well towards New Year's.

Should your space allow a regular train of the fruit, from early to latest, say Giffard, Henicart Bartlett, Hull, Sheldon, Des Nonnes, Anjou, Lawrence, Niles, and Easter Beurre. All these, except the Lawrence, are above medium, some quite large. Being large, if you want to sell, some buyers are always ready.

So, if you plant largely, either in home ground or the orchard, looking to sell your fruit, plant the best of the large varieties. Small pears must be very fine, and large of their kinds, to sell well. I find slow sale for any small pears, but Dearborn's Seedling and the Seckel. The golden yellow, and real excellence of the Dearborn, and the supreme quality of the Seckel command a market.

MANAGEMENT OF LESS DESIRABLE SORTS.

Let no one suppose that in the above lists, I have named more than a taste out of the very large number I deem desirable for either home or market. There are many, large, fair and excellent, which, though desirable for the home, are unfit to market very largely. Such are the pears that readily decay either on the surface, or at the core. Some of the very best, for your table, do this so persistently, that neither you nor your customer will try them a second time. I think, however, much of this trouble may escape him who makes it his business, to watch and pick his pears just at the right time. They will well repay every man of leisure, who whiles away his years in the graceful care of fruits and home. It especially concerns him whose sole eye to pears is their culture and sale, as a business. Even those like Clapp's Favorite, Dunmore, Beurre Superfine, etc, may be shielded from this evil, by picking and housing just those which have nearly reached ripening. This cannot be done by sending up Patrick to pick the "peers." His eye has not been taught the task, and he will surely make a clean sweep of the green as well as the ripening.

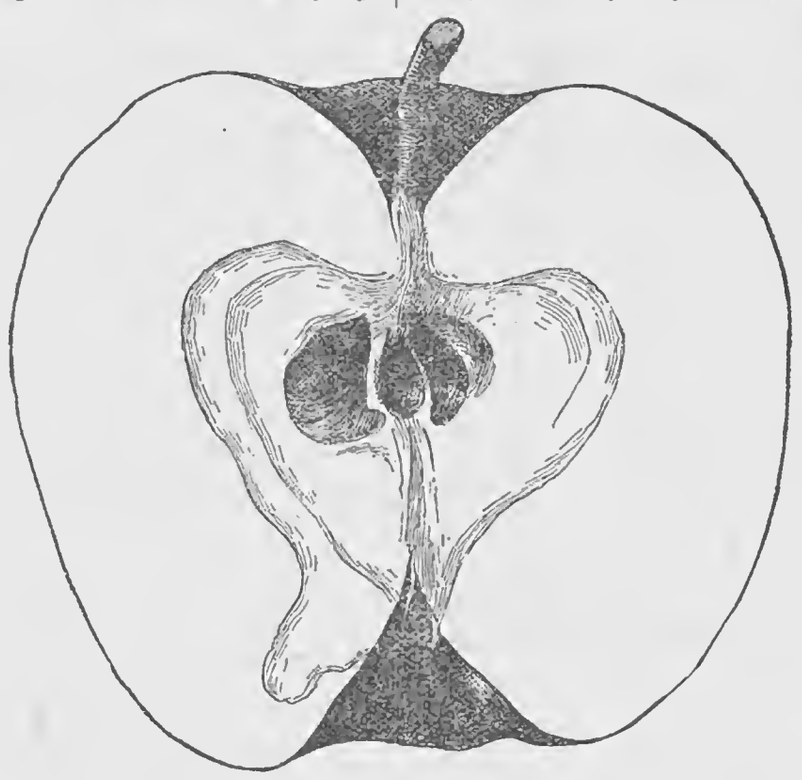
PROFITABLENESS OF FRUIT.

I will not spin out this "short article," except to say that the pear should have a broader acreage on our farms, and that as the supply swells and prices lessen we should be content with fewer dollars per bushel. At fair paying prices, there is hardly a limit to sales. Not half or a tithe of the acreage, care and culture which more profit invites is given to any fruit. No crop pays better than apples or pears. A short supply of the latter cannot be gained on very much for years. The crop is one, too, which needs and will pay for careful culture and harvesting. The fruit business is a vast industry. Year by year it swells in value with the growth of the land and the more refined tastes of the people. No such young nation ever gave to fruit culture the like devotion, or made such strides in its acreage or improvement. Fine fruits are a national longing, and they pay. From what can you, year by year, be surer of a harvest in a crop or cash?

I finish with this counsel. Let more be done for a supply of winter pears. It is these, in the long run and the large way, that will pay best. They require some study as to kinds and their keeping, not found in books. These things must be learnt by watch and trial. To fair brains and right care, it is no more trouble to have fine pears, tempting to look at and taste, all through the winter, than is needed by a Rhode Island Greening or a Roxbury Russet.

KING OF THE PIPPINS.

This is an English apple which has proved to be hardy in the province of Quebec. The fruit is said by the Montreal Horticultural Society to be larger and more highly colored in Canada than as grown in England. The tree is a strong, vigorous grower and forms a spreading head, forced open by the weight of the fruit. It is an early and unusually heavy bearer, killing itself, indeed, by overbearing if the fruit is not thinned, and being therefore usually not long-lived. The fruit is large, sometimes very large, and never runs to small, even when heavily bearing. When large, it is roundish-conic; when very large, oblong-conic. Color, yellowish green, mostly covered with dark red and slightly marked. Calyx large and open; flesh yellow, firm, juicy, sub-acid; season (in Canada) Sept. 10 to December. Use, kitchen and market. This is as given in the report of the Montreal Horticultural Society for 1876. The fruit is quite abundant in the Montreal market during its season, and brings a good price. The apple from which our drawing is made was kindly sent to us by Dr T. H Hoskins of Vermont.



KING OF THE PIPPINS.

Arboricultural.

EVERY-DAY NOTES.

SAMUEL PARSONS.

TRANSPLANTING LARGE TREES FROM THE WOODS.

It seems a very simple and economical operation to merely transplant an Elm from a piece of woodland lying near the very house perhaps, or at least on the farm. Great size is obtained at little cost, and the farmer is thus enabled to do lawn planting with materials produced by his own land. Lawn planting would indeed become very simple, if this were the case. Let us look at the matter squarely. Trees in the woods are invariably crowded, shut out more or less from sun and air, and their roots confined among the multitudinous fibers of other trees. Now let them be transplanted with all the skill possible, and in any case, their environment changes utterly Surfaces of branches always heretofore shaded, come into full sunlight; roots always matted and crowded together, not only have free and unaccustomed room, but are fully exposed to the swaying influences of the wind. In addition to these sudden changes and hardships such trees are obliged to endure, another one is added by professional tree planters, when they cut back the tree to a bare pole, and thus allow the sun, frost and sleet to strike vertically on a large wound. The monstrosities and scars arising from this treatment are often perceptible throughout life, whereas if the tree is merely relieved of its heavy branches, and enough be left to feed or assist the flow of the sap, it will soon loose all appearance of having been pruned at all. Elms fare best under the operation of removal from the woods, and many entertain the idea that they continue to do perfectly well, because they live and grow.

But it makes a vast difference how one lives and grows. There is a difference that needs no pointing out between two trees in a vigorous, growing condition, when one develops naturally and harmoniously with a healthy open bark, and the other throws out spasmodic, irregular growths that never continue harmoniously and in proportion to the growth of the stem. One compound word expresses the condition of the stems of the forest trees: it is "hide-bound." The unhealthy bark and adjoining tissues have gradually lost vitality, and the center of the tree having no real life, the active functions of the stem are reduced to a narrow compass, or ring. In the shade of the forest and in positions to which it has long accustomed itself, such a tree will thrive probably after a fashion, but on the open lawn, the strain of transplanting and other adverse influences will be sure to overcome or stunt the practically half-dead tree. The larger the tree, moreover, the more difficult always becomes the operation of transplanting. Thrifty, well grown nursery trees, ten to twelve feet high and one and a half inch in diameter of stem at a point one foot from the ground, will always eventually surpass, in size, beauty and everything else, transplanted forest trees with stems exceeding, say half an inch in diameter. There is no easier tree to transplant from the forest than the Elm, but these statements apply to the Elm also.

Allow me to illustrate by a short anecdote. Twenty years since my father moved from the woods with great labor and care, several large Elms at least eight inches in diameter of stem. They grew and did well, for forest trees; indeed, they attained large dimensions. About the same time, if not the same year, two rows of Elms taken from a nursery, were planted along a street in the neighborhood. Soil and general conditions were very much the same. Yet to-day the nursery-grown Elms are the largest, thriftiest and decidedly the most shapely; the "hide-bound" forest trees having hardly increased at all in size of stem. If you must move forest trees, avoid, if possible, any that have grown about swamps or in dense woods, selecting rather trees from open fields or lawns. In any case retain every particle of root-fiber you can.

WINTER PLANTING FOR LARGE TREES.

There is a general impression abroad that any large tree, a foot in diameter of stem, if need be, may be transplanted with safety, provided it is moved with a frozen ball of earth around its roots. Doubtless this plan works well in many cases, where the distance of transportation is short, and the handling quickly and easily accomplished. Much experience in moving trees, both with and without frozen balls, has convinced me that the chances are, on the average, better without the frozen ball or freezing weather. I do not undertake to explain why this is so, but simply give it as my experience, and rather to my surprise, the experience of very many to whom I have referred the matter as to respected authorities. Perhaps the injury to the frozen tree comes from a jarring during the operation of moving, that vibrates throughout its structure and, in some way, disarranges its organization; but I will not elaborate this theory. Reasons are readily given for most things, but, then, they are always true in part only. Natural conditions are decidedly complicated. After all, it is safer to fall back on the fact, after the manner of Falstaff, and hazard no reason whatever.

Flushing, L. I.

[It seems to us under the system of removing trees with a frozen ball, that the best parts of the roots, the fibers, are left in the ground from which the tree is taken, and that the frozen ball preserves only the larger and less valuable roots.—EDS.]

HOW FAST YOUNG FOREST TREES GROW.

PROFESSOR W. J. BEAL.

At Lansing, Michigan, near the center of the Southern peninsula, is located the State Agricultural College. Twenty years ago most of the surrounding country was a wild forest. It seems too early to awaken enthusiasm on the subject of forestry; nevertheless we have made a small beginning. Some of the results so far may interest readers of the RURAL.

A hard frost in last May, killed the early growth of many trees and checked them for a little while. In our collection, in the arboretum, there are not far from two hundred and seventy-five species of trees and shrubs. At this time I shall only speak of some of the most prominent trees which we have planted for timber. The oldest of these were started from the seed or transplanted to this lot three years ago this fall, or since that time. The soil is a sandy loam and not what one would call strong. It is naturally well drained. An old road once cut the lot in two, at which place the land has been graded down

A TABLE SHOWING RAPIDITY OF GROWTH.

NAME.	Age.	Hight.	Girth.	Weight. Cut at surface.	REMARKS.
Burr Oak	3 years.	36 inches.	1¼ inch.	3¾ ounces.	Not transplanted.
White Ash	3 years.	9—36 in.	3—4½ in.	16—22 oz.	Not transplanted.
White Ash	3 years.	72 inches.	2¾ inch.	2 ounces.	Removed after 1 year.
Basswood	3 years.	96 inches.	3¾—4¾ in.	....	Not removed.
Sugar Maple	3 years.	72 inches.	2¾ inch.	....	The largest tree.
Sugar Maple	3 years.	36 inches.	1¼ inch.	8 ounces.	A large average.
Sugar Maple	3 years.	18 inches.	1¼ inch.	....	Many of this size.
Butternut	3 years.	72 inches.	2¾ inch.	....	Largest tree.
Butternut	3 years.	66 inches.	1 inch.	44 ounces.	An average tree.
Butternut	3 years.	34 inches.	2¾ inch.	10 ounces.	Grew in old road, graded off.
Butternut	3 years.	43 inches.	2¼—2¾ in.	2 ounces.	Transplanted after 1 year.
Chestnut	3 years.	28—13 in.	2¾—3¾ in.	....	Not transplanted.
Black-walnut	3 years.	8 inches.	....	3¾ ounces.	Not transplanted.
Black-walnut	2 years.	162 inches.	8 inch.	11 ounces.	Moved after 3 years.
Carya sulcata (Hickory)	2 years.	105 inches.	7 inch.	2 ounces.	Moved after 3 years.
Box Elder	5 years.	144 inches.	12 inch.	1-5 ounce.	Not transplanted.
White Ash	5 years.	12—15 ft.	8¾—12 in.	....	Transplanted.
Ailanthus	4 years.	12 feet.	9 inch.	....	A large sample.
Catalpa	6 years.	18 feet.	11—11½ in.	....	Moved after 3 years.
Butternut	6 years.	....	....	....	Moved after 3 years.
Silver Maple	4 years.	....	....	....	A sucker, 3 years set.
....	....	....	....	....	Moved after 3 years.
....	....	....	....	....	Moved after 3 years.
....	....	....	....	....	Moved after 1 year.

Some people never read tables, but this one will bear studying by those interested in trees. The weight of the tree is in ounces avoirdupois, as the trees were cut at the surface of the ground. It will be seen that the trees grew small where the top soil was taken off. See, too, the effect on the trees which were once transplanted, as in the case of the White Ash after one year, the Butternut and the Black-walnut. The seeds, in all cases, were planted soon after they were gathered, in rows four feet apart. The tape line to learn the circumference, was applied six inches from the ground. The seeds of the Ashes, Oaks, Maples, Butternuts and Box Elders, all came up well without delay or accident. At the end of two years, the Ashes were straight, clean, and without a branch.

In case of the three-year-old Ashes, Butternuts, Black-walnuts, Chestnuts, which were transplanted after growing one year, they seem to be checked about one year in size of growth. Whether this difference will grow less or more remains to be seen. The single specimen of Ailanthus is already damaged and will soon die to the ground. The Catalpas have passed through two dreadful winters when the thermometer marked 32° and 33° below zero. They were killed back, to some extent, yet the main trunks now all appear sound. The trees have grown well. Last winter was a mild one, so during the past summer they made a fine growth.

Three years ago, I transplanted three small Red or Slippery Elms from the woods. They were then about four feet high. We generally consider this a slow grower, but these have all grown rapidly. One of them has this year made a growth, on one of its leading branches, of eight feet and six inches.

In all cases, the trees have been well cultivated and the land kept very clean all summer. In case of the Black-walnuts, the nuts were much disturbed by red squirrels in spring. Half of the nuts were dug up. The soil is probably rather too sandy for the Sugar Maples to do their very best, but they are very slow growers by the side of most others tried. Some European Larches, some Norway Spruces and other evergreens have done well, but the growth is less so far than with most other trees. A second species of Hickory—one growing in the neighborhood—is on trial. The plants have grown one year, but like the Hickory given in the above table, the plants are feeble and small.

Agricultural College, Lansing, Mich.

TOO LATE FOR CLASSIFICATION.

The annual convention of the New York State Dairymen's Association will be held in the Court House, Binghampton, on Tuesday, Wednesday and Thursday, December 17, 18, 19 next.

THE HENRIETTA RASPBERRY ONCE MORE.

SOUTH GLASTONBURY, Conn., Oct. 15, 1878.

WE notice, in issue of Oct. 12, a statement made by J. T. Lovott that the Henrietta Raspberry is nothing but the old Belle de Fontenay brought out under a new name, and he goes on to say that he would not make such a statement did he not know it to be perfectly correct. Now, the facts are there was never a plant of Henriotta sold until the fall of 1877, and Mr. Lovott bought a very few for the first time in April 1878, which, of course, bore no fruit this year, and as he has never taken the trouble to come to Conn. to see it in fruiting season, *he knows nothing* about it except what he can judge from the plant and foliage.

That the Henrietta is an entirely new and distinct variety we can prove by a large number of prominent fruit growers who have visited our grounds, and seen not only the plants but *the fruit.*

The first small plant sprang up in the middle of a large currant stool, in a well cultivated garden that had not had Raspberries growing in it for more than 20 years, showing conclusively that it must have been a chance seedling. The above can be vouched for by reliable parties living in the vicinity.

HALE BROTHERS.

EXTRACTS FROM CORRESPONDENTS' LETTERS.

OKOLONA, Miss., Nov. 19.

Some of the Pelargoniums sent me by the RURAL last year are now large, velvety and very pretty. T. J. B.

NORFOLK, Conn., Nov. 12, 1878.

All the seven cuttings of Pelargoniums sent me last season started, but two have since damped off, the remaining five, however, are flourishing, L. P. S.

RECEIVED the cuttings of Pelargoniums in good order. Six out of eight are growing very nicely. One of the others we think will start, but the eighth is dead. J. H. W.

SPRINGBOW, OHIO, Nov. 13.

AMONG seed received from the RURAL last year was a paper of Phlox. I planted them early in the house, afterwards replanted them in the garden where they bore a few flowers. Those were the nicest I ever saw.

MRS. W. H. C.

WILLIAMSVILLE: Erie Co., N. Y.

THE seeds sent me by the RURAL last year gave such satisfaction and the plants and the flowers from them attracted such attention that I gladly avail myself of the RURAL'S kind offer of seeds to its subscribers this year also.

O. F. A.

CLYMER, N. Y., Oct. 18, 1878.

WE live on a dairy farm and all work hard, but I manage to have a few flowers. I think it rests me to go out among my flowers after a hard day's work, and see their wonderful beauty of form and color. I have a family to bring up and educate, so I do not have money to spend for seeds, and so do not have any but common varieties, and am, therefore, thankful for the RURAL free seed distribution. MRS J. W. G.

ALMA CITY, Minn.

THE Geranium seed sent to me by the RURAL two years ago came up in a short time after sowing. Two of the plants are very fine; the others are as good as those usually for sale. One of the best is a very strong grower, the leaves very large, with a dark zone in the center; the flowers large, bright scarlet. The other is a medium grower; leaves about one-half the size of the first, with a very dark zone; flowers large, color between salmon and pink; they are splendid bedders The Hollyhocks were large and fine, and the Antirrhinums the largest I have ever seen.

CLYDE, Wayne Co., N. Y., Nov. 6.

From the seeds sent me by the RURAL last year, I obtained several fine plants of Cleome spinosa, which bloomed. but did not ripen seeds. I also had a fine Ricinus which did not succumb to the frost until the night of November 5 My other plants did not bloom, but I did not plant all the seeds sent me, so that I have another chance. One of my Chinese Yams I gave to a friend; another died; but the remaining two are fine. I have dug up one of them, and intend to keep it in the cellar; the other I shall leave in the ground. M L.

CASTILE. N. Y., Nov. 2.

I HAVE thought many times that I would write to the old RURAL and tell my experience with it. I commenced taking the Genesee Farmer, published in Rochester, when the first number was issued, and when the RURAL took its place, I subscribed for it, and have continued taking it every year up to the present time, and probably shall as long as life is spared me. I have never seen the day during the whole time, that I regretted the outlay. I don't expect to take any paper many years longer, but mean the RURAL to be the last received by me during life. Are there many among your present subscribers to the paper that can boast of such long acquaintance with it, and in this case it has been on the part of one who has been an agriculturist but a very small portion of the time. C E. T.

Entomological.

SECOND REPORT OF PROF. C. THOMAS, State Entomologist of Illinois.

THIS Report, which constitutes the seventh of the series of Entomological Reports of the State of Illinois, is at length printed and will soon be ready for distribution. By the Act of the Legislature of that State during its last session, this Report is made to the State Board of Agriculture, and hence is bound in the Proceedings of that Board of which it constitutes a part. Although this arrangement is not so satisfactory to those who devote considerable attention to entomology and desire these Reports in the separate form, yet for the farmers and horticulturists of the State, for whom it is intended, it is a decided advantage and allows a much larger number to be published than would otherwise be done.

This is much the largest, and also the most comprehensive Entomological Report that has yet been issued in that State, or, in fact, in the West. It will contain, when the tables and indices are added, about 300 pages, with numerous illustrations. An introductory letter to the President of the State Board of Agriculture, occupying some 12 pages, gives a brief account of the insect injuries in the State during the previous year; the work of the entomologist and his assistants during the year; and next follows "Notes on Corn Insects," occupying something over 90 pages, and embracing an account of some thirty-five species that depredate upon this valuable cereal. Some 30 pages of this portion are occupied with an exhaustive account of the chinch-bug, giving a pretty full history of its operations in Illinois since 1840, drawn chiefly from the files of the Prairie Farmer; and a careful estimate of the loss on corn occasioned by it in 1874, which amounted to about $20,000,000. The cut-worms and wire-worms also receive a large share of attention.

Next follows the Report of Miss Emma A. Smith, who acted as assistant to Prof. Thomas during the summer in the northwestern part of the State. It contains "Notes of the Year" on injurious insects observed; an account of the "Stalk Borer" (Gortyna nitela); and somewhat lengthy notices of the Oak-leaf Tortrix and Maple-tree Bark-louse, occupying in all about 52 pages. Most of the remaining portion of the Report is taken up by Part Second of the "Economic Entomology of Illinois," (Part First in the previous Report included the Coleoptera). This part is confined to the Lepidoptera, or Butterflies and Moths, and their caterpillars, and was compiled by Prof. G. H. French, who was employed as a general assistant by Prof. Thomas who was engaged during a large part of his time as one of the Commissioners to investigate the Western Locust.

Following this is a Synoptical Table of the families and genera of the Lepidoptera mentioned in the Report, which is introduced for the purpose of facilitating in determining species.

One valuable feature of this work is an alphabetical list or index of the various plants and other substances injured by the insects mentioned, with the scientific names of the insect or insects injuring each, placed opposite also in alphabetical order. By means of this index or table, the labor of hunting out the insect found injuring a plant is greatly lessened. The Report closes with a very full and copious general index to all the common, generic and specific names mentioned.

This Report will doubtless prove of great value to the agriculturists not only of Illinois but other sections of the West.

The Poultry Yard.

LEGHORNS AND PLYMOUTH ROCKS ONCE MORE.

In my article, Sept. 28th, page 618, I did not mean it to be understood that I thought "Anon" to have committed any error by not giving the monthly product of his Leghorns. I simply expressed my regret that he had not done so, in order that it might be compared with the table given in same article. The quantity of feed given to my Plymouth Rocks was all they would eat; if the quantity named by "Anon" was the same, I still consider the Leghorns had the advantage, by the unlimited range for foraging; with the unlimited range, they will not require or consume as much food as when confined.

I am aware that many are of the opinion that hens can be over-fed, thus producing too much fat at the expense of eggs; but I am not aware of any one having yet learned just the exact point between too much or too little. If "Anon" believes his method the correct one, the number of eggs shows the Plymouth Rocks to excel in egg production while confined and fed all they will eat, as against the Leghorns with a free range, and fed as stated by him.

It makes little difference what breeders generally allege, if they cannot substantiate their assertions with facts. I was led to try the White Leghorns on just such pronounced opinions, only to dispense with them after two years' experience. In my experiments it was not for the purpose of profit by sale of fowls or eggs, but for my own family use. Whatever breed may be best for this purpose may be justly considered the best for all practical purposes. When I am convinced that fowls of any breed combine more essential qualities in this respect than the Plymouth Rocks, I shall not hesitate to adopt them; but I shall want something more than breeders' pronounced opinions to make any change. Rutherford, N. J.

Miscellaneous.

WHAT OTHERS SAY.

"NEW ENGLAND begins to fell the need of some of the money and a good many of the young men she has sent out West."—N. E. Farmer.

DECLINE OF THE WHEAT CROP IN ENGLAND.—That the increased depth of plowing may enhance the crop is highly probable, but we cannot help arriving at the conclusion that wheat-growing is, year by year, getting less successful, and we fancy the time will come when even at better prices than at present wheat-growing will hardly be able to be done at a profit.—London Ag. Gazette.

SHEEP ON ROOTS ALONE.—Professor Church of Cirencestor says that many experiments have been made to ascertain how far sheep could be fed on roots alone. Mangolds, swedes and turnips have been used, but chiefly mangolds, in the Continental trials, and the general conclusion seems to be, that not only must one lose a very large proportion of the feeding material in roots when he employs them alone, but that the rate at which animals increase in weight when so fed, is excessively slow.

"BEAUTY OF HEBRON" says the Weekly Tribune, is the resonant name of a new seedling potato circulated for test by Messrs. Thorburn, of John street. It "originated in 1874 from seed-balls of Chili Red, and reports from various quarters where it has been tried, indicate that it may be the 'coming potato.'" One says it is ten days ahead of Early Rose, a better cropper and of better quality than that famous kind, and is more easily harvested, as the tubers lie very close together in the hill.—[THE RURAL NEW-YORKER is circulating this potato for test, though we are free to express our obligations to the Messrs. Thorburn for their liberality in supplementing our own supply, which is quite inadequate for our purpose.—EDS.]

AXE-GRINDERS.—Horticulturists are usually men of generous instincts, but not all. There are among them a number who watch constantly for opportunities to grind their axes gratuitously on somebody's grindstone, and especially to get their advertising free. They will send a small sample of some new variety of plant, fruit or vegetable, to some prominent member of the profession, or some editor, with the request that he will "give it a trial and report"—the "report" being their objective point. And if a truthful report is unfavorable, then they are "mad," while if it is favorable, they make extensive use of it in circulars, etc., without a word of thanks or acknowledgment. We have had a wide experience with these gentry, and our good-nature has led us to tolerate, and even encourage them much more than we are likely to do in the future.—Vermont Watchman.

WORTH THINKING ABOUT.—The Monetary Times says that farmers, as a rule, capitalize a larger part of their earnings than most other classes. A farmer and a professional man make equal incomes; but while the professional man spends his whole income and often necessarily and unavoidably, the farmer adds largely to his means of reproduction. The man who spends relatively the larger part of his income in the cost of living, does most for trade in the meantime: the man who spends the smaller part, is conquering the leisure which affords opportunities of higher education to his offspring, or leaving to his descendants a capital-power by which labor can be moved and further material progress made. It is just when the farmer spends with the freest hand that he does most for trade; but when he kills the goose that lays the golden eggs, retribution must follow.

PENNY WISE, POUND FOOLISH.—Dr. Hoskins says in the Vermont Watchman: "We hear it said, on every side, that the immense shipments of agricultural products from this country to Europe are making us rich. But are we not selling more than the corn and the wheat, the butter, the cheese, the cotton and the tobacco? What is the recorded history of that section of our country that in years past exported the bulk of its agricultural productions? Are we not now transporting over sea not alone the products, but the productive power, of our corn and wheat and grass lands, as in former days the productive power of Virginia's tobacco fields and of Carolina's cotton fields went to Europe along with the crops themselves? Are we not engaged in the diffusion of barrenness and of leanness over the country for a little money in hand,—a little "balance of trade,"—that will not make our farmers rich, though it will leave their farms poor?"

INCREASING THE VALUE OF KAINIT.—The London Chamber of Agriculture says that a quantity of fresh horse dung was taken to the science school (Cirencester), and placed in a large stone cistern, and between different beds of manure of a few inches thick, the kainit was scattered. The smell of the dung was strong and offensive, and the pupils complained of it on the day on which it had been mixed, but in a few hours the smell entirely disappeared. On the following day and subsequently no smell was observed, and when the manure was tested chemically about three months after, it was found that a mutual exchange had been effected, and instead of sulphate of potash and carbonate of ammonia evolved from decomposed manure, there were carbonate of potash and sulphate of ammonia. It is unnecessary to say that the value of both of these bodies is considerably greater than that of kainit, and that both of these have a certain and prompt action.

FAIR ENOUGH.—The Smith's Falls News (Ont.) of last week has the following:—"EDITOR'S TROUBLES.—A late number of the RURAL NEW-YORKER, the prince of good papers for farmers and their families, contains a complaint that a New York daily, big enough and old enough to know better [N. Y. Sun.—EDS. R. N. Y.], stole an article from its columns, gave it a new heading, and published it as original. The same paragraph states that numerous lesser journals are in the habit of appropriating their matter without credit. Well, the News uses its matter and says nothing about it, but does *not* palm it off, or any other selections, as original. The entire outside of our paper is made up of carefully selected and boiled-down reading from numberless exchanges, and no one comes under the scissors oftener than the RURAL—the fact is, so many really excellent articles are taken from it that it would become seriously monotonous to give the regular credit every time. Perhaps a good plan would be, whenever rural readers find anything exceptionally interesting or profitable to them, to just say: 'That's from the RURAL,' and take it all for granted."

CATALOGUES, &c., RECEIVED.

THE third annual exhibition of the Berks Co., Pa., Poultry and Pet Stock Society, will be held in the city of Reading from the 24th to the 28th of December next. The exhibition promises to be the finest of the character held in that city.

ANNUAL REPORT of the Secretary of the Interior on the operations of his Department for the year 1878. These Reports from the different governmental Departments often contain matters of interest and always of instruction, though their dry form is a trifle uninviting. But during the leisure of long winter evenings their perusal might help to pass time profitably on the farm. This is a pamphlet of 48 pages, issued free to applicants by the Interior Department, Washington.

INSTITUTE.—The College of Agriculture of the Illinois Industrial University will hold an Agricultural Institute, at the University, from Monday, January 27, to Friday, January 31, 1879, which all interested in Agriculture are invited to attend. The Institute will open on Monday evening with addresses by the Regent of the University and others. During the forenoons of the four succeeding days courses of lectures—four in each course—will be given by members of the faculty, on the following subjects: Soils and their Management; Animal Husbandry; Diseases of Animals; Plant Growth; Chemistry; Rural Architecture and Hygiene. The afternoons will be devoted to more General Lectures and Discussions on Agricultural topics by members of the faculty, aided by representatives of the leading agricultural interests of the State. In the evenings a course of lectures on the Political Economy of Agriculture will be given by the Regent. Opportunity will be given for the examination of the University Museums and Collections, and the Library will be open for use by those in attendance. There will be no fees or charges of any kind. Reduced fare on the railroads running through Champaign is expected. Board can be had at a cost of not exceeding one dollar a day. Full programmes will soon be issued. For these or any special information address Prof. G. E. Morrow, Dean of the College of Agriculture at Champaign; to whom those purposing to attend the Institute are requested to send their names

Dairy Husbandry.

WHAT IS BUTTER?

T. H. HOSKINS, M. D.

"BUTTER is a fatty substance extracted from milk," would be a general answer to this question. But what is milk, then, and how does butter come to be a constituent of it? We are told that milk is a substance secreted in the udder of a cow (or some other mammal), and that it is composed of water, casein, butter, sugar and mineral salts. The casein, sugar and mineral salts are in solution in the water, while the butter is dispersed through the fluid in the form of very fine globules, which have a tendency to rise to the top when the milk is left at rest.

ABOUT THE GLOBULES,

then, which are butter in its first stage—how are they produced from the blood of the cow? The blood of all warm-blooded animals contains fatty or oily matter, derived from their food. Some of this comes directly from the oil of the plants that are eaten. Besides this, the digestive organs are able to transform starch and sugar into fat. The milk-glands contained in the udder are, as to their minutest parts, composed of myriads of little sacs, or bladders, called cells. A thousand of these would, often, not make a mass as large as a turnip seed. These cells lie surrounded by a net-work of the smallest blood-vessels, called capillaries (from *capilla*, a hair, on account of their fineness), and continually grow from matter which they draw from the blood that flows on all sides of them. Their growth is at first simply enlargement, but when their full size is attained, they begin to "segregate" or "proliferate," that is, to divide or bud, producing from each mature cell a number of little ones, in which the same process of growth and division continues. The space allotted to these cells being limited, as they continually increase in number and size they must have an opportunity to escape, which is afforded by the little passages called ducts, which lead from every part towards the pouches provided in the lower part of the udder to receive the milk. The mature cells do not pass along these passages without rupturing and dispersing their contents. This rupture of their inclosing membrane is caused by their absorbing the surrounding moisture until they burst. The milk consists of the contents of the cells, mixed with the surrounding fluid, which has exuded from the capillaries without entering the cells. The special contents of the cells, which escape when they are ruptured, are the butter globules—those little masses of oil (for butter at the temperature of the blood is fluid), which, as remarked above, are butter in its first stage.

It might be interesting here to say something about the peculiar nature of

BUTTER, AS DISTINGUISHED FROM OTHER ANIMAL FATS,

such as lard, tallow, or suet. The oleomargarine makers contend that there is no difference, or, in substance, that the fat of cows' milk is simply tallow, and of sows' milk, simply lard. But chemistry is able to show, though as yet not with perfect precision, that secreted fat differs from deposited fat; that is, that fat formed in the secreting glands, like the glands of the udder, for instance, is differently composed from the fat which is simply deposited in the tissues of the body. We know, as a matter of common experience, that it is both more palatable and more digestible; and it is reasonable to suppose, aside from the demonstrations of science, that these differences are due to variation in composition, adapting milk to its special use as food.

COVERING OF GLOBULES.

It is stated above that the cells are little sacs, that is, they have an envelop, wall, or covering around them, similar to the shell of an egg, only not hard, but thin and flexible. This covering, or cell-membrane, as it is called, is visible under the microscope as a transparent film, and there is no doubt about its existence. But after bursting, it dissolves or falls to pieces, and disappears in the fluid by which it is surrounded. It is often asserted that the butter-globules, the minute oil-drops that constitute the principal contents of the cells, have also each a fine covering, similar to, but thinner than, the cell-membrane; and we have long been assured that the process of churning is only a process of thrashing these globules in order to beat off the membrane, which is said to be the impediment that prevents the globules from adhering together to form visible butter. But this is a belief which some of the best observers declare has no proof, either optical or chemical, to sustain it. It is a hypothesis merely, a bare supposition, which probably arose from the notion that without such a covering the oil-drops would run together of themselves. There is, however, abundant proof that this is not necessarily so. The drops are able to preserve their identity if not violently disturbed; and even when so disturbed, they cannot be made to unite except within certain narrow limits of temperature, while the milk itself remains pure and undecomposed.

THE RISING OF CREAM.

So long as these oil drops remain disunited they may be heated to scalding heat and cooled, even more than once, without injury to the butter. Under certain circumstances, this heating will favor their separation from the milk by the action of gravity—that is, the rising of the cream. But if undisturbed, they will always tend towards the surface at all temperatures from scalding down to freezing; and according to recent experience the colder the milk, so long as it remains fluid, the more quickly and completely this rising occurs.

When these oil globules are cooled, they become solidified. They crowd together upon the surface of the milk closer and closer, hour by hour, so long as the milk lying between them remains sufficiently fluid to permit them to do so. This phenomenon, which is best observed when the milk is set to rise in a deep glass vessel, is called the "shrinking" of the cream; and if it is not understood, error will occur in estimating the comparative quantity of cream in the milk of individual cows, since some creams "shrink" more quickly and more completely than others. It is not, strictly speaking, a shrinking of the cream itself, but a drawing more closely together of the globules, which presses out the milk from between them. It is the large-globuled milk, such as that from Jersey cows, that exhibits this contraction most rapidly and strikingly, because the larger globules have the strongest relative attraction for each other in proportion to the resistance offered by the milk.

BUTTER MAKING.

In order to make the butter globules adhere together and form butter, it is necessary to agitate the cream in a suitable vessel at a proper temperature. If too cold, they will not adhere for the same reason that cold butter is "crumbly"—particles of fat not being adhesive at a low temperature. If, on the other hand, the cream is too warm, the action of the churn is ineffective to cause adhesion, since warm fat in a half-oily state will not cohere into a plastic mass, such as we expect butter to be. The temperature for securing the best results is in the neighborhood of sixty degrees.

The physical condition of the butter globules, when they become adherent under the action of the churn, has a very important influence upon the commercial value of the product. As they join, globule to globule, the little pellets thus formed become, after a time, visible to the naked eye. Supposing the right temperature to have been preserved, now is a very critical period in the operation. "Over-churning" has the same effect as "over-working" to destroy what is called "the grain" of the butter. This "grain" is the result, simply, of the preservation of the form of the little pellets distinct even after their union, and this is effected by first lowering the temperature a little so as to harden them slightly, yet not enough to prevent cohesion of their sides when moderately pressed together. The method is usually to draw off the buttermilk as soon as the pellets have reached the size of peas, and pour cold water into the churn, before going on to "gather" the butter by further moderate churning. The succeeding operation of removing the adhering buttermilk and replacing it with a small quantity of strong, clear, pure brine (called "working"), requires the highest skill of the dairyman, and, supposing all preceding operations to have been rightly performed, is the determining crisis that decides whether we shall have a perfect product, waxy, and uniform in texture and color, that can be kept sweet for a long period, or a salvy, streaked mass, that hastens rapidly to rancidity.

Thus I have tried to answer, briefly, the query, "What is butter?" and the facts stated are all of them important for butter makers to know, since they each have a direct and important bearing upon the practical operations required of them in developing a "gilt-edged" article of trade from the milk of their herds.

WHICH BREED FOR THE DAIRY.—NO. 1.

L. S. HARDIN.

DIFFICULTY OF FINDING OUT THE TRUTH.

It is a fearful thing to tell the truth. You may not believe it, but it's a fact. For instance, if you have ever made a laborious and conscientious effort to succeed with any particular breed of cattle, sheep or chickens, or in growing any special crop of roots, fruits or foreign grasses, and ignominously failed, and then gone back and read up all the celebrated writers have published on the subject, the chances are a dozen to one that in all your reading you did not find a single word relating to the very prominent, inevitable and unavoidable fault, habit or weakness in the breed or crop, that shipwrecked your fortunes. The writers know very well that so far as getting readers is concerned, if they cannot speak well of a thing, they had better leave it alone. But fortunately for those who are desirous of getting at the truth of things, there are some of us not inappropriately termed "free lances." Having been through the mill, we own no cows and write no books. If we tell an unpopular truth, the breeding world comes at us with blood in the eye, but having become somewhat expert at dodging, we say something good about the breed, and for a time the offence is forgotten. Of course, some correspondents become so expert at replying, that few enter the lists against them, unless they are guilty of a gross mistake.

These remarks are intended to preface a few short articles on dairy breeds of cattle, wherein it is my intention to give my candid opinion of the merits and demerits of the various breeds without the slightest hesitation or reservation. If any one will furnish me well-authenticated facts or statistics, I will cheerfully alter, amend or revoke any statement that these facts or figures prove to have been erroneous. It is the truth we are after, and there are no pet theories to support.

RELATIVE YIELDS OF MILK AND BUTTER.

While I draw a strong distinction between beef breeds and dairy breeds of cattle, I cannot say that I have ever been impressed with the importance of that further distinction which most, if not all, writers on the subject draw between what they call cheese and butter cows. The Jersey, Guernsey, and sometimes the Kerry and Swiss cattle are called butter cows, while the Ayrshire, Short-horn and Holstein are called cheese cows, whereas the poor native is disowned by both sets. It is, of course, true that the milk of the former class is richer in butter qualities than that of the latter. As a matter of fact, on an average the milk of the Channel Island cattle contains one-fifth more butter than the milk of the English or Dutch breeds, but if they give one-fifth less milk, unless there are other economical points about them, the thing is as long as it is broad.

A few weeks ago I gave to the public a statement of the milk and butter yields of the various breeds that are now aspiring to dairy honors in this country. The test was the average yield of a herd of not less than ten cows for one full year. I applied to all the noted dairymen in the country for statements of their herds, and, of course, used my judgment as to which were sufficiently explicit and reliable to go on the record. From the best information I could get I made up the following table:

NAME OF BREED.	No. of cows in the herd.	Av. No. of lbs. milk per cow per annum.	Av. lbs. milk to lb. butter.	Av. lbs. butter per cow per annum.
Short-horns	28	Actual.	..	252½
Ayrshires	11	5,469	25	273
Jerseys	14	5,625	20	281
Natives	17	Actual.	..	302
Holsteins	12	8,767	25	350

The Short-horns belonged to Harris Lowis, the Ayrshires to E. T. Miles, the Jerseys to E. Burnett, the Natives to O. Bronson, and the Holsteins to H. C. Hoffman. This statement encroaches so closely upon the individual interests of breeders, laying, as it were, a rude hand upon their tenderest nerves, that few who were not directly interested in the matter cared to venture upon such dangerous territory, as the slightest slip would bring an avalanche of abuse upon the unfortunate victim. As it is, I have been able to gather but little further information, but I think it will be interesting to discuss the relative merits of the different breeds in the light of this comparison.

Sheep Husbandry.

PROFIT IN KEEPING SHEEP.

AN excellent farmer told me this year that for every sheep he kept he sold, in lambs and wool, an average of five dollars' worth per head. He said also that his sheep paid him better than anything else grown on the farm. Five dollars are nearly ten cents per week, and during the pasture season sheep can be kept at a cost of two to four cents per week. In the winter the cost is a little more; but if bean straw and other coarse fodder are freely used, winter keep need not be very expensive, and the manure would be worth a large part of the cost of feeding. I am not so clear about the profit in summering sheep. Where a farmer has a large amount of rough land unsuited to cultivation, sheep will utilize it better than any other stock, provided the land is not wet as well as rough. On low or swampy lands sheep will not do well, are liable to foot-rot and other diseases. But if a farmer has only clover pasture, let him beware of sheep. Either he must feed so light as to get little benefit from his pasture, or he will ruin the young clover—and he may do both. Sheep and clover both improve the farm, but they will not do it together. One neutralizes the other. That "the foot of the sheep is golden," is a proverb only true when pastures are filled with natural grasses and the herbage is made sweeter and richer from being kept closely cropped.

Five-dollars-per-head sales from a flock of sheep pre-suppose a good many ewes, nearly or quite as many lambs as sheep and a good market for them. My friend this year sold lambs at $3.63 per head and wool at $1.50. Not all the lambs were sold, the ewes being saved for breeding and about as many old sheep fattened in the winter as were saved of ewe lambs. To get such a price for lambs, they must be good ones. A full-blood Cotswold buck is used. As the ewe lambs are saved, the second cross is three-quarter blood, and the third is seven-eighth. Lambs even of the half cross are very strong, thrifty and heavy for their age. They are commonly dropped in February and March. This requires close watching and warm quarters in cold and stormy weather; but with these there is usually little loss, often less than farmers suffer who have ordinary lambs dropped in April or May. The grade of the Cotswold buck on the common native sheep, is hardier than the thoroughbred. They need better feed than the common native lambs; but they pay well for all they get. It will pay well to have a field of winter rye to turn on early in the spring, after the weather becomes warm—better still if some grain is given to the ewe to stimulate her flow of milk, and as soon as the lamb is old enough to eat, to increase its size. Young lambs will begin to nibble at oats when two or three weeks old and will soon learn to eat greedily. Only a very little is needed in addition to the dam's milk. The larger the lamb, the higher the price per pound. This is an unvarying rule, be the price high or low. I know no way in which a little grain will pay so surely and so well as if fed to young lambs. Unless extra feed is given to the mother at least, early-dropped Cotswold grade lambs are apt to become stunted and will never fully recover.

W. J. F.

The Apiarian.

EXPERIMENTS WITH BEES IN CALIFORNIA.

I HAVE seen several articles in the RURAL from bee-keepers, giving their experience, success, profits, etc., with bees during the past season. With fifteen years' experience in that business myself, in northern Ohio, I should say that they were more than ordinarily successful. Their success most certainly shows that brains are very essential to the bee-keeper to enable him to develop to the full extent, the capacity of his bees to collect and store the sweets that nature has so bountifully supplied.

Here in southern California, bee-keeping is almost another business from what it is East. We have scarcely one day of the three hundred and sixty-five in which the bees do not collect some honey. The swarming season commences the last of March and continues into August, thus affording an excellent opportunity for a strong colony to propagate its species and gather honey. Let me give the readers of the RURAL a little item of bee culture, that came under my observation the past season.

Mr. J. Archer—formerly a Michigan bee-keeper—experimented with three several swarms, with the following results, an account of which was published from month to month in the Santa Barbara Press, as the experiment progressed.

From No. 1 no swarm was permitted to issue. The top, or honey board, was removed and an empty hive with frames was placed upon the first, and others added from time to time, as the stock increased, until five hives were placed one above another. The honey was extracted as often as it became necessary to give the bees store-room. Seven hundred and thirty-five pounds were thus extracted, besides leaving enough in store to carry the bees safely to the next honey season.

Nos. 2 and 3 were swarmed artificially. No. 2 increased to thirty-six swarms, and fifteen hundred and seventy-six pounds of strained honey, and sixty-five pounds of comb-honey were taken from it. No. 3 increased to twenty-four swarms, and gave twelve-hundred and sixty pounds of strained honey and twenty-four pounds of comb-honey. With No. 3 the result would have been more favorable, had the bees remained in Mr. Archer's apiary a month longer, but they were removed to another place in the beginning of August. At this time, the greater part of the hives contain very much more honey than is necessary to carry the bees to the next season.

Everywhere.

FRUIT CROP REPORT FOR THE SAN JOSE VALLEY, CAL.

LAST winter was a very wet one over the entire State, and dry weather came suddenly, without our usual gradually diminishing showers. Fruit of all kinds ripened more nearly together in this section than ever before. Early Beatrice, Early Rivers's and Early Louise peaches ripened at the same time. Plums which are usually far apart, as the Prince of Wales and Bradshaw, ripened simultaneously. Prices for early fruit were, on the whole, lower than ever before. Cherries of the Black Tartarian and Royal Ann varieties brought 12c. per lb.; other varieties, not over 6 to 7c. Peaches were worth

25 to 50c. per box of 30 lbs. Apricots were high, ranging from 4 to 5c. per lb. Plums, of large varieties brought only 2c. per lb.; other kinds rotted. The late fruit paid better. Pears are now high, but the market is over-stocked with apples. Apricots, clingstone peaches and late pears have paid best this year.

Alameda Co., Cal., Nov. 10.

RURAL SPECIAL REPORTS.

SENECA, Nemaha Co., Kan., Nov. 20th, 1878.

WE are having exceedingly fine fall weather. During the last two months we have had several fine rains, so that winter wheat and rye have a very healthy color. Farmers are very busily engaged husking corn. Many of them have finished, and nearly all are much farther along than they usually are at this season of the year. The corn crop is not as good as it was expected to be, but is of good quality and is very dry where the land was well cultivated; the yield has been about fifty bushels per acre on prairie land, and more on bottom lands. Owing to the depredations of Chinch-bugs and rust, spring wheat was nearly a failure. In fact, farmers here would do well not to try to raise spring wheat, as it is very seldom that they get paid for their seed and labor. Barley and oats were very fair crops. Millet, the tame grasses, and our prairie grass were all a little better than usual, and nearly all the hay is of extra quality. Potatoes were not generally a large crop. Produce of all kinds, and also cattle and hogs, bring very low prices; but either because we are more philosophic, or because we are more used to being "hard-up," we don't grumble as much as farmers further east do. An immense number of "prairie schooners," or immigrant covered wagons, have passed through here this fall. The most of them were bound for the homestead region. G. H.

WALDEN, N. Y., Nov. 22.

Walden is situated in the fertile Walkill valley, is eleven miles west of Newburgh and is noted for its great water-powers. It is a very prosperous village, and has a large number of persons employed in its various manufacturing interests; consequently we farmers find a good home-market for much of our produce. The weather is quite warm and cloudy; farmers are generally up with their work, and some of the more active ones are making needed improvements. Crops have been good. Prices are about as follows: Wheat, $1 to $1 25; rye, 56c; oats, 30c; corn, 50c to 53c; hay, $8 to $10 per ton; eggs, 26c to 30c; apples, about $1 to $1.50 per barrel; good fruit sold to-day at 75c; cider is very plentiful and hard to sell, from $1.25 to $2 per barrel; potatoes sell at 90c per bushel by the load; wages are 50c to 75c per day. With strict economy we anticipate a good balance on the profit side of our farm accounts. RURALIST.

LOWVILLE, Lewis Co., N. Y., Nov. 25.

IT has been cloudy and rainy for a week, but we have had a pleasant fall. Cows are looking well; good cows are worth from $20 to $26 a head. Butter 18c. a pound; corn is 50c. a bushel; potatoes 75c. a bushel. I send the RURAL a sample ear of Compton's Early Corn, which I planted on sod 3½ feet each way, 1⅓ acre. I spread two loads of hog manure on the ground. I leave three stalks in a hill; it yields fifty-five bushels per acre. This is the second year I have planted it, and I have taken the first premium at our county fair both years. M. B.

BEAR LAKE, Manistee Co., Minn., Nov. 18.

OUR soil here is what is called sandy loam, and our winters are usually long, with deep snows, though last winter was almost like a continuous spring. Moreover, we are somewhat subject to droughts, although the past year has been an exception in this respect, for in this locality we have not been two weeks without more or less rain, and during the last three months it has rained a great part of the time, thus keeping the farmers from their fall work, so that much of it yet remains to be done. M. E. A.

LARNED, Kansas, Nov, 22, 1878.

I am a squatter on Government land where, four years ago, the Indian and buffalo ranged. Two years ago last May I came here and took up my home in a little dug-out. There was no house within sight. South of me it was sixty miles to the nearest house. Now I can stand at my door and count over one hundred homesteads. I have raised over 7,000 bushels of wheat since I came here, besides other crops, mostly on rented ground, my own not having been broken until this season. I had only one span of mules, and "nary" dollar to start with. J. D.

MELROSE, Florida, Nov. 21, 1878.

This is a nice country and climate in winter for those with plenty of money; but during the rest of the year one is tormented with insects, etc., and the soil is very poor, or most of it is at any rate. Some of the hummuck land is rich, but it will cost $40 per acre to clear it, and we can make apples pay us more North than they can get out of their orange groves here, after deducting expenses. On the whole, Florida is a nice place to stay during the winter if one has money; but no money can be made here at farming, and it is no place for a poor man, for a laboring man cannot get work that he can depend upon. H. L. C.

ROCKFORD, Floyd Co, Ill, Nov 25.

THE Beauty of Hebron potato I have, and find this variety most excellent. I took the first premium on them at the county fair this fall. The failure of the wheat crop hereabouts, the very low price of beef and pork and, in fact, of all farm products make our people curtail expenses in every way. The weather continues beautiful. For the past two weeks it has been dry, before that it was very wet. The corn crop proves good; but corn is worth only 15c. per bushel; wheat, owing to its poor quality, brings only 35c; oats, 15c; potatoes 25c; hogs $2 00 per cwt; beef cows, 1¼, steers 2¼; butter, 12½; eggs 12½. The kind of wheat most extensively raised hereabouts is Lost Nation; Fultz comes next. W. L. MC'E.

PERKINS, Erie Co., Nov. 20.

WE have had no snow hereabouts as yet this fall, and no very bad storms. Husking is nearly all done. A few are plowing. Wheat is looking well; not much fear of the fly. Some fields of potatoes gave a full crop; the yield of others was much below an average one. On the whole, potatoes were not an average crop. The corn crop was good; at present corn is worth 21c.; wheat, 85c.@87c.; oats, 22c.; potatoes, 50c.@55c.; apples, 00c. Cattle and hogs are away down. F, A. A.

ITHACA, N. Y., Nov. 26.

IT has rained every day, with one exception, for ten days past. The roads are therefore bad. Corn is nearly all husked at last, and farmers are fitting things up for a hard winter. Times are hard and money is scarce. Hay is worth $5 to $7 per ton; oats, 25 cts. bushel, buckwheat, 35 to 40 cts.; barley, 65 cts.; potatoes, 60 to 65 cts.; cider, $1 50 per bbl. Fall-sown wheat is looking fair. Labor abundant and cheap. Apples are an immense crop, but they are rotting badly. ANON.

DUNNSVILLE, Essex Co., Va., Nov. 22, 1878.

OUR crops of corn and vegetables have been saved. This has been an unfavorable year for the farmers of this section. The best manured land produced the poorest corn—very unusual this. Wheat is looking well, and so is clover. With the exception of hogs, all other stock is looking well, but prices are very low. Corn, 40c. per bushel; wheat, 80c. to 95c., according to quality. Farmers are very much disheartened. R. S.

FOSTER'S CROSSINGS, Warren Co., O., Nov.,24.

The farmers in this neighborhood are getting well through with their fall work. I have my stock corn all cribbed, and only a day or two more are required for husking my standing corn, which I intend feeding to my hogs. Wheat is looking finely, and a larger area of it than usual has been sown. Some fields of corn are yielding well; others are not so good. A field I finished to day averaged fifty bushels per acre. J. D.

GALLION, Crawford Co., O.

WEATHER pleasant for time of year, but very little freezing weather yet. Fall wheat looks good. The last crop was very good, the average yield in this part of the country having been 25 bushels to the acre. Corn is about a medium crop, average 30 bushels; oats, 45 bushels. Wheat is selling for 84c. per bushel; corn, 35c.; oats, 21c.. Live pork, per hundred, $2.25. S. H. B.

ALMA CITY, Minnesota, Nov. 19.

We have had very fine weather this fall, and it still continues. The past week has been more like September than November. Farmers, although greatly behind with their work two months ago, are fully up at present. Produce of all kinds is very low; wheat, from 30c to 50; corn, 20c; oats, 20c; pork, 2c per lb.

NAPLES, N. Y., Nov. 26.

THE weather is cool; there has been some snow; the roads are simply horrid. Times are dull; produce low; wheat, 80c. to 90c. per bushel; corn, 40c. to 45c.; oats, 25c.; potatoes, 35c.; butter, 18c. per lb. Potatoes were a light and fruit an abundant crop. Farmers hereabouts are generally ready for winter. L. F. D.

NEW HAMPTON, N. Y., Nov. 25, 1878.

THE wheat crop hereabouts was nearly all a failure both in quantity and quality, fetching only 25c. to 40c. per bushel; oats, 10c.; corn, 15c. to 18c. in trade; pork, $1.70 to $1.90 per cwt., live-weight. W. O.

AUGUSTA, Ga., Nov. 28.

WE are now planting wheat and oats, transplanting cabbage, strawberries, and raspberries. Our turnips have suffered for rain, it having been remarkably dry. J. M. A.

ELM POINT, Bond Co., Ills.

THE weather is fine. The wheat crop is large as regards acres sown, and looks well. There has not been cold enough to hurt root crops in the open ground. N. C.

GARRETTSVILL, N. Y., Nov. 22.

We are having warm, open weather, with considerable rain. Farm produce of all kinds is low, and slow of sale.

The Querist.

ANSWERS TO CORRESPONDENTS.

Utilizing Bones

R. R., Friendship, N. C., asks whether bones lose any of their fertilizing ingredients in process of burning. 2. Which would be the most profitable way of using bones—to burn them or draw them eight or ten miles, and then give half for grinding?

ANS.—In the process of burning, bones lose their organic constituents, chiefly composed of gelatine, and containing from two to four per cent. of nitrogen, worth 20c. per pound; so that in every one hundred pounds of bones burnt, from forty to eighty cents' worth of nitrogen is lost, besides an uncertain amount of advantage supposed to be derivable from the other constituents of the organic matter. 2. Still this loss can be so readily restored by the use of a little guano or other nitrogenous fertilizer, that on nearly all farms burning bones, so as to be able the more easily to pulverize them, is certainly the most economical way of utilizing them. Indeed, the addition of the potash from the ashes of the wood fires in which they would be generally burnt, would go far towards compensating for the small loss of nitrogen. In the present case, therefore, it would certainly be more profitable to burn them on the farm and save all the bone and wood ashes, than to haul them either eight or ten miles, and then give half for grinding them.

Donnelly's Early Champion and Tolman's Grapes.

P. H., Lynn, Mass., asks whether there is any difference, except in name, between these two sorts of Grapes sent out by the same dealers?

ANS.—Mr. D. S. Marvin says he has grown and fruited for several years the Tolman from Fredonia, and the Champion from Rochester, and there is no difference between them. Donnelly's claim that his Early Champion is a new Grape, ripening its fruit two weeks before the Tolman, is unfounded. The Grape is very early and hardy, but of poor quality. It originated at Syracuse, N. Y., and is a seedling of Hartford Prolific.

Remedy for Lice on Cattle and Hogs.

A correspondent sends us the following recipe for the above purpose, with the assurance that he has found it more effective than any thing he has ever tried:

To one gallon of soft water add one pint of soft soap, and boil them together; then add one ounce of arsenic, and stir the whole till well mixed. After this add another gallon of soft water and the mixture is fit for use. His theory is that the soap neutralizes the poison and renders it harmless to the cattle, and the whole is a "dead shot" to the lice and their eggs.

Apples for Virginia.

W. B. H., Henrico Co., Va., asks which varieties of Apples are likely to thrive best between latitude 38° and 37° in Virginia. Among the Apples there are the June (Red June Sweet?) ripening in the latter part of the month from which it derives its name; the Strawberry, ripening at the end of July; the Cheese, ripening about the middle of September, and the Winesap, an early winter sort.

ANS.—Nicksjack, Pryor's Red, Rawle's Genet, Winter Sweet Paradise, York Imperial, London Pippin, Edward's Early, Fallawater.

Fish Pond.

W. J. Beaty—no address—has a large running spring, which he is thinking of utilizing for the purpose of making a fish pond, and asks how much care, expense, etc., would be needed to construct and maintain it.

ANS.—Much depends upon the size of the pond; how much earth is to be removed; how much to be added for banks; the lay of the land; what sort of a dam, or outlet, is desired, etc. We do not see that we can make an answer of any value without these particulars.

Privet Berries.

A. C. W., Hugo, Ill, asks when should privet berries or seed be plucked, how treated, and when and how planted to produce young plants for an ornamental hedge.

ANS.—As soon as ripe. They may now be preserved in sand and sown the same as any other small seeds in the spring. They will make a foot of growth the first season. They may be planted now in boxes or pots in the greenhouse.

Pulling Beans.

Can any one suggest a new mode or tool for pulling beans when ripe? This work is both slow and back-ache-producing when done by hand. S. R. M.

Miscellaneous.

W. Collins, Talbot Co., Md.: 1. Has a mare over one of whose eyes a blue film and false skin had grown. He has treated by blowing white vitrol and burnt alum into it, and also by using a wash made of the same. There is still a film over the pupil, though the animal can see. Owing to restlessness, he can put no more of the powder into the eye, and the wash seems to do little or no good. He asks what is the best form of treatment. He also has a young mare that injured her right hind limb while practising for a tournament. He thinks the injury is in the hip or upper part of the leg. 2. She has only been able to walk with the greatest difficulty for six weeks; when running that leg is held up; after exercise the stiffness and soreness seem less, and when brought out of the stable in the morning, it cannot be used at all. Has been bathing with cold and warm water, and "Horsemen's Hope."

ANS.—1. The film mentioned was simply opacity of the external coats of the eye, the result of inflammation. The treatment mentioned was decidedly wrong, and, besides causing much unnecessary suffering to the animal, the disease was undoubtedly aggravated. It is much better to pay for good advice in such cases than to trust to one's own judgment. The treatment in such cases should consist of soothing applications and protection from the light, instead of blowing irritating substances, like burnt alum and white vitrol, into the eye; these are sufficient to cause inflammation when it does not already exist. The best treatment now would consist in occasionally touching the spot over the pupil with a feather dipped into a solution made by dissolving four grains of nitrate of silver in an ounce of water. It may or may not be possible to remove it.

2. No advice can be given in regard to the lameness, as no symptoms are given by which it can be located. Would advise a careful examination of the hock joint.

Mrs. G. S., Springville, N. Y., has had a Passion Vine for three years without its having shown a blossom, and inquires how long she must wait before seeing it bloom, and what is the cause of its tardiness in this respect.

ANS.—Many Passion Vines are stove-plants, and to do well require a temperature of between 60 and 70 degrees, and a moist atmosphere. If the plant is otherwise healthy, and these conditions are complied with, Mrs. G. S. ought soon to have the gratification of seeing flowers on her plant. There are several half-hardy species.

W. H. M., Haddonfield, N. J., asks what is the matter with his chickens. Their appearance is drooping; they stand about with their eyes shut; there are lumps on their faces and heads; their dung is loose and of a light-brown color, and their faces somewhat pale.

ANS.—The above symptoms are common to several ailments. The disease is probably Roup. Hale's Roup Paste is a good remedy; keep the fowls warm and in a dry place; feed with soft, warm food daily.

D. Pierce—no address—asks when and how to plant seed of Peony and Perennial Phlox, and how to increase the Calla Lily?

ANS.—Sow the seed of Peony and Phlox in boxes in March; prick out the plants soon after they come up, and when they are large enough to set out, transfer them to the open ground.

The Calla is propagated by the young bulbs that form around the old plant. After flowering let the plants dry out partially, shake the soil off, remove the young bulbs, and plant them separately in pots or in the garden.

M. W., St. Joseph, Mich., says: "From th flower seeds sent me last year, I raised plants of Shell-flower, Aquilegia, Cleome and a variety with long, notched, curled leaves of silvery color, whose name I do not know. It did not blossom; how shall I call it?"

ANS.—Glaucium luteum.

M. E. W., Burlington, N. J., asks how ears of corn can be sent to this office?

ANS.—By mail. We have to thank our subscribers for quite a number. The trouble is we can not always tell which letter and ear of corn go together. Whenever we can, we are happy to return postage stamps.

F. K. G., De Golier, Pa, asks when is the best time to cut back an Oleander. 2. Is there any such bulb as Zephyranthes, and if so, is it hardy?

ANS.—(1.) Now. (2.) No doubt Amaryllis Atamasco is referred to. This bulb was first sold as Zephyranthes, by which it is called by some authors. Yes, it is hardy in Pa.

Mary Waley asks if she can be supplied with bound volumes from this office, as her friends read the RURAL so continuously that the current numbers are actually worn out.

ANS.—We regret that we cannot supply complete bound volumes.

Mrs. T. J. B., Okolona, Miss, asks the price of Azaleas and Rhododendrons, and the best time to plant them?

ANS.—The best time is in the spring. The price varies from fifty cents to one dollar each.

E. L. M., Greenwich, O, asks whether the Early Vermont potato is a distinct variety.

ANS.—Yes.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY DEC. 7, 1878.

OUR readers are particularly requested to read the particulars of our free seed distribution on p. 785, under publisher's notices, before ordering seeds. We thought we had made the postage particulars very plain—but many are sending us too many stamps. A one-cent stamp suffices for all except *three*—the Beauty of Hebron requires a two-cent extra stamp, and the Defiance Wheat and Pearl Millet, *together*, require a two-cent extra stamp.

SKILLED LABOR.

AMERICAN agriculture is undergoing a rapid change. The capital invested in it is increasing more rapidly than in any other industry. The cheap lands with poor dwellings, occupied by the pioneers, have become well tilled farms with buildings costing three times as much as the original value of the land. The sickle, scythe and cradle have given place to the mower and reaper. Most farm operations are done by machinery which requires some mechanical skill to manage. The evident tendency is to work larger farms, the operations of which the owner can only superintend, the labor being almost wholly hired. It costs less, in proportion, to work two hundred than one hundred acres, and still less as the farm grows larger, provided the labor is skillfully directed. And the more machinery is substituted for hand labor, the stronger will be this tendency to absorb the smaller into the larger farms. This has been the result in Great Britain, and it is not likely to be avoided in the United States. We believe it would be better for the individual independence of the farmers if the small holdings might continue, instead of their being aggregated together, and the present proprietors, more or less, becoming laborers. This result cannot be avoided, except by co-operation in the purchase of machinery to work small farms, a plan for which we may soon point out in another article.

But this change is strongly demanding the substitution of skilled labor on the farm for the very unskilled labor at present employed. One of the greatest impediments to successfully carrying on farming on a large scale, is the fact that there are no skilled laborers in the market. Farming has been carried on, in this country, so much at haphazard, and with so little order and system, that a laborer, when he can find nothing else to do or succeeds in nothing else, offers his services to the farmer. On the farm he regards success as certain. The consequence is that the laborers are entirely unskilled in the parts they are performing, and unless directed by unusual activity and knowledge, the work must be badly done. It requires skill everywhere in farming—skill to lay out a field for the plow, to turn a fine straight furrow, to put it in fine tilth for the seed, to sow the seed accurately; skill in cutting and curing grass, in harvesting grain; still greater skill in raising and feeding animals; skill in milking and managing cows; skill in all the operations of the dairy. Indeed, what operation in agriculture does not require skill? And yet a large part of all these operations is carried on by laborers new to the business, and who perform them in the clumsy way of novices, at wages which in Europe are only paid to skilled mechanics. Perhaps this explains why the farmers' profits are all gone, when he hires the labor to carry on his farm.

The manufacturer never carries on business with such unskilled labor. His workmen have served a regular apprenticeship at the various branches of his manufacture, and he can estimate with a reasonable certainty the profit upon each workman. The English farmer stands on as favorable ground as the manufacturer, having skilled laborers at his command, and can make a reasonably certain calculation upon the result of their labor. The English plowman serves an apprenticeship at this most important specialty from the time he is old enough to reach the plow-handles till he becomes an expert; whilst the American farm-hand thinks he can perform this skilled operation without any previous practice! The American farm hand makes up in assurance what he lacks in practical knowledge. But assurance, however important in desperate enterprises, will never lay a straight and even furrow. The American farmer is, no doubt, saved from even greater losses through unskilled labor, because a large percentage of his labor is done by machinery, which works much more perfectly than the unskilled hand. But the cost of wear and tear of machines operated by unskilled hands, is much greater than if they were run by experts.

It is evident that the changed condition of our agriculture must soon compel the employment of skilled hands, and these skilled hands must be educated before they can be employed. Agricultural laborers are composed too largely of a floating, unsettled class, and this must be changed before amendment in the degree of skill can be expected. They must be composed of a class with settled and definite ends and aims, who are educated to the business as earnestly as mechanics. With such assistance agriculture will attract capital, and afford it a safe investment. Skilled labor is the immediate demand of the future in agriculture.

PURCHASING HORSES.

FEW persons who purchase and use horses are able to make a selection of an animal with a sufficient knowledge of what they are buying. It is rarely that a horse is bought except upon faith in the declarations of the seller, and a haphazard sort of dependence upon luck. The consequence is that when a man is very frequently "stuck" in his bargain, and when he suspects or discovers it, he thinks it no harm to put off the beast upon some other purchaser in the same way that it was palmed off on him. "Is he all right?" asks the would-be purchaser. "Well, I bought him so, and so far as I *know*, he is all right," replies the seller, trying to make believe to his own conscience that he really *knows* very little, although he may *think* a great deal.

Now, it is very easy for any person of judgment to learn to know, when he is buying a horse, whether the animal is sound or not. Blemishes speak for themselves, but unsoundness requires a close inspection and some knowledge, for its detection. The feet are the most usual seat of unsoundness in work horses. From the general careless habit of caring for horses and the reckless manner of using them, there is a large proportion of them unsound in the feet. But disease of the feet is easily detected, although there may be no apparent lameness. An intending purchaser should have the horse brought out before him, and watch the animal as he stands at rest. If the owner is continually starting the horse into motion and urging him to "show off," something may be suspected; because it is when the horse is at perfect rest that his weak points are divulged. If the horse is sound, he will stand squarely on his limbs, without moving any of them, the feet being placed flat upon the ground and all the legs plumb and naturally posed. If one foot is thrown forward with the toe pointing to the ground and the heel raised, or if the foot is lifted from the ground and the weight taken from it, disease of the navicular bone may be suspected, or at least tenderness, which is a precursor of disease. If the foot is thrown out, the toe raised and the heel brought down, the horse has suffered from lamnitis—founder—or the back sinews have been sprained, and he is of little future value. When the feet are all drawn together beneath the horse, if there has been no disease, there is a misplacement of the limbs at least, and a weak disposition of the muscles. If the horse stands with his feet spread apart, or straddles with the hind legs, there is weakness of the loins and the kidneys are disordered. When the knees are bent and the legs totter and tremble, the beast has been ruined by heavy pulling and will never be right again, whatever rest and treatment he may have. Contracted or ill-formed hoofs speak for themselves.

If the eyes are of a bluish or milky cast, they constitutionally tend to opthalmia and there will be certain trouble there. If the ears are thrown backwards, the temper is bad; if they are thrown forward and the horse starts nervously at every movement or sound, he will probably be a shier and unsafe to drive. If the hind legs are scarred, he has been a kicker. If the knees are blemished, he is apt to stumble. If the skin is rough and harsh and does not move easily and smoothly to the touch, the horse is a heavy eater and has poor digestion. When these peculiarities are absent and there is nothing to cause suspicion in any other way, the horse may be taken to be all right so far as soundness of foot, limb and digestive organs are concerned. Disease or imperfection of the respiratory organs may be discovered by pinching or holding the throat, by observing the behavior of the horse when he is speeded, or by placing the ear at the side of the chest, when any sound heard other than a clear, resonant one, is indicative of trouble.

The Unscientific Temperament.

Men who form their opinions hastily and adhere to them tenaciously, are unfitted by the very constitution of their minds for scientific investigations. Usually the less substantial are the grounds for such a person's opinions, the more violent is he in the expression of them, and the more intolerant of other views. We have too many writers of this type in agricultural journalism. They will give no attention to facts that oppose their preconceived ideas, and have no other method of opposing the propounders of such facts but by a weak scornfulness. Truth cannot be put down in that way, but its progress may be hindered when those who find pooh-poohing! more convenient than reasoning occupy conspicuous places. The history of all progress shows the encounters of truth with this false conservatism, which stands in the way of progress as snow obstructs a railway engine. Sometimes it is packed in drifts so hard that it has to be *shoveled* out. But though hindered, truth makes its way out at last.

How to Eat Milk.

—There are many who say, "I like milk, but milk does not like me,"—that is, it does not agree with them. The reason for this, in most cases, is, that the milk coagulates in the stomach in too firm a curd to be easily digested. But many who cannot drink milk, or eat bread and milk, find no difficulty in digesting a bowl of baked apples and milk. Upon this hint the experiment has been successfully tried, by a physician of large experience, of telling his patients who could not digest milk to use apple-sauce as a concomitant, taking a spoonful of apple alternately with a spoonful of bread, crackers, or pudding-and milk. The apple prevents the formation of a solid mass in the stomach, and its juice also aids digestion, so that no distress or sense of heaviness follows after a meal thus taken. This information is given for the benefit of RURAL readers, and we think it will be worthy of trial, though, perhaps, not successfully in every case.

BREVITIES.

WE are now laying down and covering up our grape vines and raspberry canes.

MR. TEMPLIN thinks there is as much in pedigree in corn as in horses or cattle.

IN a short time we shall present our readers with a poultry number of the RURAL.

FARMERS are liable to forget the necessity of pure water for their stock during winter.

UNCOVER the celery during warm days, or when the temperature is above freezing, and recover at night.

ASK yourself: "What can I do now that would otherwise have to be done in the spring when time is twice as valuable,"—and do it.

WE are now preparing articles and illustrations for a poultry number of the RURAL NEW-YORKER. Any hints or suggestions from our readers, the outcome of experience or observation, will be welcomed.

WITHIN a few weeks we have had three well-to-do city gentlemen apply to us for the names of intelligent farmers who would take their sons on their farms and be willing to instruct them and give them their board and bed for their services.

SPEAKING of Catalpa speciosa in last week's issue, speciosa ought to have been given as a *variety* instead of a *specific* name. The correction was made in the proof but overlooked. It is claimed that Catalpa bignonioides speciosa is hardier than the species.

WE have heard it stated more than once that Bridgeport, (Conn.) is indebted to Palliser, Palliser & Co., more than to all other architects for its beautiful suburban architecture. We present this week the second of an original series of elevations and plans which they have prepared for us.

IT seems to us, from a casual notice of returns, that the average yield of Clawson wheat is far higher than that of any other variety. It is now well known that this wheat should be well seasoned before it is ground. We find, also, that the bread made now is better than that made earlier from flour ground at the same time.

THE price of the RURAL NEW-YORKER is now two dollars to all. Those, therefore, who cannot get up clubs, or who do not live near club agents, may send us the money direct, feeling assured it is the lowest price. While those who spend time in getting up clubs are unquestionably entitled to pay, it has long seemed to us that all are entitled to receive the paper at the same price.

THERE are few plants more showy in appropriate places than the American Aloe (Agave Americana). The plants grow very fast and increase by suckers which are readily separated from their parent plant. All may be wintered by covering the roots with soil and keeping them where the thermometer does not sink below 28°. We do not know of a fine plant that may be wintered with less trouble, or that will stand more neglect.

WE would suggest to those of our good friends who can afford to do so, that The RURAL NEW-YORKER would prove, to those interested in its departments, a more suitable present than many others which are thoughtlessly selected. We have well-grounded hopes that the RURAL for 1879 will prove more stirring, more instructive, more independent, more earnest than ever before. As this year we have inaugurated several new features not promised, so we desire for next year to please our readers beyond their expectations.

MR. THOMAS, referring to what Mr. Lovett says respecting the identity of Early Andrews with Highland Hardy; of Norwalk with Naomi and Franconia; and of Henrietta with Belle de Fontenay, says that a single season or single observation is hardly sufficient to determine questions of this sort, the same variety often differing more under influences of seasons and soils than others well known to be unlike, and *vice versa*. The seedling from any sort may appear very much like the parent and be pronounced identical, while really a distinct variety.

IT is a singular fact, strikingly illustrated within the past ten years in the case of real estate, that people are readiest to buy when the article is at its highest price. Thousands of people made fortunes by holding real estate and selling it at the right time, it is true; but tens of thousands have been reduced to poverty by not selling. There is little doubt that real estate is now below its real value. Yet there are no buyers, because there is no immediate prospect of an appreciation. But for this impatience for immediate returns, farmers would give more thought to planting timber trees. There is a sure market in the future and those who sow now will then be the fortunate reapers.

OUR readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

OUR new Premium Lists, specimen copies and agents' outfits will now be forwarded free to all who apply.

OUR Free Seed Distribution will remain open to all subscribers who may apply until further notice.

THE RURAL NEW-YORKER *is invariably discontinued at the end of the subscription term.*

Literary Miscellany.

WISHING AND HAVING.

R. H. STODDARD.

If to wish and to have were one, my dear,
You would be sitting now
With not a care on your tender heart,
Not a wrinkle upon your brow;
The clock of time would go back with you
All the years you have been my wife,
Till its golden hands had pointed out
The happiest hour of your life;
I would stop them at that immortal hour;
The clock should no longer run;
You could not be sad and sick and old—
If to wish and to have were one.

You are not here in the winter, my love,
The snow is not whirling down;
You are in the heart of the summer woods,
In your dear old sea-side town;
A patter of little feet in the leaves,
A beautiful boy at your side;
He is gathering flowers in the shady nooks
It was but a dream that he died!
Keep hold of his hands, and sing to him;
No mother under the sun
Has such a seraphic child as yours—
If to wish and to have were one.

Methinks I am with you there, dear wife,
In that old house by the sea;
I have flown to you as the bluebird flies
To his mate in the poplar tree.
A sailor's hammock hangs at the door,
You swing in it, book in hand;
A boat is standing in for the beach,
Its keel grates on the sand;
Your brothers are coming—two manly men,
Whose lives have only begun;
Their days will be long in the land, dear heart
If to wish and to have are one.

If to wish and to have were one, ah, me?
I would not be old and poor,
But a young and prosperous gentleman,
With never a dun at the door;
There would be no past to bewail, my love,
There would be no future to dread;
Your brothers would be live men again,
And my boys would not be dead.
Perhaps it will come all right at last:
It may be when all is done,
We shall be together in some good world,
Where to wish and to have are one.

WEAKER THAN A WOMAN.

CHAPTER XII.

(Continued from page 767.

"I must not stay, Felix," she murmured.

"No; I will not ask you. My darling, say only once more to me the words I love to hear—'Felix, I belong to you.' Say it, Violet!" he added with sudden passion.

"Felix, I belong to you," she whispered, and he was content. He touched the lilac-flowers with his hand.

"Darling," he said, "I shall love every lilac bloom because it will remind me of this night and of you. See, there are dew-drops on your hair! You must not stay, sweet; you must go in, Violet. You will repeat my name before you sleep to-night, and when you wake? You will say 'Felix—I love Felix, and will be true to him.'"

"Yes," she answered.

He touched the little golden chain she wore round her neck.

"I wish I were that chain. I wish I were this golden ring of hair that lies on your face. I wish—oh, Violet, I am mad with wishing—mad with longing! But I love you so dearly."

In another minute he was gone. The moon was shining, the dew lay upon the lilacs, and Violet stood alone, her heart beating as it had never beaten before.

"After all, it is better to be loved than to be rich," she thought—"it is better to have love than riches. I—I wish that I had always been kinder to Felix; but I did not think—I did not understand."

She stood for some minutes while the western wind cooled the hot flush on her face, and she became calmer as she watched the pale light of the moon.

"There is nothing like love," she repeated; "and there never yet was any love like his for me."

If the girl's father and mother suspected anything they made no sign, they said no word, and Violet was grateful.

It happened three days later that Felix, finding he had a leisure hour in the afternoon, went over to the Limes. He took with him a little bouquet of roses; they were the first choice ones that he had seen, and he knew that Violet loved roses. He found her at home; and he was received with civility, though not with warmth, by her parents. Violet was pleased with the roses. She praised them—she buried her face in them, and Felix wished with all his heart that he were one of them.

While he sat there, a box came from the Hall. Francis Haye was excited about it. It must be opened at once—he could not imagine what it contained. Felix offered to help, and his offer was eagerly accepted. The first thing they saw was a magnificent bouquet—such a bouquet as had never been seen in Lilford—the conservatories must have been robbed to provide it. There were camellias, red and white, gardenias, stephanotis, white heath, heliotrope, lemon-scented verbena—the rarest and loveliest flowers that grew. A little white card was at the side of it—a card which bore the hackneyed quotation, "'Sweets to the sweet.' For Miss Haye, with Sir Owen Chevenix's compliments."

Violet gave a little cry of delight when she saw it. Mrs. Haye took it up in her hands, and, turning it round, said, in a most impressive voice—

"This is worth five guineas, at least."

Then they uncovered several bunches of superb grapes, some fine peaches and apricots—delicacies such as previously Violet had only heard mentioned—also a dozen bottles of choice Madeira for Mr. Haye.

"It is very kind of him," said Francis Haye—"wonderfully kind. I have never met with any one so generous."

And Felix, who was far above all ignoble jealousy, joined in praise of the Baronet. But when Violet stood at the garden gate alone with him he said half sadly—

"What does it all mean, Violet? I cannot understand it." For to his mind—so brave, so noble, so incapable of meanness or wrong—it had not yet occurred that any man could deliberately try to take his betrothed wife from him. He would have scorned the notion—he never even so faintly suspected it, until it was too late. But, as he stood there—and it was only natural—there came to him for a moment a passionate longing for wealth. If he could only make such presents as those he had just helped to unpack!

"Violet," he said half sadly, "I am afraid my roses seem very poor and trifling by the side of all Sir Owen's magnificence. My darling, if I could coin my heart's blood into gold and lavish it upon you, I would do so. My poor roses!"

She laughed a low rippling laugh, that sounded very sweetly to him.

"Those beautiful flowers will stand in mamma's favorite old china bowl," she said. "Look where one of your roses is"—pointing to the bodice of her dress; "they shall change places if you like."

A passionate embrace was Felix Lonsdale's only response; and as he walked home that night he felt that he was the happiest man in the world.

CHAPTER XIII.

There was no place in England prettier than the old parish church at Lilford. It was an old Norman edifice with quaint square towers and a harmonious peal of bells. The church stood on rising-ground, and behind it was a grove of oak-trees—fine old spreading oaks, that had seen many generations of men and women come and go. Great green hills stretched out on either side—hills with quiet little hamlets nestling on their wooded slopes; little old-world villages were dotted around, and the old church stood up royally on the hill-side. The walls were gray, and covered with ivy; the old windows were of stained glass; ivy covered the square towers; the old porch with its stone seat was a marvel of architecture; the path that led to it was bordered by lime-trees; look where one would, one saw nothing but ripples of foliage and a gold-green light.

Sunday in Lilford was a day that would have charmed a poet. The very spirit of peace and rest seemed to brood over the earth, while the sweet chime of the Sabbath bells sounded through the venerable oaks.

So long as he could remember, Felix had always walked home with Violet from church; when they were children they ran down the hills in very gladness of heart, but now they walked sedately, Felix almost forgetting the beauty of the fair world around him, as he looked into the beautiful face of the young girl by his side—Violet faintly conscious of the admiring glances that came from all sides, yet really trying with all her heart to disregard them because it was Sunday.

It would hardly have seemed like Sunday to Felix if his privilege had been withdrawn. He went, as usual, on the first Sunday in June, when the old church was looking its fairest and the sunlight on the oak-trees was wonderful to see. There was Violet, her beautiful face shining, he thought, like the face of an angel; there was Evelyn, looking like a fair, meek saint. Great was his surprise to see Sir Owen Chevenix also. It was the first time that he had made his appearance at church, and the congregation was just a little excited about it. Doctor Hunter, on seeing him there, fondly fancied that it was due to the fame of his effective preaching. Lady Rolfe suspected that the charming Lavinia had lured him there, but the Vicar's wife, shrewd Mrs. Hunter, sighed and smiled. "It is the old story," she said to herself; and then she reproached herself for the thought and applied herself to the Psalms.

Felix did not think much about the matter. He was not ashamed to bow his handsome head, and join with all his heart in the beautiful words of the service; but when it was all over he hastened to meet Violet. She was standing with her mother, and, to his surprise, Sir Owen Chevenix was talking to them. He gave a careless nod to Felix, but continued talking.

"I beg that you will let me drive you home, Mrs. Haye," he was saying. "To tell you the truth, I ordered my carriage on purpose—I did indeed. It is a lovely morning, and if you will permit it, we will drive round by Queen's Ash."

He did not look at Violet as he spoke. He knew that whatever her mother did she must do. Felix had taken her hand. He did not care if all the world heard what he had to say.

"You will not break through the old custom of walking home with me, Violet, or rather of allowing me to walk home with you?"

She looked from one to the other with real distress in her face. Sir Owen did not even glance at her; he knew that his cause was safe in Mrs. Haye's hands.

"Violet," said Felix, "you cannot hesitate;" and the girl stood staring at him while her mother said——

"Really I do not know what answer to give you, Sir Owen. I do not know what people will say."

"Why, what does that matter, Mrs. Haye?"

"Well, you see, Sir Owen, Lilford is a small place, and 'everybody' knows 'every thing.'"

"My dear lady, what can it matter if all the world knows of this? I shall be very proud of the honor, I assure you. Lady Rolfe would not require so much pressing."

The last words, vulgar as was the spirit which dictated them, quite determined Mrs. Haye. Evidently, if she did not go with him, he would drive Lady Rolfe and her daughter. She simpered a little.

"Since you are so kind, we will accept your offer," she said. "It will certainly be very pleasant. I always tell Mr. Haye that the one thing I want to make me perfectly happy is a carriage. Now, Violet."

"Violet will allow me to escort her, Mrs. Haye," suggested Felix.

"Oh, no," replied Mrs. Haye, "Violet must come with me! I cannot go alone and leave Violet with you. Another time, Felix, you shall be her escort. Sir Owen has been kind enough to order his carriage for us; it would be really unpolite to refuse. We will say good morning to you now." And she watched him while he shook hands with her and then with Violet.

His handsome young face had grown white even to the lips; but what could he do? He was a gentleman; he could not make a "scene;" he could not take the girl from her mother's side against her will; he had no carriage with roan steeds, and coachmen and footmen in livery. What could he do? Only one thing. If Violet was to go in the carriage he himself would put her into it. The Baronet's hand should not touch even his darling's dress.

So he walked by her side down the avenue of limes, and they reached the high road where the carriage stood. There were many curious eyes watching them. Lady Rolfe and the fair Lavinia looked on in angry indignation.

"What does that girl mean by encouraging Sir Owen?" said the mother. "Surely one lover ought to be enough for her. Felix Lonsdale must be blind."

"Perhaps he cannot help himself, mamma," returned the philosophical daughter, and in that she was right.

When Felix had helped Violet into the carriage, he bent over her to arrange her dress.

"Darling, you would sooner have walked home with me would you not?"

"Yes, I would," she replied; and after that the disappointment was not quite so hard to bear. He turned away without a word or a bow to Sir Owen.

"This is pleasant," said Mrs. Haye, as the carriage rolled swiftly along the high road. "Violet, of all the luxuries of life give me a carriage."

The luxury and grandeur were certainly very pleasant; while the novelty delighted Violet.

Sir Owen did nothing to alarm her. He talked to Mrs. Haye, while he merely looked at Violet. He was wonderfully solicitous that she should be comfortable, and there was but one drawback to Violet's pleasure, the memory of the pain on her lover's face.

"How I wish Felix had a carriage!" she said to herself. "But that will never be."

She enjoyed her father's surprise when the horses stopped at the Limes, and she wondered what her mother meant when she said—

"If I had a chance of keeping such a carriage as that, I should not lightly throw it away."

CHAPTER XIV.

It was a bright day in June, the lilies and roses were all in flower, the laburnums were in the full perfection of their golden glory, and again the sun at noon-day found Sir Owen at the Limes. He had discovered Violet in the garden dreaming idly amongst the roses. It was a picturesque, old-fashioned garden, with quaint-looking seats under the trees and a pretty arbor of trellis-work in the back-ground. Sir Owen professed himself so charmed with it that he would not go into the house, and Mr. and Mrs. Haye went out to meet him there.

After the first greetings were over he turned to Violet.

"Miss Haye," he said, "I have come on purpose to see you. Do you remember our conversation about a *fete* in the park? You said that you thought it would be very pleasant.

Violet looked up with animation.

"Yes, I remember," she replied. "I had forgotten it."

"I have come to say that if it pleases you I will give orders for everything to be prepared for it. What do you say?"

She looked at him with a curious expression on her face, while her father and mother glanced at each other.

"What do I say?" she echoed. "I have nothing to say, Sir Owen, but that I have no doubt it will be very pleasant."

Sir Owen looked disconcerted. After a pause, he added—

"But you do not understand. If I give the *fete* at all, it will be in your honor and to please you. Everything in it shall be as you wish—you shall choose your own amusements—indeed, you shall be the queen of it. Now what do you say?"

Mrs. Haye frowned at her daughter.

"You must really show some little interest in it, Violet," she said, "since Sir Owen is so good as to consult you."

"'Consult'—that is just the right word, Mrs. Haye—thank you. That reminds me," he added, with a smile, "Lady Rolfe told me to consult her when I found myself in any difficulty."

Violet looked up with an air of great relief.

"I wish you would," she said. "She knows far more about such matters than I do."

"But you see it is your opinion I want, not hers," said Sir Owen. "I thought of this—a *fete* in the park, and, to wind up with, a grand ball in the house. We could have Pearson's quadrille band from London; and I thought of sending to Gunter for the supper. What do you think of it?"

Her beautiful face paled a little and then flushed up.

"I think it would be most delightful," she replied."

"Though Mr. Haye is an invalid, still he would like to see everything going on," continued Sir Owen. "Perhaps he, Mrs. Haye and yourself would come to the Hall on the day before the *fete* and stay until the day after."

"I should like it very much," declared Mr. Haye. "I have not had such a treat for years."

"Nor have I," said his wife. "I cannot imagine anything that I should like better."

After that Violet could make no objections.

"But you must grant me one favor," continued Sir Owen—"you must promise to open the ball with me."

Again the girl's beautiful face flushed and then paled; but her mother looked impatiently at her.

"Why do you hesitate, Violet?" she said. "It is an honor of which any lady in the county might be proud."

"You consent, then?" pursued Sir Owen.

"Yes, I am willing," she replied, inwardly dreading all that Felix would say about it, yet half delighted with the idea.

"And I have your sanction for all that I do. Is there anything you wish to suggest in the way of improvement?"

"No, I think not," she replied, more than half frightened.

"What do you say to Tuesday week?" he asked. "Then I can drive over here and take you all to Garswood on the Monday. Lady Rolfe will stay two days; we shall be quite a pleasant little party. I may rely upon you?"

"Yes," agreed Violet, still somewhat nervous; then, looking up at him quite suddenly, "Why do you set store by my opinion and sanction?' she asked. "I do not know anything of these matters; I do not understand why you consult me."

Sir Owen laughed a loud, hearty laugh that was music to the ears of Francis Haye and his wife.

"I have a reason," he replied, "and a very serious one; I will speak to you about it later on."

She could not imagine to what he alluded, and Mrs. Haye listened in silence.

Sir Owen showed her a list of names.

"I thought of sending invitations to these people," he said. "If there are any among them you do not like, strike them out; if there are any you wish to ask, add them."

She read the long list of names, and then produced her little pencil-case; she added two more—those of Evelyn Lester and Felix Lonsdale.

"That is her lover," thought Sir Owen, as he looked reflectively at them. "Well, he may come—it will save trouble. When he sees all that he will see, he will be taught a lesson."

Violet was more pleased and contented when he smiled. She did not know why she felt so greatly relieved.

Then Sir Owen rose to take his leave; he was going to London that evening, he said, and it would be some days before he would see them again. He asked Violet to go with him to the garden-gate; and again, when Mrs. Haye saw the peculiar expression on her husband's face, she whispered—

"Not one word, Francis Haye, not one word, or you will spoil it all;" and he obediently held his peace.

They saw a look of perplexity on Violet's beautiful face all that day, and she had lost her animation. She fell into long fits of musing; she was unlike herself; but no word from father or mother helped her in her difficulty, or solved her doubts.

Felix had been quite pleased about his invitation; he smiled and thought to himself how foolish he had been. What could be more natural than that Sir Owen should admire his beautiful Violet? He could not help it; he told himself that he had been unreasonably jealous, that here was a proof of it. If Sir Owen had entertained any false, dishonorable notion of supplanting him in Violet's affections, here was a proof that he had changed his mind. Another and more generous idea still came to him—namely, that Sir Owen had not known at first that Violet was engaged, and hence had admired her; but, that, now that he did know it, he had changed his ideas.

"Some one has told him," thought generous Felix, "and that is why he invites me."

This noble-hearted man could not imagine a fellow-man holding out one hand with a smile, while he clutched a dagger in the other. He was sorry for having misjudged him, and thought to himself that on the day of the *fete* he would seek out Sir Owen, and shake hands with him. So, to Violet's great relief there was no cloud on his face when he told her that he would be pleased to attend the *fete*.

But he looked very thoughtful when Violet told him of the invitation.

"I do not want to go," she said—"I do not like Lady Rolfe; besides, I do not see the use of making friends with all these great people—it cannot last."

"You really do not care to go there, Violet?" he asked.

"No not to the ball. I shall enjoy the *fete*, but I shall not enjoy the visit."

Felix drew near to her.

"Violet," he whispered, "you will not think me jealous or disagreeable?"

"No," she replied.

"I want you to do something for me. I am puzzled. Sometimes I think Sir Owen must know that we are engaged—sometimes I fancy he does not; yet he must know."

"I should imagine that he does know—every one round here knows; he would be sure to hear it spoken of."

"Most probably. But, Violet, let us make sure of it—tell him yourself, sweet. He will be quite sure to talk to you, and it will be so easy; just a few little words, and then all my suspense will be ended—indeed I have not felt at all anxious about it, since I received this invitation:

No man could be so false as to invite another to his house if he intended doing him any harm. I am quite easy about it, Violet."

And he meant what he said; he judged others by himself, and in his nobleness of heart had no notion what meanness was.

There was a great surprise in store for Violet. She had talked to her mother about her dress, and Mrs. Haye had said that she must have something very nice; but something "very nice" would be costly, and Francis Haye was hard to manage on such points.

Mother and daughter were discussing what was to be done under the circumstances, when a large box from London was brought by the carrier's cart to their door; it was for Miss Haye—there was no mistake as to the address—and with some curiosity they hastened to open it.

"It is directed in a lady's hand," said Violet. "What can it be, mamma?"

"We shall see, my dear," replied Mrs Haye.

When it was opened both ladies were speechless with surprise. It contained three complete costumes—one for a garden-party, a most charming combination of blue and white, with a tasteful Parisian bonnet, gloves, shoes and everything to match—a dress that Mrs. Haye declared made her heart beat to think of the money it must have cost; then an evening dress of white silk, with a train of blue velvet and blue velvet trimmings; lastly, a full and most exquisite costume for the ball, of white silk trimmed with silver fringe and silver leaves.

Mrs. Haye was amazed when she saw it. With it were white satin shoes, a fan, white feathers mounted in silver, a silver bouquet-holder, gloves, and a marvelous handkerchief of dainty lace. Violet looked at the treasures in wonder.

"Who can have sent these, mamma?" she asked. "I do not like to take them. Have you ever seen anything so beautiful?"

"If I believed in fairies," said Mrs. Haye, "I should think that a fairy had sent them."

In her own mind she felt quite sure that the donor was Sir Owen, but she would not say so. Violet had no suspicion—not even the faintest. She never thought of Sir Owen.

"It must be a lady who has sent them," said Violet. "No man would have understood what was wanted. Mamma, should you think that it was Lady Rolfe?"

"I am really puzzled," replied Mrs. Haye. "We will call your father."

Francis Haye came to the rescue. Violet wearied herself in trying to guess, but she could not divine who was her benefactor. When she had carried the ball-dress away, the husband and wife looked at each other.

"It is just as I said, Francis; but, mind, not one word! One careless word may spoil it all."

And neither of them breathed a sound to Violet of what they suspected.—To be continued.

MALTA DE VERE.

H. A. H.

THE day had been cold and stormy. A drizzling rain, with now and then a flurry of snow, had set in at early dawn, and still continued, with no prospect of abatement.

Doctor Morand had returned from his evening calls, and, in dressing-gown and slippers, sat before his cheerful fire, studying the glowing embers, as though he could see in their fiery depths his own futurity.

Elton Morand was a bachelor, and the last surviving member of a proud family, and sole heir to immense possessions. Proud and ambitious, he was not content to live a useless and idle life.

"No," he said, "I will win for myself a name befitting that of Morand."

And now, to-night, as he sits in his luxurious home, and reviews the thirty-five years of his life, a smile of pleasure flits across his face, with a consciousness that in all those years he has to the best of his ability, done what he thought to be right.

Rising, he walked to one of the windows, drew aside the rich lace and satin drapery, and peered out into the darkness.

The storm had increased in violence, great whirls of snow and wind dashing against the house in all its mad fury, then onward, moaning and creaking through the tall pines, compelling them to bow in submission before the blast.

"What an awful night!" said he. "I hope no poor mortal will have need of my assistance before morning." And with a cold shiver, he turned and resumed his place by the fire.

But such was not to be the case, for scarcely had he seated himself when his servant entered and handed his master a small slip of paper containing these words:

"Doctor:—Please come as soon as possible; mamma is much worse. MALTA DE VERE."

"Two horses and the close carriage," he said, hurriedly to the servant, who still remained awaiting orders; "and do have them here quickly."

"Poor woman!" thought Dr. Morand, as he prepared to go forth on his mission of mercy, "it is very doubtful if she lasts till morning; and Malta! dear little Malta! what will become of her?" And as he entered the carriage, buttoning up his fur coat, an idea presented itself to him. "Yes; I have more than enough, while this poor child has literally nothing. I will adopt and educate her as I would a sister; sheltering her with a brother's watchfulness from the cold blasts of this troublesome world."

* * * * *

Mrs. de Vere was the only child of Colonel and Mrs. Wallingford, and they, proud of their beautiful daughter, lavished upon her everything wealth could offer. But alas! in an unguarded moment she had given her heart to a man far beneath her in social position, and one against whom her father entertained the greatest dislike, knowing him to be utterly devoid of principle.

In vain he reasoned, entreated, and finally commanded his daughter to cease receiving attentions from August De Vere. It was of no avail; she turned upon all a deafened ear, even when told that the moment she became his wife her claim upon them as a daughter would forever cease; this, like all other warnings, she passed by unheeded, and married the man of her choice.

For a few years all went smoothly, until he, seeing no prospect of a re-union with the family of his wife, gradually became more tyranical, until the poor woman was obliged to seek refuge elsewhere; while the man who had vowed to love, honor, and cherish her, was rapidly sinking deeper and deeper into the pit of vice and degradation, ending ultimately in his death. And long years after, as she looked back upon her shattered life, it was with that pang of remorse which only those who have suffered can feel. Her atonement now was in the desire so to rear her child in the path of honor and obedience that she, unlike her mother, might never know the anguish of heart caused by filial disobedience.

It was before a small cottage, white as the snowdrifts around it, that Mr. Morand's carriage stopped.

The door was opened by a young girl of not more than fifteen; tall and slight with long golden curls, eyes of a violet hue, and a complexion of the opal tint.

Yes, Malta de Vere was beautiful, and so thought Dr. Morand, as he took the small white hand in his, tenderly asking after his patient.

"Oh! doctor," was the shivering reply, "mamma is so very ill I fear she will never be any better. After you left she continued to grow rapidly worse."

Entering the cosy little sitting-room into which the dying woman had been moved, Dr. Morand saw at a glance her stay upon earth was short.

"You have come," she said, faintly; "I am so glad. Malta, dear, leave us; I wish to see the doctor alone."

Moving to a small stand upon which stood glasses and phials, he mixed a cordial, reviving in its effects, and held it to the lips of Mrs. De Vere.

"I am stronger, now," she said, motioning him to a seat, "and what I have to say must be said quickly. Doctor, I am dying. My moments are numbered; one link alone binds me to earth. My child. What, oh! what will become of her? Who will care for her when her mother has ceased to breathe?"

"Mrs. De Vere, with Heaven's help I will care for your child; and so long as I live and possess a dime she shall never want."

"Heaven bless you, my friend!" was the almost inarticulate response. "I can now die happy."

In a few hours all was over. All that remained of Colonel Wallingford's daughter had been consigned to the dust, and as Dr. Morand led the weeping Malta back to the carriage, he gave orders to drive to Morand Hall, that being now the only place Malta De Vere could call her home, and the only one she was destined ever to know.

* * * * *

Malta's grief became lessened by time. Five years have passed since her bereavement, and the wound is gradually healing.

Again Dr. Morand sits before his cheerful fire, but not alone; his beautiful and accomplished ward is his companion. She, busily intent on her book, sees not the look of affection bestowed upon her, and not until her name has been spoken twice, does she look up.

"This book is so interesting," she said, smiling, as she met the clear eyes of her guardian fixed upon her.

"I do not doubt it in the least, my dear," he replied, "for I spoke twice before I could bring you back to this earthly sphere."

"You did?" she exclaimed; "and I only heard you once. I must have been wrapped up in my story. But, guardy," she continued, in her sweet, gentle way, "it is dull for you sitting there without anyone to speak to. It was selfish of me to not think of this before."

Rising, she crossed the room to where Dr. Morand was sitting, rolled a cushion to his feet, and sat down.

If beautiful at fifteen, Malta De Vere is now superb; and particularly lovely she looks to-night, in her dress of black silk and velvet, and glittering jewels.

The five years she has been under Dr. Morand's guardianship have been improved, and the unusually fine education she possessed at the time of her mother's death, has received additional polish. Now that all has been acquired, and her masters dismissed, she controls Dr. Morand's household, and entertains the society in which he moves, with the grace and air of one born to rule.

To-night, as Malta sits silently looking into the bright red embers, her mind is evidently far away, while she is silent, unusually so, for her.

"Guardy," she said at last, hesitatingly, "it is five years since you took me in, a wanderer, and cared for me. My education, everything that I am, I owe to you; and, dear guardy, I think now I ought to try and do for myself. I know I have been a great expense to you, and it is my duty to repay as much of it as I can."

She glanced up into the face of Dr. Morand, while he, unable longer to restrain his mirth, leaned back in his large easy chair, and laughed heartily—more heartily than Malta had ever before seen him do.

"Oh! guardy!" she said, her face flushing crimson, while her eyes filled with tears, "what did I say so terrible? If you would only look at it as I do."

"My child," said he, drawing the agitated girl to his breast, "do you really care so little for me that you wish to leave me?"

"Oh! no, guardy, it's not that; but I feel so dependent; and to-day I saw in the Times that a teacher is just now wanted in Legrand Seminary, and I am sure that I could meet the requirements, if, guardy, you would only let me try. Please, guardy, do say yes."

Dr. Morand smoothed gently the bright golden head, with his eyes turned away from the sweet, childish face looking up so pleadingly into his.

He looked steadily into the firelight, the one absorbing thought of his mind being how best he could weaken Malta De Vere's resolution.

That she was sincere in her request he well knew, yet not for one moment could he think of his idol, his Malta he had reared so carefully, going forth into the world to earn her livelihood. Could he, possessor of thousands, and without a relative in the world, remain submissive to so preposterous a piece of folly? Never!

"Malta," said he, tenderly, turning to the bright, expectant face, "tell me, my child, if your sole idea in wishing to leave me is because you feel yourself to be a burden? I cannot part with you, my darling. You are the light of my home—of my life! Tell me, my child, do you love me enough to share with me through life my joys and sorrows? Is there in your heart no response to the great love I bear you? Will you, Malta, accept that love, and be my wife?"

"Oh, guardy!" she faltered, with quivering lips, "I am not worthy your great love! You forget the difference in our positions. Choose from your acquaintance some one of wealth and rank, and let me go, as I have asked. I will not deny that I love you better than anyone else on earth; but, oh! guardy, think what your friends would say! Please let me go away; do not ask me to do what my better judgment tells me would not be for the best."

"But I shall, Malta, urge you now, more than ever," he said, drawing the golden head still closer to his breast. "Oh! Malta, do not wreck both of our lives for the sake of pleasing society! What do I care for the remarks of the envious? Now, little one, which shall it be—'yes,' or 'no?'"

"It shall be 'yes,'" was the low reply; "and I will strive to be all you would desire."

"Heaven bless you, my darling! for you have to-night made me the happiest of men!"

* * * * *

Three months have passed since Malta De Vere pledged herself to be the wife of Dr. Morand, and now three days only remain before she will be his—made his by vows pledged before Heaven and man.

"Malta," said he, that night, as they sat at dinner, "I have a surprise for you."

"For me, guardy! What can it be?" she asked, eagerly.

"Read this," he said, handing her a letter, "and tell me what you think of it."

Without the slightest suspicion of its contents she opened and read the following:—

"DR. MORAND—Sir.—By the last will and testament of the late Colonel Wallingford, his daughter's child, and only surviving heir, inherits all his vast estates, personal and real. Communicate with us at once. BRADLEY & WELLER, Att'ys."

Malta's face was a shade paler as she looked at her guardian, while upon it there was a bright and happy expression, as she said:

"For your sake, guardy, I am glad; for, after all, you will not marry a poor girl."

"Malta," was the reply, "my love for you now is no greater than when I thought you penniless: and could I have had my choice I should have preferred that the fortune of Colonel Wallingford had been given to public charities. However, little one, if it gives you a greater feeling of content, I will for your sake try and think of it with pleasure."

The morning of Malta's bridal dawned clear and bright. The wedding was to be a grand affair; for Dr. Morand would have it so; and now that the hour has come, St. Mark's is filled with hundreds, eagerly impatient for the coming of the bridal party. They come at last, passing slowly up the broad isle, to the altar, while the great organ peals forth one of Beethoven's grand marches.

Radiantly beautiful is Malta De Vere as she stands at the altar to take upon herself the marriage vows, as, with heart-felt trustfulness she clasps the hand of the man beside her, while the minister slowly repeats, "What God hath joined together let not man put asunder!"

Together they kneel in prayer, invoking Heaven's blessing and guidance through life, rising as the marriage bells merrily peal forth their congratulations.

The vow of Dr. Morand, registered at the bedside of death, and the second act in the drama of their lives have thus far been fulfilled.

CLARA MORRIS AND HER HUSBAND.

Her Statement to The Dramatic News.

I NEVER loved Mr. Harriott, but I looked up to him as a man in whom I might have confidence and respect. I did not marry him for money, for I thought he had merely a good business—not that he was wealthy. I desired to settle down, to become somebody in a social world, outside the eternal work and anxiety of a theatre. Probably two more ill-assorted beings never were paired. To this day he is an enigma to me. He has his good qualities, and I can see in him good traits which, apparently, nobody else can see; but he is, nevertheless, the opposite of myself. I am warm-hearted and impulsive. He is cold, phlegmatic, indifferent, and sometimes almost forbidding in his demeanor toward me.

Above all, he is selfish, and appears to think no more of me than of some useful article that can be used to bring in so much a week. Such a life is killing me. I feel that I am gradually growing discouraged, and that, sick as I am at all times, this weight is the most potent in bearing me down. I shall not leave Mr. Harriott, not because I ought not, but for the sake of the world's opinion. I have taken my burden and I shall bear it. I must act. If I did not, heaven only knows what would become of us. His business does not pay, and my earnings go to keep it up. And yet I am unfit to act. I am never out of suffering. Never a night passes that I go on the stage that I do not feel I would sooner die than end the play. As I sit here I am in agony enough to break down any ordinary woman.

Many a time have I been lying on my bed wondering if I could live another hour in such pain, and he has come and urged me, almost forced me, to go to the theatre, in spite of the most strenuous orders of my physician. And then I am reproached by both the press and public for simulating sickness to make myself interesting. How little they know Clara Morris! How little they are aware of the eternal struggle of my life, battling on through calumny and opposition, yet always ready to do my work; always taking the abuse in good part and submitting to it. I never felt I could hate my husband until he told some Boston woman who wrote to the Sun that I made his life miserable, and that I was worn out, physically and mentally; for nobody knows my life better than he does, and no one is aware how I have struggled for him better than himself. I am nothing but his chattel—his property. I feel that he looks upon me as no use if I play to poor business; it is not the business that terrifies me, but what he will say at my drawing no more money. In Philadelphia recently the business of the week opened only fairly, probably better than any other house in town, but still only fairly. He never spoke a word to me that week until Friday, when there was a large house, and then he came to my dressing-room, spoke to me affectionately, and wanted to know if there was anything he could do for me. How can I be expected to care for such a man? Yet, I do not suppose that he realizes to himself that I notice all this or feel anything about it. Pure selfishness, that is what it is. I know I can't be alone in these feelings, and that other people see him as I do.

RECENT LITERATURE.

Just How. A key to the Cook-Books. By MRS. A. D. T. WHITNEY. Boston: Houghton, Osgood & Co. Price $1.00.

THE place this book aims to fill in the world of cook-books is well explained by the author, who says: "The Literature of Cookery is already enormous. The name of the recipe books is legion. I do not madly propose to add, as such, to the number. But what is a literature without a grammar? I do propose to make a little grammar of cuisine. I mean to take up the very A B C of its etymology; to give its parts of speech; to show the elementary principles of its syntax. Then you may go to the encyclopedias and libraries. All print will be open to you. With due and thankful acknowledments to the books of direction that have helped me in more than thirty years of housekeeping to get my experience, I must say that in none of them have I found what would anticipate that experience with a sufficiently definite showing of 'Just How.' In no recipe that I ever mixed by, has the mysterious element of 'knack,' 'gumption,' been allowed, resolved, and measured with the least attempt at precision. Yet it should be, more than—even instead of—ingredient, weight, or proportion. Good guess and clever invention may compass these; the other is the *trade*, the *handling*,—that one must be apprenticed to learn.

You cannot learn to knit by a pattern-book that tells you to "knit four, purl three, cast off one;" you must be shown first how to hold your needles, how to catch your yarn and put it over, how to pick the stitch through. You could not make a garment by being told to "close the side seams, hem the bottom, gather the top into a band," if you did not first know how to use thimble and needle together; how to run and stitch and over-sew; how to turn a hem and fit a band.

More than half the difficulty and bewildermont of kitchen work is from taking things wrong end foremost, or plunging into the middle, and so making an anxious muss of it, instead of a clean, clear, successful process. I will save you, if I can, the using of an unnecessary cup or spoon, or the hurry of a critical moment for want of a dish or an ingredient that should be right next at hand.

There are in cookery, as in all things, three definite stages of doing; and they are the stages of the children's play-rhyme:—

"One to make ready;
Two to prepare;
Three to go slambang,
And there you are!"

If you can make ready and prepare, you can go slambang with the most delicious confidence.

There are no fancy or hearsay recipes in this manual of examples. Neither are there any so closely duplicated, or so superfluous, as to perplex you in your choice, or be needless in your regular repertory. You may begin with "Yeast," and cook through to "Cider Apple Sauce," with perfect reliance. Having done so, in such order and combination as you found convenient, you will have set forth from time to time, in your results, just such a fair, simple, palatable, and sufficient variety of food-preparations as befits most family tables, from which you may form a comfortable bill-of-fare for the year round. By the same progress, you have become, in like degree, a capable journey-woman at your trade."

The Dinner Year-Book. By MARIAN HARLAND. 713 pages. Price $2.25. New York: Scribner's Sons.

THIS book will be most acceptable to many a housewife whose life is burdened by the eternally recurring question, What shall we have for dinner? The colored plates (a new departure in cuisine literature) serve not only to embellish the book, but they illustrate the text. The author says, that there have been dinner-giving books published, that is, books of *menus* for company dinings, "Little Dinners" for especial occasions, etc., etc.; but that she has never yet met with a practical directory of this important meal, for

every day in the year. In this volume she has furnished the programme in all its details, and has superintended the preparation of each dish, proceeding even to the proper manner of serving it at table. Yet large as is the variety in a book so extensive, there has been no yielding to the temptation to extravagance. The book has been prepared for the family, for the home of ordinary means, and it has hit the happy line where elegance and economy meet. The most simple dishes are made dainty and inviting.

The Art of Flower Painting. By Mrs. WILLIAM DUFFIELD. With twelve illustrations by Dalziel. Edited by Susan N. Carter. New York: G. P. Putnam's Sons.

This little volume will be found of great service to all who are in any way interested in that most beautiful of arts, painting in water-colors, and a glance through its pages will stimulate many to attempt a little in this line. The suggestions are clear and practical, and it is to be hoped, now that ladies have recovered from the mania for pasting tinsel, gauze and coarse pictures on blacking-bottles and tomato-cans, they may be induced to turn their attention to something which will be truly art work.

Fourteen Weeks in Physics. By J. DORMAN STEELE, Ph.D., F. G. S. New York: A. S. Barnes & Co. Price, $1.25.

This work is designed mainly for the use of those beginning a course in Physics. It is fully illustrated and contains much that will be of interest to many beside students. As the author claims, the work "has grown up in the classroom," there is little doubt but that teachers will find it a valuable assistant.

Francis Murphy's Gospel Temperance Hymnal. Price, 50c. New York: A. S. Barnes & Co.

MANY of the hymns in this collection are new, some are old favorites, and altogether it is a most attractive book for use at prayer and temperance meetings. There are, in all, one hundred and fifty hymns, arranged with music.

MAGAZINE NOTES.

ST. NICHOLAS for December whets the appetite for more. There is just enough of ante-Christmas flavor about it to let you know the merry season is near, and to assure you that the real Christmas number of St. Nicholas is yet to come.

The December number has eight extra pages and fifty pictures, and begins with a poem of home-life that sings itself into the heart.

There are several short stories, the most attractive of them being those retold by T. F. Crane from the versions familiar to Italian children. They are the dear old fairy tales that everybody knows and loves, but in strange Italian dress, and delicately illustrated by Alfred Fredericks. Mr. Crane also explains from what ancient sources come these beloved stories.

Young students of German are presented with a short legend in that language, for them to turn into English; and Very Little Artists are supplied with white-line pictures to be copied upon their slates.

The serial story, A Jolly Fellowship, by Frank R. Stockton, carries its readers through a "jolly" installment of fun and travel in the sunny southland. Half a Dozen Housekeepers, with their winter fun and frolic and laughable scrapes, continue, and the text is enlivened by three fine pictures from the pencil of Frederick Dielman.

SEVERAL articles in Lippincott's Magazine for December will be found of special interest to different classes of readers. All who have made mechanics an object of study, theoretical or practical, should read Edward H. Knight's lucid description of the machinery exhibits at the Paris Exposition, which is accompanied with cuts of some of the most striking and novel specimens. Every one who cares about art will find a masterly, yet not too technical, analysis of the characteristics of the different schools of the present day in Some Aspects of Contempoary Art, by M. G. Van Rensselaer. Those who care to know something of what Spain is doing in the way of literature, and indeed general readers as well, will be charmed with Professor T. F. Crane's account of A Spanish Story-Teller. Edward King writes pleasantly of Danubian Days, with the aid of many good illustrations, and Isabella Anderson, a resident of Venezuela, gives a graphic account of the great earthquake which destroyed some of the fairest regions of that country in the spring of the present year. For Percival is concluded in this number, which is, we observe, enlarged to admit of its completion with the year. Miss Olney's Through Winding Ways grows steadily in interest; Sister Silvia is the title of a very touching story, and the poems and shorter papers are numerous and diversified.

THE December Scribner contains fiction by four of the leading American novelist, viz: Mrs. Burnett's Haworth. The Great Deadwood Mystery, by Brete Harte, a complete story in a semi-satirical vein. An Irish Heart, a pathetic Oldport story by T. W. Higginson, and the fifth installment of Mr. Boyesen's Falconberg.

The illustrations of Dr. Brewer's fourth paper on Bird Architecture (The Humming-Birds) are regarded by the managers of the Monthly as among the most exquisite cuts yet published by the Magazine. The Cliff-Dwellers, by Emma Chamberlain Hardacre, embodies the latest discoveries regarding the ruins of the San Juan region (some of which are situated in the rock at a hight of 700 feet), and is written under the sanction of Professor Hayden. The Douglass Squirrel of California, has found a friend in John Muir, who writes with enthusiasm and with rare knowledge of this little forest-planter. Mr. Bolles draws some Indian boys using the Douglass as a target for archery-practice. There is also a sketch of Dora D'Istria the eminent philanthropist and social writer of Wallachia, with a portrait after Schiavoni.

In public discussion there are some timely papers by experts; The National Bank Circulation, by Professor W. G. Sumner: Are Narrow Gauge Railroads Economical? by Lorenza M. Johnson, an engineer who has built both broad and narrow gauges, and a painter's view of Art at the Paris Exposition.

Dr. Holland discusses The Prudential Element, Literary Materials and Tools, Social Needs and Social Leading, Home and Society has a second installment of Hints to Young Housekeepers, and an account of The Maternity Society. The World's Work has descriptions of new appliances, including Street-car Motor, New Electric Lamp, Improved Ironing Machine, Improvement in making Artificial Stone, Automatic Device for Reproducing Music, etc.

SCIENTIFIC AND USEFUL.

A GOOD waterproof cement is made by dissolving five parts of gelatine in hot water, and adding one part of chromate of lime; the cement must be kept in vessels which are well shielded from light.

THE Suez Canal, among its other curiosities, presents the traveler with the extraordinary spectacle of vast flights of flying-fish, which at times suddenly appear in the vicinity of the vessel and as suddenly disappear.

THE reason that milk boils more readily than water is because it is a thicker liquid, and consequently less heat is carried off by evaporation of steam; therefore the heat of the entire mass will rise more rapidly. Again, there is a thin skin which forms upon the top of heated milk, which of course confines the steam, and increases the heat.

THE principles of acoustics are but poorly understood. As a general rule the ceilings of halls and churches should be at a moderate elevation only. Sometimes the hanging up of flags or draperies will improve the acoustic properties, sometimes a hood or false ceiling becomes necessary. The whispering gallery of St. Paul's, London, offers an interesting example of one of the principles of acoustics.

THE article known as vegetable isinglass, and which has hitherto been derived from eastern Asia, is now extracted from French factories. It is, in its crude state, a yellowish gelatine, but which, after repeated experiments under the auspices of the Industrial Society of Rouen, has been successfully converted into what bids fair to prove the best sizing for cotton cloth known. Macerated in water for twelve hours, boiled for fifteen minutes, and stirred till it is cold, the article gives a clear solution, which, as it does not again become a jelly, can be laid in its old state upon any textile fabric, and be left to dry. One invaluable property it possesses is that of defying, at common temperatures, damp and mildew, and is therefore being applied to give luster not only to French prints and muslins, but to woolens and silks.

TREATMENT OF CHRONIC ALCOHOLISM.—In reply to a question in the British Medical Journal for May 4, p. 669, regarding the best treatment for the tremors of chronic alcoholism, and a substitute for the constant craving for drink which exists, Dr. Lauder Brunton recommends fifteen minims of tincture of perchloride of iron, with ten minims of tincture of nux vomica, as most efficacious for the tremors, combined with bromide of potassium if restless at night. The chalybeate mixture, either alone or with the addition of tincture of capsicum (five or ten minims), relieves the craving for drink, for which purpose also a mixture of carbonate of ammonia in infusion of gentian is valuable. If there be derangement of the stomach, it should be treated by ten-grain doses of sub-nitrate or carbonate of bismuth, with magnesia and tragacanth.—*London Med. Record.*

AMONG the hosts of catarrhal specifics that almost annually are pressed upon those who are inconveniently aware that they possess noses, we acknowlege the presence of a stranger which is spoken of by "New Remedies" as follows: "Among the new remedies for catarrh, cold in the head, sore throat, foul breath, asthma, and all bronchial affections, the smoking of a preparation, of which cubebs forms one of the principal ingredients, seems to have been received with great favor by the medical profession and the public, and is rapidly coming into general use. It can be smoked in an ordinary pipe with ease, comfort, and even pleasure, as well by the ladies and children as by the men of the family, and a direct cooling application is made to those parts which are found irritated in catarrh and other diseases mentioned. Those who have tried this remedy, (Marshall's Prepared Cubebs), say that after smoking one pipeful of it, the worst cases will experience immediate relief, and a permanent cure may eventually be effected by using it according to directions.

THE WOMAN'S CLUB.

AMUSEMENT FOR THE LITTLE FOLKS.

WHAT shall I do with my little ones to amuse them during the cold days which are hastening on us? you ask Some day when you are very busy give wee little Bess (who can just sit alone) a feather, be sure her fingers are a trifle sticky (as most babies' are); then see how she will amuse herself by pulling it from one hand, only to find it adhere just as closely to the other. It will entertain her for a long time, and Julia who is older can make bubbles with a pipe. No matter if she does wet her apron, let her enjoy herself. It is difficult for adults to be content unless employed, and what can we expect of these little active minds and spirited bodies unless engaged in some busy occupation. They must be diverted, and many simple things will interest them for hours at a time. Let them string button molds, build block houses, watch the sand in the hour-glass or give them geograpical puzzles to place together, and they will be instructed as well as entertained.

All of us can remember when visiting, how lonely and weary we were because of nothing to do. Let these little ones all have something to do, and make it your study, for if you do not find something for them, Satan will.

When visiting recently, the little daughter of my hostess came into the room, her pinafore cut to pieces, and holding the scissors, behind her. "Mamma, see what naughty scissors did" said the little culprit.

"Child what have you done" said the irate mother, "why did you cut your apron thus?" And, taking her rudely by the arm little Miss was thrust—not gently—into an adjoining room, there to await her punishment.

"My friend" said I "you know I would not interfere in the government of your child, but in her absence let me remind you that she came to you asking for some paper to cut, and you cast her aside. Had you then given her something to do, the tempter would not have enticed her into mischief."

Listen to the wishes of the little ones, do not put them off till they can be taught to remember that older ones must be cared for first, and instead of slapping the little hands, even when erring, kiss them when they have done well, and refuse the kiss when they have been wicked. Soon you will see that the kiss would do for them what unkind treatment never would. Learn the great luxury of doing good, and, sisters, think more of brightening the lives of the little ones given to your keeping than of using the rod to to enforce obedience. God pity the mother who cannot govern herself! how can she rightly govern her child? Do not wait till the little hands are at rest to fill them with flowers, or till the loving hearts are still ere you bestow the words of endearment and praise. They will fall more sweetly on the listening ear than on the closed coffin lid. Fill their lives with sweetness now while you may FERN LEAF.

USEFUL AND USELESS HUSBANDS.

THE average husband is conceded by all intelligent wives to be utterly useless when at home. He may be acute and skillful at his business, and he may be an affectionate husband and father, and when there is anything to be done in the house in the way of repairing furniture or improvising cheap substitutes for bedsteads or mop-handles, he is of less value than his own little boy, who often helps his mother. While this is undoubtedly true of most men, there is occasionally found one whose delight consists in constantly practising as an amateur cabinet-maker plumber or carpenter. He often prowls about the house, seeking articles upon which he can use a little glue or varnish, and devising plans for filling up the corner of the dining-room with a few triangular shelves, and for putting up a wooden mantle-piece in the hall bedroom. The sound of his saw and hammer are heard often, and he goes to bed at late hours, with more paint adhering to his fingers than his wife regards as strictly necessary.

It is a curious illustration of the perversity of the female sex that a husband with this fondness for doing little useful things is held among wives to be even more undesirable than the kind of husband who is perfectly useless. He is charged not only with a fiendish fondness for late hammering, but is constantly upbraided because he "makes so many chips." In vain does he explain that planing a board necessarily results in chips, and that saw-dust is the inevitable consequence of using a saw. He is told that he ought to be ashamed of himself, and that no decent man would think of making chips all over the floor. These things, however, never dishearten a husband of an active disposition, who cannot possibly find enjoyment in sitting at home and doing nothing at all; to him the little domestic jobs are a relaxation, especially when the nature of his daily routine business is of another kind; and we earnestly implore wives who happen to have such husbands to be indulgent toward them, as they are really of more value to them and their children than those who, when at home, do nothing but fill their rooms with tobacco-smoke.

JOHN LYNN.

LIFE'S CHEERY AUTUMN.

RUTH.

I WISH that any one who fancies life at forty is necessarily gloomy, would read the noble sermon by that most noble man, Albert Barnes, on "Life at Four-score." Such cheery, inspiring, heavenly views are good for body and soul. With good health and even measurably easy circumstances, forty may be the very golden autumn of life. The little children are probably now grown and sound sleep can prepare one for the day's duties, and helpful older ones relieve the mother from many cares. A good woman in any neighborhood has an assured position, and is prized in any community; and this last adds not a little to the pleasantness of one's condition. She has time now for small, neighborly charities, which bless her own soul even more than those to whom she ministers. Do not dread the fortieth milestone, because the bloom will depart. Many a woman is far more charming at middle life than she was in the rosy flush of youth. Wisdom, the result of experience, and a thoroughly kind heart will make a wrinkled cheek and silvery hair more beautiful than the fairest face which has the "crow's feet" of a sharp temper, or a sinful, censorious spirit. It is ourselves, and not our age, that will make us happy and admired, and better still, beloved.

Do not adopt the gloomy view even when you have gone still further on the journey. As Linda gave us a verse on "Forty Years," let me give you another on a still later age:

"Just sixty-two! Then trim thy light,
And get thy jewels all re-set.
'Tis past meridian, but still bright,
And lacks some hours of sunset yet.
At sixty-two be strong and true,
Scour off thy rust and shine anew.

"'Tis yet high day, thy staff resume,
And fight fresh battles for the truth;
For what is age but youth's full bloom,
A riper, more transcendent youth.
A wedge of gold is never old,
Streams broader grew as downward rolled.'

Above all, to have the way seem glad and bright as we go down life's sloping hill-side, we need to have it lighted from the cross of Christ. This can gild the darkest clouds that ever brooded over our earthly path, and it will light us through the low-lying valley which stands at the end of the way.

ONE REASON WHY SOME WOMEN ACCOMPLISH MORE THAN OTHERS.

LEOLA.

WE are always being told that Mrs. So and So, with a large family and a large dairy, manages to keep her house in admirable order, besides finding time to read all of the newest books, as well as to visit and entertain, while Mrs. Somebody-else, who has only a small family, and but one or two cows, has an untidy house, and although she works incessantly, she never has any leisure, for reading or visiting. One of the latter class once said: "I was wishing last night that we had more cows, so that I could have more butter to sell. Father said that he could not see the sense of people killing themselves to earn something, and that I worked all of the time now. I did not say anything, for I knew by experience that it would do no good. But I thought over my day's work. First, I moved a bedstead; it was an old-fashioned cord-bedstead, with one side broken at that; the cord was in three pieces, and I was an hour taking it down; when I put it up the broken side would slip out, and it took me an hour to get it up. If I'd had a decent slat-bedstead it would not have taken more than fifteen minutes to have moved it. Then, I worked three hours washing wood-work that would not have needed any washing if there had been netting to keep out the flies Next, I sat down and sewed two hours by hand and did not accomplish as much as I would have in twenty minutes with a machine. That makes six hours and ten minutes lost time in one day, and it is just that way every day. I think if I should do dairy work six hours every day all summer I would make butter enough to pay for more than one sewing machine."

I thought so, too.

A HOME CHAT.

A FEW months ago I was made glad by reading in the dear, old RURAL the proposal for a "Woman's Club," a corner where we might exchange experiences for our mutual benefit, and now that the club is fairly established, it remains with us to make it interesting and readable.

The October meeting of the Club was burdened with the drudgery of house work, particularly dish-washing. I have done house work nearly all my life, and am now keeping my own house and doing all my work, besides caring for a dear, blue-and eyed baby, I consider it more independent and less wearing than either teaching or dress-making. I began washing dishes so young, that I was obliged to stand upon a stool to reach the dish-pan, and yet to me there is something really enjoyable in the washing of a big pile of dishes, with plenty of hot, soft water, good soap, and a clean, soft cloth. The crockery looks so nice after being polished with a dry towel.

Won't some of the many women who are striving after perfection in the art of housekeeping and home-making, give their experience?

I have nothing, I believe, that I can exchange; but I have patterns for a complete suit of infants' clothes, a night-dress, a yoke-dress, robe-dress, a morning-wrapper, and a shirt and bib; six patterns in all, which, if anyone would like, I will send to them for 12 cents, to pay postage and trouble of cutting the patterns. M. E. R.
P. O. Box 169, Phelps, N. Y.

"GIVE YOUR GIRLS A CHANCE."

AUNT FLORA.

IF one has never taught her little daughter to dress her own dolls, as well as to make little quilts, sheets, pillows and shams, she can have but little idea of the benefit of such instruction. Little girls desire to have their dolls dress neatly, as well as fashionably, and if they are shown how to make the garments and furnished with suitable material, they will do it themselves, at an early age. I knew a little girl who often astonished her mother with a new, stylish hat for her doll, which she had made from scraps her mother had given her. In this way she learned to fit and make the wardrobe for her doll, and when her doll was laid by she began making her own clothes, so that at the age of fourteen years she could make herself a suit throughout.

When I see mothers sit up half the night to dress dolls for their little girls, I cannot but think, what a pity mothers will not be wise and teach them to do it themselves! The children would really enjoy it better, as it makes their little fingers skillful, and they feel such an interest in having each doll look as neat as those owned by their playmates. I know this to be the case. Will not some one try it and report for the benefit of other mothers and daughters?

Domestic Economy.

CONDUCTED BY EMILY MAPLE

PEN THOUGHTS FROM EVERY-DAY HOUSE.

BY ANNIE L. JACK.

"WELL, girls, I wonder if all mothers have such a time with mud as I do," I said in despair. For Willie had brought in the milk by the passage door, and forgotten to wipe his feet on the mat, and Jim, whose work it was to carry the wood in, left his mark from the kitchen door to the wood box. I was turning over my scrap-book in search of a recipe for citron preserves when speaking, and my eyes caught a verse that checked my murmuring. It was the sorrowfully spoken regret of a mother for her lost boy and I read:

"I wonder so that mothers ever fret
At little children, clinging to their gown,
Or that the footprints, when the days are wet
Are ever black enough to make them frown."

Ah! well, mud is bad enough, but health and strength are best; besides, if boys know the care and toil their mothers undergo to clean the floor, they will soon learn to be more careful. It is an excellent lesson for a careless boy to present him with a bucket of clean water and a cloth after some particular act of careless walking, and let him wash the floor he has soiled. A few such lessons will soon teach him to remember the mat. It is very often the case, too, that other members of the family give themselves work by thoughtlessness, and a little attention to spilling water, or needless going out and in, would prevent a great deal of dirt, of which we complain.

While I moralized on the subject, the citron was cooking slowly in the steamer after being pared and cut up into squares, and a sirup of sugar and water was boiling on the stove. When the pieces of citron had changed color, turning from a dull white to a watery hue, they were left to cool a few moments and then, with a few pieces of candied peel and a teaspoonful of essence of lemon, the citron is put into the sirup, and slowly boiled. We know when it is ready to be taken out by its transparent appearance, and then the jars that have once this season been filled with strawberries which have been used early, are again in requisition. The sirup is boiled a few minutes longer, and then poured over the fruit. It looks well and the critics of the family jars, say, "tastes a great deal better."

Just now it is impossible to settle down to anything of importance in the house. There are so many little things to finish out-of-doors. To-day it is some Pansies to be removed to another part of the garden; yesterday some late Hyacinths must be planted; and the white raspberry vines must be gently laid upon the ground and covered with a shovelful of earth, to keep them in safety till the snow gives a warmer blanket. The boys revel in the glints of sunshine, and chase each other over the orchard in search of any stray apples that may have escaped their numerous raids, and if by chance a choice one is found among the frosted grass, be sure it will be brought in and shyly given to *mother*.

KNITTING WORK.

As long evenings put in an appearance, we begin the winter campaign with the everlasting knitting work. Oh! who invented knitting? and to use the words of "Josiah Allen's wife," "again I ask wildly," who invented it? It is a useful occupation, and a blessing almost after all, especially for the dear old fingers that find other work too hard. But oh! the endless loops of the endless rows of endless stitches. But as we must accept it, we will try to find something interesting in it. I know of a grandmother who colored a skein of woolen yarn with butternut bark, and knit it in strips for stockings belonging to little six-year-olds with a beautiful magenta, colored with Leamon's aniline dyes. They were so pretty that I never once heard—"Will they *ever* be done!" In fact, we might put a seven-line advertisement in the RURAL concerning "knitting made easy." But instead of any kind of a machine, I would recommend bright colors and new ways of specking, striping and dotting, to cheat the monotony.

After the knitting comes darning, which many regard as an especial nuisance, only to be got along with by hustling over it with all possible dispatch, no matter if heels and toes *do* look like puckered-up ruffles, only get it out of the way. But I don't believe a woman feels quite satisfied unless her work looks well, after all. A glass egg, or, better still, a round ball, is excellent to darn over, making the work look smooth and even, and I know a lady who always "darns" biasing. And I would say to all darning women, "try it—you will find almost a pleasure in the work from the happy results. AUNT EM.

COPPERAS.

ONE pound of copperas (sulphate of iron) dissolved in four gallons of cold water, makes a good and cheap deodorizer. Pour the liquid into the waste-pipes of sink and drain, not forgetting to give the cellar a light sprinkling close to the walls. Sprinkle from a common tin watering-pot, and be careful in handling, as copperas stains badly. In very warm weather everything about the premises needs more than ordinary care. Perfect cleanliness should be the rule for the dwelling, barn, poultry house, etc. Bones, decayed fruit, and the like, ought never to be thrown near the house. Such objects are unsightly, and, worse than that, they make the air impure, tending to cause disease. The pails used for the refuse of the kitchen should be rinsed often with copperas-water, and left out-of-doors over night. Many housekeepers keep chloride of lime in the cellar, and though an excellent disinfectant, its suffocating odor makes it objectionable. With these simple agents at hand, it is easy to have the atmosphere in and about our dwellings healthful and pure.

Iowa. MRS. M. G. R.

DOMESTIC RECIPES.

Delicate Apple Sauce.

Pare, halve and quarter a sufficient quantity of nice stewing apples; put them into a baking dish and cover thickly with sugar—bits of lemon peel may be added, if liked; put a plate over the dish and set it into a pan having a little hot water in the bottom, and place in a hot oven. Bake until the pieces are clear and tender.

Cranberry Sauce.

I usually "plump" the cranberries before stewing by pouring boiling water over them and letting them stand until the water is cold. For one quart of berries I allow one pint each of water and sugar. After adding the water, which should be hot, let it boil twenty minutes; then add the sugar and boil ten or fifteen minutes longer. Stir the berries often, mashing evenly. When done, the sauce may be strained into a mold or bowl, and when cold, cut and served in slices, or poured into a sauce-dish and served the commoner way.

Snow Potatoes.

I dined with a friend last week where potatoes were brought on the table in an unusual form to me. They made a delicate, appetizing dish, and I will append my friend's simple directions for preparing: After the potatoes are boiled and steamed off, rub them through a colander, where they will drop below in coiling strings, heaping themselves in a light and airy mass. Serve at once. MARY B.

Genuine Boston Brown Bread.

Sift together three teacupfuls of Indian meal; two of rye meal, not flour; one of wheat flour; a teacupful of sirup or molasses; a teaspoonful of salt; mix with one quart of sweet milk in which one tablespoonful of soda has been dissolved. Bake four hours in a moderate oven in a covered pan.

Dish-Washing.

Why do all the housewives make such an ado about washing dishes? There are many other things more disagreeable to do. All that is needed is plenty of soft water, just hot enough to bear the hands in, and enough soap so as never to let the water get greasy—if it should, turn it away, and get clear—with soft, white, sweet towels, and a good dish-cloth—not a rag.

Florida. MRS. M. B. ROLFE.

Lemon Cake.

Three cups of sugar; one and one-half of butter; one of sweet milk; a teaspoonful of soda; four eggs; six cups of sifted flour; the grated rind of a couple of fresh lemons, and the juice of one. Stir the sugar and butter to a cream, then add the eggs beaten to a froth, and half of the flour. Dissolve the soda in the milk, and strain it in; add the remainder of the flour. When the whole is thoroughly mixed, add the lemon juice and rind, and stir it for several minutes. Then bake it in buttered pans in a quick oven.

Cold Meats.

Cold boiled ham, or any cold boiled meat or fowls, can be made into very dainty dishes by mixing cold boiled potato with the meat after it has been chopped fine; season with salt and pepper, and moisten with beaten eggs; make up into balls, roll in beaten eggs, then in rolled cracker, and fry in butter or fat. Serve as soon as done.

How to Cook Rice.

Soak a cup of rice for several hours in cold water; then cook slowly without stirring it, till perfectly tender. Be careful to have as little water left as possible. Add one pint of rich cream, one cup of white sugar; three eggs and lemon to taste. Let it boil up two or three minutes, and it is ready to dish up.

Cranberries.

To keep these berries whole while stewing, prick each one with a pin; lay them in sugar over night, and cook very slowly. They cook much nicer in this way than when stewed all to pieces. LORETTA E. K. TURNER.

News of the Week.

Monday, Dec. 2d, 1878.

POLITICAL.

There is little or no political news of importance or interest this week. The reaction after the late excitement during the elections is now keeping even politicians moderately quiet. There is, however, a world of rumors with regard to the constitution, action and management of the next Congress, but it is hardly worth while to repeat such reports this week, in order to have to correct them next. Political papers, of course, find it absolutely necessary to employ such trickery to fill their columns, and keep up interest enough in their contents to obtain buyers; but the RURAL is so interesting everywhere that it disdains to have recourse to such expedients.

MISCELLANEOUS.

Dispatches from the West say a tremendous snow and sleet storm prevailed on Saturday night along the line of the Missouri Pacific Railroad, west of Otterville, and extended into Kansas. The telegraph line was torn down on the Pacific road, Kansas City was entirely isolated telegraphically, and the whole surrounding country is buried in snow.

Senator Davis of the Judiciary Commitee will report in the case of Surgeon Draper, restored to the navy by order of Secretary Thompson, and of Major Runkle, restored to the army by order of President Hayes—that neither had a legal right to restore. It does not appear, however, that the present position of either one of these officers can be affected by these reports, even if adopted as the opinions of the Senate committee. It is said that the administration will hold that under the tenure of office law Merritt, whom Hayes appointed Collector at this port, *vice* Authur suspended, will hold office till March 4, whether the Senate confirm him or not. In any event Mr. Authur will not be permitted to resume the office till that date, when the power of suspension will again rest with the President.

The Stewart grave robbery will undoubtedly result in greater precautions for the protection of the remains of the dead. Some of them are heard of already. The grave of Mr. Powers, the ten-millionaire who died last week at Philadelphia, will be watched by night and day, four men being employed. To the tombstone will be attached a key to a watch locked in a case which the men on guard will carry. The watch must have the key at the grave inserted every half hour, and it will be inspected twice a day to see whether it has been carried to the grave at the intervals required. Vanderbilt's grave in this city is now also watched nightly. Meanwhile all the efforts of "the finest police in the world" to discover what remains of the body of sixty-million-dollar Stewart are unavailing—perhaps, because the detectives, like the thieves—their frequent friends—are waiting for heavier rewards and immunity for their "pals." What is the sum of $50,000 divided between a dozen first-class thieves and second-class policemen in payment for the trouble, thought and risk incurred in getting away with the "sacred remains," which became "sacred" only when they became useless except for purposes of extortion?

It is claimed that under the amended Virginia constitution legislative sessions must be held biennially, and that its assemblage next month would be unconstitutional. The treasury is said to be empty. A Legislature would cost $150,000. At Richmond, Va., commissioners from various States interested in the erection of the Lee monument decided not to award a contract at this time, owing to the insufficiency of funds in the treasury of the Association. The matter has been indefinitely postponed. At Memphis, Thursday, a public meeting of returned citizens adopt resolutions expressive of gratitude to the President of the United States and public and private individuals, associations, etc., who contributed so generously to the aid of the stricken city during the epidemic, while they were in safety elsewhere.

Commissioner Raum states that it is a remarkable fact that while the authorities in the southern States are ready to proceed rigorously against revenue officers who commit offenses against State laws, no hand is raised to punish crimes of the most outrageous character against the persons of United States officials. Between 25 and 30 revenue officers have been murdered or wounded in the discharge of their duty in the southern States during the last two years. With only a single exception, and that in a republican district in East Tennessee, no indictment or arrest has followed.

The Marquis of Lorne and his wife, the Princess Louise, have been making a right royal progress from Halifax, Nova Scotia, to Ottawa, Canada, having been greeted everywhere along the route with enthusiastic loyalty. This is easily pardonable in Canadians, for a provincial is always disposed to become a flatterer of any offshoot of royalty, but it is apt to give rise to a feeling of contempt to see some of the most prominent of American daily papers containing column after column of telegrams detailing, with sycophantic minuteness, all the sayings, doings, etc., etc., *etc.*, of this worthy couple and of their obsequious entertainers. Pshaw! No sort of toad-eater has such a glutonous appetite as a free-born American citizen of the tuft-hunter type.

From the book of estimates which the President will transmit to Congress, it appears that the Commissioner of Education asks an increase of $18,000. The Commissioner of Agriculture recommends an increase of $1,000 to his own salary, and an increase of $100 each for five other officers, and $200 each for two more. He also recommends the appointment of three assistant chemists. There is an increase of $18,000 asked for by the Department of Justice, but none of this is in the fund used for such prosecutions as those now in progress in the South. The funds required for this purpose are under the head of United States Courts, and the increase asked is $260,000. Of this sum a considerable portion is stated in the text to be for defraying the expenses incurred in the enforcement of the act to protect the right of citizens of the United States to vote in the several States of the Union. Upon this item and the corresponding one asked by the Commissioner of Internal Revenue, a great political battle is expected to take place in each House.

Mrs. Lockwood, the female lawyer of the District of Columbia, whom Judge Magruder, of the seventh judicial circuit of Maryland, characterised as a wandering woman and forbade to speak, not only in his court, but in his court house after the court had adjourned, intends to test the question of her right to practise in the Maryland courts. The federal courts in Maryland, it is said, permit her to practise before them, but it is doubtful if the State courts will be found as liberal.

FOREIGN.

The following news with regard to the grain crops in England was cabled last Saturday: During the earlier portion of last week the weather was cold and boisterous. The excessive rainfall caused serious floods in the Midland and Eastern counties. Large tracts of land were submerged and enormous damage was done to stock and property. Toward the middle of the week the waters subsided to a great extent and a normal temperature has since prevailed. Some little progress has been made with agricultural labor. The supplies of home-grown wheat continue very moderate in both the Mark Lane and Provincial markets, but, taking all things into consideration, the present aspect of trade appears to be sufficiently sound to justify the farmers in withholding their produce as long as possible, and the continuance of light offerings indicates the expectation of better prices later on. Business has been restricted owing to the impaired condition of most of the samples, it having been quite impossible to thrash with satisfactory results of late. The absence of speculation has been largely felt in the grain trade, and the spirit of commercial enterprise has been broken by the severe financial vicissitudes through which the general trade of the country is passing, but brighter days for the merchant and agriculturist may be looked for with the new year.

The law passed by the Brazilian Legislature in 1871 for the gradual emancipation of the slaves, declared that all children born of slaves after the date of the passage of the law, should be held in all respects as though born of free mothers. The bill provided that the owners of the slave mothers should have the care of the free-born children up to their eight year with their gratuitous services until the children are twenty-one years of age; or the option of $36 annually during thirty years for each child attaining eight years. In this last case the minor is to be at the disposition of the State, but a part of his wages will be paid to him when he reaches his majority. It was believed at the time of the adoption of the measures that the cost to the State for compensation and carrying out the provision of the law, would be about $800,000 annually. The Government is now preparing for the free-born children which will come under its care in next September or next year. The actual number is not accurately known, but in the province of Rio de Janeiro, where there are 570,000 slaves, the number of children born free since September, 1871, is 62,000 of whom 18,300 have died. It is estimated that, at the same rate, there should now be in the empire 248,000 of these children, and that of those the Government will have to receive and care for 26,000.

The population of European Russia is estimated at 77,000,000, about 64,000,000 of whom are peasants. According to official reports there are only 29,308 primary schools, and 1,152,713 scholars. The amount of money appropriated in 1877 for instruction was $30,000,000. The constant cry of the minister of finance when applied to for money for schools is said to be: "The State coffers are empty." The Golos publishes a budget for 1877. It shows that the revenue was 549,000,000 roubles, and the expenditures 1,014,000,000 roubles—nearly half on the army. The czar will arrive at St. Petersburgh to-day. General Kauffman is expected to arrive at the same time, and the action of the Russian Government with regard to the war in Afghanistan will be decided in a great measure by his report. 'Twas he who had command of the successful Russian expedition, three or four years ago, against Khiva, and since then he has been in command of the Muscovite forces in central Asia, and knows more about matters in that quarter than any other Russian.

Last Tuesday, shortly before 12 o'clock at night, the Hamburg-American steamer Pomerania, on her way from New York to Hamburg, after having touched and landed some passengers at Cherbourg, in France, was proceeding towards the Downs, in the English Channel, when she was run into by a coasting bark called the Moel Ellian, and sank in twenty minutes. Out of 111 men composing the crew, 108 were saved, while about 78 passengers are reported to have been lost—upwards of two-thirds of the whole list. The night is said to have been foggy, the vessel going at ordinary speed—about 14 knots an hour—and a bright look-out kept, yet, although it was the captain's 126th voyage across the Atlantic, he could not save those committed to his charge from so terrible a calamity.

A New York Daily gives a list of the ocean steamers wrecked during the past twenty-eight years which, though palpably incomplete, is startling in its aggregate of lives lost—3,730. The vessels named number thirty-two, and among the wrecked steamers not named, occur to my mind the Schiller, Deutschland, Abbotsford, Russland, Colombo, Europe, City of Washington, City of San Francisco, America, Japan, Bramall, Hermin Ludwig, a Guion vessel, the

Idaho, if memory fail not—and others on various oceans whose names are forgotton. The loss of life by the Schiller was larger than by any other of the wrecks here named—something over three hundred. The Columbo sailed from New York less than two years ago, and was never heard from. The Ludwig is now so long overdue as to be given up for lost. A correct list of all the ocean vessels lost during the time specified, would present an appalling aggregate of fatility.

Angell, the Chicago defaulting secretary of the Pullman Car Company, has been arrested at Lisbon as an Englishman, under the name of Seymour. He is on his way home a prisoner. Out of the $125,000 he stole, $80,000 were found on his person. Most defaulters become so through speculating at first with money not their own, losing, and gradually sinking deeper into debt and dishonesty. Angell, however, is merely a common thief, uncommon only in the amount of his theft.

The British attack upon Afghanistan is made in three columns, which are intended to penetrate the territory of the Ameer by the three principal trade or caravan routes and to divide his defensive resources. The principal column, consisting of 16,000 men, and under the command of Sir Samuel Browne, was collected at Peshawur, and has already won a signal battle in the capture of the Khyber Pass and Fort Ali Musjid. This fort was the frontier post of the Ameer, and is distant from Cabul, his capital, about one hundred and fifty miles. The second column of 6,000 men, under command of General Roberts, has crossed the frontier at Thul, and is advancing up the Koorum valley, with Ghuznee as its objective point. The latter city, which was stormed by the British in 1839 and again captured by them in 1842, is very near the heart of the Afghan territory and about eighty miles southwest of Cabul. The third column, 12,000 strong, commanded by Donald Stewart, is advancing from Quettah, the frontier town in the Khanate of Beloochistan, in the direction of Candahar, two hundred miles beyond which, is the large town of Herat, near the Persian frontier. The Ameer is said to have under arms 100,000 men, good but undisciplined fighters. Among them is a large number of Russian volunteer officers, who will doubtless be of as much service against the English as a similar class of the latter, in the Turkish army, were against the Muscovites during the late war. Cablegrams received this morning seem to indicate that the British advance will not extend beyond seizing the Mountain Passes until milder weather in early spring.

Our transatlantic cousins for years, nay for generations, have taken a good-natured (?) pleasure in twitting us with dis——well, not altogether upright dealings; but we have never had a bank so outrageously mismanaged as the Glasgow Bank, and seldom have we had among us so disgraceful a bankruptcy as that of Smith, Fleming & Co., mentioned here in October. An approximate statement of the affairs of this firm shows gross liabilities $14,557,425, but only $8,132,975 of this is expected to rank against the estate. The assets are $1,426,915, or less than 17 cents on the dollar, and after the costs of liquidation are paid, it will not yield 10c. on the dollar. The Times says one of the partners stated that the house would have stopped long ago but for the intervention of the manager of the City of Glasgow Bank. Whoever may be responsible for it, this failure must be ranked among the most disgraceful and disastrous of our time.

A SPECIAL meeting of the N. Y. State Farmers' Alliance will be held in the Court House, in the city of Binghampton, on Thursday, Dec. 19th. Specific measures of reform in Taxation, Transportation and Insurance will be discussed, and also the best plans for extending the Alliance organization through the State. It is desired that all Agricultural Societies in the State be represented, and farmers should be present in as large numbers as possible. A special invitation is extended to members of the State Dairymen's Association to remain through the meeting.

The proposition of State Assessor Jas. A. Briggs, to assess only real estate for purposes of taxation, should receive an effective protest from the farmers and real estate owners of New York.

By order of the Ex-Com.,

Wm. J. Fowler,
Sec'y.

PUBLISHER'S NOTICES.

OUR readers are requested to read the following before making up their orders for seeds:

Any ten of the following require a one-cent postage stamp:

The Voorhis Water-melon.
Golden Rural Tomato.
Acme Tomato.
New Bronze Ricinus.
Hibiscus moscheutos.
Callicarpa Americana.
Chater's Lemon Hollyhock.
Weigela.
Dentzia crenata fl. pl.
Hibiscus militaris.
Eryngium Leaveuworthii.
Geranium sanguineum.
Yucca filamentosa.
Vitis heterophylla.
Rural hybrid Aquilegia.
Grindelia squarrosa.

When the Beauty of Hebron Potato is included, a two-cent extra stamp.

When both Pearl Millet and Defiance Wheat are included, a two-cent extra stamp.

We request that our subscribers will write their addresses IN FULL and PLAINLY, and not *stick the stamps to their letters*. By so doing they will save us a deal of trouble and expense. For particulars, send stamp for RURAL of Nov. 9.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Nov. 30, 1878.

BEANS AND PEAS.—The bean market is quiet; receipts are large and prices for the moment have a lower tone. Local buyers have been busy with Thanksgiving purchases, and that fact has tended to slacken trade. Still, unless export buyers put in a larger presence than is expected, prices may now favor buyers. Receipts of beans for the season are less than for same date last year, while exports are somewhat larger. Ordinary Canadian field peas in bulk and bond, 70@72c.; choice, 75c.; green peas, $1.25@1.30; Southern B. E., 2-bush. bag $2.50@2.55; Medium beans, prime, $1.65@1.67½; fair to good, $1.55@1.60; Marrow, free to ship, $1.75; fair to good, $1.60@1.70; pea, $1.60@1.80; white kidney, $1.80@2.00; Red do., $1.85@2.15; Black, $1.90@2.25.

BUTTER.—Trade has run steadier but does not indicate prospective vigor. Dealers look upon last week's rates as fairly full and do not attempt to advance any grade in the present better attendance. Full dairies are in demand, and as some eastern buyers are calling for larger supplies, Welsh tubs are quite active. Low styles of butter are still neglected, as exporters and bakers have a good selection in the unsold under grades without looking at the common accumulations. Western butter holds quotations rather better than any other class but must have real table merit to reach extremes. Rolls are low and not attractive; buyers are suspicious of early lines of roll as some shippers keep up the practice of injudiciously packing old as fresh.

State, full dairies, choice, 20c.; other, 16@19c.; firkin dairies, fair to prime, 13@18c.; Welsh dairies, fine full, 18@19c., choice dairy, pails and half tubs, 22@23c.; fair to prime do., 16@21c.; choice Welsh, 21@22c. fair to prime 13@17c. Choice creamery 26@27c.; other, 22@24c.; sweet cream, 24@26c. Best Western creamery, 25@26c.; other, 20@24c.; early packed creamery, 17@20c.; poor State 10@12c.; Western dairy, fine fresh, 16@18c.; fair to good, 10@14c.; factory, choice, 13@14c.; other, 6@12c.; rolls, 10@14c.

Receipts for week, 26,900 pkgs. Exports, 4,573 do.

CHEESE.—The exports for the week have been 33,667 boxes; these are partly of through shipments from the country, and include Canadian lots. Requirements as shown on this market have been very light, and centering on the choicest grades. A few special factories have reached 9; but most of the business in the fancy lots has been at 8¼@8¾. For the lower grades the market with the stagnation is left without fixed values.

Quotations are 8¼@9c. for fancy, 8@8¼c. for fine lots; 7@8c. for good and prime; 6@7c. for fair to good; 3@5c. for skimmed. State, farm dairy at 8¼@8½c. for good to choice; 7@8c. for fair to good. Wisconsin factory, fine to fancy, 8¾@9c.; do. good to prime, 7@8¼c.; do. fair to good, 6@7c. Western factory, fine and fancy, 8@8½c.; good and prime, 6@7c.

Receipts past week, 74,336 boxes.

Gold closes at 100¾.

Liverpool cable 47s.

COTTON.—There has not been much activity, and the market has been lowest on the weakness abroad. The latest prices are for November, 9.15c.; December, 9.17c.; January, 9.25@9.26c.; February, 9.37@9.38c.; March, 9.47@9.50c.; April, 9.61@9.62c.; May, 9.73@9.74c.; June, 9.85@9.81c.; July, 9.92@9.93c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Upland.	N. Orleans.	Texas.
Ordinary	7¾	7⅝	7⅝
Strict ordinary	7 13-16	8 1-16	8 1-16
Good ordinary	8 5-16	8 9-16	8 9-16
Strict good do	8 11-16	8 15-16	8 15-16
Low middling	8⅞	9⅛	9⅛
Strict low middling	9 1-16	9 5-16	9 5-16
Middling	9¼	9⅜	9⅜
Good middling	9 9-16	9 13-16	9 13-16
Strict good middling	9⅝	10⅜	10⅜
Middling fair	10 7-16	10 11-16	10 11-16
Fair	11 3-16	11 7-16	11 7-16

Stained.

Good ordinary	7⅛	Strict good ordinary	8
Low middling	8¼	Middling	8

DRIED FRUITS.—The best lots of State quartered apples are having a light export movement and rule steady in price, and there is a fair sale for choice sliced. Peaches are without change and firmly held. Small fruits are held at strong prices.

Southern Plums, 13@14½c. State plums, 15@16c. Blackberries are quoted at 5½c. Peaches—Peeled Georgia, at 6c. for poor; 8@9c. for fair to good; 10@10½c. for prime; choice North Carolina, 11½@12½c.; good do., 8@9c.; unpeeled halves, 3@3½c.; quarters, 3@3¼c. Pitted cherries, 20@22c. Apples—Old State quarters, 2½@3c. New apples, 2¾@3c. for southern quarters in bbls.; 4½@5½c. for prime sliced, State at 4@5½c. for new sliced; and 3½@3¾c. for quarters; western at 3@3½c. for new quarters. Raspberries, 30c.

Exports, past week, 244 bbls. dried apples.

EGGS.—Moderate receipts with the extra call for the recent holiday leaves a scantily supplied market and prices are firm at quotations for fresh. Near points 28@30c.; State and Penn., 25@25½c.; Western and Canadian, 24@24½c.; poor do. as low as 20c. Limed State 16½@17c.; Canada, 16@16½c.; Western, 14@16c.

Receipts for the week, 6,214 bbls.; do. last week, 8,102 do.

FLOUR.—There has been a very liberal home trade movement and export demand fair with prices generally steady.

Quotations are $3.25@3.80 for very inferior to very fancy superfine State; $3.85@4.10 for very poor to good extra do., odd lots and lines; $4.10@4.35 for good to very choice do., strictly choice and fancy lots above this; $3.25@3.75 for inferior to very fancy superfine Indiana, Iowa, Michigan, &c.; $3.85@4.10 for poor to good shipping extra do. and $4.10@4.35 for good to very choice extra do.; common to about choice white wheat extras, $4.20@5.10, choice to strictly fancy do at $5.10@5.85; red and amber winter wheat very inferior to very choice trade and family $4.10@5.75; round hoop Ohio at $3.90@4.30, and trade and family brands of do. at $4.35@5.75, the latter rate for very choice; St. Louis, $4.15@4.85 for very poor to good extra, and $4.85@5.75 for good to choice; Minnesota clear, very inferior to very choice at $3.85@5.15; few brands going above $4.75; Minnesota "straight," inferior to very choice at $4.05@5.75; and patent fair to strictly fancy at $5.25@6.50, few brands going above $7.50; unbound stock at from $2.00@4.75; city mill extra at $4 80@5.10 for West Indies (the latter rate in new packages), do. for England, $3.85@4.60; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.60 for fair to very choice; No. 2 at $2.50@3.15 for very inferior to very choice.

FOREIGN DRIED FRUITS.—Layer raisins at $1.65 per box, loose Muscatel do, at $1.55@1.65; Valencia do., at 6½c. per lb.; London layers, $2.00@2.10 per box; Turkey Prunes at 5½@5¾c. per lb.; Currants at 3½c. per lb.; Sardines at 10½@11½c. per quarter boxes.

FRESH FRUITS.—The market continues easy for buyers of lots; lighter receipts, however, have to some extent decreased the pressure to sell, but a low season is looked for. Lady apples, selected, $9 bbl.; choice King's and Spitz, $2; good Spitz, and fine Baldwin, $1.50@1.75; good Greenings and other sorts, $1@1.25; common, 75@87c. Cranberries have moved better and are higher; fancy Cape Cod, $8 bbl.; other, $6.25@7.50; best crates, $2@2.25; poor to prime, $1.25@1.75. Catawba grapes have wide ranges and varied quality quoted, 2 to 8c. lb. Fla. oranges are in good order, and are rapidly assuming their place in retail places. Standard boxes, poor to choice, $4.50@4; bbls., $6@7. The usual varieties of California late pears range at $3.50@4 per box. Cal. grapes are done. No hot-house in this week. Chestnuts scarce and firm at $3.50@4. Hickory nuts, shellbarks, $2.25@2.50. Trade in peanuts is stimulated by the very low rates. Hand-picked Va., $1.15@1.20; other, 85c.@$1.05; shelled, 5½@6c. lb.; Pecans, new, 12@14c.

Exports, apples, past week, 8,000 bbls.

GRAIN.—Wheat was subjected to speculative manipulation early in the week, but towards the close has eased off a little on full supplies and easier foreign advices.

Latest sales are, of ungraded white at $1 08½@1 10½; white State at $1 09@1 10; extra white at $1 11@1 11½; No. 1 white at $1 09½@1 10; do., steamer grade, at $1 08; No. 1 red at $1 08½@1 10; No. 2 red, at $1 05½@1 09½; No. 3 red $1 03; ungraded red at $1@1 04½; No. 2 amber at $1 05@1 05½; ungraded amber at $1 03; No. 2 spring, at 99c.@$1; ungraded spring at 90c.@$1; No. 3 spring in store and afloat and to arrive at 91@92c.; No 1 white, first half December at $1 10½; No. 2 red, Nov. option, at $1 09; do. Dec. option, at $1 09; do., January option, at $1 10@1 10½; No. 2 amber, November option, at $1 05½; do., December option, at $1 05@1 05½; do., January option, at $1 06½@1 07; New York No. 2 spring, January option, at $1. Rye at 58c. for No. 2 Western, and 60@61c. for State. Corn has been rather slow and easy in price; latest sales are of steamer mixed at 46@46½c.; New York No. 2 at 47@47½c.; New York No. 3 at 41½@41½c.; ungraded mixed at 44@47c., round yellow at 52c.; yellow Western at 48c.; New York No. 2, November option, at 47c.; do., December option, at 47½@47½c.; do., January option, at 48½c.; steamer mixed, November option, at 46½c.; do., December option, at 45½c. Oats have scarcely varied, with demand fair; latest sales are of New York No. 1 at 31c.; New York No. 2 at 30@30¼c.; New York No. 2 white at 32½c.; New York No. 3 at 29¼c.; New York No. 3 white at 31c.; white western at 31@35c.; mixed do., at 29@31c.; white State at 32@36c.; mixed do., 30@31c.; No. 2 Chicago quoted at 30½@31c.; New York No. 1 white at 34½@35c. Barley, State, rowed 90@95c.; do. 2 rowed, 75@80c.; Canadian, 95c.@$1 22½. Malt, State and Canadian, $1@1 25.

HAY AND STRAW.—There are pretty good supplies, but demand is very good and especially for prime stock, with prices well sustained.

Sales at 35@40c. for shipping, and 65@75c. for retail qualities. Straw quoted at 35@45c. for long rye, and 30@35c. for short rye.

Exports past week, 3,152 bales.

HOPS.—Business is not brisk, but steady, and seems to absorb choice stock. The feeling among holders is one of confidence on the parcels wanted for export, but good and lower grades are put upon the market freely at current figures.

Quotations are for New Yorks, new crop, choice to fancy, 13@15; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, low to fair, 8@10; Eastern, new crop, 10@12; Wisconsin, new crop, 10@12; Yearlings, growth 1877 (nominal) 5@7; Olds, all growths, 2@4; Pacific coast, 12@15.

HONEY.—Market quiet at easy rates; single comb clover, 15@16c.; two comb, 13@14c.; Buckwheat, 10@12c.; strained, 6@12c. A large consignment of comb honey (80 tons) has gone to Europe this season, Chiefly California product.

OIL-CAKE.—Western brings $28 ₰ ton.

LEATHER.—Hemlock sole at 19@20c. for light; 20@21½c. for middle; 20@22½c. for heavy, and 17½@19c. for good damaged.

POULTRY AND GAME.—Moderate arrivals of live poultry have given prices some tone.

Fowls and chickens, 9@10c.; roosters, 5@6c. Turkeys, 9@11c. Ducks, pair, 45@90c. Geese, choice, $1.25@1.50; other, $1@1.12. Pigeons, 25@30c.

Supplies of dressed for Thanksgiving sold briskly at 13@15c. for turkeys; quality averaging better than usual. This was particularly noticeable in remote State and Western. The market since Tuesday has experienced the usual quiet that follows a feast day and quotations are generally easy at the close.

Good turkeys quoted 10@12c.; common, 9c.; dry-picked, 13@14c.; chickens, dry-picked, 13@14c; good to prime, 10@12c.; common and stuff in poor order, 6@9c. Ducks, choice, 12@14c.; other, 9@11c. Geese, fancy, 11c; other, 8@10c. The weather has been somewhat off for carrying, but dealers do not apprehend an uncomfortable glut

In game the holiday did not lead to very high rates, and the supply did not sell out as well as turkeys and other fine poultry. Venison cheap, owing to mild weather.

Quail, doz., $1.12@1.37; Grouse, trapped, pair, 60@70c.; drawn, 40@50c.; Partridges, 40@75c.; Woodcock, 40c.; wild Ducks, Western, $1.37@1.50; Havre de Grace, $1.62@1.75; redhead, 75c.@$1; Mallard, 40@50c.; Sqnab, tame, $1 62@1.75 doz.; common, 25@30c.; Venison, whole deer, 6@8c; long saddles, 9@10c; short do., 10@12c.; Hares, pair, 30@40c.; Rabbits, 25@50c.

PROVISIONS—Have shown insufficient export demand, the large receipts considered and the tendency has been generally to a lower basis of values. Mess pork quoted at $7.45@7.50 for spot lots; $7 40@7.45 for December and new for January at $8.80. Bacon at 4½ for long clear and 4¾c. for short clear. Lard—Western steam at $6.10 for spot lots; $6.07½ for December; $6.12½@6.15 for January and 6 20 for February. Stearine at 6¾@6¾. for best Western. Tallow at 6¼@6 9-16 for prime. Beef Hams at $14.50@15. Beef—Extra India mess $20@21 50 for city brands; do. Philadelphia, $19@19 50; packet at $11@11 50; new plain mess at $9 50@10; new extra mess at $10 50@11.

SUGAR.—Refined quoted at 9¼@9¾ for crushed and cut loaf; 9¾ for powdered; 9@9¾ for granulated; 7¼@8½ for soft white and 6¾@7¾ for soft yellow.

SEEDS.—Grass seeds are moving out moderately well; clover quoted at 6¾@7¼c. for about prime to choice, and timothy at $1.20. Rough flax at $1.40.

TOBACCO.—The home trade are taking seed leaf promptly, and the export call for western leaf runs very fair, with prices generally well sustained. Quotations are for

VEGETABLES.—Potatoes are arriving heavily, especially from P. E. I. and N. S. Dealers quote as before, but an early break in prices would not be surprising. Nova Scotia E. Rose, bulk, $2.85 bbl; Prolific and Chili red, $2.50; P. E. I. Jackson whites, $2 37; Mercers, $2@2.25; Eastern E. Rose, with bbl., $2.75@3; State, $2.50; fair to good, $2@2.37; do. Peach Blow, choice, $2.50@2 75; common, $2@2.25; Peerless, choice, $2.37@2.50; poor to good, $2@2 25. Sweet potatoes, Del., $2@2.25; Va., $1.50@1.75, which is higher. Onions steady. White, $1.75@2 25; red and yellow, $1.75@2; Chester, $1.25@1.62. Hubbard and marrow squash, $1.75@2. Cabbage, $1@5 per 100. Cauliflower, bbl., $1.50@3. R. Turnips, 75@87c. Beets, 75c. Carrots, 75c.@$1. Pumpkins, 100, $4@8 Celery, 75@90c. doz.

Exports, potatoes, past week, 3,182 bbls.; of onions, 258 do.

WOOL.—A number of eastern manufacturers have been buying this week and the market is placed in better shape, with fleeces and combings and delaine sorts in most demand. The impression seems to be that the bottom prices have been reached.

Quotations are, for Ohio, Pennsylvania and West Virginia—XXX and picklock, 37@38c.; XX, 35@—; X, 35@—; No. 1, 36@37c.; No. 2, 33@35c; coarse, 30@32c. combing, 39@42c.

Illinois, Iowa and Minnesota—XX, 30@33c.; X, 32@34c.; No. 1, 32@34c.; No. 2, 28@30c.; coarse, 25@27c.

Georgia, Alabama, Mississippi and Louisiana—Fine unwashed, 23@28c.; medium unwashed, 26@29c.; coarse unwashed, 18@21c.; burry, 11@16c.

LIVE STOCK MARKETS.

Saturday, Nov. 30, 1878.

BEEVES.—Receipts for the week, 8,862 head do. last week, 9,536 do. Poultry week did not materially vary the demand for beef, though moderate receipts helped to give the market steadiness. Poor to ordinary steers ranged at 7@7¾c., dress 55 lbs.; medium to good, 8@9c., dress 55 lbs.; prime to choice, 9¼@9¾c.; a few extras, 10c.

COWS AND CALVES.—Quiet and unchanged; $40@65 ordinary to good; extras have brought $75.

VEAL CALVES.—Receipts have been small; a special poultry week keeping back some supply. Choice milk, Buck's Co. and N. J., 6¼@7c; good, 6c.; heavy weights, 5¼@5¾c. State, fair to prime, 5¼@6¼c.; fed calves, 3½@4½c.; grass, 2@2½c. Hay dressed, 8@10c.

SHEEP AND LAMBS.—Receipts for the week, 19,426 head; do. last week, 23,372 do. The market has ruled steady. Western sheep, fair to prime, 3½@4¼c.; N. J., 4@4½c.; N. J. ewes, 3½@4c.; Lambs, 4¼@5½c.

SWINE.—Receipts for the week, 46,019 head; do., last week, 45,192 do. Market steady; rough hogs, $2.90 per 100; good Ohio, $3 2 @3.30.

Dressed hogs in fair demand, but cheap. N. J. pigs, 4¾@5¼c.; medium, 4¼@4¾c.; heavy, 3¾@4c.; city, 3¾@4¼c. Tenderloins, 6@7c.

PAYING HER WAY.

WHAT has my darling been doing to-day,
To pay for her washing and mending?
How can she manage to keep out of debt
For so much caressing and tending?
How can I wait till the years shall have flown,
And the hands have grown larger and stronger?
Who will be able the interest to pay
If the debt runs many years longer?

Dear little feet! How they fly to my side!
White arms my neck are caressing;
Sweetest of kisses are laid on my cheek;
Fair head my shoulder is pressing.
Nothing at all from my darling is due—
From evil may angels defend her—
The debt is discharged as fast as 'tis made,
For love is a legal tender!

[*S. S. Advocate.*

SPONGES.

A. HYATT.

AMONG the dark-brown leaves and green filaments which are borne upon the edge of the incoming tide, one frequently observes a substance hardly distinguishable from the surrounding plants, except for its light-brown color and porosity. This is sometimes dendritic (branching like a tree), with lank branches springing from broad, thick-spreading bases; but generally it is broken into fragments, and only the palm-like parts, with their finger-shaped ends, are left grasping among the froth-covered sea-weeds. A slight pressure will expel the water, and the aspect of the half-dried specimen will at once arrest attention.

It is in fact a Sponge, differing only in the details of its structure and its general form from the sponges of commerce. The latter, whose irregular swelling outlines are so familiar to us, are of foreign origin, the better kinds coming from the more eastern shores of the Mediterranean, the coarser and larger kinds from the Bahamas. The commercial value of these is based upon the horny nature and closely interwoven texture of their internal skeleton.

A sponge is, typically, a gelatinous mass, in which is imbedded numerous little spikes and plates, of a horny, calcareous, or siliceous substance; or hair-like threads of various forms, which are so thickly disposed and knit together by animal matter, that they form a sort of open-work frame supporting the looser tissues.

In the common sponge this frame-work is wholly composed of horny hairs, which are so densely packed and elastic that they immediately resume their original shape after being compressed. The gelatinous matter is in all cases cleaned out after the sponge is torn up from its rocky bed, and those which we utilize are only the horny skeletons of the living animals. So loosely constructed and fragile, however, are the large branching species of our own coast, that a dried specimen may be crushed to powder in the hand.

The exterior of our beach specimens have a furry look, due to the projecting points of the spicular, which protrude through the outer skin. Scattered holes of considerable size reveal portions of the interior, and between them are innumerable smaller pores. These larger apertures connect with distinct channels which ramify through the mass in all directions, and, when surrounded by their native element, expel continuous jets of water. In fact the whole is only an apparatus for absorbing and ejecting sea-water, well deserving its old name of sea-lungs.

The surrounding liquid is taken in through the smaller pores of the outer side, and, passing through the lung-like interstices of the structure, is finally collected in the main channels and thrown out again, together with quantities of feculent matter through the larger openings. The meshes of the sieve and the channels are thickly lined with myriads of microscopical animalculæ, to which the perpetual current bears their minute food, sifted of all the coarse, unsuitable particles, and maintains an invigorating supply of fresh sea-water throughout the whole colony. The animals themselves create this current by the motion of cilia, or little hairs, which grow out from the region of the mouth. The form of their bodies has been ascertained in only one species, called *Leucosolenia botryoides*. In this, which is quite small, though common on the shore, it was found that they were minute sac-shaped beings, with a collar projecting from the free end, in the middle of which was the mouth, situated at the base of a long filament which was hardly ever at rest. It seemed to be employed principally in casting morsels of food down into the mouth, and this action, in itself so slight, is yet, when carried on by the thousands of neighboring filaments, sufficient to keep the fluids in rapid motion through the meshes.

Until of late years the animal nature of the sponge was disputed. Then it was referred to the Amœba forms, creatures which are mere sprawling drops of jelly, without mouths or stomachs, but which, however, manage to move about, and even in some species build up most elaborate internal structures resembling minute shells. Now, through the investigations of Professor Clark, we know that they are colonies of such comparatively highly organized beings as those I have described, and we are also able to state, upon the same authority, that their young are free, roving globules, resembling an isolated individual of the parent stock.

The mode of growth has not been studied in the sponge itself, but in a closely allied animal where a number of little bells grow upon a stem (*Codosiga pulcherrima*). The young of this is free at first, but finally attaches itself, and becomes elevated on a pedicle. Then the vase grows more oval, the opposite sides at the narrowest diameter approach each other, coalesce and split, dividing all the internal organs, and the mouth and calyx, or collar, into two parts. Two other filaments grow up from these halves, and a fissure begins in the disc, which gradually spreads both upward and downward, until two transparent vases, complete in structure, swing upon the trunk which bore only one an hour before. This process in some species is continued until quite a cloud of descendants cluster around the parent branch, but in others, again, only separate and distinct individuals are produced, the division totally separating the stem as well as the body.

The sponge, probably, grows in the same way; but the vases, having no stems, remain attached side by side, and secrete the gelatine and spiculæ, or horny hairs, from the lower surfaces of their bodies. These support the membrane and enable it to maintain a definite outline, and continue its growth without the danger of collapsing.

There are several species on our coast, but the most noticeable is the great Halichondria, whose favorite resort is an old wharf-pile. This may not seem an attractive object, but Nature has clothed the whole coast with her living tapestries, and even here, her taste is as faultless, and her hand as lavish in decoration, as in more favored and sunnier spots.

Get into your boat, and when the tide is lowest float down under the wharves through which the current has a clean sweep. The waves lift the dank bladder-weeds and long green sea-hair which cover their stained sides, while below these, brown clusters of mussel-shells open their fringed mouths, and huge anemones, as thick as your arm, spread their laced crowns of white, brown, crimson, or variegated colors on the water-worn logs; and in the midst our great sea-lungs hangs out its mass of branches, and spreads its weird fingers up towards the observer. Even the sponge is beautiful in such places and with such associations.

THE PACK OF RAGAMUFFINS.

A COCK once addressed his Hen thus: "It is now the time when the nuts are ripe: let us go together to the hills, and eat all we can before the squirrels carry them away."

"Yes," answered the Hen; "let us go and enjoy ourselves."

So they went together to the hills, and as it was a bright day they stopped till evening. Now, I do not know whether they had become proud, but the Hen would not go home on foot, and the Cock had to build a little carriage out of the nut-shells. As soon as it was ready, the Hen sat herself in it, and said to the Cock, "You can harness yourself to it." "You are very kind," said he, "but I would rather walk home than harness my own self. No, we did not agree to that. I will willingly be coachman and sit on the box; but drag it myself I never will."

While they were quarreling a Duck called out hard by, "You thieving folk, who asked you to come to my nut-hill? Wait a bit, and it shall cost you dearly." And she rushed up to the Cock with outstretched beak. But the Cock was not idle either, and attacked the Duck valiantly, and at last wounded her so badly with his spur that she begged for mercy, and willingly undertook to draw the carriage as a punishment. The Cock set himself on the box as coachman, and off they started at a great rate, crying out, "Quick, Duck! quick!" When they had gone a portion of the way they met two walkers, a Pin and a Needle, who called out to them to stop, and said it had become too dark to stitch, and they could not go another step; that it was very dirty upon the road, and might they get in for a little way? They had been stopping at the tailor's house drinking beer, and had been delayed. The Cock, seeing they were thin people, who would not take much room, let them both get up, but not till they had promised not to tread on the toes of himself or his Hen.

Later in the evening they came to an inn, and because they could not travel farther that evening, and because the Duck had hurt her foot very much, and staggered from side to side, they turned in. The landlord at first made many objections, saying his house was already full; he thought, too, that they were nobody of any consequence; but at last, after they had made many fine speeches, and promised that he should have the egg which the Hen had laid on the road, and the one which the Duck laid every day, he said that they might remain over the night.

So when they had refreshed themselves, they held a great revel and tumult; but early in the morning, when everybody was asleep and it was still dark, the Cock awoke the Hen, and fetching the egg, they broke it, and ate it together, throwing the shell away into the hearth. They then went to the Needle, who was still asleep, and, taking him by the head, stuck him in the cushion of the landlord's chair, and the Pin they put in his towel, and then they flew off over the fields and away. The Duck, who had gone to sleep in the open air, and had stopped in the yard, heard them fly past, and getting up quickly, found a pond, into which she waddled, and in which she swam much faster than she walked when she had to pull the carriage. A couple of hours later the landlord rose up from his feather-bed, washed himself, and took up the towel to wipe himself dry; then the Pin, in passing over his face, made a red scratch from one ear to the other; so he went into the kitchen to light his pipe, but just as he stepped on the hearth the egg-shells sprang into his eyes. "This morning everything happens unlucky to me," said he, sitting down in vexation in his grandfather's chair; but he quickly jumped up again, crying, "Woe's me!" for the Needle had pricked him very badly. This drove him completely wild, and he laid the mischief on the guests who had arrived so late the evening before, and when he went out to look after them they were gone. So he swore that he would never again take such a pack of ragamuffins into his house, who destroyed so much, paid no reckoning, and played mischievous tricks in the place of thanks.

THE DUTIES OF SCHOLARS.

THERE is much said about the duties which the scholar owes his teacher. The teachers give their pupils many hints concerning duty, but very seldom do they speak of the duties which the student owes his fellow student. At one time a scholar will become angry at his teacher, and thinking to revenge himself, will do wrong repeatedly, not dreaming of the harm he may be doing his schoolmates.

Scholars ought always to be punctual. This is one of the duties they owe each other. How disagreeable it is for a scholar to come stalking into the school-room just after the morning exercises have begun! He disturbs the whole school, and unless all work is stopped until he takes his seat, there is so much noise and confusion that only a few, if any, can hear or remember anything which the teacher is reading. Thus the tardy scholar is not the only loser, for he prevents his schoolmates from gaining the good which they might if undisturbed. The pest of a class-room is a student who is always late to class. I remember a young lady who was in my Algebra class, and she was invariably late. She left chapel at the same time the others did, and had as much time to reach class as others, yet she never came in till after roll-call. It did not seem to occur to her that she was infringing on the right of her fellow-students. Students owe each other patience. They owe this in all their school-work. If there is a dull scholar in class who really tries to learn, it is the duty of his companions to be patient. If he does not understand an explanation of some part of the lesson and requires some one to explain it, he should do it patiently and kindly, and not with a frown on his face, for often that hurts the questioner so much that he cannot understand or think about the explanation, even if it is given clearly and precisely. Each student should do his own work as nearly as possible, and very seldom ought he to ask for outside help. Each and every scholar should dare to say no! Often this is hard to do. For instance, Charley and Will are in the same Arithmetic class. Will studies carefully and thoughtfully and completely masters his lessons. Charley knows this, and evening after evening goes to Will, asking him to do his examples or help him to do them. Will works his examples, and by looking them over a few times, he is quite well prepared to write his lesson the next day; but very likely in three days he cannot do one of them. This is doing Charley much harm; it is hurting his memory and he is losing his independence. Even now, he could not recite his lesson at all without Will's assistance in preparing it. Is it not Will's duty to refuse to help him? Each scholar should prepare his lessons well and thoughtfully. One or two in a class, without good lessons, half kill the interest of the others and makes the teacher impatient. Scholars should not work for their own selfish interests alone, but should be obliging and ready to work wherever duty calls them.

A COUSIN.

THE DODO.

THE Detroit Free Press has been devoting its genius to natural history for very young people, and directly under the picture of an uncommonly sorry-looking Jack is the following "lesson:"

"What do I see here?"

"It is a dodo, my boy—one of the largest and finest specimens ever seen."

"But I thought the dodo was extinct?"

"Oh, no. Some men, on account of family resemblance, have evinced a disposition to bury the dodo in obscurity."

"Didn't the dodo used to have wings and fly?"

"He did, but as he was of no account among the birds he was given two extra legs and deprived of his wings."

"Where is he now found?"

"Travelers can hardly run amiss of him wherever they go."

"How does he enjoy himself?"

"In various ways, one of which is in assuming the position seen in the above cut. It tickles him immensely to get that way and then have fifteen or twenty men try to move him along the highway."

"But why does the dodo have such long ears?"

"He was either first intended for a rabbit, or the rabbit was first intended for a dodo, and Nature could never fully unravel the mystery. If his ears were small, like those of a horse, he could not stand and flop them when he had an idle hour, and would, perhaps, resort to some vicious practice, like cribbing and kicking."

"Is his song anything like the sad notes of the whip-poor-will?"

"Not a bit. When you hear the sad notes of the bird you named you think of some dear dead friend. When you hear the strains of the dodo you think of some dear friend who ought to be dead for not coming around with his shot-gun and a full bag of swan shot. The song of the dodo, when first rising on the midnight breeze, is as soft and sweet as the sound of a buck-saw striking a nail, but as they float further and faster the strains seem to grab each other by the hair and you feel as if a tarantula was walking up your spinal column."

"Does a dodo kick the same as a mule?"

"He does not. He could if he wanted to, but it would be too much of an effort."

"What is the prevailing color?"

"A fashionable gray. One of them standing against a fog-bank may sing all night and not be hit with a brick-bat."

"Do they prefer mountainous countries or low lands?"

"They have no choice. If they find the garden gate open they would not stop to see whether a Balkan Range divided the land. If one of them should fall over a precipice he would stay right where he struck instead of hunting up new territory."

Sabbath Reading.

HERE AM I, O LORD, SEND ME.

J. E. RANKIN, D. D.

I HAVE not an angel's tongue,
Skilled in winning speech or song;
Weighty words at my command,
Pleas fallacious to withstand—
Is there not some little child
I can win from paths defiled?
Weak, unworthy though I be,
Here am I, O Lord send me.

I cannot the sickle wield,
In the noon-day harvest field;
Bear the burdens of the day,
Garner loaded wains away;—
I can only stoop and glean
Where more stalwart forms have been.
Weak, unworthy though I be,
Here am I, O Lord, send me.

I cannot the sword gird on,
If there's vict'ry to be won;
When has ebbed the battle shout,
I can seek the wounded out;
Soothe the dying; make the bed
Of the sad and lonely dead.
Weak, unworthy though I be,
Here am I, O Lord, send me.

Send, O Lord, by whom thou wilt!
Cleanse this world of woe and guilt!
Where the hosts of error low'r,
Clothe thy chosen ones with pow'r;
In the kingdom of thy grace,
Give to me some humble place.
Weak, unworthy though I be,
Here am I, O Lord, send me.

[*S. S. Times*

CONSCIENCE VOID OF OFFENCE.

"Herein do I exercise myself, to have always a conscience void of offence toward God and toward men."—*Acts xxiv, 16.*

WHAT is conscience? The indicator of our doings; the tablet on which are writ all our deeds, good and bad. We find a good conscience spoken of seven or eight times in the New Testament. In this portion of the Acts Paul speaks of "a conscience void of offence toward God, and toward men." Let us see if we can understand what the apostle meant.

The conscience that God has given us is the guide of our lives when it is "void of offence." Paul meant that he always acted so that his conscience did not reproach him, and, more than that, so that his conscience approved of what he did. "Void of offence,"—that which is offensive, or might cause another to stumble. He kept his conscience so pure and enlightened in regard to duty, that he acted in accordance to its dictates, and his conduct was not displeasing to God nor injurious to men. "Toward God,"—he endeavored to discharge all the duties of public and private worship, did constantly what God required, believing all He has said, and doing all that He approves.

Let me try and show you what I mean by acting so that the conscience approves.

There was a lad in Ireland who worked at a linen manufactory, and one day a piece of cloth was wanted to be sent out which was found to be shorter than thought to be. The master thought it might be made the proper length by a little stretching. He unrolled the cloth, and, taking one end himself, told the boy to take the other. "Pull, Adam, pull," said the master. The master pulled with all his might, but the boy stood still. "Pull, Adam, pull," said his master again. "I can't," said the boy. "Why not?" said the master. "Because it's wrong," said the boy, and he refused to pull. His master discharged him. That boy became Dr. Adam Clarke. His conscience approved of what he did. It was the purity of his conscience that enabled him so to act.

Could we, in as simple a thing as that, act as he did?

Paul says, "Herein do I exercise myself, to have always a conscience void of offence toward God and toward men." But how toward men? What does it matter to our fellow-creatures whether we have a conscience void of offence or not? Having it toward men is endeavoring to meet all the demands of justice and love; to promote their happiness, knowledge, and salvation so that we may look back on our lives with the reflection that we have done our duty; so that we may have nothing to reproach ourselves for, nothing of this kind to make a death-bed miserable.

Now how had Paul come to speak with such certainty about this matter. "Herein, do I," etc. He had found, through constant study and practice, that he could, trusting in God, so act as not to have an accusing conscience. E. T

THE LITTLE ORPHAN.

WHEN I was in Europe Mr. Spurgeon told me a story of a boy who was in an orphan asylum. This little boy came up to Mr. Spurgeon and said: "Mr. Spurgeon, would you allow me to speak to you?" He said, "Certainly, get upon my knee." The little fellow got up and said: "Mr. Spurgeon, supposing that your mother was dead, and that your father was dead; and that you were put into this institution; and that there were other little boys that had no father or mother, but they had cousins and uncles and aunts, and they brought them fruits and candy and a lot of things. Don't you think that you would feel bad? 'Cause that's me." Why, Mr. Spurgeon put his hand in his pocket and gave the little fellow some money right off. The little fellow had pleaded his cause well. When men come to God and tell their story—I don't care how vile you are, I don't care how far down you have got, I don't care how far off you have wandered—if you will tell it all into His ear, the relief will come.—*Moody's Child Stories.*

PERSONAL ITEMS.

Ex-Governor Fenton will spend the winter in Paris.

Prince Gortschakoff is suffering from continually increasing weakness.

"Mrs. Gibbs, elocutionist, poetess, washer and ironer," resides in St. Louis.

Ex-Minister Pierrepont has resumed the practice of the law in New York City.

Victor Hugo says England produces wealth admirably, but distributes it miserably.

Hans Breitman works steadily for a London journal and talks broken English no more.

Sir George Nares, of Arctic celebrity, has been commissioned on a voyage of scientific exploration in the South Pacific.

Daniel Webster's widow is still alive, though very aged and in feeble health. She resides at New Rochelle, New York.

Miss Celeste Winans of Baltimore is said to be the richest young lady in America. She inherited $20,000,000 from her father.

Thos. A. Doyle has been nominated for Mayor of Providence, R. I., for the fifteenth time. He has never been beaten for the office.

The Hon. W. D. Washburn, elected to Congress from Minnesota, is the fourth of that famous brotherhood given seats in the lower House.

Mr. Bancroft recently presented the lady who reads the proof of his work with $50 for discovering an error in a Latin quotation. Would that there were many of him!

Miss Braddon is in Brittany turning out twenty pages of novel a day. Novel writing has become automatic with her now, as it has with our own Mrs. whole-alphabet Southworth.

Mrs. Hayes seems to be a good match-maker; her niece Miss Cook who was married the other day, is the fifth of the young ladies who have visited Mrs. Hayes at the White House who has married within eighteen months. The others are the two Misses Sullivant, Miss Platt, and Miss Macfarland.

Chin Lan Pin, the Chinese ambassador, is a man of imposing appearance, between sixty and seventy, with a kind and intelligent face. He is slight and tall and has very courteous manners. In the credentials which he brought from the Emperor he and his suite are mentioned as "ust and honorable men."

Boston Letter says: "Miss Hosmer, who is proclaimed as having wrought wonders by her new inventions, was a school girl in this vicinity between thirty and forty years ago. She was the daughter of Dr. Hosmer of Watertown, and developed into an original character very early. There are several stories of her eccentricity and independence in those days. One of her freaks was the unhitching of a railroad engine and setting it in motion. She went to Italy to study sculpture, and has staid there ever since. I believe she lived with Charlotte Cushman in Rome at one time. She is not at all a marrying kind of woman."

Real Estate.

VALUABLE REAL ESTATE FOR SALE. Improved Farms, in tracts of from 40 to 640 acres, in Coles and Douglas Counties, Illinois, within from one to four miles of the junction of four Railroads, and near and adjoining cities of two and five thousand inhabitants. Terms, ¼ cash; deferred payments, 2, 3 and 4 years. Address
W. E. ADAMS, Charleston, Ills.

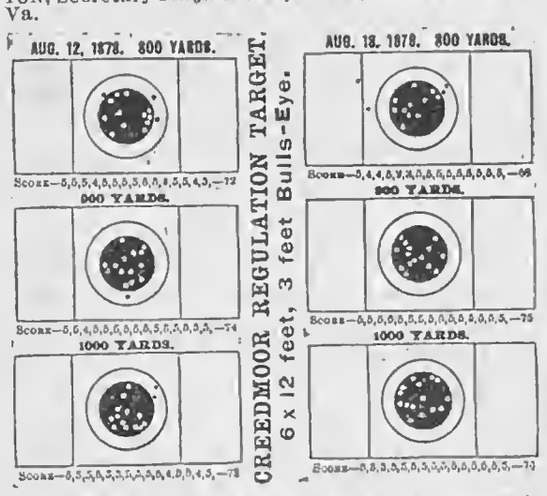
MAYNARD CREEDMOOR RIFLE.

The Maynard Ahead.

The following Targets were made by Prof. CHAS E DWIGHT of Wheeling, West Va., on Woodland Range, August 12th and 13th, 1878, with a *Maynard Long Range Rifle*, and are the MOST REMARKABLE ON RECORD. The grand total of 437 in a possible 450,—90 shots at the long ranges,—has never before been accomplished by any Rifleman, or Rifle, in the world.

These scores were made in the competition for position on the American team for 1878: open to all native-born citizens of the United States, and were shot under the rules of the N. R. A., Fulton position, no sighting shots at either distance. These scores were all witnessed and sworn to by JAMES D. STANTON, Secretary *Maynard Rifle Club*, Wheeling, West Va.



THE MAYNARD ARMS are the most perfect in workmanship as well as accuracy, of any make in the World, *particular attention being paid to the fine shooting as well as the mechanical qualities of the Arms.* For full particulars and price list, address

EPITAPHS.

To Thomas:

Died, when young and full of promise,
Of the whooping-cough -our Thomas.

A Cherubim:

Sacred to the memory of
Miss Martha Gwinn.
Who was so very pure within,
She burst this outer shell of sin
And hatched herself a cherubim.

A father:

Weep, stranger, for a father spilled
From a stage coach, and thereby killed.
His name was John Sites, a maker of sacengers,
Slain with three outside passengers.

Our Willie:

Our dear little Willie,
As fair as a lily;
God for him sent
And so we let him went.

Mrs. Bly:

Oh! mournful day
That stole away
Poor Mrs. Bly:
Who chanced to die
Of a sky—
Rocket
In her eye—
Socket.

[*Traveler.*

"TAKE away women," asks a writer, "and what would follow?" We would. Give us something harder next time.

WILLIAM AUGUSTUS to sleepy room-mate: "Come John Henry, why don't you get up with the lark, as I do?" John Henry, grimly, "Been up with him all night."

"Is your master up?" asked an early visitor of a nobleman's valet. "Yes, sir," answered the valet with great innocence; "the butler and I carried him up about three o'clock."

FRENCH papers state that Gambetta is about to marry a widow with a fortune of $8,000,000. If the right-angled and everlasting truth were told it would probably be that he was about to marry a fortune of $8,000,000 with a widow.

A PHYSICIAN, finding a lady reading "Twelfth Night," said: "When Shakespeare wrote about Patience on a monument, did he mean doctor's patients?" "No," she answered: "you don't find them on monuments, but under them."

A FULL-BEARDED grandfather recently had his beard shaved off, showing a clean face for the first time for a number of years. At the dinner table his three-year-old grand-daughter noticed it, gazed long with wondering eyes, and finally ejaculated. "Grandfather, whose head have you got on?"

THE following startling announcement was given out by the parish clerk in a small church in Somersetshire, England: "I gees notice nex Sunday there wun't be no Sunday, 'oause Rector's goin' to t'other parish fishin'" By this the accustomed congregation understood that the clergyman would be officiating a few miles off.

A Problem Long Since Solved.

How to remedy those prolific causes of disease, an impoverished circulation and an impaired digestion, was a problem the solution of which had often baffled medical skill, but which was solved over a quarter of a century ago by the introduction of Hostetter's Stomach Bitters to public and professional notice. Since that time, which may well be said to have initiated a new epoch in the history of medicine, the remedy and preventive referred to has obtained a foothold in the confidence of the American people that each succeeding year has only served to strengthen. It is recognized throughout the Union as a tonic of the first order, a remedy for sure means of preventing fever and ague, and disorders of the stomach and bowels; as a reliable means of reforming a disordered state of the liver, and of counteracting a tendency to rheumatism, gout, urinary and uterine disorders.

MANUFACTURERS *of the* FINEST TABLE CUTLERY *in the* WORLD. *Their* CELLULOID HANDLE *is superior to* IVORY, *and especially suitable for* HOLIDAY GIFTS. *Warranted and sold by all dealers, and by* MERIDEN CUTLERY CO., *49 Chambers Street, New York.*

Imperial Egg Food.

WILL MAKE YOUR HENS LAY!

The value of this preparation is established beyond question, and notwithstanding the most vigorous competition and many malicious attacks during the past few years, Imperial Egg Food is the favorite assistant of the best breeders, poultrymen and farmers in every State. It permanently benefits Laying Hens, Moulting Fowls and Young Chicks, and is invaluable in warding off and arresting the ailments of all varieties of Poultry.

☞ A special preparation for Canary Birds and Pigeons. 50 cents, post-paid.

Trial packages, 50 cents, post-paid; 5 lb. boxes, by express, $2; 25 lb. kegs, by express or freight, $6.25. We also carry the largest stock of Oyster Shell, Bone, Beef Scraps and other Poultry Supplies, and are prepared to give favorable prices for large or small quantities, and make very low rates for shipping. Inquiries promptly answered.

C. R. ALLEN & CO., 215 State St., Hartford, Conn.

PALACE ORGANS

THE BEST IN THE WORLD

Manufactured by the LORING & BLAKE ORGAN CO., of Worcester, Mass., and Toledo, O.

The only organ made in which is successfully combined the following essential qualities of tone: power, depth, brilliancy, and sympathetic delicacy.

The most exquisitely beautiful solo effects ever produced.

The only stop-action ever invented that can not be disarranged by use.

The only organ made with bellows capacity so great that it requires but little effort with the feet to supply all the air desired.

The *best made* and most elegant cases in market.

No shoddy ornaments used—*nothing but solid wood. Every Organ fully warranted for five years.*

Write to us for Illustrated Catalogue and Price List, which will be mailed postpaid on application. Address

LORING & BLAKE ORGAN CO.
Worcester, Mass., or Toledo, O.

DIAMONDS

IN SOLID GOLD MOUNTINGS.

ONE DOLLAR ONE DOLLAR

THE WONDERFUL LEFEVRE DIAMONDS TRADE MARK PAT'D

Lefevre Ring, $1. Set of Studs, $1. [The Shah] Stud, $1. Lefevre Ear Drops, $1.

THE ONLY PERFECT FAC-SIMILE OF THE REAL DIAMOND IN THE WORLD.

Pronounced by the Academy of France that *M. Lefevre has really obtained artificially the true diamond.* The basis of these gems are pure crystals found in the Sierra Nevadas, from whence they are exported to the Lefevre Laboratory in Paris, France, where they are submitted to a chemical and voltaic process,

BY WHICH THEIR SURFACES ARE COVERED WITH A COATING OF PURE DIAMONDS,

imparting to them all the BRILLIANCY, HARDNESS, and refractive qualities of the natural diamond, and making them as desirable for **Wear, Brilliancy, and Beauty**, as the veritable gems themselves. The Ring, Studs, and Ear Drops, as displayed in this announcement, are accurate engravings of

SOLID GOLD MOUNTINGS, CONTAINING THE WONDERFUL LEFEVRE DIAMOND, warranted by certificate U. S. Mint assay.

ON RECEIPT OF ONE DOLLAR we will send free, by REGISTERED MAIL, to any address in America, either article as above represented. Our "Book on Diamonds," with illustrations of artistic Diamond Jewelry in solid (14 k.) gold, mailed free.

I have seen many imitations of diamonds, but never any that could equal the Lefevre Brilliant.—M. ELLROY, Stamford, Conn.

I am in receipt of a pair of the Wonderful Lefevre Ear Drops, for one dollar, to say that I am pleased with them hardly fills the bill, they are simply elegant.—ANDREW MORRIS, Hornellsville, N. Y.

The Wonderful Lefevre Diamond Ring, for one dollar, came to hand this morning. It is really elegant, giving entire satisfaction, and eliciting wonder and admiration from all who see it.—W. H. REEDY, Martinsburg, W. Va.

The Lefevre Diamonds, mounted in solid gold, are truly marvelous.—B. F. AVERY & SONS, Home and Farm, Louisville, Ky.

The eminently successful experiments of M. Lefevre silences all doubt of the artificial reproduction of the true diamond.—M. DU FRENOY, the great French Scientist.

The Lefevre Diamond most effectually disturbs the slumbers of the possessors of costly gems.—Journal of Science.

☞ We guarantee the Wonderful Lefevre Diamonds for **One Dollar** to be mounted in **Solid Gold**, and will cheerfully refund the money if found unsatisfactory. Address all orders to the

Farm Topics.

AN INNOVATION.

WORK is always pressing on the farm. And often farmers fail to have a good garden, thinking they couldn't spare time from attending to the farm crops to prepare the ground and put in the seeds. Where this has to be done with the spade and by hand labor it is a great deal of work and necessitates patience and painstaking. Farmers' boys hate to work in the garden where much hard labor is required, and especially when it has to be done at odd times and at noonings. They will follow the team without murmuring, but "puttering" in the garden among beds is another sort of business. This system is apt to put the garden in the background, or to put it out of the way altogether. A better place and one more in accordance with the boys' tastes, and the fathers', too, is to have the garden in a field. The corn field, if not too remote from the house, is a good place. In the field

SCENE AT THE INTERNATIONAL DAIRY FAIR.

the sweet corn and early potatoes may be planted with all sorts of vegetables, in rows, and be cultivated with a horse, reducing the labor of raising at least three-fourths. Compared with most gardens, vegetables in the field will be earlier, as here they will get the full benefit of sunshine and moisture, of which the trees about and in a garden rob the crop. Renewal crops may be put in readily, as a few minutes' work with a horse and cultivator will prepare the ground. Plenty of vegetables is a decided acquisition for a farmer's table, and helps the good housewife wonderfully to prepare the meals, when fresh meats are not attainable, and good health demands that food should be plentiful and in accordance with the season. A greater variety of wholesome food is one of the lacks to many homes, and helps to make discontented those who gather around such an uninviting table, besides discouraging housekeepers who might be made happy where plenty abounded. Let the old garden be given up to more delicate plants and to flowers.

USE OF FERTILIZERS IN OHIO.

M. B. BATEHAM.

BENEFITS TO CROPS OF THE GROWING USE OF FERTILIZERS.

Thanks to the agricultural press, there has been a very rapid increase in the number of farmers disposed to make use of commercial fertilizers in the north-eastern half of this State, embracing most of the old wheat districts. On the clayey soils of this region, which have become a good deal worn by hard cropping, applications of moderate dressings of bone dust or a good superphosphate were found generally beneficial, and, in many cases, the increased yields of wheat and the succeeding crop of grass, were so noticeable that old-style farmers were compelled to lay aside their prejudice and to admit that there was, in these new-fangled notions, something which they might as well look into.

Hence they began to experiment, and the demand for the fertilizers increased, so that the manufacturers were induced to appoint local agents in almost every county, to distribute printed circulars and encourage sales. In this way the amounts sold have, in most districts, doubled each year for two or three years past, in some cases several car-loads at a time going to one neighborhood; and it is estimated that not less than ten thousand tons were sold during the past year. The proprietor of a bone mill informed me recently, that his sales the past season were more than double those of any previous year, and some of the time the demand exceeded the capacity of his machinery, though grinding at the rate of five tons per day. Some credit is due to this movement for the excellence of the wheat crop on thousands of old farms during the past two years, in this portion of Ohio.

BENEFICIAL EFFECTS ON THE MINDS OF FARMERS.

But it is of the *moral influence* on the minds of the farmers that I wish especially to speak, as I have not seen this distinctly alluded to in any of our agricultural journals.

In the first place, the farmers in these old wheat districts, where the fertilizers are used, are more hopeful and cheerful than before, as they now feel that the means are within their reach for restoring fertility to their worn fields. It is quite possible that some are over-sanguine, and will place their main reliance on fertilizers instead of regarding them only as helps along with manuring, the use of clover &c.; but these mistakes will soon correct themselves.

Another grand result is the prompting of farmers and their sons to read agricultural papers more generally than ever before. They see and feel that the use of fertilizers, or the effect produced on the crops, is a matter of *science applied to farming*, and it is a necessity that they should read and learn something about it. So, too, they are more ready to talk on these subjects, and to listen to discussions or lectures at the Farmers' Clubs or Granges.

We have in Ohio about a thousand Grange organizations, one in almost every township in all this half of the State. Each of these serves the purpose of a farmers' club, and, holding meetings every fortnight, discussions are held on all matters deemed of interest to the farmers. Each Grange has its "lecturer" whose special duty it is to see that suitable topics for discussion are introduced at each meeting, and for a year or two past no subject has afforded so much interest as that of fertilizers and their use.

Another good result is the effect on farmers' sons in convincing them that agriculture is really an intellectual pursuit, affording scope for scientific knowledge as well as strength of muscle, and that the old farms can be made to produce more bountifully than they have supposed. Hence, more of them are disposed to stay on the farm instead of going west, or risking the chances of finding success in the city or town. As a result of this mental awakening among the farmers, we find a large number desirous of attending the course of lectures to be delivered by the professors at the State University at Columbus, (Agricultural College), which are to commence the 9th of January and continue four weeks, four lectures each day, on the various branches of science relating to agriculture. There is a prospect that the number in attendance at these lectures will be quite large; but there are hundreds of young farmers who would gladly attend them if the low price of farm products did not prevent their finding the means for defraying the expenses of travel and board.

Our farmers feel severely the effects of such low prices; but, with the exception of those who are pressed with debt, they know that they are more comfortably off than are the great majority of the residents of the towns and cities; and so they are content to wait till the better times come, and until the lessons of adversity shall have their due effect on the people at large.

Lake County, Ohio.

MOISTURE-RETAINING POWER OF THE SOIL.

EXPERIENCE VERSUS THEORY.

After reading "Notes from the Rural Grounds" in the issue of October 19, three times, I am still at a loss to understand whether the writer wishes the reader to believe that soils will resist the effects of drought more effectually without pulverization in ordinary field cultivation, or whether he applies his reasoning only to pots. In the case of two adjoining plots of land alike in every respect, except that one has received no more cultivation than has been necessary to destroy the weeds, while the other has been thoroughly stirred to the depth of several inches at least once a week, in such a case every observant tiller of the soil knows that the plants growing thereon plainly show, by the greater thrift of those growing on the well tilled ground, which plot has received most cultivation during a protracted drought. Moreover, on examining the soil, it will be found that the neglected plot is dry to a considerable depth, while that which has been cared for, is moist nearly to the surface.

Now, whether this moisture comes from the sub-soil or from the atmosphere, it is undoubtedly the result of thorough cultivation. In a measure, the conclusions arrived at in the experiments, are applicable to such soils as are thoroughly underdrained; for there the percolation of the water through the soil, produces a partial loosening of the particles of clay or loam; but since only a small proportion of our cultivated lands are so drained, I fear such reasoning may lead many unthinking people astray, unless the subject is amply discussed. If, however, it can be proved that this new departure is correct, it will certainly be a boon to the lame and the lazy. If the writer of "Notes" only expects to show that the moisture in the loose soil is not due to capillary attraction, then he may be right; but even in that case, he does not show that stirring, working, and breaking up the surface soil are unnecessary.

THEORY VERSUS EXPERIENCE.

One more point deserves consideration. I suppose the soil in the pots continued moist as long as there was any water in the buckets; when the supply was exhausted, then the drying commenced. Of course, the soil could not draw, by capillary or any other attraction, moisture that was beyond its reach. Now, it is supposed that somewhere down in the earth there is always a stratum of water, and if the soil be in a proper condition, may not the water be raised a long way? M. B. PRINCE.

[Rarely, if ever, more than a few feet—five or six.—EDS.]

A SINGLE EXPERIMENT VERSUS A LIFETIME'S EXPERIENCE.

The conclusion drawn, in RURAL for October 19, from experiments with pots and buckets upon the utility of cultivating the soil, go to quite upset the results of my life's experience in doing that very thing. Would not the test be more satisfactory, if equal plots of ground, side by side, were experimented upon? At wheat-sowing time I have often seen the ground so dry that the only soil that would sprout the seed, was fallow land which had been plowed early and often until seeding time, and ground so treated I have never known to fail to do so. This was my experience in Western New York where all farmers adopt the practice as an essential requisite of good farming; here, however, the theory of the inutility of cultivation is likely to be popular—until bankruptcy at any rate—for few either use, or believe in the utility of using, a turning-plow. When I began to plow here one foot deep, the natives said it was a great mistake, as the Almighty had put the right side of the land on top, and gave vent to not a little more ignorant wisdom, to the same effect. Yet, despite their prophecies, the best results followed my work, and they begin to see the advantage of the practice now—and to do likewise S. I. C.

Fulton Co., Ga.

FARM NOTES FROM ILLINOIS.

Corn here is a large crop and well matured. Husking has commenced, and if the weather continues favorable, the crop will all be cribbed in good condition by the first of December. Very little corn is cut off in the West and the fodder saved as in the East; but here it is husked from the stalk, thrown into wagons and hauled direct to the cribs, a method which economizes the labor. Then the cattle and other stock are turned into the fields to glean what may have been missed and devour the stalks, which afford them good feed during most of the winter. I am not sure this is the best way, as the animals are often exposed to the inclemency of the weather, but it is the practice here, and the stock seem to stand it well. This State is celebrated for its fine horses, cattle and swine. Sheep, however, are not so plentiful as they might or should be.

Potatoes are about all dug. The crop, in general, is a light one, though some yielded well. Those that were planted very early in suitable, well-drained soil, and properly tended, did well. Early Rose, planted late, turned out poorly. Some of the late potatoes (Peachblows) are good, and others "small and few in a hill," which shows the importance of good cultivation. The Colorado beetles did not prove so troublesome this year as formerly, though they did some harm and in some fields had to be picked off or "Paris-greened," in order to save the crop. Owing to the general scarcity of potatoes throughout the country, the price has advanced here from 25 cents to 35@40 cents per bushel, and it is thought they will be still higher before spring.

Apples are also rather scarce and of poor quality, but they are more plentiful than they were last season. A considerable amount of cider and apple-butter has been made this fall, and those who are so fortunate as to have orchards, have their cellars pretty well supplied with apples for winter use. The price of apples this fall ranges from 30 to 60 cents per bushel. Good-keeping apples are worth more.

Turnips, beets, cabbages, etc., are variable—some good; others failed to do well. The turnip crop is generally a "hit and miss." If the seed is sown at the right time, just before rain the latter part of July or first of August, in good clean soil, the crop seldom fails, but if the land is foul with weeds, and the seeding is done in a careless, "slip-shod" manner—which is too often the case here—the crop fails. Under such conditions this is a thing it has a perfect right to do, but "ye farmer" will say, "turnip-raising don't pay anyhow." Root crops are not in much favor "out West," as the farmers don't like to "stoop to such work." If they could perform all the labor by automatic machinery, this necessary adjunct to good farming would be in better repute. The time will come when more attention will be paid to the culture of vegetable crops than at present, for the soil is well adapted to them.

Buckwheat is another crop that is grown here only to a very limited extent. It sometimes does well, but more often fails, and our prairie farmers don't like to be called "Buckwheat Farmers." They may fail in raising wheat, and will thereon sympathize with each other; but any one who is foolish (!!) enough to attempt raising buckwheat and fails, gets no more sympathy from his fellows than does a whimpering boy with the tooth-ache. In a drive over the prairies this fall, through quite a long distance, I saw but one field of buckwheat. It looked well.

Clover Seed had the appearance of a good crop this season, but the weather has been so stormy every little while, that it has been a difficult task to save it, and as it is not hulled yet, we cannot tell how it may yield.

Hay was a heavy crop and most of it was saved in good condition; but still a large amount got spoiled and wasted for want of suitable shelter in which to store it. It pays to have good barns and "hay-barracks," and, no doubt, the animals would express their grateful thanks for such kind consideration—if they could only talk. And they do speak by their looks and actions—a kind of language more expressive and far more truthful than words.

Threshing is mostly finished now, and the crops—with the exception of spring wheat, which was injured by sun, blight, rust, etc.—have yielded well. Winter wheat and rye were unusually good, and a larger acreage of these cereals has been sown this fall than heretofore.

The Fall Grain and Pasturage are very promising, as there has been no severe "killing" frosts yet. The weather has been generally favorable to the autumn crops and for work.

Ogle Co., Ill., Oct. 23. W. B. Derrick.

NOTES FROM CENTRAL ILLINOIS.

The great bulk of the corn crop is in the crib here. The yield, as usual, is very unsatisfactory, and will be till we learn to put in less and cultivate more. How much better would it be to have fifteen acres yielding 75 bu. per acre—1125 bu.—than 45 acres yielding 25 bu. per acre—1125 bu.—to say nothing at all about the grass, wheat, oats, pasture, potatoes turnips and garden truck the 30 acres botched in the latter case would afford.

Fultz wheat seems to be stooling better this fall with us, than any other sort I have noticed, and I have seen six or eight varieties.

The Butman was the finest squash I raised this year; its color, too, was not as objectionable as that of most varieties.

Of 27 varieties, the Monach of the West strawberry, looks the thriftiest after several hard frosts.

Now is a good time to brandish a sharp knife and make a brisk attack on those old brush heaps many a farmer has been in the habit of calling grape-vines. Those having such piles of brush, often waste enough time to prune them in spinning out some long "yarn," or talking politics.

The rabbits already are gnawing some of the young trees belonging to those who think that to set out trees is all that is needed to insure fruit. When a young orchard is a wilderness of grass and weeds, rabbits find good quarters therein, and the trees will very likely be injured. If young orchards are clean through the winter, and an ear of corn is placed near each tree, rabbits will not stop to bark the trees; but a better plan is to wrap all rapidly growing trees, young and old. An Old Subscriber.

Arboricultural.

EVERY-DAY NOTES.

SAMUEL PARSONS.

AMPELOPSIS JAPONICA. (?)

Japonica is a broad term, and I fancy that in this case it has been given for want of another and more correct name. The plant is certainly rare, and yet most readily grown and worthy of employment. Many good qualities commend it and it should only be known to gain appreciation. It is exceedingly vigorous and very different in every way from the Japan Creeper, Ampelopsis Veitchii. [A. tricuspidata.—EDS.] The green foliage is less deeply cut than that of other varieties, and bright blue and red berries relieve and increase the beauty of the rich coloring of the leaves in fall. As a member of its genus, and a climber generally, it is very distinct in form and appearance, possessing at the same time all the good qualities of the genus Ampelopsis.

A NEW WEEPING JAPAN CHERRY.

We have long had Weeping Cherries which are pretty and graceful, but this introduction from Japan is of another make. Its growth is as strong and vigorous as that of any variety of the ordinary fruit-bearing Cherry, and as eccentric and grotesque, if less beautiful, than that of the Weeping Beech. Throwing up great far-reaching shoots of young growth, the branches curve finely and sweep down to the very surface of the ground. The leaves are large and healthy, and the general appearance is that of a common cherry tree. It remains as yet extremely rare, but would soon be common, if people only knew its value and demanded its culture, which is not difficult.

THE JAPAN ALDER

is another tree bearing the broad designation of Japonica. It is, however, a noble tree, vigorous and rapid in growth and attaining large size. The leaves are of a bright shining green, and of a long oval shape, forming a compact, erect head, strikingly elegant. Were not comparisons odious, and had not nearly every tree its own special claim and suitable place, I should be tempted to term this the finest Alder I ever saw. One of the marked peculiarities it possesses in a higher degree than other Alders, consists in large, curious, roundish seed-vessels, green late in the fall, and strangely marked, like an undeveloped cone. These seed-vessels hang in clusters of four or five, and impart a peculiar appearance to the tree at this season of the year. The Cut-leaved Alder (Alnus imperialis laciniata) has been heretofore considered the most ornamental of Alders; but this Japan species is quite as ornamental in its way, and of hardier and more vigorous habit. [Not *hardier* it seems to us.—EDS.] It deserves general recognition.

THE JUJUBE TREE.

The remarks concerning the Jujube made by Mr. Wm. R. Smith, Chief of the Botanic Gardens, Washington, in the Star of that city, and quoted in a late number of the RURAL NEW-YORKER, interested me much. I have seen the tree several times in Washington, and have been much impressed with its valuable qualities. It is well known how greatly we need a good hedge plant, one that is at once cheap, rapid-growing and hardy, and at the same time satisfactory as a barrier, ornament or screen. The Jujube, as I have seen it growing, has apparently all these qualities. It comes surely and rapidly from seed, and can therefore be grown cheaply. Evidently, also, it is a natural hedge plant, from the fact that it remains after many years' growth, a tree of moderate size, although in five years or so we have seen that it will develop into as many feet in hight. This is an important quality, as indicating the aptitude of the shrub for hedging purposes. Unlike the Osage Orange, there are no suckers about it, and as far as tested, it has proved hardy. As a barrier, its value can be easily proved by the size and sharpness of its thorns. Good ornamental qualities are evident in its thrifty, shining acacia-like leaves, and richly colored bark and fruit, the latter of which

is very ornamental as well as edible. A very vigorous foliage demonstrates sufficiently its capacity for screening. It would indeed be strange if in this long-known shrub, a valuable hedge plant should be discovered. If such is ever the case, the merit of strenuously and persistently calling the attention of the public to the fact will be due to Mr. Wm. R. Smith.

TREE SURGERY.

GEN. WM. H. NOBLE, BRIDGEPORT, CONN.

LACK OF TIMLEY SURGERY IN THE ORCHARD.

THERE are little items of home and homestead care, rarely known and more rarely practiced. They are not great or vital matters; but their neglect leaves a good work undone, and a waste all the while gaining.

One of these neglected duties is the rightful care of our fruit trees. I never go near an old home lot or homestead, or to a residence which has known the household presence of a century, but I find lots of their tumble-down and gangrened trunks. Somebody has driven his loaded cart hub against a choice Apple or Pear, and gouged a big wound into sap-wood and bark, or in haste or ignorance, some large limb has been sawed off, and a long stump left to rot. The wet, and frost, and air, have made havoc of the unsightly deformity, and have mined down into the trunk. Thus, year by year, a ceaseless corrosion, has chambered out great areas of decay. Rarely is thorough work done to stay this waste.

THEIR VITAL FORCE HELPS TREES TO A LONG LIFE.

Now, the trunk of the Apple and the Pear, and the sap-wood of most fruit trees, are so life-bearing that they keep up the struggle against their decay, for years. After the heart-wood and all, perhaps, but a strip of sap-wood and bark, are gone, the old thing still puts out leaves and blossoms, and bears fruit. It is done, though, under a strain of vitality and against a drag and a torment, which is plainly seen after the ailing tree has submitted to a little wholesome surgery. Though but a maimed, diseased remnant of its former self, yet you may so stay its waning forces that for years it will yield the comfort of its fruit. The song of "Woodman Spare That Tree" may well be paraphrased for one of these old landmarks and memories of early homes. Its companionship for a score of your allotted years is only a question of care. A generation may gather its store before the young tree of to-day gives you more than a taste.

HOW AN OLD TREE WAS SAVED.

The story of an old pear tree near by, and of help to the ills and waste of lots of old fruit trees on an ancient home ground here, though told before, will bear telling anew.

That pear tree's trunk, if whole, would have been some 18 inches through, but it was a mere shell, some three inches thick, and one whole side was gone, clear to the ground. I think it would have keeled over many times, had not a kind of cork-screw twist in its fiber, made one whole turn and stiffened it to hold above its shoulders its three stout and sound limbs. Inside this shell, the borer-grubs and gnawing ants had honey-combed the decay, and channeled burrows well into its sound wood. It looked as if a stiff northern blast would topple over the old thing. But the twist held it, and surgery was tried.

First, all decayed and unsound limbs were pruned off and their stumps well painted. The top was also somewhat lightened. Then the bark was thoroughly scraped and washed, away up to the small limbs, with a coat of lime and sulphur. The inside rot and a good slice of the channeled hard wood were cut clean out. All the grubs and ants were dug, killed, or smoked out. This work was carried on away down to the roots. Then all that bare and raw interior was coated with a heavy shield of paint skins. All small holes were puttied tight. Every opening and every crevice were filled. This shut out the rain and air and kept moisture in the wood, which else would have drank up the vital flow of sap. Moreover, such coatings are not relished by the boring pests.

This work was done in the early spring. The ailing thing seemed to feel the care. That very season it took on new life and growth, and has since flourished in forgetfulness of its maimed and crippled state. Now for 25 years the venerable tree has never failed of a crop, partly of its own Old Harvest pears, and partly from grafts of choice varieties, grown on its thrifty young shoots. It has during all that time stood wet-nurse for lots of fine fruits, as each new and valuable kind came along to be tried.

HOW TWO OTHER OLD PEAR TREES WERE REPRIEVED.

Several other old pear trees on the same property have been saved, or given a new lease of life, by operations fitted to their cases. Two, not quite as large as our venerable friend, had become heart-rotten, for six feet from the ground. Only the sap-wood and bark, about two inches thick, were left. A slender crack, which ran down the whole shell, gaped wide at every severe cold snap. They were but hollow shafts, full of rottenness and of all the vile pests that fatten on decay. The trees evidently felt the torment and drain upon their lives of this gangrene and gnawing.

Along in these cracks, at equal distances, holes about three by four inches, were cut through the shells. Into these, and up and down the rotten space, stout wires were bent and thrust. This regimen worried and drove the decay "down and out." After thorough cleaning had thus been done, water was poured into the holes at the top of the hollow, and the whole interior again churned and washed clear of dirt and insects.

Strong hydraulic cement, moist enough to flow from a tin trough fitted to the second opening from the ground, was then poured therein, and worked down with those same wires, so as to fill compactly every space of the void. As the filling mounted to an opening, that opening was stopped tight. The like pouring of cement was continued from higher orifices, till under the pressure of the column and the working of the wires, all the hollows were filled. The whole inside to the topmost opening, thus became a mass of stone, effectually shutting out moisture, air and insects. The very year this operation was performed, both trees marked by their growth, vigor of leaf, and size of fruit, the virtue of this regimen. I have no doubt that, in time, they will close over every crevice and opening with a new wood and bark.

LIKE SURGERY ON SOME OLD APPLE TREES.

Some fine old apple trees, on the same homestead, were saved and given new life by like means. There were, in some of these, great hollows, a foot or more across, and deep and big enough to hold a bushel. Some were only holes where the neglected stumps of limbs, left at the pruning, were at the mercy of the elements, and had invited decay. Those smaller voids, after all rotten wood and uncleanliness had been carefully dug out, were troweled full of cement, and then coated with paint.

Those larger places, after having been thoroughly cleansed of all unsoundness, were filled with concrete of sharp, small, broken stones and cement, well rammed solid by an iron rod. The surface of this was then troweled smooth with rich cement. This, when thoroughly hardened, was heavily coated with thick paint, to keep all dry and tight. The result is that, after some twenty years, most of these unsightly, gaping wounds are entirely closed with sound wood, which, year by year, has lapped over the cement. In the largest, which once were only water log, waste and disease, there is now but a span's breadth of cement, whose bareness year by year the bark curls over and contracts.

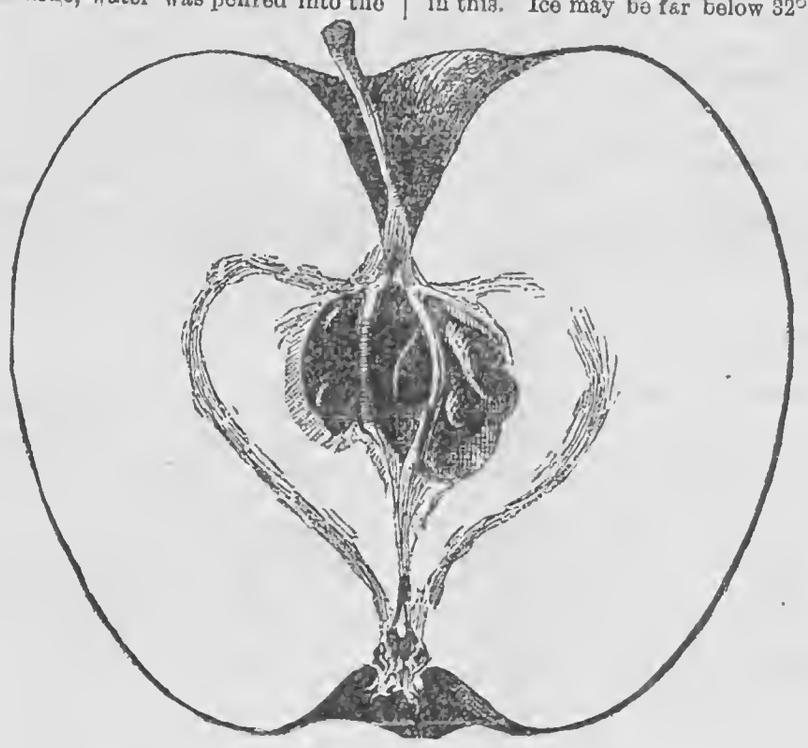
MORE OF SUCH TALK TO COME.

In some future articles, I shall have a word to say about "pruning, as a fine art," and about that sensitiveness of trees, which some one has lately called "tree mind," a sensitiveness that makes suffering from decayed limbs, rotten trunks, and slovenly treatment in general, something very much keener and more hindering to the life and health than would be any real injury, the gnaw of insects, or the waste of gangrene.

VAN'S VIEWS.

BEST SOIL AND MANAGEMENT FOR AN APPLE ORCHARD.

IN the Pomological number lately published by the RURAL I see its worthy contributor, Henry Stewart, advises choosing a light soil for an orchard. This may be the best plan in his region, but here in Brown Co., Wis., we have found, at a severe cost, that it is of no use to set anything but crab Apples on a light soil. I see that he also recommends manuring the ground where the trees are set; with us this will stimulate the tree to too great a growth, so that much of the wood will not be riponed and will be winter-killed. According to him, all that one needs to care about is to get a good growth of the tree and the rest will take care of itself; on the other hand, we wish to keep the tree from making more growth than can be thoroughly ripened the same season. If there is unripe wood it will be winter-killed, almost certainly. Another mishap that must be guarded against, is root-killing; and one of the preventives against root-killing is a wet soil (?). The temperature of a wet soil can be lowered to only about 32° above zero; while that of a dry soil can sink to 40° below zero, and still lower, if the weather is cold enough. [We think our friend is wrong in this. Ice may be far below 32° though, it is true, a better non-conductor than the dry soil.—EDS.]



THE WINESAP APPLE.

An acquaintance of mine had his trees—which had been potted and were making a famous growth—all killed by the cold winters of '72-3 and '74-5. He was "mad," and, on being told he cared for them too well, he chose the poorest piece of land on his place, and in the spring of '75, set out an orchard, 16½ feet apart each way. The ground was at once seeded down and has been mowed annually since. The trees were well mulched, and bore this year for the first time. They are thrifty, healthy and able to stand a cold winter well. He is converted. We have but few Apples that are hardy enough to stand the winters and bear. Perhaps, the following is as good a list for this country as can be had of tested Apples:

SELECT VARIETIES FOR 250 APPLE TREES.

160 of Famouse—our very best winter Apple; 25 each of Pewaukee, Wealthy, Walbridge and Plumb's Cider; 10 Duchess of Oldenburg; 10 St. Lawrence; 5 Red Astrachan; 5 Tetofsky; 2 each of Northern Spy, Sops of Wine, Sweet Pear, Bullock's Pippin, Wagener, Belmont and Jewett's Fine Red; and 6 sorts of Crabs for home use—no sale at all for them here. The Spy and the last four in the list should be top-grafted on some *very hardy* variety, such as Plumb's Cider.

I believe that we shall have good orchards here, and will make apple growing a success, just as soon as we shall take proper precautions, and set only those trees which are top-grafted on crab or "iron-clad" stock. Setting out an orchard of this kind here is expensive at this time because, so far as I know, only one of our nurserymen keeps a stock of these trees, and we have to graft our own. The time will come, however, when the name of Wilcox will be held in as high regard among Western orchardists as those of Warder and Downing now are in our American pomological circles.

Brown Co., Wis.

Horticultural.

THE TEXAS INDIAN APPLE.

THIS is a beautiful and profuse-blooming, scarlet-flowered, shrubby plant which bears an abundance of smallish, scarlet fruits. It belongs to the Mallow family, and is botanically named Malvaviscus Drummondii. It is a native of Texas, where, in Leon county near the Trinity River, it is locally known as "Indian apple plant." I found it freely scattered along the banks and upon bottom lands of the Brazos and Colorado and their tributaries, but I don't remember having met with it on Trinity land. My friend Capt. Henderson of Jewett, however, sent me specimens from Leon county, with the following note:—"I herewith send you some young plants, also shoots of older ones, to show you the handsome red flowers and berries. It grows wild hereabout, and we call it 'Indian apple plant.' The plants are from three to four feet high, and die down in the winter, growing up again from the same roots in the spring, when they blossom all along through the summer and fall."

It grows thriftily and blooms copiously in our northern gardens in the summer time, but as it is not hardy, it requires the winter protection of a well-clad cold-frame or a cool greenhouse, or it may be wintered quite successfully in the cellar, like a Crape Myrtle, Pomegranate, Fuchsia or Oleander, but the roots must not get very dry.

One of the prettiest combinations of wild flowers I remember having seen, was near the Brazos where, on a bank, the Indian apple plant and the Mist Flower—Conecliuum cœlestinum—grew up together, forming a soft but brilliant carpet in front of the dense and high-depending vine-drapery of that rich bottom land.

It is a smaller grower and more profuse bloomer than M. arboreus, the West-Indian species commonly found in greenhouses, but otherwise both kinds are much alike.

W. FALCONER.

THE WINESAP APPLE.

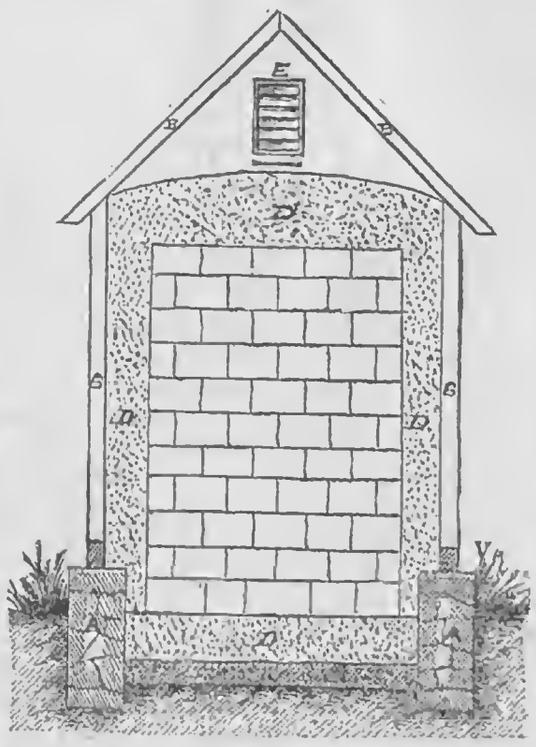
THIS variety, in the West particularly, is one of the most reliable and marketable sorts cultivated. The tree is perfectly hardy, comes into bearing early, and is very prolific, fruiting annually. As to quality, it is quite above medium—a little too tart for some—handles, ships and keeps well. In Illinois, Iowa, Missouri, Kansas and Nebraska, it is classed among the "iron clads." No orchard, or nursery is considered complete without a good supply of Winesaps. We have to thank Ex-Governor Furnas, of Nebraska, for the specimen from which our engraving is made.

Rural Architecture.

PLAN FOR AN ICE HOUSE.

THE season is once more at hand when the construction of an ice house would be in order by all those who intend to make preparations for the enjoyment of this luxury next summer. The construction of a building that will properly keep ice through the hot summer months, is a very simple problem, if three points are kept well in mind; these are non-conduction, drainage, and the prevention of air spaces or *drafts, through the body of the ice.* Ventilation over the top of the body of sawdust covering the mass of ice, should also be provided for. The plan shown in the accompanying sketch fulfills all these requirements in a very simple and inexpensive manner. The sketch shows a sectional end view of the ice house, filled with ice and packed with sawdust.

A represents the stone foundation in cross section. It should be carried below the ground about two feet and rise one foot above the same. B sectional views of the walls and roof, the sides formed of four-inch studding and boarded up smooth and tight on the inside, at least. The construction of the outside is more a matter of appearance, perhaps, but it might also be made an additional protection. The roof is shingled.



The earth is excavated inside the foundation walls to within six inches of the bottom of the same, and then filled in to a depth of six inches with round stones, the smaller ones on top. On this, place a foot or more of sawdust, and on this, lay the ice to within a foot of the inner walls all around. C, in the picture, represents the stones and D the sawdust. As you fill in the ice, keep the sawdust well packed down all around in the space between the ice and walls of the building. When you have reached as high as the eaves, cover the ice all over the top with two or three feet of sawdust. A ventilator, made like a Venetian blind with immovable slats, is shown at E, at the farther end of the building; one should also be placed at the opposite end.

With this general plan to guide him, any intelligent person will have no trouble in constructing a *very good* ice house. The dimensions, of course, must depend upon the size of the family and the requirements. A building 10 feet wide, 14 feet long, with 12 feet walls, would be a good size for a farmer's family of eight to ten persons, and a dairy of a dozen cows.

WILLIAM ROBERT BROOKS.

Ontario Co., N. Y., Nov. 27th, 1878.

THE INTERNATIONAL DAIRY FAIR.

The Greatest Display of Dairy Products Ever Made.

AN ENCOURAGING SUCCESS IN ALL RESPECTS.

FULL SPECIAL REPORTS.

THE GREAT DAIRY FAIR.

The term International is applied to so many evén petty things now-a-days that, with all deference to the management, the use of the word gives a sort of impression of clap-trap—a cheap "greatest-show-on-earth" sort of thing. So the visitor to the International Dairy Fair, has been at once most agreeably disappointed in finding solid excellence and positive interest of a very high degree drawing him thither day after day and detaining him, in spite of himself, in the investigation of what might at first have seemed common-place and unattractive to any except professional dairymen.

THE ARRANGEMENT OF THE DISPLAY

is very simple. The spacious floor of the old "Rink" (now the exhibition building of the American Institute) is occupied by the butter and cheese display, mainly arranged in groups, by States, or classified according to certain premiums offered for the best butter or cheese made from certain kinds of salt. The cheese is shown in lots weighing not less than 250 lbs.; the butter in lots of 200 lbs., if made in creameries, and in lots of 100 lbs, if made in private dairies, except when competing for the special prizes offered for the best 50 pounds made with Higgins's Eureka salt, or with Ashton's Factory-filled salt.

Grouped near the great fountain in the center of the floor, are the lofty cheese pyramid of the Messrs. H. K. & F. B. Thurber & Co., surmounted by a well stuffed specimen of a Jersey cow and gay with flags, evergreens and quaint mottoes from the Bible, Shakspeare and Hudibras, and a far less pretentious, but scarcely less attractive pyramid of American cheese, erected by Smith & Underhill, conspicuous for its severe simplicity and freedom from any clue to proprietorship; and besides, there are two more or less pyramidal pillars of salt in bags—the one, Higgins's Eureka, shown by the Thurbers; the other, Ashtons', shown by their agents, F. D. Moulton & Co. Along one side of the floor, happily the cheese side, the cow stalls are arranged, and at the farther end two cheese factories, Whitman & Burrell's, and Jones & Faulkner's, are in full operation, exhibiting rival vats and apparatus. Churning and butter-working are going on also at each of these stands, to the great interest of the ever-changing crowd.

DAIRY APPARATUS AND APPLIANCES

of all kinds are shown on the elevated platform surrounding the floor; as are also patent milk-pails, strainers and coolers; vats for setting for cream; vats for cheese making; creamers, that is, systems of setting milk for the rapid separation of the cream; churns in great variety; butter-workers to the number of five or six; butter prints or molds, some for simply stamping the butter upon one side, and one for stamping it upon five sides in brick-form and very rapidly; butter packages in great variety, including those wrapping or packing butter in pound or half-pound prints, and those adapted to packing 50 lbs. in tubs, or 100 lbs. in boxes; butter coloring shown in three different forms, namely, in solution in alkali and water, in solution in oil, and in the form of highly colored salt; rennet-extract in both solid and fluid form; lactometers, cream gauges, etc.; thermometers for dairy use and a great variety of minor utensils; butter and cheese tryers, etc.; Howe's New Improved scales; jars of glass for transporting milk, cream or butter; milk cans, and perhaps other articles of property for dairy use.

Besides these, the New York Plow Co., makes a display of goods particularly adapted to dairy-farmers' needs. Somebody shows a hay cutter working with a scalloped knife which would make hard work on most farms look like fun. The exhibitor had not any cards and did not tell his name. The Alligrotti and Whitson refrigerators made each a great show. There were in addition a number of exhibits having not the least reference to dairy matters which were allowed in the building probably because they paid well and helped to fill up, for there was room and to spare.

THE CATTLE SHOW

was a source of constant interest to all classes of visitors, and to none more than to the exhibitors of cheese and butter. There were a few good specimens of the cows of several breeds and a few bulls. The Ayrshires came nearest the door and consisted of a number of young things with a single cow which, by the way, had a nice calf the second day of the fair, shown by Wm. Crozier, and three superb cows belonging to S. M. & D. Wells of Wethersfield Ct. These three cows represent the three principal families of their herd. They are 24-to-30 quart cows and have won prizes enough to lead us to speak of them with great respect, even were they less perfect types of the breed than they really are. Next to them come the Holland cattle called Holsteins, belonging to Jas. Neilson, two bulls and half a dozen females. Among them were two very symmetrical heifers, and some fresh cows, yielding each a large mess of milk. Beyond these stand three beautiful Devons belonging to Harvey N. Weed, of Stamford Ct. How sleek and smooth their red coats! How symmetrical their white horns! And how fine their forms! How closely also they match in form and feature! No breed of neat cattle has anywhere near so thoroughbred a look or is so perfect in all good points as the beautiful Devon. Next to the Devons stand the Polled Norfolks only two—a cow, and a heifer shown by G. F. Taber, of Patterson N. Y. This beautiful breed is red, like the Devons, and is claimed to be equally good for beef, and for milk. The animals exhibited are remarkably fine; in fact, one seldom sees a finer cow, take her all in all, than the older one.

It was unfortunate to place the Jerseys next, for they rarely show well alongside of Devons, and the Norfolks are no better companions for them. These breeds keep in good flesh while they are giving 14 to 20 quarts of milk a day, but the Jerseys milk down very thin, and it is impossible to keep a good cow in flesh while she is in full milk. Next to the Norfolks come James A. Hoyt's Jerseys, very beautiful ones they were, and very good ones, too. He showed a large solid-colored bull and several females, among them one old cow, quite thin but of most excellent form, having a fine maternal face, which it is a pleasure to see. Next to these, Mr. Crozier showed some good Jerseys and one Guernsey, among them two cows recognized as those with which their owner won the award at the Centennial Exhibition, and also the highest prize as well as the herd prize at the New York State Fair this year—namely, Josephine second and Bella Hinman. The line of cows is completed by a number of "natives" exhibiting points of decided excellence as milch cows; but, as a rule, coarse, heavy gross animals contrasting unfavorably with all the rest.

As a whole, the cows form not only one of the most attractive features, but one of the most instructive; and to the breeders the advertisement has been so valuable that similar opportunities will not be neglected. Nevertheless, it was a great blunder to place them on the floor of the Rink. There was plenty of space in the rear room, called the machinery annex, where the odors of the stable would not have contaminated the butter and the milk. We observed butter which was exposed near the cows only a short time, which though freshly churned from excellent cream, was so tainted with those odors as to be absolutely unedible.

BUSINESS ASPECT OF THE FAIR.

A Dairy Fair is a novelty in the city of New York. We are quite accustomed to seeing one whole quarter of the city, and other localities besides, given up, in a great measure, to traffic in butter and cheese, and our dealers might any day, and in fact *do* every day, make a greater show than is this week seen at the American Institute Building. Nevertheless the show proves of great interest to many people. So far as appears upon the face of things, we conclude that the show had its inception in the natural desire of the great cheese and butter interests of the great West, to gain for their ever-increasing and improving products a wider reputation and better market than their home shows and fairs afforded. The Dairymen of New York and Pennsylvania have long enjoyed a sort of monopoly in which they have felt secure, and have not minded it much when somehow or other prizes to which they felt themselves entitled, as at the Centennial, for instance, by the favor or error, or just decision (?) of Judges, went to the West, especially when the slighted articles would bring several cents more per pound in the open market than those which won the prize. They have been, to say the least, not enthusiastic about the fair, and perhaps have not prayed fervently for its success. Why should they? They stand at the head now, and it is not exactly pleasant to be crowded and jostled by an aspiring crowd, each trying to gain the same position of pre-eminence, many not being over scrupulous as to the ways and means. Nevertheless, we are proud to say they contributed liberally to the show. They made their entries in time—on or before the 20th of November—and their goods were here and ready to be put on the tables promptly on the 28th. This was according to the published requirements, and, of course, they feel as if it was hardly fair for goods, especially for butter, to to be entered and presented as late as the middle of the week of the Fair, and still be admitted to competition with their own—"kept" as one of them phrases it, "in a cow stable for a week."

This state of things was unavoidable; even the managers had no idea of the grand success which the Fair would prove, and were unprepared for it. Exhibitors held aloof and many had to be urged to come. These came quite at the last, and every allowance ought to be made, considering that the whole thing was new to those who had the control of it, as was painfully evident from the rules and premium list put out by them.

The Fair owes a great deal to the zealous co-operation of the Messrs. Thurber & Co., one of whom has just returned from a dairy trip to Europe where he attended the great Dairy Fair of London. There he interested at least one notable English dealer to make a most interesting exhibit of

FOREIGN CHEESES,

and moreover, he brought out a most curious and instructive collection of cheeses, himself. It is wonderful what attachment mankind exhibit for cheese such as they have been accustomed to, or brought up upon. This alone will account for the continued use of those barbaric forms and varieties of cheese which one sees, such as the common kinds of Italy, Spain, Switzerland, and even of Germany and Holland. Nothing can be worse in appearance than the cheese put up in bladders or other skins, in Italy and Spain; certainly nothing is so bad in odor as the Limburg and some others of the cheeses of Central Europe. We have long imitated the cheeses of England; more recently those of France and Germany; and it is not too much to expect that our cheese-makers will be vying with Spain in goats' milk cheeses, and possibly with Nubia in cheeses of mares' and camels' milk, if there is a market for them.

THE MARKET.

We may well consider what the market is for our Dairy produce. It seems fairly to be limitless. Certainly at present and for a long time to come it is and will be unlimited. We are making great advances in our ability to produce these standard articles cheaper and better than ever before. Herkimer County butter, packed in June 1875, was opened on Thursday last, "fresh as a rose." We need not fear to meet the butter of either Ireland or Denmark, famous and excellent as they both are, in the markets of the world. If, however, great as our exports have become, we study statistics as we should, it will appear that we are not doing very much, after all. France and Holland are vastly our superiors; and beside the enormous exports from these countries, their populations consume cheese as we do meat. What we have especially to look to is improvement in flavor, and this should begin with the feed which the cows have both in summer and winter. Next, the purity of the milk promoted by its exclusion from the air of the stable, and from all contamination, is one of the most important things—all the more important because neglected and very hard to secure. We have been improving our processes of cheese and butter making and marketing, until but little improvement seems now to be possible, and yet it may be in these particulars that the most important advances may soon be made.

In one thing certainly we must change; we should eat more cheese ourselves, as a nation. We are small consumers of cheese, and it is an exceedingly palatable, nutritious, muscle-building and cheap food.

THE ADDRESSES.

The instructive addresses of Ex-Governor Seymour on Tuesday evening, of Hon. B F. Butler on Wednesday, and of Mr. F. B. Thurber on Thursday evening, have been an important and valuable feature of the fair. The speakers have dwelt more or less upon statistics, but have given us other and very instructive views of the whole subject. This was particularly the case with Mr. Webb, a very large English dealer in dairy goods, whose address on Friday evening was a comprehensive view of the mercantile features of cheese from a foreign standpoint. Prof. Arnold, also, spoke entertainingly, but his words, like those of most of the other speakers, were indistinguishable six feet from the platform, because of the ever-present noise in all parts of the large hall.

PROGRESSIVE FEATURES OF THE BIG FAIR.

IMPROVEMENT ON BYGONE SHOWS.

The big fair, the Grand International Dairy Exhibition, has come and gone. The memory of it is stupendous. Think of it—three acres of butter and cheese, and some of it thirty feet deep. It was truly international, and, dairymen of America, allow me to blush for you! England took the grand sweepstakes premium for best cheese, and Ireland, the beautiful gem of the "say," beat us in butter. I will never look an Irishman in the face again. I am not altogether certain that the Irish victory was in the sweepstakes contest, but I tasted the butter and it was better than anything I got hold of at the fair, no matter where it was made.

Having indulged in these few "glittering generalities" let us come down to the business in hand and see if there is any solid good to come of all this hurly-burly.

All exhibitions of dairy products, like the exhibits in any other line of commerce, must of necessity be, to a great extent, mere repetitions of one another. We must not look for something new and startling at each dairy fair we attend. Gradual progress is better than sudden revolution, and if this fair has contributed its quota of improvements, that is all we have a right to ask of it. That it has not only done so, but greatly surpassed any other dairy exhibition that has ever been held in this country, I think no one who has seen them will deny. Fortunately there was no disagreement or dissention among the projectors of the enterprise, and without any special experience in this line, they had energy and good sense enough to press it through to a magnificent success. All men cannot be original, but they can be accommodating, and this excellent quality pervaded every member of the committee of arrangements, and caused them to furnish everything within their power for testing cows, implements and products, which to the practical eye that is familiar with the common processes of the dairy was interesting, absorbing, educating to the highest degree. If milk was wanted, it was furnished by the wagon load; so with water, ice and anything that was called for, the supply was equal to the demand. The patent cheese vats turned the milk to curds. The patent annatto was on hand to color it; the new-fangled press to mold it; the different kinds of cheese cloths to cover it, with innumerable boxes to put it in. For butter the different cream raisers were on hand to separate the cream. The multitude of churns pounded, sloshed or rolled the butter out of it. The numerous patterns of butter molds formed it into quarters, halves and pounds; and there was every conceivable form of package on hand to ship it in. With these processes in operation before our eyes, we would have been dull scholars, indeed, if we had not noted many vast improvements over the old ways of the dairy.

IMITATION CHEESE.

In cheese the most interesting feature was the perfection of the American imitations of the finer classes of European cheeses. The factories have been able to imitate English cheddar pretty closely, but the art of imitation was carried highest by the dairy makes. A dairyman from Otsego County, whose name I have lost, displayed a cheese of his own make, that was full brother to an English Gloucester. I was particularly struck with a remark this dairyman let fall. He told me that his great-great-grandfather was an Englishman and made Gloucester cheese in the Old Country and came across the Atlantic bringing the knowledge with him. This family has now been making this cheese in this country something like a hundred years, imitating an English cheese, and yet this was the first time that any of the family, except the original great-grandfather, ever saw an English Gloucester cheese. It is simply a miracle that they have been able to preserve the uniform quality of their cheese until it is to-day as correct an imitation as it was a hundred years ago, without once seeing an original package to pattern after.

There were two displays from Orange County of imitations of the French cheese called *fromage de Brie*. Unfortunately there was no original package on hand to compare with these makes. This cheese being made of fresh cream, will not bear transportation well across the water. This cheese sells in this market for from fifty to seventy-five cents a pound.

Why is it that our dairymen insist upon making a third-rate skim cheese that sells for six or seven cents a pound and drives the consumer out of the market, when a little more enterprise and patient study would quadruple their profits? These imitations contain a grand lesson, and it cannot be long before the dairymen will profit by it.

DEEP SETTING.

Nothing about this fair was so striking as the evidence of the drift of the inventor's energies towards perfecting a system of deep setting for cream raising. A few years ago the whole space of a dairy fair was taken up with full-grown or model pans for shallow setting, made to run water through, over, under and around them, with hot, cold and no-water attachments. At this fair that class of pans was conspicuous by its absence. I saw but one model of a shallow pan, while there were four systems of deep setting on exhibition, with the representatives of three others present. This thing has certainly been revolutionized. It was generally regretted that a warm room could not be gotten to test the coolers in.

SALT-LINED BUTTER PACKAGE.

There is probably no one thing that causes a greater loss to the butter dairyman than the taste of the wood that always gets into butter when packed in wooden tubs and firkins. Various linings have been invented to prevent this, but with one common result of a failure. The best the dairyman has been able to do was to soak his tubs in brine and in that way kill the wood taste as much as possible. There was on exhibition at this fair a salt-lined box. The lining looked as though it were made of pure salt, and was about the sixteenth of an inch in thickness, and—if it does not melt down, and the agent assured us it would not—I would consider it a very decided improvement, and of the very highest value to the dairyman.

The professional butter maker was there go-

ing around like a roaring lion seeking whom he might devour; or in other words, looking for some man to talk to death, telling him the only true way to make good butter.

It did me good to hear one cheese dealer remark that one day at that fair had taught him more than he had learned in three years in the store.

There was an immense show of butter colors. Many of them were good, while others had on exhibition a vile stuff, compounded of old butter or rancid lard, that would help to spoil the meanest butter that was ever made. H.

DAIRY IMPLEMENTS AND SUPPLIES.

Our special reports of the fair which follow will give a comprehensive idea of its extent and importance, while our engraving shows some of the more striking exhibits. The success of the enterprise has led to a desire to perpetuate the fair under an organization to be known as The International Dairy Fair Association, and at a meeting of exhibitors it was moved and carried that a committee of twenty-one be appointed to meet in Utica, the second Tuesday in January, to perfect an organization. The committee are J. H. Reall, c, H. D. Sherman, Wm. Crozier, F. D. Moulton, Hon. T. Ballantyne, D. E. Wood, R. P. McGlonsey, W. E. Smith, N. D. Hoard, A. M. Fuller, G. W. Simpson, T. Mortimer Seaver, Sec., Jno. Gould, M. Folsom, H. Lewis, F. B. Thurber, Geo. A. Blanchard, C. W. Hoer, G. C. Lawrence, L. S. Hardin, and X. A. Willard. Messrs. Reall, Seaver, Hardin, Moulton and others, were energetic in debate, and after some little friction concerning details, the meeting adjourned, after thanking Messrs. Seaver and Folsom and Reall for their efforts in contributing to the success of the fair.

The dairy implements ranged around three sides of the hall included about every necessary mechanical appliance for the manufacture of good butter and cheese, while the rennets and artificial colors were in great force. Nothing was more conspicuous than the patented

CHURNS,

and it would really seem that every possible shape and motion had been exhausted, in the endeavor to secure something that should express the final and supreme effort in this direction.

The Blanchard in various shapes and sizes was at the head of the dash churns, and notwithstanding the constant change maintained its position among churns with success.

The oscillating principle found exponents in the Monitor pendulum, a metal cylindrical churn, with tapering pointed ends. It is swung from a rack by cords which allow an easy swinging motion that throws the cream with force into the contracted ends, where it rebounds upon itself falling back into the larger part of the cylinder. The motion in the Davis is the same, but the churn is made of wood, semi-square, with beveled corners, while the Bullard is an unmodified box, as angular as the tenets of the Puritans, with a hobby-horse motion that would make it as welcome in the nursery as the dairy. Whipple's rectangular is a square box fastened to a rack by two of its corners, that imparts an end-over-end, tumultuous motion quite unlike the Herndon churn which is the same in shape, but fastened at the center of the diameter of the flat side. The churn is made of metal. The large revolving barrel factory churns are too well known to require comment. The old dash churn, the lineal descendant of the goat-skin, was neglected entirely.

It is said butter can be made in anything that will hold the cream together during its agitation, so that the test is reduced to questions of rapidity, ease of handling, and grain of the product. Almost all the churns enumerated made butter that seemed a most acceptable article, but the judges were so slow in their movements that the result can only be ascertained at the close of the fair—too late for comment in this part of the report.

BUTTER WORKERS

were almost as plentiful as churns and as various in design. Mr. Geo. Blanchard of P. Blanchard's Sons, showed a power worker, something entirely new. The action nearly approaches human motion, and the machinery is simple, strong and effective. The Vermont Farm Machine Co. had a butter worker that depended for its pressure on a large roller hung on a frame one end of which ran in grooves at the side of the table, while the other end formed the handle. The motion was lateral. The Lilly worker, as well as Embre's, revolved the butter on a circular table over a grooved stationary worker, the the power being contributed by a crank-motion. Whitman & Burrell used a worker somewhat similar to Reed's which was also on exhibition.

The improvement in butter workers has greatly lessened the labor of handling the product, and the power worker mentioned is an excellent thing for factories.

The patented apparatus for setting milk was conspicuous in the

COOLEY CREAMER,

which is an exponent of the cold, deep-setting plan, and, in operation, it made a very satisfactory exhibit. The cans are immersed in a box and surrounded by ice-water, on the theory that the congelation of the milk forces the light cream globules to the surface mechanically. Shaw's Creamery works on precisely the opposite system. In a metallic box containing places for deep cans which are immersed in a water-jacket, surrounded by a hollow compartment is forced hot-water or steam until a temperature of 130° is attained, when the process is reversed and cold water becomes the agent to cool the milk from the bottom upwards. This is all done on the "current" theory, and its inventor claims fine results, as do also Smith, Ryder & Clark with their creamery pan which is said to be self-skimming, top-cooling or refrigerating, a combination that enables the owner to practice either, or both systems. We regret we have not space to describe the apparatus, which is somewhat intricate.

The average dairyman would be puzzled to decide among the many means suggested for carrying milk and butter to market.

BUTTER PAILS AND BOXES

consisted of the familiar Orange County pail, and one somewhat similar, made by J. B. Gilberds, which has a new, simple fastening, and is very low in price. The same exhibitor has a wood-lined tin package for preserving butter, and a pail was opened in the presence of the judges that had been sealed three years, and subject during that time to all temperatures. The butter was sweet and palatable. Tinkham's butter box and shipping case was simply a nest of six square wooden boxes in a felt-lined case, while Sabin's box was of similar construction, salt-lined. N. Waterbury appealed to the consumer by placing butter in brine-soaked one-pound boxes, which are packed in a large case, the interstices being filled with salt. The Lester Milk Company showed how they delivered milk in glass jars, hermetically sealed, while Mr. Ward of Washington, had a model of his manner of keeping milk in good condition while being delivered. He simply incloses the cans in a refrigerator jacket. N. Halsted uses glass jars for butter. When filled they are placed in a box, the bases resting on rubber buffers, and the compartments separated by double strips of thin wood. Ice may be inclosed in the case if desirable.

MILKING-MACHINES, PAILS AND STRAINERS.

Durand's milking-machine is a new idea. It is sought to impart the natural motion of milking by inserting the teat into a vulcanized rubber cup with soft rubber continuation. By working a lever, a vacuum is created which pulls just as does the motion of the hand. The motion is the same as if the operator were manipulating a large pair of pruning shears: It was not experimented with on any of the cows in the stalls.

The Perfect Milk Pail is a tin pail that supplies a seat to the milker who directs the streams into an open-mouthed funnel, passing through which it comes into contact with a strainer before entering the pail. Bailey's Milk Pail is also a covered receptacle which receives the milk into a funnel so placed that impurities are said to drop outside on the ground before reaching the funnel. Those who do not avail themselves of either pail, may choose between two strainers made by Moseley & Stoddard, and P. S. Ryan. Both strainers hail from Vermont. The Pyramidal strainer made by the first-named firm, is a pyramid of very fine wire cloth (100 threads to the inch), that projects up into the bowl. The milk impinges on these surfaces, impurities falling to the bottom of the bowl. This arrangement admits of very fine gauze being used, and secures a good, clean milk. The

BUTTER COLOR AND RENNET

men were in force, Wells, Richardson & Co., taking the lead with their color, which was displayed to advantage by a sample of butter from the farm of A. W. Cheever, editor of the N. E. Farmer, one-half of which was colored by the butter color. C. Hansen, Mrs. H. B. Smith, Geo. B. Sanders & Co., and Perrin, with his granulated June butter color, followed.

Whitman & Burrell displayed some fine rennets, while F. A. Reichardt's dry extract of rennet, and Visser's artificial rennet attracted attention. Charles Millar & Son, made their entire exhibit of Visser's rennet.

Mr. C. Am Ende had eggs, fruits and vegetables in a state of fine preservation by means of his Regalin preserving powder.

CHEESE FACTORIES

in operation were fully shown by Whitman & Burrell, and by Jones, Faulkner & Co., these two firms making the finest, most complete and interesting exhibit in the hall.

The "Cooley system" of butter-making, for a young invention, may be said to be progressing. In the short time it has been before the dairy public, something over four thousand of the creamers have been introduced, and the sales are increasing, we are told, in a very satisfactory ratio. At the fair, the Vermont Farm Machine Co., of Bellows Falls, Vt., made a very complete exhibit of the creamers, Davis's Oscillating churn, and its Eureka butter-worker, all of which were put to the test of practice under the supervision of the energetic vice-president and manager of the company, Mr. Butler.

As the Cooley system is a new departure in the treatment of milk, our readers will doubtless find a brief description of it interesting.

Mr. Wm. Cooley discovered, as the result of his experiments, that cream could be raised in twelve hours, or between milkings, and, as a result of that, the labor, expense and annoyance of handling this product would be materially lessened, while the manufacture of butter would be placed on a uniform basis that would permit of anyone making butter that should be of one uniform quality all the time; that is, that climatic changes would not in the least interfere with or modify the product. As a result of this discovery, we have the Cooley Portable Creamer, which is a water-tight, tin-lined box fitted for the reception of cans, and provided with inlets and outlets for running spring water, which may be used instead of ice, when thought desirable, or in connection with it. Into this receptacle are submerged cans that are twenty inches in depth, and eight and one-half inches in diameter. A tight-fitting cover fits over the can, the air between the cover and the milk forming a barrier to the entrance of the surrounding water. The temperature is then maintained at from forty to forty-five degrees in spring and summer, and at forty degrees in winter, and no further attention is required until the cream shall have risen in about twelve hours.

The celerity and neatness of the operation enable the operator to employ sufficient cans only to contain a single milking, which is a great saving in dairy utensils; sweet cream from sweet milk of a uniform quality is said to be secured, that makes a uniform quality and quantity of butter, and as the milk is cooled rapidly and equally in a closed can, it is free from any contagion, and is certain to remain unvitiated by noisome odors. The milk set during the fair produced perfectly sweet cream, free from any "animal odor," and the quantity was the subject of comment. This cream was worked in the Davis Oscillating Churn, a churn which may be described as an oblong box with beveled corners, swung from a rack by iron hangers, which give the churn a lateral swinging motion, by which the cream is thoroughly agitated, the globules crushed and the butter made in a very short time.

The Eureka Butter-worker is a table with a shallow tray, one end of which is shelving. A large wooden roller is hung on a frame, the lower sides of which run in grooves on each side the table. The other end makes the handle, by which the roller is manipulated. By this arrangement, it is claimed, that an even pressure is exerted, and the table being deep, the butter may be covered with brine that cuts the buttermilk, brings out the flavor and color of the butter better than water, keeping the tray moist, and preventing the butter sticking to the roller or sides of the table.

This rapid generalization of the exhibit will convey an impression of its completeness, and inform those who wish to keep abreast of new and meritorious inventions what is being done in the dairy interest of the country.

Occupying a large area in the northwest corner of the hall was the very complete exhibit of Messrs. Whitman and Burrell of Little Falls, N. Y. The firm had made elaborate preparations not only to display its excellent wares, but had also arranged its machinery in a way to give an intelligent idea of the operations of a cheese and butter factory—a really novel sight to New Yorkers, whose notions of cheese making are not quite as clear as crystal. The announcement that *real* cheese would be made during the progress of the fair attracted large crowds, and when the milk was poured into the six-hundred-gallon vat and the steam turned on, the curiosity to see how the thing was done, knew no bounds.

It is only necessary to add that the skillful cheese-maker (a lady by the way) went through her part of the work as serenely as if she were at home, raking over the curd and mixing things generally to her entire satisfaction, and when finally the curd was made ready for the gang-press, it was discovered that an excellent product had been made in a very short time.

To old hands in the business this is of course understood, and while the newly-made cheese is in process of curing we will stroll through the exhibit noting the many new improvements in cheese- and butter-making machinery. As we enter the inclosure, we stop to look at the easy noiseless action of the new "Economiser" return-flue boiler, which is furnishing power to run a large Blanchard factory churn. This boiler has some peculiar points in its construction, that command attention.

It is very economical of fuel to begin with, and by surrounding the fire with water all the heat at the sides and bottom of the fire is utilized, and fire tile are made an unnecessary expense. Owing to the arrangement of the heating surface, the fire does not impinge on the bottom of the boiler, hence does not bake the scale into the rock-like substance that is such a trouble and expense, especially in localities where lime-water is prevalent. The sediment remains in loose particles and is easily removed through the hand holes. Since the introduction of these engines by the firm, the sales have been rapid, and testimonials to the efficiency, power, economy and cheapness of the "Econmizer" have been most flattering. But all this time the large cheese vat has been silently obtruding itself upon our notice. Its tastefully painted exterior completely disguises the fact that it is made of clear pine, two inches thick, the bottom of but two planks which are furnished with bolts that traverse their entire length, effectually regulating any tendency to swelling or shrinkage, while the levers applied to the legs at one end, make dumping a simple matter of a twist of the wrist. The inner vat is made of large sheets of heavy tin of a quality and smoothness that leaves nothing to be desired,—except perhaps a Hubbell gang press. This press exerts a pressure that would convince even Congressmen, and with the Wilson hoop that discards rubber-ring, followers, etc., relying on its two solid stamped-out covers and hoop to give perfect shape to the cheese it is easy to press cheese evenly and with little labor. A new gang press that flanks the Hubbell is just being introced by Messrs. Whitman & Burrell. It is so simple and easily worked, and the device for exerting and holding the pressure is so ingeniously contrived that it elicited approval from all who saw it worked.

Another specialty, that looked to the uninitiated like an instrument of torture, was a knife curd-mill. The cylinder is studded with knives instead of pegs, which are arranged spirally so as to carry the curd through rapidly. The grate also is a set of knives, and when the cylinder is set in motion there is no nonsense about it.

Perhaps this explains why the cheeses made by it have so monotonously carried off first premiums at fairs. Since the introduction of these mills three years ago, two hundred of them have been turned loose and are making sad havoc with curd—but only to benefit the cheese.

It would consume too much space to particularize the many small things that, while in themselves inconspicuously meritorious, contributed to the completeness of the entire exhibit. There, for instance, in one corner, was a cunning machine for making cheese-boxes, while whole rows of bottles of rennet extract, contained enough liquid to curdle the milk of human kindness itself. A long table was filled with nickel-plated cheese and butter-tryers, thermometers, curd-knives, annatto, and similar small articles, looking quite like a surgeon's table waiting for a "subject."

Strolling out of the inclosure after our round of inspection, and meditating on the perfection to which the science of cheese-making had been brought, we were attracted by a legend—"Get the best"—and it seemed to the reporter that he had seen enough to be competent to advise any one where to go who was seeking for the best.

Messrs. Moseley & Stoddard of Poultney, Vt., displayed a pyramidal strainer. It is a seamless bowl made in brass, copper or britannia, to the bottom of which is screwed the strainer, made of very fine wire gauze. As the strainer projects up into the bowl in the shape of a pyramid, the milk as it is poured around it, cannot deposit sediment on the meshes, hence clogging is avoided. This is the main principle. Additionally are many conveniences for its application to cans of any size and shape, which, with its extreme simplicity and low price, makes it a very desirable addition to the apparatus of every dairy.

The display of coloring compounds made by Wells, Richardson & Co., of Burlington, Vt., was awarded a diploma. During the fair the cheese made by Jones, Faulkner & Co., was colored with their color, and butter exhibited showed its merits to good advantage. If popular taste will demand a uniform tint in butter and pay proportionately for it, it is fortunate that the color made by this firm is so generally used as it is not in any respect deleterious, in fact, is perfectly neutral in its effect except on the price of the butter which its use increases in value from four to five cents per pound.

Mr. James B. Gilberds of Jamestown, N. Y., had a few of his recently improved Optimus butter pails on exhibition, as also a wood-lined metallic package designed for preserving butter for an indefinite time. One of these packages was opened for inspection, which contained butter that was perfectly sweet after having been packed and sealed for three and a-half years. The Optimus is made as a return pail, and Welsh tubs are also fitted with the cover, making it a very cheap, serviceable package. It received a diploma.

Three very meritorious articles, namely, liquid rennet extract, liquid cheese-coloring, and liquid butter-coloring, were shown as products from the laboratory of C. Hansen, 444 West Sixteenth street, New York City.

These articles have, in addition to the honors just received at the fair, taken three gold medals at the Paris Exposition. It is claimed for the butter-color that it increases the yield of the butter by its own weight; it does not color the butter-milk, and that the color given the butter is very fine. The liquid rennet extract is a pure extract of calf rennet, perfectly preservable, always uniform and free from objectionable ingredients. It is endorsed by Prof. Arnold and other authorities.

(Continued on page 797.)

Everywhere.

NOTES FROM NORTH-WESTERN PENNSYLVANIA.

In the RURAL of October 26th, a correspondent from Steuben County, N. Y., inquires which is the best sweet corn. Having tried several varieties, I can recommend the Russell's Prolific as the best for table use and general cultivation. It is only a few days later than the Early Minnesota, has ears nearly as large as the Evergreen, and in flavor is far more sweet and nutritious than any kind I ever saw.

I am located in a good farming country, about twenty miles south of Lake Erie. In this section, along the creek bottoms, the soil is gravelly, but changes to a loam as the surface becomes higher, until we reach the oak and chestnut ridges, where the soil is principally clay. The highest land is generally selected for fruit, because it is considered that the frost is heavier and more injurious in the valleys. All farms, however, have more or less fruit trees of various kinds, yet it is very seldom that the farmers along the valleys have enough fruit for their own use. They are quite often obliged to call on the hill farmers for their supply of fruit.

This is a good country for corn, the average yield being about seventy-five bushels per acre. During the past season a new variety called the Early Compton, has been raised with success. A neighbor of mine informs me he husked 140 bushels on one acre, one ear measuring eighteen inches in length. The ears are quite large at the butt end, and sometimes are difficult to break off. But that is the only fault that can be found with it. When ground, the meal is very fine, and most excellent for making bread.

Wheat is one of the main crops here. We usually have from twenty to thirty bushels per acre. The ground is plowed; next about twenty-five loads per acre of good barn-yard manure are spread on, then harrowed in, and after that the seed is put on at the rate of two bushels to the acre, when the ground is well harrowed, if the drill is not used, and, lastly, the field is well leveled with a roller. The White Michigan has been the variety mostly sown till this fall, when quite a number of farmers have sown the Clawson.

A neighbor of mine has an excellent plan of mixing his manure. He has two barns with a space of about sixteen feet between them, occupied by a hog-pen. In one barn he stables his cows and in the other his horses, and it is so arranged that the manure of all his stock is thrown into one part of his hog-pen where his hogs have a wonderful faculty of mixing it with their own droppings. He says that since he has used the manure after the new plan, he can notice a difference in his land and crops, both being much better than before, when the manure was applied separately. A RURAL READER.

RURAL SPECIAL REPORTS.

HURON CO., OHIO, NOV. 28.

FARMERS are well along with their work in this section. The weather has been favorable; some frosts, but no cold weather yet. Winter never varies more than by a few days from the 1st of December in its genuine advent to this "south shore country," and provident farmers have learned to be prepared, though often we do not need the precautions usually taken, owing to the mildness of the winters.

We have an abundance of apples, with very low prices—ranging from 75 cents down to 50 cents per barrel for selected fruit. Cider apples only bring from six to eight cents per bushel; thousands of bushels of good fruit have not been picked and will be wasted. Wheat sells for 90 cts. per bu.; clover seed, $3.60; corn, 30 to 35 cts. for 75 lbs. in the ear from the field—about 40 cts. in the crib; potatoes, 75 to 80 cts. per bu., and scarce.

Here let me say that I saved a large amount by not contracting my potato crop last fall. I saw by the Crop Reports in the RURAL that potatoes would bring a good price, so refused an offer that I would otherwise have taken, and have made at least $100 by being posted, and have about 500 bushels of nice potatoes in my cellar yet. Is it needful to say to farmers that it pays to read the papers? I do not know of a better investment than is the money paid out to keep posted upon, not only the prices of produce, but the amount of produce that will be offered for sale, thereby giving the farmer data to form intelligent calculations.

We have here an excellent farming county; good intelligent people; good schools; plenty of social advantages; good markets; congenial climate; good water, consequently a healthy, satisfied community, with but little land in the market, and that is generally held at war prices. Considerable improvement is going on in buildings, etc., in town and country. E. L. M.

HOWARD LAKE, Minn., NOV. 30.

NOTWITHSTANDING the fair prospects of farmers, during their last harvest, times are still pressingly hard, somewhat owing to the quality of wheat being much poorer than has been common in this State, and therefore bringing, of course, a smaller price. Another reason is, that many left the State the year before, to get work elsewhere, and had not returned, so that labor was so very high during harvest time that some fields of wheat were not cut. Farmers hereabouts depend very much on teaming—drawing ties and wood for the railroad—and last winter being an open one, but little was drawn, on account of bad roads. This causes nearly all of them to be behind with debts at all of the stores, and these kinds of debts are a little the worst misfortunes with which farmers are afflicted, but still they will ask credit, and the merchants will give it, often ruinously to all parties. A.

CUMBERLAND CO., Maine, Nov. 29.

THE present year has been full of encouragement to the "Down-East" farmer. No severe drought during the season afflicted him, nor any considerable injury to crops from any source. The Colorado beetle appeared plentifully in many sections of the State, but where he was fought with determination he was generally conquered. The beetle was not, I think, so injurious to the potato crop as the dry period which commenced in June and lasted several weeks. Yet the potato crop was not a failure, though light. Good Early Rose are worth, in Portland, 85c. to $1; beans, $2; Baldwin apples, barrel included, $1 to $1.50; poultry, 12 to 14 cents. Corn and wheat raised in Maine are not for sale, and therefore are not quoted in our papers. Western corn is about 60 cts. per bushel. Dressed hogs are worth 4½c., though Portland papers quote them 5½ to 6½c.; but that is higher than Boston or New York papers put them. Pears and grapes were very abundant and of fine quality in this State. We now raise nearly all the popular varieties of grapes here in great perfection. Our warm, dry, granitic soils will ripen the Isabella nearly every year, and we produce Rogers's Hybrids No. 3, 4, 9, 15, 19, 22, and possibly others, in great excellence. This is worthy of note, I think, especially as scientific writers have placed Maine mostly north of the northern limit of grape growing. So, we snap our fingers at isothermal lines, and as the phylloxera has not yet put in an appearance in this precinct, we feel quite elated at the prospect for the future. No insect has yet troubled the Grape except the rose-bug in certain localities. Extremely fine crops of corn and wheat have been raised in every part of our State this year—many times as much as were grown a few years since; and the courage of our farmers is getting braced up by the results of their endeavors to free themselves from dependence on other sources of supply. G. F.

BURLINGTON, Kansas, Nov. 26, 1878.

WE are having a very pleasant fall so far, and farmers are taking advantage of the good weather by getting out their corn and fixing up for winter, and most of them are well prepared for cold weather. We have had some hard frosts, but no cold weather or snow yet. To-day has been cold and raw, and it has been trying to snow, but only succeeded once in a while in floating a few small flakes. It has been dry here since the last of July, with only occasional showers, enough to lay the dust, but not enough to wet the soil to any depth. Stock water is getting scarce; for most of the farmers hereabouts who have a good many cattle, depend on the creek to supply water for their stock. The principal business in this section is stock raising—mostly cattle. There are a few flocks of sheep, which are doing very well; they are mostly native coarse-wool sheep.

The crops were very fair, except potatoes, and they were scarce, except with a few who raised a very fair crop for this season. I raised from an acre of Irish potatoes, 150 bushels, and from half an acre of sweet potatoes, 95 bushels, but they were not all salable; for, on account of the dry weather, a good many were small. Corn gave 50 bushels to the acre.

The market prices are as follows: corn, 20c. a bushel; oats, 15c.; potatoes, from 40 to 50c.; wheat, 60c.; butter, 12½c. a lb.; hogs, $2 per 100 lb., with a dull sale at that. E. C. F.

MILL BRIDGE, Rowan Co., N. C., NOV. 24.

WE have had very little cold weather yet, but a good deal of wet weather, although there have been no heavy rains this fall. Fall work is about all done; cotton nearly all picked and a pretty fair crop. I raised 10 bales on 12 acres, which is a good yield for this State. Wheat is nearly all sowed. I don't think there is a large acreage sowed here to this crop. Corn yielded well, but it is not as plentiful as last year. Sweet potatoes were fine. I know one man in this county who had 100 potatoes that weighed 600 lbs. No apples here this year; peaches were abundant and fine.

Wheat is worth $1 per bu.; corn, 30 to 35 cts.; oats, about the same; sweet potatoes, can't be sold; pork, 5 to 6 cts., net; beef, 4 to 5 cts., net; butter, 20 to 25 cts.; green apples, $1 to $1.25 per bu. Sheep do very well here when attended to; they are worth about $1 per head; there are very few improved sheep in this county. The weather is too warm to kill hogs, and very changeable—some days cool and the next almost hot. AN OLD SUBSCRIBER.

AFTON, Union Co., Iowa, Nov. 23, 1878.

THIS is a high rolling prairie country. Timber is scarce here; consequently most of us use coal for fuel. It is shipped to us from neighboring counties, and costs the consumer 16c. per bushel. Crops were fair; corn being heavy.

The fall work is mostly done, except plowing, and this would have been done had it not been too dry in early fall, but if the weather remains as it is now, most of it will be done yet.

Our market prices are: wheat, 45@55c.; rye, 25c.; oats, 8@10c.; barley, 25c.; corn, ear, 13c.; corn, shelled, 15c.; hogs, $2; cattle, fat, $2.50@3.00; cows, $1.15@1.50; butter, 12c.; eggs, 15c.; potatoes, 15c.; chickens, per doz., $1. 20.

W. H. B.

BAILEYVILLE, Ogle Co., Ill., Nov. 27.

TO-MORROW is Thanksgiving and truly the people have "something to be thankful for." The crops in general were good throughout the country, though some sections have suffered losses from various causes. In this locality the farmers have no cause to complain, except that the prices of their products are so low that they afford them little or no profit, after deducting expenses. The small grain crops were good, excepting spring wheat, which was injured by blight, rust, etc. The corn is now nearly all husked, and is of excellent quality; it will average about 45 or 50 bushels per acre, though some fields produced over 60 bu. The weather is highly favorable this fall to the farming interests. W. B. D.

BRYANT, Ia., NOV. 26, 1878.

WE are having one of the most favorable seasons for farming operations we have ever had—no frost sufficient to hinder plowing as yet, and the farm work well ahead. Corn is nearly all husked—the crop was a full average in yield and extra in quality. Many of the young hogs have died from disease, yet pork is very low in price—about 2½c. gross. Wheat sells for 70c.; corn, 25c.; potatoes, 40c.; oats, 16 to 18c.; rye, 35c., and barley, about 70c. per bushel; butter, 16c. per pound, and eggs, 15c. per doz. It can be seen, therefore, that money must be a little scarce among farmers; but the crops have, as a general thing, been very good, and we are hopeful of better times in the near future. D. O.

ARKANSAS CITY, Ks., Nov. 27.

CROPS of all kinds were good here last season. Prices are; wheat, 40 to 50c. per bu.; corn, 15 to 20c.; oats, 20c.; hogs, on foot, 2½ to 3c. per lb.; cattle, on foot, 2 to 2½c. per lb. The fruit crop was good, especially peaches. Apple trees hereabouts are just beginning to bear. I have not failed for four years in succession to have full crops of grapes and blackberries—the Concord grape and Kittatinny berry. Raspberries and gooseberries do well, and all the small fruits except currants. The tree growth here is marvelous. I have had peaches from trees two years old. Most vegetables do well, making a more luxuriant growth than I have seen elsewhere. A. J. B.

NEAR MONTREAL, Dec. 4th, 1878.

THE weather for the past month has been a succession of rain and mist, the gleams of sunshine so rare as to provoke immediate remark if a stray sunbeam gleamed from the murky sky. Yet in the garden we find Pansies blooming; Daisies, too, and sprays of Sweet Alyssum, with a few flowers of hardy Chinese Pinks. Plowing in this locality is well finished up. A good deal of ditching has been done, and general preparation made for the coming winter. So far there has been no snow to stay on the ground and very little frost; but we expect either every day.

A. L. J.

ATLANTA, Ga., Dec. 2.

AFTER a hot, dry summer, we are at last having rains with light frosts. From the middle of May to the first of December the rains that fell were never heavy enough to soak the grounds thoroughly, and consequently the crops in this county were very light; but they were heavy in adjoining counties, especially corn. Wheat, however, yielded fairly with us, and what little fall wheat has been sown is looking well. Corn is worth from 60c. to 70c. per bushel; oats, from 40c. to 50c.; sweet potatoes, 40c., and Irish ditto, $1 per bushel. Farm labor is worth 50c. per day and from $6 to $8 per month.

C. D.

OAKLAND, Douglas Co., Oregon, Nov. 19, 1878.

WE have splendid growing weather now. Grass is growing finely. Stock is doing well. The weather is very warm—thermometer at 62°. Grain sown this fall looks well. We plow and sow here any time in the fall, winter or spring. We have an abundance of fruit of all kinds. Winter apples are worth 25c. per bush.; pears, 75c.; grapes, 10c. per pound; wheat, 75c. per bushel; oats, 35c. sacked; potatoes, 75c; butter, 37½c. per pound; eggs, 38c. per dozen; turkeys, live-weight, 16c, and 18c. per pound. I have young onions, ready for use, growing out in the open ground. H. C. U.

ALICE, Grundy Co., Nov. 30.

OUR wheat crop hereabouts was almost an entire failure in quantity and quality. It yielded only from five to ten bushels per acre and was only worth from 20 to 30 cents a bushel. Corn is selling for 15c per bushel and hogs for from $1.80 to $2.25 per 100 lbs live-weight. Under these circumstances many farmers find it hard to raise taxes and insurance, although they have plenty of horses, cattle and hogs—but then nothing can be got for them. J. M. K.

DELTA, York Co., Pa., Nov. 27.

WE had an unusually good wheat crop hereabouts. Oats were a good growth, but a light yield. Corn was but little over half a crop, owing to dry weather at the earing season. Potatoes were not over one-third of a crop. Hay was very abundant. At this date wheat is worth 99c.—the Fultz variety being chiefly grown hereabouts. Corn sells for 50c. per bushel; oats, 25c.; potatoes, 80c. to $1; butter, 25c. per lb.; eggs, 20c. per doz. at stores. H. O. S.

RIDGEFIELD, Conn., Dec. 5, 1878.

THE winter weather as yet has been mild. Pastures and forests, however, are quite bare. The first snow fell November 6. Farmers are looking cheery. The market gives $5 for pork, and $6 and $7 for beef. A neighbor of mine has recently had butchered, a pair of Chester White Pigs—stock imported from Pa.—weighing 832 pounds. K.

ARCADIA, Wis., Nov. 25.

WE have had a splendid fall. The farmers are well up with their work and ready for winter; which is in no hurry to come, although it announced its approach by a little snow last night; but it is warm this morning. Wheat is a light crop and of poor quality. Calico Dent corn is the best variety we have here: it ripens early, yields well, and husks easily. F. A. B.

WEST JERSEY, Stark Co., Ill., Nov. 28.

THE weather is good; farmers are busy with their corn. We have had but very little rain this fall. I wish to correct an error in my last report: hay is there quoted at $14 per ton; it should have been only $4. The hay crop was very large here, and can hardly be sold at any price. H. E. M'C.

SALEM, Kenosha Co., Wisconsin, Nov. 25th, 1878.

WEATHER warm; no frosts to freeze the ground; fall work well done; times hard; pork less than $2.50; good butter does best of anything, bringing, in Chicago market, from 25 to 30 cents. D. L. B.

WELLINGTON, Ohio, Dec. 2.

WE have had good crops this season. Butter is worth 15c. per lb.; cheese, 6½c.; corn, 20c.; oats, 22c.; wheat, 80c.; hogs, 2½c. live-weight; hay, $8 per ton; potatoes, 70c. We have had very fine weather most of the fall. A. G. F.

CORNWALLIS, Nova Scotia, Nov. 26th.

THE weather here this fall has been delightful. Crops were generally good. Hay and grain heavy. Potatoes a fair crop, price from 50 to 60c. per bushel, with several vessels loading. J. E. E.

WAUKEGAN, Ill., Nov. 29.

THE weather here is very fine—more like October than November. No frost has yet visited us hard enough to prevent plowing. A. R. C.

PINE BLUFF, Ark., Nov. 28.

THE weather here now is simply terrific. The corn crop was good; the cotton crop light and about all of it is picked. J. M.B.

The Querist.

ANSWERS TO CORRESPONDENTS.

Raising Potato Seed in a Greenhouse.

W. W. K., Toronto, Canada, asks whether it would be possible to plant the Beauty of Hebron potato now, in a bed in the greenhouse, so as to have the product for planting in the spring.

ANSWER BY PETER HENDERSON.

If W. W. K. will split the "Beauty of Hebron," or any other potato, lengthwise, so as to expose the most of the eyes possible, then let the pieces dry for a week or two, so as to heal up the cut part, and place them on three or four inches of soil on the bench of his greenhouse, as near the glass as possible, sometime about the 15th of March, not sooner—within two weeks (if the temperature is not less than 60° at night) they will have started shoots two or three inches long. These shoots, or cuttings, can then be taken off and propagated, like Dahlias or any other flowering plants. One should be careful, in taking off the cuttings, to cut so as to leave a bud or eye to start again, for from a single potato, 50 to 200 plants can be made before the middle of May, which is as soon as they can be planted outside. Every plant of these, if properly handled, is equal to a dry "set." When the Early Rose was first sent out, I grew from five pounds of it, in this way, a crop that was perfectly enormous. I published the result of the experiment at the time in one of the agricultural papers; but what

the quantity was I do not now recollect, except to know that it well repaid me for the labor, and the greenhouse space the plants occupied. Of course, the potato cuttings must be grown in small pots (three-inch pots are best) just like any plant under glass in a greenhouse or hot-bed, until the time of setting out, which, in Canada, would not be safe before June 1st.

[We have planted potatoes in boxes of convenient size about Jan. 1st in the greenhouse, and they have been ready to use about May 1st.—EDS.]

Feeding Oil-Meal.

F. S. W., Genesee Co., N. Y., saw a statement in the RURAL, eight or nine months ago, to the effect that cows would give one-third more milk if fed oil-cake meal. He would like to know how often and in what quantities it should be fed.

ANS.—To answer this question in a thorough manner would require us to write a small volume, for it involves the whole subject of cattle feeding. Oil-meal contains the nitrogenous elements of food in a much greater proportion than is needed by animals; it, consequently, can only be fed to advantage with other articles of food which are deficient in such elements; and the amount to be fed daily, therefore, depends entirely upon the nature of the other food. If good clover hay is fed for coarse fodder, the concentrated food may consist of one part of oil meal to three of corn-meal, and this should be fed in quantity to suit the peculiarities of the animal. If a poorer quality of hay or straw is fed for part of the ration, the proportion of oil-meal should be increased. Too large a proportion of the nitrogenous elements in the feed makes a soft, oily butter, which soon becomes rancid, while too small a proportion causes the butter to be hard and tallowy. The proper proportion is one of albuminoids to five and one-half of carbo-hydrates (including the fat multiplied by 2½), the digestible elements alone being considered. In some sections of the country it is cheaper to use bean meal, bran and shorts, than oil-meal.

The following table, taken from the Report of the Connecticut Experiment Station, for 1877, illustrates the method of composing these rations:

RATIONS FOR MILK COWS.

	Dry Organic Matter.	Digestible. Albuminoids.	Carb.-hydrates.	Fat.
12 lbs. Meadow Hay	9.5	0.65	4.92	0.12
6 " Oat Straw	4.9	0.08	2.40	0.04
20 " Mangolds	2.3	0.22	2.00	0.02
25 " Brewers' Grain	5 6	0.98	2.70	0.20
2 " Cotton seed Meal	1.6	0.62	0.36	0.24
	23.8	2.55	12.38	0.62
Standard Ration	24.	2.5	12.5	0.4

The standard ration contains these elements in the right quantities for animals of 1,000 lbs. live weight; and in composing rations to obtain best results, we should endeavor to have the constituents approach as nearly as possible to the standard.

Incomprehensible Growth of Celery.

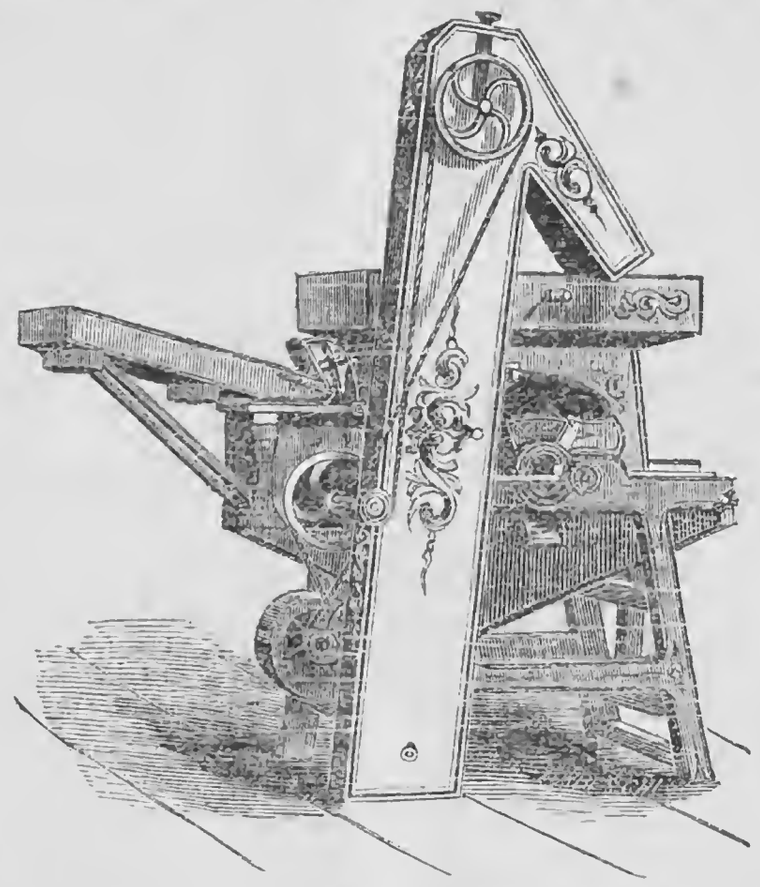
F. A. C. M., Zanesville, Ohio, says that he plants celery every year for family use, that it looks well this year until he digs it, when he finds it all gone to stalk, while the leaf-stems are short and of little account, and he asks for some remedy.

ANS.—From this account we cannot say whether the celery has run to seed or not. If it has it is, of course, useless; but it may be only that it has not been blanched. What is meant by the expression, "it has all gone to stalk," we cannot understand unless it be that it has run up to seed.

Fish for a Stagnant Pond.

E. A. M., Macon City, Mo., has a half-acre pond of stagnant water used for the purpose of getting ice from it. The dam and bottom are of such tenacious clay that no water can filter through them. Cat-fish, he knows, succeed well in such places, but he would like a choicer sort, and asks which kinds would be the most likely to thrive, and whether more than one sort should be introduced.

ANS.—There is some difficulty in stocking a stagnant pond with good kinds of fish. One cannot have the choicest fish without the very best conditions for their culture. Trout require cool spring water, and it should be a flowing stream unless there are abundant springs at the bottom of the pond, springing from gravel beds. Black bass is the next best fish to trout, and may be kept in a pond if there is an ample supply of fresh water and food. The yellow perch comes next, and this will thrive where bass will not; a pond with a muddy bottom, if it is planted with aquatic vegetation, will provide a comfortable home for this variety. Then come sun-fish and cat-fish. In the case in question, it might be well to first put in some cat-fish and let these propagate and increase for a time; then add some yellow perch which would live on the cat-fish and increase as these diminished until they took complete possession of the pond. It would then be necessary to provide some food, if a large stock was desired. Cat-fish can easily be caught with a hook, put into a tub of water and transported to a pond for a long distance. Yellow perch could be procured in the same way. A few dozens of fish would soon stock a pond of half an acre. When the fish are put into the pond, it would be well to transplant some water plants by taking up roots of Water-lilies, &c., making a ball of mud about them and dropping them into the water here and there.



COMBINED MILL AND CORN SHELLER.

Hulless Oats.

G. F., Cascade, Wis., says there are some peddlers going about in that section selling Hulless Oats for ten dollars a bushel (!) and refusing (!) to sell less than six bushels to any person, and then they bind the purchaser not to sell any until after he raises a crop. Remembering to have seen in past years, several references in the RURAL to this kind of oats, he asks whether it is a "humbug."

ANS.—It's now about ten years ago since the RURAL first informed the public of the nature of this variety of oats, and every year since then, it has had occasion to speak with greater emphasis on the matter. This kind of oats is not a "humbug," but the fellows who peddle it about as something new, or something extra good, very decidedly are. The variety, a decade ago, was not new; it has since then been widely introduced into nearly every State in the Union, yet so small are its merits that it is so little known that swindlers every year reap a dishonest, though rich harvest, by selling it as a new and extraordinarily good variety—mostly, however, to farmers who never read an agricultural paper unless it is a borrowed one. On suitable soil the yield of this Hulless oats is about on an average with that of other sorts, but it has absolutely no special merit to justify, or even excuse, the extravagant prices asked for it. The peddlers of it, in placing restrictions upon its sale, and asking high prices for it, are merely following the example of travelers among the savages in central Africa, who, relying on the dense ignorance of the natives, place a preposterous value on glass beads and similar baubles.

Treatment of Various Flowers.

E. R. B. Bucklin, Mo., asks: 1. What can she do to insure the safety of her young Chinese Wistarias this winter? 2. Should newly-planted Tulips, Narcissi, etc., be covered before the ground freezes hard? 3. Must seeds of Yucca and Geranium sanguineum be started in the house, or will they "come to the summit" if sown in the open ground in spring? 4. She would like to learn what has become of "Daily Rural Life."

ANS.—1. Lay them down and cover them with straw or evergreen branches. 2. No, we think it best *after* the first hard freeze. 3. Either way as more convenient. They germinate freely and will thrive with ordinary care. 4. His address is Ridgewood, Bergen Co., New Jersey.

Exterminating an Osage Orange Hedge.

F. J. R., Hecka'oo, Lincoln Co., Ark., asks what is the most effective way of exterminating an Osage Orange hedge, planted in 1860, some of the stems being now six or eight inches in diameter.

ANS.—The stems and suckers of the Osage Orange are not easy to exterminate, but the following method should do it: In fall, winter, or early spring, cut off these stems or suckers below the crown or junction of root and stem, which is generally some two or three inches under ground. Repeat this operation once or twice during the following summer and winter, and the most lively hedge should yield up its life. One operation, however, will be usually sufficient.

Making an Arbor-Vitæ Hedge.

L. G., asks how can he make a front-yard hedge from arbor-vitæ plants.

ANS.—Dig a trench 18 inches wide and deep. Procure young plants from any nursery. Place them in the trench from a foot to three feet apart, as you may choose, and fill in with good soil. In making a hedge, we advise placing the young plants three feet apart at least, and then keeping them cut back until they meet, when the hedge may be permitted to grow in hight as desired. Thus managed, the hedge will remain healthy for many years longer and endure the severities of the climate better than when planted closer together, because the roots have more room and food. We would refer our friend to an experiment made at the RURAL Grounds. A single arbor-vitæ was cut back from season to season so that it was never permitted to attain a hight of more than 18 inches. It is now, after four or five years of such treatment, not less than five feet in diameter. Now, if two plants will fill a space of say eight feet and be the more vigorous for it, what is the use of employing three or more plants to fill the same space?

To Remove a Superfluous Hole in a Cow's Teat.

J. N. W., Brandon, Vt., has a very choice heifer, and, on milking her for the first time, found there was, about half-way up the teat, a small opening which let out a small stream of milk while milking. He asks how this can be remedied.

ANS.—If the epidermis is removed from the sides of the channel, so that raw surfaces are brought in contact, the opening will be obliterated in healing. The method usually adopted by dairymen is, to take a three-cornered file, insert it in the opening, and turn it till the desired effect is produced. Care should be taken not to insert the instrument so far as to injure the main channel of the teat. A stitch through the opening with fine silk sometimes assists, and a milking tube used in that teat during the healing, would be an advantage.

Wintering Various Flowers.

D. L. B. Kenosha Co., Wis., asks: 1, The botanical name of a plant called Malthea thereabouts, a flower and leaf of which she sends. 2. Would plants of the Cactus family winter safely in the cellar? 3. Would it be right to dry off Smilax bulbs in the fall and place them in the cellar for summer use? 4. How can Ivy Geranium be kept during winter?

ANS.—1. Achania malvaviscus. 2. Yes, if frost-proof. 3. Yes. 4. Ivy Geraniums may be kept in the cellar; about 40° is the best temperature for them.

Alfalfa Seed.

W. H. B., Afton, Ia., asks, 1. What would be the charge for binding a yearly volume of the RURAL NEW-YORKER. 2. Can Alfalfa, when once grown, be killed out, and if so, how? 3. Where can the seed be purchased and at what price?

ANS.—1. The charge would, of course, depend on the style of binding. For neatly binding in boards, with leather backs and corners, the cost here would be one dollar. 2. When Alfalfa once gets hold in a suitable soil and climate, it is hard to eradicate it; but this can be done by persistently plowing it under. 3. Of any prominent seedsman in Chicago or New York. 30 cents.

Borrowing Money on Life-Insurance Policies.

H. B. C. asks if one can borrow money on a life-insurance policy, and incloses a form of application sent him by a New-York house which appears to lend money on this class of security.

ANS.—A life-insurance policy is negotiable, and in commercial transactions is often used as collateral. We know nothing regarding the standing of the firm mentioned.

Treatment of Seeds for a Nut Grove.

Frank E. B., Brandon, Vt., wishing to plant a nut grove, asks, 1. Where he can get chestnuts, etc., to plant. 2. Which would be the better plan, to plant them this fall or cover them with sand and leave them until spring.

ANS.—1. Of any grocery or commission house. 2. It would be best to place them in sand in boxes, and bury the boxes in well-drained soil during the winter.

Alfalfa Seeds.

J. K., Union City, Pa., asks, where can Alfalfa seeds be bought, and at what price.

ANS.—Of any prominent seedsmen of Philadelphia. D. Landreth & Son, for instance, or of Thorburn & Co. or W. H. Carson, of this city. Price 30 cents per pound.

Planting Seeds of Free Seed Distribution.

M. H., St. Mary's, Ont., asks whether it will be necessary to plant the above-named seeds in cold-frame or in the window, or will it do to plant them in the open ground in the spring.

ANS.—All of the seeds of the shrubs may be planted in prepared open ground in spring.

Defiance Wheat.

J. M. Stirling, Ky., asks whether the Defiance wheat is a fall or spring variety.

ANS.—Spring.

Miscellaneous.

W. P. M., Kingston, Pa., who is extensively engaged in raising cabbage, sowed a packet of seed on a plot of ground quite as fertile and well cultivated as the remainder of his cabbage patch, and producing plants as fine and healthy; yet of these plants only a few thousand, scattered here and there, matured fine, well-developed heads, while the others, under conditions in every way just as favorable, grew into a large mass of leaves without forming heads. He asks the cause of this difference, and whether the sex of the plants might have had anything to do with it, or if not, to what other cause should it be attributed, aside from club-foot.

ANS.—Our friend may have a variety not suited to his climate; otherwise the failure is owing to poor seeds. The flowers of cabbages are perfect, *i. e.*, both male and female organs are in the same flower.

M. L. G., Frankford, Pa., asks, 1. Where can the beautiful grass, Eulalia Japonica variegata be purchased, and also the Old-Man Cactus. 2. Does the latter ever bloom?

ANS.—1. Of Peter Henderson, this city; Geo. Such, South Amboy, N. J.; John Saul, Washington, D. C.; Hoopes, Bro. & Thomas, West Chester, Pa. 2. Oh! yes. We should like to know of a plant that does not. Ferns and the lower orders of plants have no stamens and pistils, it is true; but they produce spores instead of seeds.

Industrial Implements.

COMBINED MILL AND CORN SHELLER.

A COMBINATION of feed-mill and corn-sheller that will simultaneously grind feed, and shell, clean and sack corn, has its advantages. It is a condensed labor and time-saving implement, and needs only to be well and thoroughly made on correct principles to demonstrate its value.

The Challenge Mill Co., of Batavia, Ill., in conjunction with Mr. Nelson Burr, early turned their attention to iron mills and succeeded in inventing a construction that has stood severe tests satisfactorily. The grinding surface is composed of metallic rings attached to beds, or backing-plates, in such a way that the rings do the grinding, the backing-plates serving to convey the grain to the rings. When the rings become worn they are easily replaced at small cost, when the mill is in complete grinding order again. This principle is embraced in the patents that have just been reissued to the company, and it may be important that our readers should plainly understand the claims.

The illustration is the combined mill and sheller, which may be worked by wind—, water—, steam—, or horse-power. It will grind feed at the rate of 15 to 20 bushels per hour, at the same time shelling, cleaning and sacking corn at from 20 to 40 bushels per hour, when driven by a four-horse power, which indicates large results with great economy in power.

The implement is substantially built; has but one pinion in addition to the necessary machinery required to run a feed-mill or corn-sheller, and is cheaper than if the two distinct machines were purchased separately, occupying no more room than either. Its use as a separate or combined machine, is not the least of its many good features. It weighs—the size illustrated—350 pounds.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY DEC. 14, 1878.

OUR readers are particularly requested to read the particulars of our free seed distribution on p. 800, under publisher's notices, before ordering seeds. We thought we had made the postage particulars very plain—but many are sending us too many stamps. A one-cent stamp suffices for all except *three*—the Beauty of Hebron requires a two-cent extra stamp, and the Defiance Wheat and Pearl Millet, *together*, require a two-cent extra stamp.

THE INTERNATIONAL DAIRY FAIR.

The first International Dairy Fair ever held in this country closed last Saturday night in this city. Although we fully realize that from the conception of its name to its close, there were few things connected with it that were not capable of obvious improvement by those with a single eye to the advancement of the dairy interests of the country, still we must confess that we regard the exhibition as a move in the right direction. Through the large number of visitors to the show and still more through the press, the general public has learnt much of the importance of the dairy business in particular and of the agricultural interest in general. Many mistakes and shortcomings in such undertakings have become so glaringly apparent that their avoidance in future has become imperative. The necessity for many changes in the management and conduct of future exhibitions has been so strongly forced on the public that they must inevitably be made.

Our pages this week contain a full account of the Fair from every point of view; while our artist has illustrated (necessarily in a hurried manner) in our first-page engraving the most prominent features of the exhibition. In view of its being the first attempt of the kind ever undertaken, and in order to give a clear description of it so as to lead to improvements in any future undertaking of the same nature, we have devoted to it more space, perhaps, than its actual merits entitle it to; but we trust that our readers will agree with us that our object justifies our liberality.

THE NECESSITY OF A NATIONAL VETERINARY COLLEGE

yearly becomes more urgent; but, like many other agricultural needs, little governmental attention to the matter can be expected until the farming community itself becomes fully alive to the importance of such an institution and agitates for its establishment. Last year $20,000,000 were lost to the farmers and breeders of the country through hog cholera, and a small fraction of this vast sum would have been amply sufficent to endow a veterinary college, together with an associated experimental station, the skill and experience acquired in which would go a long way towards preventing, alleviating, or totally eradicating this and similar scourges. There is no country in the world in which the vast extent of the live-stock interest makes such demands on veterinary science, and no nation in Christendom in which Government pays less attention to these demands. According to the latest census, there were in the United States, three years ago, 11,149, 800 horses and mules; 27,870,700 cattle; 35,935,300 sheep, and 25.726,800 swine. Prussia has a little over one-third of this number of live stock, and Great Britain and Ireland considerably less than one-half, yet while there is not in this country a single veterinary school of national reputation, there are five veterinary colleges in Prussia and four in Great Britain, all of European renown. The former, however, are strictly governmental institutions, while the latter are either personal ventures or maintained by private endowment, and the great superiority of the former was apparent during the late European outbreak of rinder-pest, which was extinguished in Prussia within a week, whereas in England its ravages contined for months.

The great advance made of late years in this country, in the quality of all kinds of live stock, would now vastly enhance the losses to our farmers and breeders, should a plague similar to the rinder-pest or foot-and-month disease break out on this side of the Atlantic. The great extent of the losses from such a disease among thoroughbreds is well illustrated by the testimony of the late T. C. Booth, of Warlaby, before a committee of the House of Commons last year. He swore that his losses within a few years from deaths among his Short-horns by foot-and mouth disease alone, amounted to £30,000 or $150,000.

Our comparative immunity hitherto from such scourges has made us negligent in providing against their possibility or rather probability in the future. It would be folly to await the advent of such a calamity to provide means for combatting it, and, moreover, so great is our annual aggregate of preventable losses from ordinary diseases of live stock, that measures should be promptly taken to relieve the agricultural classes and consequently the people at large, from this persistent drain on their resources.

APROPOS OF DAIRYMAIDS.

"RURAL JR." who writes many sensible things in the Weekly Chicago Tribune and who frequently quotes approvingly from the RURAL NEW-YORKER, objects to some of our recent remarks as to dairymaids. He says:

"We are on the side of the girls. We do not believe it is woman's business to milk the cows. Woman is entirely out of place in the barn-yard, and she should not be called on to go there, except in cases of great necessity. We frequently read of accidents to women while engaged in milking; in fact, we are personally acquainted with several worthy ladies who have been either seriously injured or rendered cripples for life by being kicked or gored while milking."

Let us say that Rural Jr. is altogether wrong here, as may very easily be shown. If it is not woman's business to milk cows because she is entirely out of place in a barn-yard, then let her not go into the barn-yard at all. The yard is no place to milk cows in, and the man who will permit a woman to hunt a cow around a filthy yard, carrying her milk pail and vainly calling "so bossy!" is not the farmer we have reference to, nor is that woman the one we think of as our dairymaid. The fact is, when everything is well arranged about the stable, when it is sweet and clean, when the cows are clean and are comfortably secured in their stalls, then a girl may very aptly go in and do her share of the milking, without offense, and, after washing her hands and doffing her apron, may take her morning music lessons or help her mother in household duties,

Then the talk about filthy yards, kicking and goring, etc., etc. is all out of place, because there would be no such things to fear. Indeed we pity the farmers' wives and daughters who have to submit to the filthy surroundings of many cow-stables, and who daily run the risks of injury from cows that have been rendered vicious by bad management. First make the yard and stable fit for a woman's presence, and then, as everywhere else, her association with these will animate and purify all the surroundings directly and indirectly, and altogether reform most of the evils and all of the abominations of the average dairy farm. It is a gross charge against the business of dairying that it is managed in such a way that a woman is out of place in any part of it. That this is held to be true by some, must be taken as a confession that all the evil spoken of it, is based on facts. We do not admit this, and therefore do not admit the corollary which might accompany it. We will explain our opinion on this matter by saying that while we believe a woman may do good and proper service in a decently managed dairy, yet that she is thoroughly justified in refusing to have anything to do with one that is managed in such a way that decency is outraged and personal safety is risked every day.

VALUE OF PEAT AND MUCK.

CHEMICAL analyses give a varying value to peat and muck deposits, considered as fertilizers; but in nine cases out of ten, we find that these analyses, made by competent chemists, show a percentage of ammonia far in excess of that contained in common yard manure; sometimes four or six times as much. As ammonia is the most costly of all fertilizing materials, and at the same time an absolute essential for all grain and most forage crops, it is plain that there must be great value in muck and peat when rightly prepared and applied. What muck is usually deficient in, compared with yard manure, is potash and phosphoric acid. Therefore, when it is proposed to apply muck to land without first using it as an absorbent in the stables or composting it with dung, it should have added to it wood-ashes and bone-dust. These, when properly mixed and combined, will make a fertilizer that will produce the best results, especially upon our lighter soils. The proportions should be about ten bushels of good, unleached, hard-wood ashes and two bushels of bone-dust to two cords of muck that has been dug long enough to have parted with its surplus water by drainage.

Such a compost, if the muck is of average quality, ought to produce as much effect as an equal quantity of the best stable manure upon crops of grain, potatoes or grass. For the best results, it should lie six months, or a year after mixing, and be shoveled over several times during that period. If peat is used, it should lie long enough to become thoroughly rotten and fine. We should prefer to mix half the ashes with the bone, wet them thoroughly, and let them lie two or three weeks before mixing them with the muck. The rest of the ashes should be added at the same time, and by the union of its potash with the organic acids that hold the ammonia in unsoluble combination, it sets that substance free to be absorbed, in an active state, by the pile. The bone-dust and ashes will cost about five dollars, and the heap, when finished, will give six loads.

Labor-saving Machinery in France.—French farms are usually so very small that the possession of a reaper, mower, or other costly labor-saving implement is out of the question with most individual landowners. Of late years, however, the hiring of such agricultural machines has become a regular business, and so much attention was paid to implements of this kind at the late exhibition, that this branch of industry has received a strong impetus. The importations of American grain which have been greatly increasing of late, have convinced the small farmers that they must avail themselves of the best labor-saving devices to be able, with any chance of success, to hold their own against competiton from this side of the Atlantic.

BREVITIES.

NEVERTHELESS, one Great Dairy Fair per annum is enough.

For a necessarily brief condensation of addresses at the Fair, see "news" column.

WE should like to know what part a patent fire-proof roofing exhibit has to perform in advancing the dairy interests of the country.

IN the Old Country live-stock for the shambles are sold by the cwt. of 112 pounds; here they are generally sold at so much per 100 pounds.

SEC. GARFIELD writes us, (Grand Rapids, Mich. Nov. 30): "Unless we get more light on the 'Yellows,' our Lake Shore men will all have the 'Blues.'"

THE big cheese of the dairy fair, is over four feet in diameter, 21 inches high, weighs 1,700 lbs. and 17,000 pounds of milk were used in its manufacture.

IT would be a good idea for people who are going to act as judges of cattle to study up the pictures of well-known breeds. Then they would know a Jersey from an Ayrshire etc!

It must be a matter of congratulation to a dairy State like New York that an Iowa creamery should have carried off the sweepstake prize at the Fair for the best butter made anywhere.

IT may not occur to most of the visitors to the Dairy Fair that the medical electric belts exhibited are to galvanize the old cheese into life, at least if that is not the object, it is nearly close to it.

PRACTICAL sagacity accumulated by a long experience in the business was shown by a prominent officer of the Dairy Fair when he asked one of the exhibitors if the cheese he was making today could not be *cured so as to be eaten to-morrow or next day!*

THAT city people really appreciate the uses of the churn was plainly shown at the Dairy Fair here, by the remark of a lady who inquired if a certain churn was a *washing machine*. The complaisant exhibitor assured her that it was, and proceeded to demonstrate how to use it!

IT should be remembered that the object of pits, cold-frames or other contrivances for storing cabbages, roots of all sorts, etc., is, on the one hand, to prevent them from freezing and, on the other to prevent them from growing, either of which would be fatal to their keeping well.

A GOOD WAY to teach children to become familiar with the geography of the country would be to supply them with a good, cheap map and get them to find out all the places mentioned in "Everywhere." The different correspondents give, from time to time, a good idea of the nature and products of each place.

THE receiver of an ordinary Christmas present or New Year's gift derives pleasure from the good-will of the donor once only, while the fortunate soul whose friend is thoughtful enough to secure him or her the RURAL for a year, is gratified with its contents and pleasantly reminded of the donor at least fifty-two times a year.

IT is notable that the weeklies always dress up handsomely for the holidays and then "blow their own trumpets" loudly. There is a marked difference between weekly newspapers and young ladies in this regard. Young ladies dress bewitchingly, and then frown and feel insulted when people STARE at them. But the weeklies like to be stared at and talked about.

As regards numbers, the accounts given in the daily papers about the cattle exhibited at the great Dairy Fair would disappoint the visitor. The following is the entire list: One Zebu or "Sacred Cow" and calf; ten Ayrshires, most of them calves or heifers; six Holsteins, two calves and one bull; three Devons; two Norfolk Red Polled; eleven Jersey cows, one bull, and some calves and heifers, and seven natives, young and old.

As a result of careful experiments in feeding stock, it has been found that in moderate weather they require about 2½ pounds of hay per day, or its equivalent in other fodder, for every 100 pounds of their live-weight to sustain the vital functions and prevent them from losing flesh. When animals are exposed to very cold weather, a larger amount of food is needed, as some of it is used to keep up animal heat. All that is gained in the way of milk, flesh, or wool, is derived from the food consumed beyond this amount. In comparisons of the relative yield of milk and butter from various breeds of cows, allowance should be made for the comparative cost of the maintenance of each kind in accordance with this rule—an allowance which a hobby, a prejudice or a desire to make a strong point, often prevents authorities on stock matters from referring to.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

WE offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

THE INTERNATIONAL DAIRY FAIR.

(Continued from page 793.)

There is a fascination about cheese-making that attracts the learned as well as the unlearned in the art, and the crowds of interested spectators hovering over the large six hundred gallon vat in Jones, Faulkner & Co.'s exhibit attested to this interest. Considering the disadvantages under which the display was made, the firm is entitled to praise for the spirited manner in which the exhibit was arranged to show a cheese-factory in full operation, making cheese every day during the fair.

Although the boiler was not fired up, the engine was put in motion by steam supplied by the annex, and its steady, smooth motion attracted attention to the merits of the boiler. The "Reliance," as it is named, is equipped with all the latest improvements. It has been especially the aim of the makers to secure economy in the use of fuel; the fire-box is very large, extending the whole length of the under surface of the boiler. As the fire-grate surface is over two feet square, in addition to the space back of it, it will admit of the use of wood of any length up to four feet in boilers of that length. The heat and smoke pass from the fire-box to the rear end, and return through the flues in the lower part of the boiler. All parts are accessible for cleaning. Next to the boiler, and attracting even more interest, was a little gem of a force-pump, whose simplicity, compactness and trustworthiness leave little to be desired.

Over in one corner stood Ralph's vat, a vat with which many of our readers are familiar. It is a self-heating vat, the heat extending the whole length, perfectly under control and evenly distributed, warming at the top as well as at the bottom. This very desirable arrangement is effected by an equalizer, which, we believe, no other vat has. One of its great merits, aside from its good work, is that it involves no expense in setting up; has no obstructions at the side; no pipes to fill up with hard water, and needs but little fuel. This vat is specially adapted for dairies and small factories.

Its big brother, the 600-gallon vat, was used in the cheese-making operations. This vat is made of superior materials, and is put together entirely with bolts, rods and screws. The sales this year have mounted into the hundreds, which is a satisfactory test of their popularity.

Frazer's Gang-press was used to press the cheeses made during the fair, and the curd-mill was on hand ready for its part of the work.

The general display was very tasteful. All the articles that a factory or diary could want were displayed on tables, or stood about in odd corners.

As stated elsewhere, the firm took the first premium ($100) for cheese factory apparatus. The cheese factory apparatus was sold during the fair to a St. Lawrence County dairyman.

The Orange County Pail Co., 78 & 80 Murray St., New York, was represented by Mr. H. C. Carter. The Orange County pail is one of the best-known return packages that is sent to New York, and a long experience has enabled the makers to improve it from time to time until, to-day, it is very generally employed by leading creameries as well as farm dairies. A new fastening—invented by Mr. Carter—is a simple and practical device for keeping the cover in place. It is free from springs, strong enough to withstand rough usage, holding the covers securely in place, while at the same time it allows the cover sufficient play to adjust itself to any change in the shape of the pail due to shrinkage or expansion.

In addition to the above there were various kinds of butter packages, including Welsh-tubs made of ash, maple and bass-wood, oak pails with bails, firkins, kegs and lard pails adapted to every demand of the trade. A specialty is made of five and ten-pound non-returnable pails for family use. These pails, as well as the good display of cheese scale boards, and cheese box rims were awarded a diploma by the committee—the highest prize given in the class.

As may be seen by a reference to our first page the display made by Messrs H. K. & F. B. Thurber & Co., of New York City was quite the most striking feature of the entire fair. Aside from its ornamental aspect it was highly instructive and an intelligent and well-directed effort to place before the dairymen of the country a line of samples of cheeses that to-day command the highest prices in the foreign markets which our dairy produce is seeking. These particular kinds were mainly shown on a table that flanked the main exhibit and comprised Stilton, Cheddar, Common Cheshire, Monk's Head, Gouda from South Holland, Edam, Ballini di Gravina from Central Italy, Romatour, Roquefort, Cacia Cavilli and the aromatic Limburg. Many of the above were prize cheeses from the October London Dairy Show and naturally the best of their kind.

The foreign butter also was an interesting collection, consisting of famous Leinster cream butter, packed on the Dorset system. Danish butter—the quality that commands such high prices in London markets—Mild Cured Cork, Keil, Normandy, and Cured Welsh butter that was also the prize package at the London show.

The pyramid was made of cheeses in various sizes, starting off with ten monster nine-hundred pounders, that explained their presence by quoting Samuel 1, xvii: 18, "And carry these *ten* cheeses unto the captain of their thousand, and look how the brethern fare and take their pledge." After such a present it would be superfluous to "look how the brethern fare."

The Messrs. Thurber were awarded the first prize for the best display of cheese, besides a number of other prizes. In connection with their cheese and butter exhibit was a very fine display of the celebrated Higgin's salt which is being very generally brought to the attention of dairymen, and for which a patent has recently been granted by the English government to the Messrs. Higgin for improvements in salt-making. Prizes were additionally awarded by this firm for cheese and butter salted with this salt and many exhibits were shown in which it was used.

It was gratifying to note this interest in the dairy by one of the largest grocery and commission houses in the country, and the address of Mr. F. B. Thurber, on Friday evening, was replete with facts and suggestions that could only have been the result of a careful study of the subject.

Among the many butter colors was one made by Geo. B. Sanders & Co., of Taunton, Mass., which is mixed with salt, giving it a golden tint, from which it derives its name—Golden Butter Color. It is claimed that the color imparted to the butter by its use, not only secures the most approved tint, but that it also enhances the keeping qualities of the butter; that it does not color the buttor-milk, and that it is cheap.

"The way we get our bread and you get your butter," was the unique legend that attracted many to the display of Messrs. Porter Blanchard's Sons, of Concord, N. H.

The Blanchard churn has been so long before the public that it is as familiar as household words; and a striking proof of its excellence is its continued popularity. It has not degenerated into a fossil condition, as may be understood by the fact that it keeps abreast of competition—not only in this country but abroad, Russia having sent several orders very recently. That country is mentioned because it is the latest acquisition of foreign territory by the churn; it would not surprise us to hear of China next.

In addition to the regular exhibit, one of the large factory churns was operated by the steam engine of Whitman & Burrell, and made some of the fifty-cents-per-pound butter that was sold during the fair. A new cylindrical factory-churn, one of the latest patterns brought out by this house, embraces many improvements and advantages; in fact, the Blanchards are constantly making such changes and improvements as are suggested by practical dairymen to meet the wants, and, perhaps, we might say the whims of butter-makers.

We cannot leave this interesting exhibit without referring to something very novel, to wit: a power butter-worker that has great merit. The motion closely resembles hand-working, while the power is greater, consequently a larger mass may be more perfectly and rapidly manipulated.

An appropriate display in connection with the International Dairy Fair, was the collection of highly-finished Howe's Improved Scales made by the Howe Scale Company, and represented by its New York agents, Messrs. Priest, Page & Co. There were shown a four-ton cattle, or hay scale, platform scales in various sizes, butter and grocers' scales, and finally, scales made expressly for dairy use. The importance of accuracy in all operations of the dairy, cannot be too strongly urged, and a scale that is simple in mechanism, strongly made, and always trustworthy, is an article of the first importance in this connection.

The Howe scale, since its introduction, has become one of the standards in this country, and its merits are pushing it into prominence in every civilized land. It has been awarded the gold medal at the recent Paris Exposition; has taken prizes at almost all the industrial and agricultural fairs held in 1878 in this country, and for the past three years has secured the government contracts for supplying the Treasury and Customs departments, and has been adopted by the Indian Commissioners. Five thousand are now used by the government alone.

LIST OF AWARDS.

The following is a list of awards and diplomas.

CLASS A.—CREAMERY BUTTER.

First prize, $50; 2d prize, $35; 3d prize, Diploma.

No. 1—Best made in June, '78: 1, H. C. Hoffman, Horseheads, N. Y.; 2, do.; Dip., A. O. Kingsley & Co, Strawberry Point, Ia.

No. 2—Best made in Sept.: 1, P. Van Dyke, Roxbury, N. Y.; 2, J. S. Murray, Delhi; Dip., W. L. Rutherford, Bovina, N. Y.

No. 3—Best made in Oct.: 1, Chadwick & Stewart, Anamosa, Ia.; 2, J. S. Holbert, Chemung, N. Y.; Dip., Jno. Stewart, Anamosa, Ia.

No. 4—Best made in Nov.: 1, Jno. Stewart; 2, J. S. Holbert; Dip., A. O. Kingsley & Co.

CLASS B.—DAIRY BUTTER.

No. 2—Best made in June: 1, S. B. Van Dusen, Harper's Field, N. Y.; 2, B. G. Morse, Red Falls, N. Y.; Dip., W. L. Rutherford: Honorable mention, B. S. Morse.

No. 3—Best made in Oct.: 1, J. S. Shattuck, Norwich, N. Y.; 2, M. Wood & Bro., W. Martinsburg, N. Y.; 3, A. C. Bigger, Delaware Co.; Hon. mention, G. B. Lyon, Ovid, N. Y.

No. 4—Best made in Nov.: 1, D. B. Prout, Ashland, N. Y.; 2, J. S. Murray; 3, Mrs. M. Decker, Oswego, N. Y.; Hon. mention, S. B. Van Dusen.

CLASS C.—CREAMERY BUTTER.

No. 1—Best made in New York: 1, J. H. Shoemaker, Jamestown; 2, L. P. Baker, Earlville; 3, Avery Wordsworth & Co., Morrisville.

No. 2—Best made in Pennsylvania: 1, H. Canfield, Miller's Station.

No. 3—Best made in New Jersey: 1, C. Bird, Hamburg; 2, J. Northrop, Andover.

No. 4—Best made in New England States: 1, Farmington Creamery Co., Farmington, Ct.; 2, D. Whiting & Sons, Wilton, N. H.

No. 5—Best made in Ohio: 1, H. L. Stewart, Wellington; 2, C. Sage, do.; 3, Hoar, Warner & Co., do.

No. 6—Best made in Michigan: No award.

No. 7—Best made in Indiana: No award.

No. 8—Best made in Illinois: 1, Newman & Thompson, Elgin; 2, Mann, Wood & Co., Elgin; 3, L. C. Ward, St. Charles.

No. 9—Best made in Wisconsin: 1, Geo. Lawrence & Son, Waukesha; 2, N. W. Morley, Baraboo; 3, A. J. W. Pierce, Milwaukee.

No. 10—Best made in Iowa: 1, H. D. Sherman & Co., Monticello; Jno. Stewart; 3, Saml. Allison, Sr. Delhi. Highly commended, B. Hershey, Muscatine.

No. 11—Best made in Missouri; Judges report exhibits unworthy of awards.

No. 12—Best made in Minnesota: No awards.

No. 13—Best made in Canada: 1, C. Turcot, Montreal; 2, Galeo, Woodcock & Co., Montreal; 3, Hettle & Inglis, Teeswater.

CLASS D.—DAIRY BUTTER.

No. 1—Best made in New York: 1, J. S. Murray, Delhi; 2, J. P. Gulliver, Binghampton; 3, B. G. Morse, Red Falls.

Nos. 2 to 7 inclusive for best made in States of Penn., N. J., N. E. States, Ohio, Mich. and Indiana. No entries.

No. 8—Best made in Illinois: 1, T. Bacon, Waucondo.

No. 9—Best made in Wisconsin: 1, R. S. Houston, Kenosha; 2, F. C. Curtis, Rocky Run.

Nos. 10 to 12—Iowa, Missouri, Minn. No entries.

No. 13—Best made in Canada: 1, S. Goodhue, Montreal; 2, Wm. Battle, Montreal.

CLASS E.—FOREIGN BUTTER.

No. 1—Best made in the British Isles: 1, H. K. & F. B. Thurber & Co., N. Y. (representatives); 2, do.

No. 2—Best made on the Continent of Europe: 1, J. Webb, London, Eng.; 2, H. K. & F. B Thurber & Co., N. Y.; 3, Webb & Edmonds, London, Eng.

CLASS F.—SWEEPSTAKES.

For the best butter of any kind made at any time or place: H. D. Sherman & Co., Monticello, Ia.

CLASS H.—CHEESE.

No. 1—Best made in New York: 1, W. A. Johnston, Marshfield: Morton-May, Newport.

No. 2—Best made in Pennsylvania: 1, Wm. Warner, Meadville; 2, Jno. Cole, Venango; 3 P. Crane, Edinboro.

No. 3—Best made in New England States: 1, Geo. S. Burnham, E. Poultny, Vt.; 2, Smith & Underhill (representatives), N. Y.

No. 4—Best made in Ohio: 1, F. H. Snow, Garretsville; 2, F. G. Kingdom, Cortland; 3, W. S. Morton, Nelson.

No. 5—Best made in Mich.: 1, A. D. Power, Laconda; Jno. Varson, Farmington; 3, Jno. Elliott, Iosco.

No. 6—Best made in Indiana: Exhibits had not sufficient merit.

No. 7—Best made in Illino's: 1, C. E. Freeman, Alton; 2, A. Nolting, Elgin; 3, Mann, Wood & Co.

No. 8—Best made in Wisconsin: 1, C. Hazen, Ladoga; 2, M. N. Seward, Ft. Atkinson; 3, J. Mills, Lodi.

No. 9—Best made in Iowa: 1, J. B. Rose, De Witt.

No. 10—Best made in Missouri; 1, S. I. Udell & Co., St. Louis; 2, Fales & Moore, Cameron.

No. 12—Best made in Canada: 1, Hon. T. Ballantyne, Stratford, Ont.; 2, D. Chalmers, Stratford, Ont.

CLASS I.—FOREIGN AND FANCY CHEESE.

No. 1—Best made in the British Isles: 1, Geo. Gibbins, Bath, Eng.; 2, H. K. & F. B. Thurber & Co., N. Y.; J. Stafford, Son & Oswin, Leicester, Eng.

No. 2—Best made on the Continent of Europe: 1, J. Webb, London, England.; 2, H. K. & F. B. Thurber & Co.

No. 3—Best fancy shapes made anywhere: 1, H. K. & F. B. Thurber & Co., N. Y.; 2, J. Webb, London, Eng.; 3, C. P. Root, Gilbertsville, N. Y.

CLASS J.—SWEEPSTAKES.

No. 1—Best cheese made anywhere: 1, Geo. Gibbins, Bath, Eng.

CLASS L.—SPECIAL PREMIUMS.

No. 1—Best lot of Butter, not less than 50 lbs., made in N. Y., Pa., N. J., N. E. States or the Canadas, salted with Ashton's Salt. Prize $125 in gold. 1, G. S. Camp, Owego, N. Y.

No. 2—Same conditions and prize, for Butter from States of Ohio, Mich., Wis., Ind., Ill., Iowa, Kansas, Neb. or Minn.: 1, Brinkhouse & Felter, Strawberry Point, Iowa.

No. 3—For best lot of Cheese, same conditions, States and prizes as Class L, No. 1: 1, H. C. Brookway, Richfield, N. Y.

No. 4—For best lot of Cheese, same conditions and States as Class L, No. 3: 1, Stewart & Skinner, Fort Atkinson, Wis.

No. 5—Sweepstakes Prize of $250, for best lot of Butter salted with Higgin's Salt: 1, H. Smith, Sheboygan, Wis. Note: This is contested by D. E. Wood of Chicago.

No. 6—Best firkin of Dairy or Creamery Butter, made in America. Prize, set of Fairbanks's Scales, value $100. 1, George Lawrence & Son, Waukesha, Wis.

No. 7—Best single box of Cheese, made in America, same prize as No. 6: 1, R. H. Baker, Colosse, N. Y.

CLASS M.—DAIRY IMPLEMENTS, MACHINERY, ETC.

No. 1—For best Creamer or process of raising cream. Prize, Diploma: Whitman & Burrell, Little Falls, N. Y.

No. 2—For the best Churn: Davis's Oscillating Churn, Vt. Farm Machinery Co., Bellows Falls, Vt.

No. 3—Best Cheese Vat: Whitman & Burrell.

No. 5—Best Butter Packages: Orange Co. Pail Co., New York; Optimus Butter Tub, James Gilberds, Jamestown, N. Y.

No. 10—Best display of Dairy Implements in the manufacture of Cheese. Prize $100. Jones, Faulkner & Co., Utica, N. Y.

No. 11—Best display of Dairy Implements in the manufacture of Butter. Prize $100. Whitman & Burrell.

Diplomas have also been recommended for the displays of M. Halstead (glass butter package); D. C. Perrin (butter color); Durand's Cow Milker; and to Dairy Supply Co., for tin churn and a milking pail.

CLASS N.—DAIRY COWS, FULL-BLOODS.

No. 1—Devons, Best Milch Cows: Harvey N. Weed, Stamford, Conn. Diploma to "Gertie," for great excellence.

No. 2—Jerseys: 1, "Josephine 2d," Wm. Crozier, Northport, L. I.; 2, "E. Bashon," Jas. H. Haight, Paterson, N. Y.; 3, Bull, "Duke of Colt," Wm. Crozier.

No. 3—Ayrshires: 1, "Dora," Wm. Crozier; "Mysie," S. M. & D. Wells, Wethersfield, Conn. Diploma. Young bull, "Roht. Mars," Wm. Crozier.

No. 4—Guernseys: Favorable mention, Cow "Flora," Wm. Crozier.

No. 5—Holsteins: Diploma, cows "Iris" and "Dickert," Jas. Nellson, New Brunswick, N. J.

No. 7—Including all crosses of full-bloods. Diploma, for 3 cows, Oscar Duryea.

No. 8—Including all not full-bloods. Diploma, Two native cows, Spencer Springstead, Westchester, N. Y.; Diploma, Sacred cow and calf, Dr. J. Bathgate, Morisania, N. Y.; Norfolk Red polled cow, G. F. Taber, Paterson, N. J.

CLASS O.—MISCELLANEOUS.

No. 1—For best Rennets: Whitman & Burrell, Ch. Hansen, Liquid Rennet.

No. 2—Best coloring-matter: Wells, Richardson & Co., Burlington, Vt.

Literary Miscellany.

WEAKER THAN A WOMAN.

(Continued from page 782.

CHAPTER XV.

Mrs. Haye declared that it was fortunate rain fell two days before the *fete*; it cleared the air, it freshened the grass, it washed the dust from the trees and hedges, it made the whole face of nature so sweet, so fresh and fair, that it was a pleasure to breathe. The air was odorous with the scent of flowers and of green leaves.

Sir Owen appeared to time; his sumptuously-appointed carriage, with the magnificent roans, drove up to the Limes. Nothing could have exceeded his kindness—he was so attentive to Francis Haye, so kind to Mrs. Haye, so deferential to Violet. Again she felt how pleasant it was. She saw deep satisfaction on her father's face, great pride on her mother's. She was young and heedless, and on such an exquisite June day how could she help feeling bright and happy? Moreover, she held something in her hand which gladdened her heart. Just as she was starting, while Sir Owen stood hat in hand waiting for her, a messenger came with a note from Felix—only a few short lines hurriedly written, but which went straight to her heart.

"My darling Violet,—I send a few words to greet you as you are starting, and to wish you a very pleasant, happy visit. You will not forget me, sweet? you will say to yourself over and over again that you are pledged to me? I trust you implicity, You love me, and I am content. I kiss your sweet hands, and leave my heart in them."

How he loved her! She repeated it again and again. How he loved her! The little note pleased her. She drove away, with Sir Owen whispering all kinds of compliments to her; but her lover's face was before her eyes, and his words were in her heart. They drove through the magnificent park with its herds of antlered deer, through the superb grounds, to the grand entrance, and then Violet looked up in wonder.

The afternoon sun fell upon the grand old building, showing the towers and turrets, the deep oriel windows, the Venetian balconies, bringing out the picturesque outlines of the noble edifice. There was a flight of broad marble steps, and the great door opened into an entrance-hall the first glimpse of which bewildered Violet. She hardly knew that such treasures existed—that such splendor could be; unconsciously she crushed her lover's little note in her hand as she beheld the treasures on the walls.

She passed through long broad corridors, where white marble statues gleamed from among pyramids of choice flowers; she gazed on glorious pictures and picturesque fountains; and all the time Sir Owen walked by her side whispering gay, pretty compliments. They came to the drawing-room at last—a large, lofty room with an exquisitely-painted ceiling, and bright with flowers and statues. In the midst of all the magnificence stood Lady Rolfe, with a smile on her face, waiting to receive them.

That was remarkable in itself; but that she should be so gracious and so amiable was more remarkable still. She welcomed them with courtly, kindly words, and in all she said she was seconded by her daughter Lavinia. Sir Owen, she said, had asked her to assist him, and she had for a time undertaken the duties of hostess.

Then she sent them to their various rooms. Before Violet had been many minutes in hers, a pretty Parisian *soubrette* entered, who announced herself as Lady Rolfe's maid.

"Her ladyship," she continued, "thought that, as you had not brought a maid, I might be of some service to you."

For half a moment Violet felt a sensation of shame that she had brought no maid, then of wonder as to what she should do with one. She accepted the proffered help, and the little Parisian, Aimee by name, soon had every thing ready for her.

Violet had never worn a fashionable evening dress before, and she looked in wonder at the marvelous whiteness of her fair neck and arms, and at her round shoulders, that were perfect as a master-piece of sculpture, while the white silk showed off her graceful figure. The train of blue velvet gave her the look of a princess. In her hair Aimee placed a beautiful white camellia, and another lay, like a white star, in the bodice of her dress.

To Aimee it was a labor of love to dress Miss Haye. She did wonders with the shining, golden hair; and when Violet was ready to go down stairs she stood before the great mirror in wonder. Was that exquisitely radiant girl herself? She longed for Felix to see her. There was no pleasure without him. How he would admire her!

What a never-to-be-forgotten evening it was! Her greatest difficulty was in keeping herself from expressing her wonder. She went down to the drawing-room and found two or three other ladies with Lady Rolfe. She had an uneasy consciousness that they were all talking about her as she entered, for they stopped suddenly, and looked at her curiously. But Lady Rolfe introduced her, and they were so startled by her striking beauty that they were more than civil to her. Sir Owen almost followed her into the room. How his eyes brightened as he saw her!

"For a girl like that to marry a country solicitor, to hide such beauty as hers in a place like Lilford, is simple madness," he said to himself. "She will thank me in after years for saving her from such a fate."

Then he went up to her, and scarcely left her all the evening. It was against the laws of etiquette for him to take her down to dinner; but

Lady Rolfe accepted his apology with a smile. That astute lady had explained the motives of her policy to Lavinia.

"I understand Sir Owen," she said. "If any one opposes him he will lose his reason over the girl. Place no obstacle in the way of his admiration, and he will soon tire of her. He cannot marry her, for she is engaged to Felix Lonsdale."

So, with great amiability, Lady Rolfe had accepted Sir Owen's invitation to act as hostess for three or four days. She had determined that she would give him every opportunity of being with Violet, on the principle that the more he saw of her the sooner he would tire of her. Sir Owen took her down to dinner, and sat by her side, Violet was dazed with wonder. She saw the superb gold and silver plate, the magnificent epergnes, the rare flowers, the costly wines, the richly-cut glass. She felt half afraid of the well-trained butler and his noiseless assistants—it was all a scene of splendor and magnificence, that dazed and bewildered her.

Sir Owen gave her little time to think, and everyone took their cue from him—visitors and servants. Violet was queen of the evening. She concealed her trepidation, and carefully watching Lady Rolfe, she imitated her exactly. Then, when the ladies withdrew, she was the center of observation—her exquisite beauty, her dainty dress, the attention paid to her by Sir Owen, made her the most important person present.

Sir Owen did not long delay in entering the drawing-room; and then he selected a luxurious chair, and enthroned her. He found her a footstool; he waited upon her as though she had been a princess and he a page; he never left her; and she, looking at the splendor which surrounded her—looking at the wealth, the magnificence—wondered that she should play a part in such a scene. It was a night of triumph to her; but she did not forget Felix; it would have been perfect had he been by her side.

The guests talked of the morrow's *fete*—they had music and cards. Sir Owen gave Violet a lesson in besique; and when the evening was over she went to her mother.

"Mamma," she said, "how delightful it has all been! I am so sorry that it is over. I wish it would last forever."

Mrs. Haye smiled.

"It is more pleasant, Violet, than the struggle that falls to the lot of people with limited means."

It was pleasant. The dainty, luxury-loving nature found it wonderfully pleasant. Violet smiled to herself as she sat in her room that night. Aimee was brushing the long, shining, golden hair. She was surrounded by every luxury—hangings of silk and lace, Dresden china, Bohemian glass; the room was a marvel in its way. She smiled as she realized how dear luxury was to her already—how she admired soft velvet chairs and thick soft carpets—liked to eat from silver plate and drink from richly-cut glass—liked to be waited on by well-trained servants—to live in this atmosphere of splendor—to wear rich silks and costly lace, precious stones and gold. It was an entrancing life, and the other would never seem quite the same again. After all, there was nothing like money.

She dismissed her maid, and would have slept, but that a ray of moonlight shone in through the window. One part of the rose silk hangings had been left undrawn. She went to arrange it to shut out the moonlight, so that she could sleep, and, when she stood near the window and saw the silver light on the trees and flowers, her thoughts went back to that lovely night when she had stood with him by the lilac-bushes. How he loved her! His face appeared so plainly before her—the love-lit, earnest eyes and winning lips.

After all, love was best; wealth was very pleasant, but it was sweeter to be loved than to be rich. And she fell asleep with her lover's name on her lips.

CHAPTER XVI.

The next morning was bright and warm. There was a hurried breakfast—every one seemed to have so much to do; from early dawn men had been at work in the park. Sir Owen came down-stairs radiant.

"Who will say a word against English weather after this?" he cried; then, when he saw Violet, he bowed low to her. "The queen of the *fete*," he whispered, and she blushed as she heard him.

The post-bag came as they sat at breakfast, and there was a note for her; she saw that it was from Felix, and put it aside until she should be alone. Looking up suddenly she saw Sir Owen watching her intently, and again a hot flush burned her face. He did not leave her—everything was referred to her; her wishes, her tastes were continually consulted.

"My dear Lavinia," said Lady Rolfe, with upraised hands, "it is something incredible—he treats her just as though she were mistress of this house. It is quite enough to turn any girl's brain."

Though he spent his whole time with her, Sir Owen did not forget her parents. Francis Haye declared that he was "in clover;" his wife had never been so happy; they were waited upon and attended to before every one else—they had every luxury, every attention.

The guests arrived early. Everything was a success, but the crowning satisfaction of all was that the weather was so fine. Violet found time to read her lover's note; it said how disappointed he was that he could not come to Garswood, but to attend the *fete* even for one hour was an impossibility for him. His father had had a very serious relapse, and he could not leave the office. She was sorry; yet she could not understand how it was she experienced a certain feeling of relief—her present triumph was so great, and she enjoyed it so thoroughly. It must all have ended when Felix came. It was like a play now; she was playing the part of mistress of a magnificent mansion—of queen that brilliant *fete*. She must have given up this *role* if Felix had come. She must have spent the time with him.

"I shall never in my life have such a triumph again," she said to herself—"never again. I may as well enjoy this while it lasts."

She looked superbly beautiful in the dress that had been sent to her for the *fete*; and she walked through the grounds with Sir Owen by her side, she was the observed of all observers. She felt her triumph keenly—it was no small one—yet she had an uneasy sensation too that it was, after all, a false position. She was the promised wife of another man—she had no right to be queen there, with Sir Owen by her side.

It was a brilliant *fete*—she had seen nothing like it in her life. The *fete* at the Vicarage, which had always seemed to her the very acme of aristocratic gaiety, dwindled into insignificance. The sun had seldom shone on a more brilliant scene; flags and banners waved from the tall trees; there were numerous evergreen arches, marquees, and an infinity of amusements. The music from the bands echoed through the park.

"It is very beautiful," said Violet, as she stood with Sir Owen, watching the various groups.

"If you are pleased, I am well repaid," he said. "Do you not know that I would give all I have to please you? I would do all this over and over again to win one smile from you."

Suddenly, standing there, she remembered her promise to Felix that she would tell Sir Owen she was to be his wife. How was she to do it? She could not turn round to him abruptly and say, "I am going to marry Felix Lonsdale." She was tempted to do so, but it would be too brusque. "I shall find an opportunity during the evening," she thought—"I can easily make one, but not at present. I will enjoy myself now."

Then Sir Owen conducted her through the grounds. It was a veritable triumph. Her exquisite beauty, her superb dress, her radiant face, the evident admiration of this wealthy baronet by her side, were the sole themes of conversation. People bowed to her, who had never seemed to be aware that she existed before; ladies pleaded for an introduction who had passed her with haughty insolence; men crowded round her, and none seemed content until he had won one smile from the sweet lips, one glance from the lovely eyes.

They passed on, Sir Owen talking eagerly to her; but she hardly heard what he was saying, she was so engrossed in the brilliant scene. He led her past the front of the Hall, and through the superb gardens. It seemed to her that they passed acre after acre of glass-houses, then they came to a little hill. At its foot was the river bank, and its summit was crowned with a group of silver larches. A seat had been placed under them, for from the summit of that hill there was to be seen one of the loveliest pictures in England.

"Where are we going?" asked Violet, as they left the Hall and the grounds.

"I want to show you Larch Hill," he replied.

She did not quite like being there alone with him. Felix would not like it, yet how could she resist?

"Every one who comes to Garswood sees Larch Hill," he continued. "It is really the prettiest spot about here."

"But your guests will miss you," she said.

"I am with the queen of the *fete*," he returned, with a low bow; and she saw that he did not care in the least whether he was missed or not.

He led her to the summit of the hill, to the rustic seat under the larches.

"I was thinking all last night," he said, "that I would bring you here to-day. I want you to look well around you. See how the sun shines on Garswood! Look at the Hall first."

It was a magnificent panorama that was spread out before her. Not the least important feature in it was the grand old Hall, with its towers and turrets. He stood by her side.

"From here as far away as your eye can reach," he said, "is mine. North, south, east and west—it is all mine. You see the river like a broad silver line in the distance—the boats and the barges on it are mine. You see the villages nestling amongst the trees, the rich, well-cared-for farms, the quiet, pretty homesteads—they are mine—all mine."

"It is a noble property," she said.

"Yes; there is not a larger or better estate in England, and the beauty of it is that it lies all together. You see the dark mass of woods over to the left; the trees in them are a magnificent fortune in themselves, and they are all mine. You see that broad stretch of meadow-land where the cattle graze—it is all mine!"

She made no reply; his words and his looks confused her.

"I am lord of the soil," he said, "for many miles round. I know no other place so fine as Garswood. Violet Haye, all this is mine; and, if you will speak only one word, it shall all be yours."

She turned to him with a startled glance.

"I do not understand you," she declared. "How could it be mine?"

"It can all be yours if you will marry me, Violet," he whispered.

Her beautiful face grew pale as death.

"I cannot marry you," she replied quickly.

"Why not, Violet? Tell me why."

"Because I am engaged to marry Felix Lonsdale."

"Is that all? What on earth does that matter? He ought to be ashamed of himself to presume to ask such a girl as you to marry him; he must be mad to think you would."

"He loves me!" she said quietly.

"So do I—so do many others. You must not marry him, Violet; he has no money, no influence, no position; his father is under a cloud which must darken the son's future. You cannot marry him—it would be madness!"

"I am engaged to him," she replied.

"As if that matter! Engagements like yours are broken every day; it is the commonest thing in the world—no one thinks anything of it."

She seemed to see her lover's face as he had looked into hers that night by the dew-laden lilac-bushes—she almost heard his voice. She looked up at Sir Owen, her face deathly pale.

"Do you know, Sir Owen," she said, "that if I were false to Felix Lonsdale it would break his heart?"

Sir Owen laughed aloud.

"My dear Miss Haye, lawyers have no heart—what could they do with such a commodity? He might lose his temper; but men never break their hearts—a good cigar will cure the most desperate love-affair. You amuse me."

"I hope you are speaking falsely," she said. "I hope men are better than you paint them."

"They are all very much alike, my dear Violet," he returned. "It is most refreshing to hear that you think any man capable of breaking his heart."

"Ah, but you do not know Felix Lonsdale. You do not know how he loves me."

"I never wish to know Felix Lonsdale," he told her. "I have no partiality for men under a cloud. I know how much I love you, and that is more to the point."

She shrank from him with a pale, scared face. She did not like this discussion of her lover.

"Let me tell you," he continued, "how much I love you. I think you the most beautiful woman I have ever seen in my life. Your beauty gladdens my heart. To win it, and keep it always near me, I would give all that I have in this world. I love you well enough to lay all my wealth at your feet, to worship you all my life. I love you so well that neither your plighted word, the opinion of the world, nor any human power, shall come between us. I would break every tie, every bond, crush every love, to win you and make you mine. I will throw everything to the winds if you will only say the word."

The pale, beautiful girl shrank from him.

"I cannot," she said—"you know that I cannot—I must marry Felix Lonsdale."

"I could kill him!" muttered Sir Owen under his breath, with an oath. Aloud he said, "You shall never marry him."

She shrank still farther from him, and cried aloud; and then he was full of remorse—he tried his best to comfort her.

"Listen to me, Violet," he said; and once more she raised her beautiful face to his. "Forgive me—I am more accustomed to shouting at men than to pleading with ladies. Do not think I am so cruel—why should I kill him? Do not tremble so—I shall never forgive myself."

She tried to conquer the fear that had mastered her; she stilled the trembling of her hands the wild beating of her heart. He spoke more gently to her.

"I am more than half a savage," he said. "I am ashamed of myself. How different I should be if I had a gentle, beautiful girl like you near me! I should grow civilized. Now, Violet, listen to me. You shall not give me your answer now—not yet for many days; but I do pray you to be my wife. Do not look at me and say you cannot—you can if you will. Such promises as yours are broken every day. I will not let you give me an answer until you have thought the matter well over. Look around you once more, Violet—look at this stately home, this broad domain—think of yourself as its mistress—mistress of Garswood Hall and forty thousand a year. As Lady Chevenix—how well the name sounds!—as Lady Chevenix, I say, you would be queen of the whole country, you would be one of the most popular and wealthy women in England. You will have the world at your feet. I will buy you the most magnificent diamonds—indeed everything that women like best. You shall be surrounded by every luxury that the world can give, if you will only say 'yes.'"

"I cannot," she murmured; but her voice was weaker and fainter this time, and he noticed the change.

"I will not accept your answer yet," he returned. "But now look at the other side of the picture. You marry this man who is under a cloud, he takes you to some wretched little home, he works day and night, yet can hardly get money enough for his expenses: you spend the prime of your life, and lose the glory of your beauty, in a helpless struggle to make both ends meet; and you die before your time, your beauty faded and gone, worn out—even in the prime of life. I say that it is a crying shame for such a marriage to take place. You see the difference, Violet?"

"Yes, I see it, Sir Owen; but——"

"Then," he interrupted, "we will not talk about it to-day; you shall think it well over—you will be of my opinion soon. Now, we will go back again—and you will not forget the view from Larch Hill? The first moment I saw you, I meant to win you, Violet. I swore to myself that you should be mine. You have promised me the first dance to-night, remember."

He talked to her on indifferent matters as they descended the hill; then he said—

"Violet—you see that I cannot call you 'Miss Haye'—try to drive that scared look from your face; my guests will think I have been frightening you."

She made a great effort to bring back the smiles and the brightness to her face, but she did not succeed very well; the world was all changed for her since she had gone up Larch Hill, quite changed. There she had been calm, content, with just a shadow of longing for the grandeur around, yet happy in her lover and her love. Now she had been through a scathing temptation—one that had left her heart burning and her brain whirling; there could never be calm content for her again. As her eyes wandered over the various beauties of nature and art surrounding her, she thought to herself—

"All this might be mine—I might be Lady Chevenix and give grand entertainments here—I might be mistress of all.

Sir Owen said no more to her, but he redoubled his attentions, and people began to make pretty free comments about the matter.

"Felix Lonsdale will lose his *fiancee* if he does not mind," remarked Captain Hill; "and I shall be sorry for it."

"I believe, Lavinia," said Lady Rolfe with an air of dismay, "Sir Owen is so infatuated that he will marry the girl after all—he will indeed."

Francis Haye and his wife looked on in seemingly calm unconcern.

Violet found herself the center of attraction to all the men; one wanted her as a partner at croquet, another wanted her for lawn-tenis, a third craved permission to row her across the lake.

"I should like that best," she said, with a smile so sudden and so beautiful that the happy recipient of it lost his presence of mind at once.

Violet wished to be alone; she wanted time to think, to still the thrilling of her nerves; but she was mistaken in imagining that she would find solitude in a boat with a solitary companion However, no man was ever more completely deceived—Violet sat listening to him with a flush on her face and a smile on her lips. He thought that he was making a great impression on her, whereas she was congratulating herself that she was not compelled to hear or to answer his compliments.—[To be continued.

"STANDING TREATS."

No American custom creates more genuine surprise and amusement among traveling foreigners than that which is known in our saloons as "treating"—consisting in the entertainment of two or more with refreshments, for which one volunteers to pay. It is a pure Americanism. All over the Republic it is as common as in Europe it is unknown. There is probably no minute in any day in the year when two or three hundred citizens of Chicago are not guzzling something stronger than water at somebody else's expense.

The casual meeting of two men who have never exchanged a word together is a signal for both to at once exclaim, "Come let's have something," and for both to dive down into the nearest subterranean cavity below the sidewalk. The one who spoke first usually insists upon "paying the shot"—the word "shot" being a metaphorical reference to the deadly character of the contents taken into the stomach. If two old friends meet, the regular thing to say first is, "Let's drink to old times," and the resident must invariably "treat" the stranger. If a man be well acquainted, it is considered the princely thing to seize upon all his acquaintances as often as possible, take them to a saloon, and give them a complicated drink at the bar.

If there is anything more absurd than this habit, we are unable to put our finger on it. Men do not always "treat" one another to car-tickets because they happen to meet on the same seat. We never saw a man take out his pocket-book on encountering an acquaintance and say, "Ah George! Delighted to see you! Do take a few postage stamps, it's my treat!" Do men have a mania for paying each other's board bill? And is drinking together more "social" than eating together or sleeping together?

A traveler may go all over the continent of Europe, of Asia, of Africa, without seeing any man except a Yankee offer to "treat" and the Frenchmen are quite social enough, but when they turn into a cafe to sip their wine or brandied coffee together, each man pays for his own. When two Germans long separated meet, they will be likely to embrace, and then turn into an adjacent beer cellar, sit down and eat pretzels and chat, but when they part again each man settles his own score independently. So in Italy. The Italians are proverbially merry and generous, but each man pays for his own wine, maccaroni and cigars. They never go into each other's pocket-book in the sacred name of friendship. They would as soon think of transferring to each other their washerwoman's bill.

This preposterous fashion of "treating" is largely responsible for the terrible drunkenness in America. It is, take it all in all, the most pestilent custom that ever laid its tyrannical hand on civilized human beings.—[*Chicago Post.*

TACT.

It was once Causeur's good fortune to spend a few days in the modest home of a friend of slender means, a home that was all that its owner could afford to make it, yet lacking many things that would have made it more comfortable and convenient. During Causeur's stay two guests were entertained at tea, both of them men of means and wide acquaintance, accustomed to all the luxury that wealth can give. But they were widely different in their behavior. The first dwelt upon the fact that the house was an in an out-of-the-way spot, and that there were few or no neighbors. At the table he told of the delicious tea he had drank at the house of one friend, of the rich tea service that he had seen upon the table of another, of the rare old china that was used in his own household, and of the dainty meals he had eaten from it. In the cramped little sitting-room, after tea, he sat by the stove and talked of the delights of an open wood-fire, of his enjoyment of rare and costly books and pictures, and of twenty other things that the host of whose hospitality he had partaken, did not and could not possess. When he had gone it was clear, although nothing was said, that his visit had caused pain, that it had made the wife feel her straightened circumstances more keenly than ever, and cast a shadow over her husband's thoughts. The next evening came the other visitor. He brought a good cheer in his very face. The room, he said felt so warm and comfortable after his walk, which, he added was just the thing is to give a man a good appetite for his supper. At table he spoke of every-

thing that was nice, congratulated his host on having such a snug little home, apologized for eating so much, but couldn't help it, because it was "so good" and tasted "so home-like," liked the old black teapot because it was just like the one his mother had when he was a boy, and told his hostess, who was all smiles and as happy as a queen, that she ought to thank her stars that she had no gas or furnace to ruin the flowers that made her room so cheerful. After tea he insisted that the children should not be sent to bed "just yet" said he wanted to tell them a story, as he did; and when he had done, and had kissed them good-night, they trudged off upstairs with beaming faces, under the guidance of a mother who felt that a ray of real sunshine had entered her home, making it better and happier for all time.—*Boston Transcript.*

RECENT LITERATURE.

The Old House Altered. By GEO. C. MASON. New York: G. P. Putnam's Sons. $2.50.

FROM this text a number of letters are given, as if between a brother and sister, relative not only to the architectural improvements of an old roof-tree, but to other things in the same connection. The volume is appropriately dedicated to the ladies of America who have a taste for building, and contains many valuable hints as to house-furnishing, hygiene, ventilation, etc. To illustrate the subject and make it the more readily understood there is given an old domicile, with diagrams showing dimensions, etc., and then plans of its proposed reconstruction. These are discussed and explained, step by step, in language divested of all technical terms. After the imaginary dwelling is so improved, architecturally, as scarcely to be recognizable, the furniture, decorations, the plumbing and every arrangement that can be made to conduce to health and comfort, are discussed in detail, clearly and comprehensively, and the book cannot fail to convey many suggestions of practical value to the simplest minds, whose inclinations may tend to making a comfortable and attractive home.

The Little Good-for-Nothing. By ALPHONSE DAUDET. Boston: Estes & Lauriat.

DAUDET'S reputation for creating and portraying characters is in this book very well sustained. The Little Good-for-Nothing, as his sobriquet implies, is an uninteresting youth whose moral and physical weaknesses lead him through a series of adventures and misfortunes, naturally entailed and skillfully developed by the author. But the incidents, though novel, are not sufficiently interesting to enchain the reader's attention, and a monotony of detail renders it a rather tedious story, notwithstanding its many critically good points.

The White Horse of Wooten. By CHARLES J. FOSTER. Philadelphia: Porter & Coates. $1.50.

THIS is a story of "love, sport and adventure in the Midland counties of England and on the frontier of America"—in which the "sport and adventure" element so largely predominates that those who have a taste for quieter literature are not likely to be interested in it. It is well written, however, and presents a diversity of scenes and characters which is calculated to delight the sporting fraternity and the lovers of adventure.

Fanchon, the Cricket. By GEORGE SAND. Philadelphia: T. B. Peterson & Bros. 50 cts.

THIS is the story of which a dramatic version has been made so popular by Maggie Mitchell, the favorite actress. Its chief beauty is its purity of style. It charmingly depicts the trials and vicissitudes of a poor orphan girl, and is full of pathos and vigor.

MAGAZINE NOTES.

THE POPULAR SCIENCE MONTHLY for December opens with an interesting paper on Edison's Telephonic and Acoustic Inventions (illustrated). Next follows Dr. Oswald's admirable article on Fever-Factories, which ought to be widely read. It contains many valuable and timely suggestions and is alone worth more than the price of the magazine. Prof. Bain continues his instructive articles on Education as a Science. Explosions from Combustible Dust will be of especial interest to millers. Strange Animal Friendships is filled with entertaining anecdotes of horses, dogs, pigs, birds, lions, etc. The Science of Easy-Chairs is a suggestive paper. Biology and Woman's Rights is to the last degree conservative, and many of its statements are absurd. Language and the Emotions, by Dr. Chas. Walstein; Animal Intelligence, by Geo. J. Romanes, and a Sketch of Dr. Peterman conclude the body of the magazine. Popular Miscellany, with Editor's Table, Literary Notices and Notes, conclude the number. Henceforth the magazine is to be enlarged.

APPLETONS' JOURNAL for December is an unusually attractive number. The stories are by Ellen W. Olney, Auerbach, Susan Fenimore Cooper, Mary E. Bradley; the poems by Sara Jewett, Edgar Fawcett and Will W. Harvey; the sketches by Randolph Percy, Edw. Roberts, C. H. Jones, Geo. M. Towle, Chas. Carroll and C. H. Woodman.

The publishers announce that "illustrations will hereafter be excluded from Appletons' Journal, it being the purpose of the proprietors to devote the entire space to papers of a high order of literary excellence, by writers of acknowledged ability. Fiction will still occupy a place in the Journal, but a less prominent one; and while purely descriptive papers will appear, they will largely give place to articles bearing upon literary and art topics, to discussions of social and political progress, to papers addressed distinctly to the intellectual tastes of the public, or devoted to subjects in which the public welfare or public culture is concerned."

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

A WOMAN'S WISH.

MARY TOWNSEND.

WOULD I were lying in a field of clover,
Of clover cool and soft and sweet,
With dusky clouds in deep skies hanging over,
And scented silence at my head and feet.

Just one hour to slip the leash of Worry
In eager haste from Thought's impatient neck,
And watch it coursing—in its heedless hurry
Disdaining Wisdom's whistle—Duty's beck!

Ah! it were sweet, where clover clumps are meeting
And daisies hiding, so to hide and rest;
No sound except my own heart's sturdy beating,
Rocking itself to sleep within my breast.

Just to lie there filled with the deeper breathing
That comes with listening to a free bird's song!
Our souls require at times this full unsheathing—
All swords will rust if scabbard-kept too long.

And I am tired! so tired of rigid duty!
So tired of all my tired hands find to do!
I yearn, I faint, for some of life's free beauty,
Its loose beads with no straight string running through!

Aye, laugh if laugh you will at my crude speech—
But women sometimes die of such a greed;
Die for the small joys held beyond their reach,
And the assurance they have all they need!

LETTERS FROM A COUNTRY GIRL.—No. 9.

MARGARET B. HARVEY.

Crewel-Work and Outline-Embroidery.

To make the best of one's clothes is no small accomplishment, and yet it is not so great a one but that almost any woman of ordinary taste and patience may not acquire it. I do not believe in the woman who is not skilled in the use of the needle. A woman who cannot sew is like a woman who has only her left hand. No matter how good, or how wise she may be, I sincerely believe that with such a woman there is something wrong somewhere. But I do not advocate spending precious hours and days over cambric ruffles, with hair-line hems and infinitesimal stitches, exactly the same distance apart, or patchy, cinnamon-colored dogs, with step-like noses or flaming, cabbage-shaped roses, in cross-stitch. Not but that exquisite cambric ruffles, or mazy arabesques in Berlin wool, are beautiful and of occasional good use in working to give pleasure to our dear ones. My creed as regards needle-work is, first know how to do plain sewing well, and afterwards put any extra time and effort into work which is *really art.*

My auditors are mostly farmers' wives, I know, and as I have frequently said, I'm familiar with every phase of country living. Yet, I do say, I believe it possible for them, in the time they have usually given to patch-work and knick-knacks, to make beautiful adornments in the form of cushions, chair covers, hangings and lambrequins for their rooms, far more handsome than they could procure for money.

All have heard of South-Kensington-work. Many who visited our Exposition have seen some magnificent specimens of it. With taste and perseverance it is no more difficult to excel in this kind of art-embroidery than in many species of fancy-work with which most of our women are familiar. The only difficulty is, that it requires the worker to be able to draw; yet, I believe almost any one who will, can learn to draw, at least enough for ordinary purposes. The fabrics used in South-Kensington, or more properly, crewel-work, may be silk, satin, velvet, cloth; but coarse linen, crash or burlap is just as effective. The flower, often from nature, is drawn by the needlewoman herself, directly upon the material, and is colored and shaded according to her own fancy, bearing in mind, however, that little shading, with a rather flat effect, is desirable. The crewels are soft, fine yarns, of all colors, and only when of the best quality can any satisfaction be gained in their use.

The mode of working is quite simple. The first stitch being taken, the needle is brought out a little above its upper end, at the *left*, and so on—the needle always pointing directly *to* the worker, who works straight *from* her, bringing the pattern gradually *towards* her. When the top is reached the work is turned around, and the same process repeated. It is best not to outline a pattern, but gradually develop it. A blended, moss-like effect is desired in the completed work. Extra stitches, veinings, etc. may be taken afterwards. The extra stitches may be put in almost anywhere; and, in fact, great latitude may be allowed in the disposal of all the stitches, provided the needle comes out at the *left* of the previous one. The veinings may be of silk. Care should be taken that the ground does not show through and that the under side is smooth, as articles in crewel-work are not lined. When finished, the embroidery should be pressed, with its face downwards, on a thick flannel, and a damp cloth upon the back. If soiled, it may be washed in a solution of lukewarm, strained bran-water, without soap.

This kind of embroidery is really an art, for its form and beauty depend entirely on the worker, and no strict rules can be given for it. But what a wide field it opens, what a large scope for the exercise of individual taste and ingenuity! The subjects for design may comprehend the whole floral kingdom, and the completed works may be so beautiful, even though more or less conventional, as almost to rival nature.

Another species of art needle-work now attracting a great deal of attention, is outline embroidery on linen. This, too, depends, for effectiveness, upon the worker, but it is much more simple than crewel-work. If you have a handsome set of table linen, it will add ten-fold to its exquisite beauty to adorn it in this style, which you can do with a very little expenditure of time and trouble, while, to decorate your towels and toilet-mats and white curtains, you will find it no harder than the work usually put on them in the way of borderings, initials, monograms, etc.

The design is sketched directly upon the linen, and worked in soft tinted Japanese silks, pale reds, blues, grays, yellows and so forth. These etchings are scarcely more than outlines, with just a suggestion of shading, their beauty lying entirely in the perfect needle-work which may be in tent or satin-stitch. For instance, in the center of a doily may be drawn a slender, graceful vase. The outline may then be covered all round with three or four silks of different soft shades lapping over each other, or running parallel here and there, with, near the base, a few lines running into the body of the vessel, as a slight shading beneath the fullest part. Or, a scene may be formed by a few long, parallel lines, for water, at one side some rugged lines for land, with some bending rushes, and an old tree, while a flock of birds, formed merely of tiny, converging lines, may soar away in the distance. The outlines, remember, should be firm, but regard to color and shading, may be very slight indeed.

A table-cloth may have in one corner, or near the end, a bunch of wheat, or a bowl of fruit. Napkins, in the corners, shadowy pictures, or unique vases, urns, etc. White curtains may have a running, border-vine. In the center of doilies, almost any household utensils may appear,—as cups and saucers, pitchers, tea-pots, goblets, etc. Here, too, would be an appropriate place for a series of outline pictures illustrating some familiar story. I have read of a set containing scenes from Mother Goose, though I have seen just as beautiful etchings of simple, every-day objects as ever I expect to see.

The advantages of this kind of work are many. The materials are simple, a great deal may be accomplished in a short time, a high degree of excellence may be obtained with very little endeavor, the impression given by the completed work is more than satisfying.—grace resides in such a few lines and the design may easily be traced from a simple picture by one who cannot draw. I have been told, also, that such work will not fade or wear out, with repeated washings, for many years.

I don't want to see any little girl tied down to her tatting and herring-bone stitch, while her brothers are having a good time rowing and skating, or the same little girl, grown a young lady, absorbed in impossible parrots and miraculous peonies of zephyr, while her brothers paint and play chess. But neither do I want to see a young bride going to housekeeping, put fancy paper behind her towel-rack, because she can't work a simple medallion; run a woolen strip down her easy chair, because she cannot embroider even in satin-stitch, to say nothing of crewel-work;—above all, to mark her towels and sheets crooked and upside down, and hang up cotton-lace curtains, because she has neglected to learn the above-described, easy, graceful mode of adorning linen.

OUR LIBRARY.

MRS. LORETTA E. K. TURNER.

I LIVE near a small village which boasts of a flourishing library. A few years since some ladies clubbed together and bought about a dozen books. One of the ladies was installed as librarian; the books were left in her charge, and she was expected to keep a strict account of them. Soon there were others who wished to join the Association, and it was decided to charge one dollar initiation fee for each new member, and a dollar a year for dues.

The names of those who fail to pay their dues are dropped after two years, or upon their owing the Association two dollars. If a book is kept for more than two weeks without reporting it, a fine of ten cents is imposed, and an additional ten cents for each week thereafter.

The funds of the Association increased in a short time so that more books could be purchased. To-day, we have over twenty members, about three hundred books, two nice book-cases, and a little money in the treasury.

The rules of the Association are printed and pasted on the first cover of the book.

The following is an exact copy of them:

RULES REGULATING THE CIRCULATION OF THE BOOKS BELONGING TO THE

LADIES' LIBRARY ASSOCIATION

of North Fairfield, Ohio.

RULE I.—Each member is entitled to draw a book and retain it for a time not exceeding two weeks.

RULE II.—Any one retaining a book for a longer time shall pay a fine of ten cents, and an additional ten cents for each week thereafter.

RULE III.—Any one returning a book damaged, shall pay a fine subject to decision of a committee appointed by the Society.

The officers of our Association are a President, Vice-President, Treasurer, Secretary, Librarian, Book Committee and Finance Committee.

The Treasurer and Librarian of the Association are necessarily the same individual.

Our Library is now so large and valuable that we charge three dollars for the admittance of new members. We have also three-months' memberships for fifty cents, which entitle any one to all the books they can read in that time. Of course, no member can have more than one book at a time. We also rent the books for ten cents each.

We sometimes get up a festival or Lawn Fete, or an Oyster Supper, for the benefit of our Library, and quite a number of our books have been purchased with the proceeds of such entertainments. The ladies in any flourishing village can, with a little enterprise, have a library which will afford them a great deal of instruction and pleasure, and with but small cost. I think it an admirable way to procure reading matter.

HAVE WOMEN A MONOPOLY OF WEAK NERVES?

JICKS.

ONE would suppose so, to read all that male authors have to say of the proneness on the part of women to indulge in hysterics and other inopportune demonstrations when threatened with sudden death, and of the strength and calmness which men display in the face of danger; yet, judging from three occurences which took place during Thanksgiving week, men with unreliable nerves are by no means scarce, and it is possible for a woman to exercise coolness and courage in soul-trying times.

First, there was the case of the Pommerania. It is claimed by the survivors that the officers (except the captain) and crew of the steamship became utterly demoralized, and, owing to lack of discipline, and absolute brutality on the part of those in charge of the vessel, many passengers were lost who could have been saved, had anything like order been preserved. Again, the store of Rogers & Orr, dry-goods merchants in New York, was burned on the eve of Nov. 27. One of the firm, while the fire was in progress, was so overcome that friends were compelled to send him home in a carriage, and within an hour another one of the firm succumbed to fright and anxiety, and he also was taken to his home. At no time was there the least danger of any lives being sacrificed, and the only horror which confronted these gentlemen was seeing their property (which was nearly covered by insurance) destroyed. So much for the self-possession of man! Now for an exhibition of the timidity and nervousness of woman.

Hardly were the opening exercises at Public School No. 39 (New York) concluded, on the morning of the 27th ult., when the janitor discovered the felting around the steam boiler was on fire. He notified the principal, Miss Falvey, who immediately gave the signal for dismissal, and the children joyfully prepared to leave the building, thinking that their early release was due to the following day being Thanksgiving. The principal staid calmly at her post and watched the happy children troop by. When about two-thirds had passed out, the alarm of fire was given and the little ones who were still in the building became panic-stricken. Miss Falvey closed the doors, calmed the children as best she could, and by her admirable management succeeded in getting all of the children out of the school-house unhurt. Here was a woman threatened with a fearful death, who neither deserted her charge, as did the sailors of the Pommerania, nor allowed fright to deprive her of her senses, as was the case with the dry-goods merchants.

WHO WILL BE CROWNED IN HEAVEN.

A FIVE-DOLLAR note would be an extravagant price to pay for her establishment and all it contains, but if heroic womanhood ever found embodiment in human shape, it can be seen nightly upon St. Charles street, just below the Academy of Music. A week ago Grandma Wilson was in Memphis, baffling pestilence by her tireless vigilance. Hailed by a terror-stricken community as their guardian angel, Elizabeth in the zenith of her splendor could not have commanded the adulation which spontaneously went forth to that plain old woman. For thirty-eight days and nights during the frightful harvest of death at Grenada those withered hands were often the only ones to soothe the burning brow or close dying eyes. To her tender care were committed their children by dying parents. Appointed by the divine mandates of gratitude universal executrix and administratrix, in that season of deadly peril and death the confidential friend of the highest, she now sells peanuts on St. Charles Street. She did so before, and were another epidemic to carry desolation into a thousand homes, after another heroic battle with disease, would do so again; but is Cincinnatus, returned to his plow, much more heroic than Mrs. Mary Ann Wilson returned from the devastation of Grenada, Grand Junction and Memphis to her peanut stand? Mrs. Wilson was a faithful nurse here in 1837. During the epidemic of 1853 she was on duty the entire summer. In 1855 she devoted her time to the sufferers of Norfolk. Another year she visited Savannah; and, in short, for forty-one years this noble woman has flown to the aid of the sick and suffering the moment she heard of their needs. There is a seat above for her among the best of God's children.—*New Orleans Times.*

NOTE.

BY THE EDITOR.

YIELDING to the wishes of a number of subscribers, I have decided to defer the publication of the fashion article promised for this number and to give instead a short story, which I hope will be enjoyed by a larger audience than would the postponed article.

ERRATUM.—In Miss Harvey's article on Dress, in RURAL of 16th Nov., she is made to say "name' redingote, when "Hernani" redingote was meant We are sorry that so admirable an article was marred by so serious an error.—ED.

MOP-HANDLE PAPERS.—No. 9.

MAY MAPLE.

House-work Contrasted in Two Nice Frontier Cottages.

"How I dread the Saturday's work!" said Mrs. Nice, as the family gathered about the breakfast-table one morning in the early, golden October. The breakfast-room was also kitchen and parlor; for this little home of which I write, was only a log cottage in the "Far West," where were many others just as good but no better, and some that were less comfortable.

When Mrs. Nice first entered the little log cabin ten years previously, it was as a bride. And although the surroundings outside the little cabin home, were wild in the extreme, her new furniture and extreme neatness made the inside of the house look delightfully home-like and inviting. But ten years had brought some changes. Outside might now be seen a large "clearing," cultivated fields, a large barn, a thrifty orchard, a well tilled garden, where grew the finest vegetables and most brilliant-hued flowers, and, last but by no means least, a good shed for farming tools, of which there was no lack. Prosperity and good management were everywhere to be seen.

Indoors, neatness was as much the order of the day as ever. Although there were four children to make work, the delicate-looking mother managed to do it all with her own hands. And Saturday of every week, year in and year out, was her "cleaning" day. The room had been ceiled with well planed boards when the house was built. So all the wall was thoroughly washed with a cloth, instead of a good scrubbing-brush, which would have made the work much easier. The chairs which lost their paint before they had been used two years, from an excess of washing, must now be scoured with soap, sand and plenty of hot water. Benches, boxes, cupboards and bedsteads must all go through the same toilsome process. All day long did the fragile-looking woman labor to make her bird's-nest of a cottage look invitingly clean and sweet. When the weather was fine, every article of furniture that she could handle alone—for she never called her husband from his work to assist her—was carried out-of-doors to be cleansed, and then, while the pieces were drying, she scrubbed the floor with an old broom, and then poured on water to rinse it, till not a particle of dirt dared make its appearance to discolor the clear spring water. And every board was rubbed and wiped with a long-handled, woolen mop, till it was as dry as cloth could make it. Supper was often spread out-of-doors beneath the shady apple tree that stood a few steps from the house. Before the little woman retired, everything was again in the most perfect order. Flowers adorned the tables and window seats and added their fragrance to the fresh, sweet, pine odors. It was amusing to see how exceedingly careful father and children were to keep mamma's "Sunday parlor" clean.

It was a bright morning after one of these toilsome Saturdays, when Mr. Nice said to his wife: "Jessie, I think we can go over to cousin John's to-day. May will want to see how they are prospering before she returns home, and the ride and the sight of fresh fields will do you good after your hard work of yesterday."

In new countries churches are scarce, and ministers capable of interesting an intelligent audience, are few and far between; meetings are therefore held only semi-occasionally. And thus the inhabitants take the day for calling on their far-off friends. Just after dinner, Mr. Nice drove up to the gate with a handsome span of horses and a light spring-wagon, and we all found comfortable seats and were soon speeding over the ground through a delightful part of the country. An hour later and we found ourselves pleasantly seated in Cousin John's snug little cabin. We noticed, before entering the house, that thrift and prosperity were everywhere visible here as well as at the home of Mrs. Nice; and within the four square walls comforts, and even luxuries, comparatively speaking, were not absent. The two families were alike in size, had the same amount of capital to begin life with, and had managed to increase it about equally as far as improvements were concerned. Even the house-furnishings had originally been of the same kind and quantity. So, if the two cabins had been erected in the same neighborhood, they might have been called "The Twin Cottages." But now there was a marked contrast indoors.

"You see," said Mrs. Nice, "that Laura takes her comforts as she goes along through life, and sometimes I think she may be the wiser. But I never could endure the thought of living in a log house year after year. And so I scrimp and save in every way possible, that we may have our new house by the time we have seen the twelfth anniversary of our wedding-day."

"Well, May, you know when we all went to school together, that my motto was to 'make the most of life while I have youth and health; and to keep my health I must economize my strength. Now, I'll leave it to you to decide which is most likely to enjoy the comforts of a new house when she gets it. I have all the machinery I can get to help about my work. Instead of wearing myself out as Jessie does, scouring wood-work and furniture, I give the whole a fresh coat of paint and varnish about once a year; thus keeping my furniture new-looking all the time, at the trifling expense of two dollars. My walls are papered as often as necessary to keep them tidy. My floors above and below are carpeted; so that my work is no harder on Saturday than on any other day. And I very seldom feel over-worked, though I often assist John when help is scarce upon the farm, in doing light work, such as husking corn, picking apples, etc. We have plenty of books and papers wherewith to feast and cultivate the mind, some nice engravings, as you will see, to please the eye; and an organ which is a real comfort to us all. Johnny and Elsie, our two oldest, aged respectively nine and seven, can play a number of Sabbath-school tunes very well. We all have perfect health and are as happy as larks from week's end to week's end. Now, May, what does it matter whether we have a new house in two years or in five?"

And sure enough, what did it matter? Health and happiness!—would a palace bring greater blessings?

HOLIDAY RECIPES.

Wafers.

MELT a quarter of a pound of butter and mix it with half a pint of milk, a teaspoonful of salt, a wine-glass of wine, three beaten eggs and sufficient sifted flour to enable you to roll them out easily. They should be rolled very thin, cut into small circular cakes, and baked in an oven of moderate heat. Frost the whole and sprinkle sugar sand or comfits over it as soon as frosted.

Cocoanut Drops.

Take equal weights of cocoanut grated and white sugar, care must be taken not to grate any of the brown part of the nut. Beat the whites of eggs to a stiff froth—there should be just enough to moisten the sugar and cocoanut, so that they will be quite stiff. Drop the mixture on to buttered plates. Make the drops the size of a cent, and several inches apart, and bake them in a moderate oven.

Flummery.

Lay sponge cake in a deep dish, pour on white wine to moisten it; chop some raisins fine and sprinkle over the cake; then spread over it a layer of jelly and turn over it a custard made with the yolks of eggs. Beat the reserved whites to a froth and spread over the top. Put a dash of red sugar sand here and there over it or tiny drops of jelly. Slices of oranges, cut very thin, make a good garnish for it.

LORETTA E. K. TURNER.

DOMESTIC RECIPES.

Carrots for Dinner.

Wash, scrape, let lie in cold water for an hour or more; then boil until tender; drain, mash, season with a good-sized piece of butter, pepper and salt and serve very hot. E. W.

Ginger Cookies.

One cup of molasses, one cup of sugar, one cup of buttor or lard, three eggs, two teaspoonfuls of saleratus, dissolved in a little hot water, five cups of flour, one tablespoonful of ginger, mixed with the molasses.

Brown Bread.

Two cups of Graham flour, three cups of Indian meal, one half cup of molasses, three cups of milk, one teaspoonful of soda and one of salt. Steam three hours.

White Cake.

Whites of three eggs beaten to a froth, one-half cup of butter, one cup of sugar, two-thirds cup of milk, two cups of flour, two teaspoonfuls of baking powder. MRS. M. ALDRICH.

Vegetable Oysters or Salsify Fritters.

Make a thick batter of two or three eggs, a cup of sweet milk, flour, pepper and salt. Wash, scrape and grate the roots into this batter, grating enough to make the mixture of the same thickness as any other raw fritters, and drop by the spoonful into boiling fat. MARY B.

Apples and Bacon.

Cut some nice sweet bacon into thin slices and fry almost to a crispness. Have prepared some greenings, pared, cored and sliced, and fry in the fat left in the pan from the bacon. The bacon should be kept hot until the apples are ready, when they should be taken and placed upon the slices of meat. MRS. W.

Texas.

Salt-Rheum.

To those who suffer from this worrying complaint, I would recommend rubbing the parts often with raw mutton fat, just warmed enough to spread smoothly on, as you would any other ointment.

Useful Pomade.

Four ounces of lard; one dram of palm oil; one dram essence of bergamot; one ounce of castor oil. Put the ingredients into a jar, and immerse in hot water until dissolved.

Sweet Crackers.

One pound of flour; one-half pound butter well rubbed in; one-half pound powdered sugar; mix with the yelk of one egg, well beaten and a glass of sweet wine; roll out the paste very thin, and cut out in any small shape you please.

MRS. M. RANDALL.

Indigo.

Here is a good recipe for indigo: two oz. oxalic acid; one oz. Prussian blue pulverized, and add one quart of soft water. Mix well and bottle for use. H. O. S.

QUESTIONS ANSWERED.

Celery Soup.

PLEASE give directions for a celery soup?

Livingston Co., N. Y. E. Z.

ANS.—Scrape and cut into small pieces two bunches of celery, using the best parts only; add two quarts of good soup-stock with an onion cut into slices and stew gently until the celery is tender; put through a colander, season with pepper and salt and return to the fire; boil up, add a coffee-cupful of boiling milk thickened with a little corn-starch or flour, and turn at once into the tureen. A trifle of sugar is thought by many an improvement, while a few bits of fried bread put into the tureen before pouring in the soup are a nice addition.

Queen's Toast.

I have heard of queen's toast, but do not know how it is prepared. Will you give me the desired information? HOUSEKEEPER.

Dayton, Ohio.

ANS.—Cut thick slices of baker's bread into rounds or squares and fry to a nice brown in butter or lard. Dip each piece quickly into boiling water, sprinkle with powdered sugar and cinnamon and pile one upon the other. Serve with a sauce made of powdered sugar dissolved in the juice of a lemon and thinned with a glass of wine.

News of the Week.

Monday, Dec. 9th, 1878.

THAT DAIRY FAIR.

The Dairy Fair closed on Saturday last at 10 P. M. and the general verdict seems to be that it was a success. Of the thousands who visited it during the week many must have objected to its being held at a place a trifle remote from the quarter of the city which experience has shown to be the most popular and profitable for theatrical and similar displays, and doubtless not a few who would otherwise have attended it, remained away on this account; but once inside, the visitor must have felt the admirable nature of at least one point connected with it—the fitness for such displays of the building in which it was held. In size and construction it resembled not a little station at some railroad center. Running round the sides was a broad elevated platform, devoted mainly to petty side-shows and commanding a good view of the long rows of pine tables, laden with butter tubs on one side of the central walk and with cheeses of all shapes and sizes on the other. The center of the area was occupied by a fountain, to the north of which towered aloft pyramids of cheese and salt, while on the south rose a railed-in permanent platform graced with an organ at one end and fronted on the other with semi-circular rows of chairs occupied most of the time with visitors listening to the strains of a brass band from the platform, or the peals of the organ, or in the evenings looking at some speaker trying in vain to make his voice heard amid the trampling of feet and the buz of conversation from all other parts of the vast building.

Among these inaudible speakers during the week, the Management contrived to secure a few "stars," most notable of whom was Ben Butler. The bulk or them, however, belonged to the reliable old stock company, most of whom play the same parts on the stage of nearly every prominent meeting of dairymen throughout the country. Such meetings, indeed, would probably be considerably fewer were it not for the labors and influence of these gentlemen, most of whom wish to advertise their wares or themselves under the guise of helping along the dairyman's cause.

Ex-Gov. Seymour, of course, was there, bland, and wise and voluble, as usual. Instead, however, of instructing the dairymen of the Union on matters connected with their business, he enlightened the Gothamites with regard to the vast extent, the rapid increase and the admirable workings of the dairy system. He spoke warmly of the intelligence, the attainments, the close observation, the constant study, the knowledge of business routine and the necessary honesty of those engaged in the business. He explained the system followed at factories, of which there are more than 3,000 in the country, dilated upon the methods of making sales of cheese, the rivalry in the excellence of their products between the different factories, and the vast opportunities for still greater spread of the business here, and of its products both at home and abroad. So highly did he value the dairy interest of the country that he declared that if all the banks in New York failed, their failure would not inflict so great a loss on the nation as the failure of dairying for a single year, and so exalted was his estimate of the intelligence of dairymen, that when he became well acquainted with them, he actually burnt as worthless what must have been, in his opinion, the embodiment of farming wisdom—his own agricultural speeches. He insisted on the necessity of making the value of cheese as a food better known among our own people and consequently more popular, thus supplying the public with a cheap, nutritive and healthy article of diet and the dairy interest with an enlarged home-market. He pointed out that while the wholesale price of good cheese is now about nine cents a pound, it retails for double that sum, as so little of it is sold here that dealers must charge a heavy percentage. If the sales were larger, the price would be much lower. He dwelt on the proud fact that the returning prosperity of the country is due mainly, if not entirely, to the results of agricultural labor, and that the earth, its tillers and its products must ever be the foundation of abundance and prosperity. Gen. Butler made a strong plea for small farms and better cultivation; insisted that our inherited greed for land, and more land, should be checked, that it would be an evil day for this country should the huge estates and the poverty-stricken peasantry of some European lands ever become common here, and that small farms well-cared for, were better both for the individual and the nation at large, as large estates in this country are seldom permanently profitable. Large farms mean usually insufficient tillage, small productiveness, and unprofitable farming. In support of his views he dwelt at length upon the agriculture of France where the cultivated land is so subdivided that out of 5,550,000 distinct properties, only 50,000 averaged 600 acres, 500,000 averaged 60 acres, while five million properties are under six acres, yet in 1876 France exported to England of butter alone $18,672,000 worth; while we exported only $2,965,000 worth of butter, and $12,824,000 of cheese, or an aggregate of $15,789,000. Moreover, although the area of France is considerably less than that of Texas, and its population 10,000,000 less than that of the United States, still she produced in 1868,350 million bushels of wheat against 240 millions produced here and other cereal crops in proportion. The General went at length into statistics of the marvelous results of careful tillage of small farms in that country, but while his reasoning was excellent as to the good results of thorough cultivation, few will see the necessity or desirability on that account of limiting their farms to a cabbage patch of half-a-dozen acres.

Professor Arnold gave a very instructive address in his customary style, Mr. Thurber, of this city, gave an interesting account of the kinds of cheese made and wanted in Europe; so did Mr. John P. Warrington, of Liverpool. Mr. Erastus Brooks gave a lot of statistics cribbed from government reports, Mr. X. A. Willard, spoke pithily and learnedly as he usually does on such occasions. Francis D. Moulton closed the list of orators on Saturday night. He effusively thanked every body connected with the fair for their efforts in contributing to its success. He was sure that good cheese is necessary to the health, happiness and longevity of mankind; and therefore should appear far oftener on American tables. Foreigners, too, must butter their bread much thicker and oftener so as to afford our dairymen a profitable market for many times the amount of butter exported at present. He went largely into statistics for which he had, himself, to refer to paper and which therefore he could hardly have expected the few who could hear him, to remember. He urged that dairymen and farmers generally should see to it, that men were elected to Congress and State legislatures, who would be more attentive to agricultural interests than our present Solons.

HERMAN.

PUBLISHER'S NOTICES.

OUR readers are requested to read the following before making up their orders for seeds:

Any ten of the following require a one-cent postage stamp:—that is ONE *cent* for the ten, not for each.

The Voorhis Water-melon.	Weigela.
Golden Rural Tomato.	Deutzia crenata fl. pl.
Acme Tomato.	Hibiscus militaris.
New Bronze Ricinus.	Eryngium Leavenworthii.
Hibiscus moscheutos.	Geranium sanguineum.
Calliearpa Americana.	Yucca filamentosa.
Chater's Lemon Hollyhock.	Vitis heterophylla.
	Rural hybrid Aquilegia.
	Grindelia squarrosa.

When the Beauty of Hebron Potato is included, a two-cent extra stamp.

When both Pearl Millet and Defiance Wheat are included, a two-cent extra stamp.

We request that our subscribers will write their addresses IN FULL and PLAINLY, and not *stick the stamps to their letters*. By so doing they will save us a deal of trouble and expense. For particulars, send stamp for RURAL of Nov. 9.

For Bronchial, Asthmatic and Pulmonary complaints, "*Brown's Bronchial Troches*" manifest remarkable curative properties. Like all other meritorious articles, they are frequently imitated, and those purchasing should be sure to obtain the genuine "BRONCHIAL TROCHES."

THE Huron Live Stock Association, at its annual sale, to be held Feb. 12, 1879, in the town of Exeter, Prov. Ontario, Canada, will offer a fine opportunity to breeders to dispose of their surplus thoroughbred and imported stock. Entries may be made as late as Jan. 1, '79. Details relating to terms of payment, etc., may be had by a reference to the advertisement.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 7, 1878.

BEANS AND PEAS.—Local and other buyers seem to be pretty well stocked with the standard sorts of beans, and with the slack inquiry values are lower. This refers to mediums and marrows. White kidneys quiet with cheaper marrows. Red kidneys firm with their timely activity. Pea beans only saleable when strictly prime. Many lots have the fault of last season, mixture of dead and discolored beans. Black beans fairly active. Green peas in fair supply for

wants of trade, at $1.25@1.30, Canadian field, in bulk and bond, ordinary quality, 70@72c.; choice, 75c.; Southern B. E., two bushel bag, $2.50@2.60; medium beans, prime, $1.60@1.65; fair to good, $1.50@1.55; Marrow, free to ship, $1.70@1.92½; fair to good, $1.50@1.55; pea, $1.60@1.80; white kidney, $1.80@2.00; Red do., $1.90@2.70; Black, $1.90@2.25.

Receipts of beans for week, 12,700 bushels; exports, 1,174 bbls.

BUTTER.—Trade has ruled quiet, but with moderate receipts sellers have been able to obtain full late figures. When State dairies make 20c. they must have a long top of tubs, that will fill out small family orders. This demand is very late this season, owing to easy retail prices. An export demand would obtain life if sellers would meet bids. British shippers offer 18c., their average rate at the beginning of the season when exports were so heavy. Sellers, however, have more independence now as tender quality in warm weather made sales more or less compulsory. There is an abundance of early made butter here that is foolishly limited by country owners to above 11c. Continental buyers have been looking at these grades, and have and will pay 11c. Western butter unchanged. The dairy fair, held here this week, has proved a sensation; it is a favorable omen for the producer when large communities take a special interest in table supplies, and this exhibition of pasture resources has been truly instructive as well as entertaining.

State, full dairies, special, 20c.; other, 16@19c.; firkin dairies, fair to prime, 13@18c.; Welsh dairies, fine full, 18@19c.; choice dairy, pails and half tubs, 22@23c.; fair to prime do., 18@21c.; choice Welsh, 21@22c. fair to prime, 18@17c. Choice creamery 26@27c.; other, 22@24c.; sweet cream, 24@26c. Best Western creamery, 25@26c.; other, 20@24c.; early packed creamery, 17@20c.; poor State 10@12c.; Western dairy, fine fresh, 16@18c.; fair to good, 10@14c.; factory, choice, 13@14c.; other, 6@12c.; rolls, 10@16c.

Receipts for week, 31,342 pkgs. Exports, 6,000 do.

COMPARATIVE RECEIPTS AND EXPORTS.

	Receipts, pkgs.	Exports, firk
June 1, '78, to Dec. 1, '78...	8,909,75	164,150
June 1, '78, to Dec. 1, '77...	780,750	129,300
June 1, '78, to Dec. 1, '76...	746,230	87,804

CHEESE.—There has been a very meagre showing of business this week, the shipments only 28,000 boxes, and a portion of these were through lots from Canada. The little inquiry has been almost entirely for fancy factories; these brought 8½@8¾c. The good and under grades are weak. Quotations are: 8¼@8½c. for fancy, 8c. occasionally; 8@8¼c. for fine lots; 7@8c. for good and prime; 6@7c. for fair to good; 3@5c. for skimmed. State, farm dairy at 8¼@8½c. for good to choice; 7@8c. for good to prime. Wisconsin factory, fine to fancy, 8¼@9c.; do. good to prime, 7@8¼c.; do. fair to good, 6@7c. Western factory, fine and fancy, 8@8¼c.; good and prime, 6@7c.

Receipts past week, 90,615 boxes.

Gold closes at 109¾.

Liverpool cable 47s. 6d.

COMPARATIVE STATEMENT FOR THE LAST THREE YEARS.

	Receipts, boxs.	Exports, lbs.
June 1, '78 to Dec. 1, '78.....2,433,614		98,304,050

DRIED FRUITS.—There has been but little life to the market. Apples have had a moderate jobbing trade, but export interest is not important. Peeled peaches are firm in price, if choice. Blackberries are easy; other small fruits are scarce and well sustained in price.

Southern plums at 14@14½c.; State plums, 15@15½c.; Blackberries are quoted at 5½c. Peaches—Peeled Georgia, at 6c. for poor; 8@9c. for fair to good; 10@10½c. for prime; choice North Carolina, 11¾@12¼c.; good do., 8@9c.; unpeeled halves, 3@3½c.; quarters, 3@3¾c. Pitted cherries, 2@2¾c. Apples—Old State quarters, 2½@3c. New apples, 2½@3c. for southern quarters in bbls.; 4@5c. for prime sliced, State at 4@5c. for new sliced; and 3½@3¾c. for quarters; western at 3@3½c. for new quarters. Raspberries, 30c.

Exports, past week, 675 bbls. dried apples.

EGGS.—The market is steady with light supplies; the demand, however, does not call for heavy receipts of fresh. Limed will so go into use for pastry purposes. Near points 27@28c.; State and Penn., 25@26c.; Western, fresh, 24¼@25c.; Canadian, 24c.; poor stock, 22@22½c.; Limed State, 17c.; other, 14@16c.

Receipts for the week, 5,789 bbls.; do. last week, 6,214 do;

FLOUR.—There have been very large receipts, the demand from shippers and home trade buyers has been moderate, and prices have eased off a little.

Latest prices are $3.25@3.75 for very inferior to very choice superfine State; $3.85@4.10 for very poor to good extra do., odd lots and lines; $4.10@4.35 for good to very choice do., strictly choice and fancy lots above this; $3.25@3.75 for inferior to very fancy superfine Indiana, Iowa, Michigan, &c.; $3.85@4.10 for poor to good shipping extra do. and $4.10@4.35 for good to very choice extra do.; common to about choice white wheat extras, $4.20@5.10; choice to strictly fancy do. at $5.10@5.85; red and amber winter wheat, very inferior to very choice trade and family $4.10@5.75; round hoop Ohio at $3.90@4.30, and trade and family brands of do. at $4.35@5.75, the latter rate for very choice; St. Louis, $4.15@4.35 for very poor to good extra, and $4.85@5.75 for good to choice; Minnesota clear, very inferior to very choice at $3.85@5.15; few brands going above $4.75; Minnesota "straight," inferior to very choice at $4.65@5.75; and patent fair to strictly fancy at $5.25@8.50, few brands going above $7.50; unsound stock at from $2.00@4.75; city mill extra at $4.90@5.10 for West Indies (the latter rate in new packages); do. for England, $3.85@4.00; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.60 for fair to very choice; No. 2 at $2.50@3.10 for very inferior to very choice.

BROOM CORN.—There are light receipts. The new corn is classed chiefly as hurl this year. Sales at 4½@5c. for medium green to choice hurl; 4c. for inferior.

FRESH FRUITS.—Supplies are becoming less formidable. Arrivals are light, and dealers have removed most of the very low sorts. Market firm, but not quotably higher. Extra red $2@2 25, bbl.; good to prime Greenings and Baldwins, $1.25@1.50; selections of latter, $1.75; Lady apples, $3@4, half bbl.

Exports, apples, past week, 11,432 bbls.

Cranberries have advanced; fancy bbls. (Capes), $9; good to choice, $7@8.50; common, $5@6.; N. J. crates, extra, $2 50; other $1.75@2.12; Catawba grapes are scarce, fancy well kept, 8c.; poor, 2@8c. lb. Fla. oranges are rapidly taking the place they have established as a desirable sort. Standard boxes, $2@$4; poor to choice, bbls., $5@7; crops not so heavy as last season; considerable fruit lost in September gales. California pears, $3.50@4 for varieties last noted. Chestnuts scarce but no higher, $3.50@4. Hickory nuts, shellbarks, $2.50. Black Walnuts and Butternuts, 50c.; Pecans, 12@16c. for new. Peanuts have sold well, but the supply does not allow sellers to advance rates. Va. hand-picked $1.15@1.20; other, 87c.@$1.05; shelled, 4½@5¾c.

FURS AND SKINS.—The following are the opening prices, but there is not assortment enough to call quotations steady:

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₱ piece.....	$3 00@ 4 00	$2 00@ 2 50
Gray Fox.....	75@ 1 00	60@ 80

GRAIN.—Wheat has fluctuated a good deal but by the close is rather weak, with diminished export interest.

Latest sales are of No. 1 red at $1.08½@1.08¾; No. 2 red at $1.07¾@1.08¼; ungraded white at $1.10@1.10½; extra white at $1.10½@1.10¾; white State at $1.09@1.12½; No. 1 white in lots at $1.05¾@1.06¾; No. 1 white, steamer grade, at $1.07¾@1.08; No. 2 white at $1.03¾; No. 3 red at $1.03; ungraded red at 91c.@$1.03; No. 2 amber at $1.05½@1.06; ungraded amber at $1.04@1.08¾; No. 2 Milwaukee spring at $1; ungraded spring at 95c., No. 3 spring (to arrive) at 90c; No. 2 red, December option, at $1.03; do. January option, at $1.03¾@1.04; No. 1 white, last half December, at $1.10; No. 2 amber, December option, at $1.05¾; do. January option, $1 06@1.06½. Rye at 61@62c. for State and 60c. for prime Western. Corn has had, through the week, a freer export demand, and prices have been fairly well sustained; latest sales are of New York No. 2 at 46¾@47c., afloat; New York No. 3 at 41¾@41¾c.; ungraded mixed at 45@47c.; yellow Western at 49c.; white Western at 50c.; steamer white, new at 47c; No. 2, December option, at 47c.; do. January option, 48@48¾c.; steamer mixed, December option, at 45¾@45¾c; do. January option, at 45½c. Oats have a liberal home trade demand and prices are better; sales of New York No. 1 at 31¾c.; New York No. 2 at 30¾@31c; New York No. 2 white at 32½@33c.; New York No. 3 at 29¾@29¾c.; New York No. 3 white at 31@31½c.; white Western at 31@35c.; mixed do. at 29½@31c.; white State at 31@35½c.; mixed do. at 30@31½c.; No. 2 Chicago at 31½c.; New York extra white quoted at 33c.; New York No. 1 white at 33¼@34c. Barley, State, 6-rowed, 90@95c.; 2-rowed, 75@80c.; Canadian, 95c.@$1.25; malt, $1@1.25.

HAY AND STRAW.—There are full supplies and an easy market.

Sales at 35@40c. for shipping, and 65@70c. for retail qualities. Straw quoted at 35@45c. for long rye, and 30@35c. for short rye, and oat at 30@40c.

Exports past week, 2,490 bales.

HOPS.—Emmet Wells, in his circular, says:

"Notwithstanding the shipment to Europe of nearly 1,000 bales again this week, the price on low and medium grades has declined from 1c. to 3c. per lb. This unfavorable turn in the market may be attributed entirely to the continued persistency of the few holders (mostly growers) who are still here pressing the sale of their hops and accepting whatever bids they can get. These men have fallen into a trap made by their own hands, and it is to be hoped that the experience they have gained by trying to market their own produce instead of having it come here through the regular channels, may in the long run prove a blessing to them and a benefit to the trade in general. Choice New York State and Pacific coast hops, from their scarcity, maintain late values."

Quotations are for New Yorks, new crop, choice, 12@15; New Yorks, new crop, good and prime, 11@12; New Yorks, new crop, low to fair, 6@7.; Eastern, 8@12; Western, 8@12; Yearlings, 4@6; Olds, all growths, Pacific coast, 12@15.

HONEY.—Market quiet, but with a hope of holiday sales relieving the monotony of late dribbling business. White clover, 15@16c.; two comb, 13@14c.; Buckwheat, 10@12c.; strained, 8@12c.

LEATHER.—Hemlock sole at 19@20c. for for light; 20@21½c. middle do.; 20@22½c. for heavy and 17@19c. for goop damaged.

POULTRY AND GAME.—Live fowls are in demand, but prices for them or turkeys are not attractive. Chickens low.

Choice fowls and chicks, 9@10c.; other, 7@8c.; roosters, 5@6c.; turkeys, 7@10c.; ducks, best, 75@90c. ₱ pair; poor, 40@50c.; geese, N. J., $1.50 pair; other $1@1.25; pigeons, 30c.

Supplies of dressed are small, but the demand has not warranted orders for free shipments.

Dry-picked turkeys, 14@16c.; choice, scalded, 12@12½c.; other, 9@11c.; dry-picked chickens, 14@15c.; good, 11@13c.; common, 7@9c.; fowls quoted similarly. Ducks, extra, 12@13c.; other, 9@11½c. Geese, Phila., 10c; other, 8@9½c.

Game has arrived freely and prices are generally weak. The weather has been too fickle to allow much buying for show.

Quail, doz., $1.12@1.25; Grouse, trapped, pair, 70@75c.; drawn, 45@55c.; Partridges, State, 75@80c.; other, 45@65c.; canvas-back Ducks, $1.50@2.25, the latter for Havre de Grace; red head, 50c.@$1; Mallard, 50@60c.; Teal, 40@50c.; common, 25@35c.; Hares, 30@40c.; Rabbits, 25@50c.; Venison, short saddles, 12@16c.; long do., 10@11c.; whole deer, 7@8c.; wild Turkeys, 16c.

SEEDS.—Clover is lower; prime quoted at 6¾@6¾c. and choice at 6¾@7c. Timothy at $1.20 for prime. Rough flax at $1.40 bid.

TOBACCO.—Shippers have been buying moderately and the home trade demand has been fair, with prices firm. Quotations are for

VEGETABLES.—Potato dealers have been busy in finding place for the heavy supplies of Prince Edward's Island schooner cargoes. The supply is generally large, including canal stock, and few buyers day the extremes. Onions firm when fine. Other vegetables show the strength that cooler weather permits.

Nova Scotia E. Rose, bulk, $2.75@2.87 ₱ bbl.; Prolific and Chili red, $2.25@2.50; P. E. I. Jackson whites, $2 37; Mercers, $1.75@2; Eastern E. Rose, with bbl., $2.75@3; State, $2.50; fair to good, $2@2.37; do. Peach Blow, choice, $2.50@2.75; common, $2@2.25; Peerless, choice, $2.37@2.50; poor to good, $2@2.25. Sweet potatoes, Del., $2@2.25; Va., $1.50@1.75, which is higher. Onions steady. White, $1.75@2 25; red and yellow, $1.75@2; Chester, $1.25@1.62. Hubbard and marrow squash, $1.75@2. Cabbage, $3@5 per 100. Cauliflower, bbl., $1.50@3. R. Turnips, 75@87c. Beets, 75c. Carrots, 75c.@$1. Pumpkins, 100, $4@8. Celery, 75@90c. doz.

Exports, potatoes, past week, 8,195 bbls.; of onions 240 do.

OIL-CAKE.—Western is quoted at $23 ₱ ton.

PROVISIONS—Have tended lower on the large hog arrivals.

Mess pork quoted at $7.35@7.40 for ordinary brands; $7.40 for December; $8 75@8.80 for new for January; $8.70@8.75 for new for February. Bacon at 4¾@4½c. for long clear and 4¾c. for short clear. Lard—Western steam at $ @6 62½ for spot; $6.65 for January; $6.12½ for February and $6.20 for March. Stearine at 6¾. for Western. Tallow at 6 11- 6 for prime. Beef Hams at $14.50@15. Beef—Extra India mess $20.50@21.50 for city brands; do. Philadelphia, $19.00@19.50; packet at $11@11.50; new plain mess at $9.50@10; new extra mess at $10.50@11.50.

WOOL.—There has been a fair degree of activity to the market this week and price well sustained. Sales of X and XX Ohio fleeces at 44@35c; Wisconsin fleeces at 32c.; spring California at 19@22½c.

Quotations are for Domestic Fleeces: Ohio, Pennsylvania and West Virginia—XXX and picklock, 37@39c.; XX, 35@—; X, 31@33c.; No. 1, 36@37c.; No. 2, 33@35c; coarse, 30@31c; combing, 39@42c.

HORSFORD'S Bread Preparation

UNSURPASSED FOR MAKING

LIGHT BREAD,

Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder. Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof. E. N. Horsford, by the Rumford Chemical Works, Providence, R. I.

Reading for the Young.

BILLY-BOY AND BILLY-GOAT.

"Stop, Tommy, you can't catch him that way, and if you fool wid him, Old Bill,
The fus' thing you know, he will butt you clear down the foot of the hill!
You don't unnerstan' it yet, Tommy; jus' wait till I pulls off my coat—
Now gimme the halter—*I'll* show you the way for to bridle a goat!

"You's so young and so little, Old Billy, he don't eben know who you are,
I's goin' on seven years, I is—I's mighty near old as Papa,
A goat's like the show people's lions—needs a fellow to tame him, you see,
Wif a 'ticular kind of a voice and a eye and—a fellow like me!

"I carries the halter jus' this way, and marches up steady, jus' so;
Look *at* him! how quiet he's standin'—he knows who's a talkin', Bill, whoa.
Now watch me, Tom! S-t-e-a-d-y—s-t-e-a-d—WHOAP!" The billy-goat standeth there still,
Gazing calmly on Billy-boy rolling "clear down to the foot of the hill." [*Courier-Journal.*

THE CHEMISTRY OF METALS.

W. H. WALENN.

Copper.

KEEPING in full view the benefit of "leading the mind of the young chemist from what is known to what is unknown," I have selected the metal copper to commence with, as the one most likely to be known by every boy.

Until very recently, copper was employed—in its pure, or "virgin" form. It is much used now in culinary vessels, such as tea-kettles and saucepans, also for certain chemical vessels and apparatus.

Copper is distinguished from all the other metals (except the rare metal called "titanium"), by its red color; bismuth also has a slightly red tint, but it is never likely to be confounded with copper on that account, for it is nearly white.

The weight of a metal in proportion to its volume, or bulk, is a very important item amongst its peculiarities. This relative weight is called its "specific gravity," and is always expressed in proportion to the weight of exactly the same bulk of pure water.

The discovery of the law of loss of weight, equal to that of the bulk of water displaced, by an immersed body, was made by the Syracusan philosopher Archimedes, about 300 years before Christ, who, being intent upon finding the proportion of silver in the so-called "golden" crown of Hiero, king of Syracuse, and entering a bath that was full of water, observed that a quantity of water flowed over; this quantity he rightly estimated as the bulk of his own body, and thence thought of the application of the principle to finding the proportion of silver that was alloyed with the gold in the crown. So delighted was he with the discovery that he jumped out of the water, ran through the streets, naked as he was, crying "Eureka" (I have found it!) To carry out his idea, he obtained a mass of gold and another of silver, each equal in weight to the crown, and observed the quantities of water displaced by each. Alloys are very seldom of the exact specific gravity related to that of their component metals in proportion to the amount of each metal existing in the alloy; but, doubtless, some near approach to the relative weights of silver and gold in the crown was made by Archimedes, when he compared the specific gravities of the gold and silver masses thus obtained with the specific gravity of the crown, obtained by means of a like immersion. If this plan could have given truly the relative proportions of the gold and silver, it would have been remarkable, on account of its being totally independent of the abstraction of metal, however small, from the crown to be tested.

Pure copper is less easily melted than silver and more easily than gold; its point of fusion is said to be 1996° Fahrenheit. It is melted in a "crucible"—a vessel made of some substance, such as fire-clay, which stands the requisite heat—by the aid of a material called a flux. This portion of the subject will be illustrated by means of one of the more fusible metals.

The history attached to this metal is interesting from its being one of the oldest known metals. It was discovered before iron, and in the time of the Pharaohs, Nubia and Ethiopia were its chief sources. The discovery of brass—an alloy of copper and zinc—was clearly subsequent to that of copper and before that of zinc, an ore that contained zinc being formerly used in the smelting of the copper; brass was, most probably, not known more than a few hundred years before the Christian era. Zinc was known to be a separate metal in the sixteenth century. The probability follows that when "brass" is mentioned in Holy Writ, the metal copper is really meant. The earliest mention of "brass" (or copper), according to the chronologists, refers to 3300 years before the birth of our Saviour, and occurs in the twenty-second verse of the fourth chapter of Genesis, in which Tubal Cain is said to be "an instructor of every artificer in brass and iron."

In relation to the Latin name for the metal—the name by which it is known in chemistry, *Cuprum*—it is to be derived from the name of an island in the Mediterranean sea called Cyprus, where the metal was found in great abundance and purity in the time of Pliny (A. D. 100). The ancients—the Egyptians, the Hindoos, Greeks, and Arabians—had a great fancy for establishing relationships, or harmonies, between the various parts of the created universe; this they carried to such an extent, that various kinds of men and women, planets and other astronomical realities and non-realities, animals, plants, minerals, places and things, were supposed to be influenced by them.

According to this harmonic and pleasant—because highly amicable—arrangement, copper (or cuprum) was said to be intimately related to the planet Venus. Some discussion has arisen between philosophical historians as to whether the metals then known were named first and the planets from them, or whether the planets were named first, and then the metals. I am strongly inclined to believe that the metals took their mythological names from the planets, for the planets are visible to many people many times in the year, merely for the trouble of looking for; but the metals are, for the most part, found only by patient industry and hard physical labor, in separating the solid crust of the earth.

It is a singular fact that, in the harmonic arrangement above described, the island of Cyprus, where copper was discovered, or re-discovered by the Greeks, was placed under the guardianship of the goddess Venus, named after the planet Venus by a star-worshipping community, and that those who give the stars a language, place Cyprus, as well as the metal copper, under the influence of the planet Venus. Those who are curious in the matter may trace other coincidences; or, to say the least of it, related peculiarities. The planet Venus is said, by the above ancient people, to preside over everything relating to beauty or form of color, over the polite arts and all things, such as music, painting and poetry, that administer to the outward luxury and enjoyment of life; it is also certain that either copper or its alloys make a very strong appearance in the adjuncts to a refined life; it furnishes reeds, and sometimes strings to musical instruments, its chemical combinations with other substances form magnificent paints of a bluish or greenish tint, and the metal itself renders further assistance to the artist in the shape of copper plates for printing from. Bronze statues and statuettes enable us to realize the beauty of form in all its wondrous details, and the colors displayed by the metal itself, and by its chemical combinations, are of a varied and vivid kind. The particular color which the planet Venus was said to favor most was a glistening or brilliant tint of blue or purple, and it is remarkable that the great majority of the colors of the chemicals formed from copper are of a bluish tint; indeed, the most beautiful purple that chemistry affords—unable to be fixed, we regret to say—produced when ammonia is added to the solution of a salt of copper, is one of the surest means of telling the presence of copper in a solution.

To proceed with the history of the metal. The Grecians and Romans used copper and its alloys with tin for weapons and for their coinage. Since then, its non-liability to rust, its malleability, and its other properties have brought it into use for a great number of purposes.

The metal copper, doubtless—in common with its nobler companions, gold and silver—owes its ancient birth to the fact of its being sometimes found in the metallic form, or "native" in the earth; iron, zinc, and the more recently discovered metals not being found in the pure state, but requiring some chemical knowledge to evolve them from their ores. Its mineralogy is, however, exceedingly interesting; for in form, color and beauty (with few exceptions) its ores all bear out with Venus-like attributes. Native copper occurs in veins, also crystalized in the form of "cubes," or dice, and other forms. The only red copper ore is the "di-oxide" of copper, which is found in beautiful ruby-red cubes. Black oxide of copper is sometimes met with. Copper pyrites contains sulphur and iron as well as copper, and is of a deep-yellow color. The green carbonate of copper (malachite) is the most abundant as well as one of the most beautiful of all the copper ores.

Just as we like to know the character of a man, or of a boy, and, if possible, the kind of company he keeps, before being intimate with him, so the previous description will go to unfold the character and natural tendencies of our first metal that we have taken for examination and temporary companionship. We have found that he is of ancient lineage, and that by himself, as well as in company with less venerable metals, he has done much service to mankind, and continues to be a useful and ornamental member of society. He is of so friendly a nature that he forms acquaintance with many other substances besides those already mentioned. A very energetic class of bodies, called acids, are exceedingly eager to detain him when they get hold of him in the right mood. One, nitric acid, detains him under all circumstances; the others require the spur of warmth, or of an electric shock, to persuade them to establish their power over our metallic friend, Mr. Cuprum Copper. Another set of energetic bodies, known as alkalies, will sometimes, under pressure, enter into combination with our friend—especially Mr. Liquor Ammoniæ; but the general tendency of the caustic gentlemen is to dissolve the union between any acid that may have taken Mr. Cuprum in tow, and reduce him to the necessity of putting up with the bare company of any such airy individuals—we might almost say "light characters"—as Mr. Oxygen. To descend from our poetic pinnacle of personification, we wish to impress our readers strongly with the fact that the business of chemistry in relation to copper is to bring out the properties of the various combinations that we have hinted at above, and to investigate the uses to which they can be applied. Although these substances have one element, copper, in common with all of them, their properties are entirely different, and make them totally independent of each other as workers for the benefit of those who will only diligently search out their secrets. One substance forms a good paint, another furnishes a serviceable dye, a third gives up its copper to iron or zinc by the simple immersion of those metals, and a fourth will only give up its copper upon the application of the current from a galvanic battery.—[Conclusion next week.

PARENTAL AFFECTION IN SPARROWS.

I SAW a touching little incident showing the affection of sparrows for their young on the Kennington Oval cricket-ground last Thursday afternoon, a description of which you may, perhaps, think it worth while to record.

The afternoon was fine and the ground was surrounded by a dense ring of spectators, when a young pale-colored sparrow, under the guidance of both its parents, was trying to acquire the use of its wings. A slight wind was blowing towards the spectators, and the poor little bird, in its weak attempt to fly, was, to the evident consternation of its parents, carried straight into the laps of the inner ring of spectators, one of whom caught it gently in his hand and held it.

When taken hold of, the young bird gave two or three chirps or calls for help, and the old birds flew to within a few feet of the ring of spectators, and, alighting on the grass in front of them all, began to "beg" for the young bird in the most touching and beseeching manner. This they did by lowering their heads and making the peculiar flutter of the wings by which young birds beg for food from the old ones. This singularly touching appeal moved the hearts of many in the crowd, who called out, "Look! look at the old birds!"—"Don't hurt the young bird!"—"Give it back to them," etc. The anxiety and the boldness of the old birds, and their humble beseeching for the young were so evident as to come home to the hearts of these somewhat rough spectators.

My own feeling certainly was that I could not have believed that a pair of sparrows could possibly have "begged" with such touching humility and tenderness for the safety of the young bird. Their manner clearly displayed their sense of their own want of power to help the object of their affection, they therefore prayed for mercy in their own way, and with so much feeling, as to excite the full sympathy of the crowd looking on, and to make them, for the time, forget the game of cricket they had come there to see. C R.

Bristol, August 17.

The Puzzler.

HIDDEN KINDS OF RHYME.

1. BELOW zenith is the nadir, Gerald.
2. Did he flay the horse?
3. At our ball Ada fell ill.
4. 'Tis treason, Gregory.
5. Where's papa, E., and Dick?
6. The pig rammed its foot in the fox trap.
7. Is our equi umbelliferous?
8. E. A. Poe made "The Raven."
9. The Pope ends each day in prayer.
10. The code of honor.
11. He picked a thornless rose.
12. Can't a tape be found?
13. Steparo dyes his hair.
14. The leg Young showed me.
15. Give shy M. nothing.
16. Can't I clean my jewels?
17. What a mad rig Ally wore!
18. The thumb lank Versella has!
19. Pa, Lino denies it.
20. See the dog Gerella pets.
21. Seroun, delay no more.

☞ Answer in two weeks. LITTLE ONE.

CENTRAL PUZZLE.

1. HUMIDITY. 2. An old soldier. 3. Part of a ship's side. 4. Flowing violently. 5. A fortress in or near a city. 6. To whine. 7. Chimerical. 8. A liquor. 9. Thrusting. 10. Brave. 11. A tramp. 12. Importunity. Words of seven letters form the answer, and the centrals form one of the United States.

☞ Answer in two weeks. FLORIDIAN.

FRACTIONAL PUZZLE.

TAKE one-ninth of carbuncle; one-fifth of coral; one-sixth of garnet; one-seventh of diamond; one-seventh of sapphire; one-fifth of agate; one-eighth of sardonyx. Take one from each and form a gem.

☞ Answer in two weeks. DR.

DOUBLE ACROSTIC.

1. LIGHT. 2. A man's name. 3. To hug. 4. To shake. 5. A man's name. 6. Mournful. 7. Extempore. 8. Anything woven. 9. Acid. 10. A mountain of Palestine. 11. An acid. 12. A cosy recess. Primals form a novel by Mrs. Southworth; finals a novel by Mrs. Stephens.

☞ Answer in two weeks. BALTO.

POLITICAL.

The forty-seventh Congress opened at noon, sharp, last Monday. The President's message read thereat, was the chief matter of public interest, although he had permitted so much of its contents to dribble out before, that the importance of it had been greatly discounted. It deals first with yellow fever, putting the number of deaths at 20,000 and of cases at 100,000, and it is to be hoped his data for the remainder of his statements were a trifle less exaggerated. He very prudently estimates the money loss through it, indefinitely at "millions of dollars." and recommends a national quarantine as a guard against the calamity in future. He next mildly but firmly denounces the manner in which negroes at the South were deprived of the franchise, instancing especially the States of South Carolina and Louisiana; suggests that Congress should investigate the validity of elections held in the bulldozed districts, and declares that, for his part, he will use all the legal powers now vested in him, to prosecute the offenders, and that he will appeal to local Executives, legislatures and courts to prevent a repetition of the outrages, and asks for money to defray the expenses of legal proceedings. He refers to what everybody knows, namely, the great importance to a republic that the right of suffrage should be free and its practice unpolluted, and winds up this part of his address by saying that he is pretty certain that things are improving in the South. One of the best things that can be said in favor of this portion of the message is that it is assailed by republican and democratic "stalwarts" with equal bitterness; the former stigmatizing it as milk-and-watery, and and the latter vilifying it as an attempt to raise once more the "bloody shirt." He delights Frenchmen by approving of the Paris Exposition, and completes the joy of American prize-winners by commending their share in it. He then tells the country the twice-told tale about the Silver Conference lately held at Paris, describes our foreign relations and speaks hopefully about difficulties on the Mexican frontier—which, by the way, have lately entirely vanished. He expresses a hope that no new financial legislation will be attempted, so that the present laws on the matter may have a chance of trial, and he is quite eloquent on Civil Service Reform—by saying absolutely nothing about it.

The Secretary of the Treasury promises a surplus of the national revenue on the 30th of next June, amounting to upwards of $24,000,000, and a contribution of more than $36,000,000 to the fund for paying of the National Debt. He gives a brief statement of his preparations to resume specie payment immediately after next New-Year's Day,—he can't begin that day as it is a legal holiday—advises that the ratio of the relative value of gold and silver should be changed so as to make it 1 to 16 instead of 1 to 15½ as at present; and, to prevent the depreciation of silver coinage, he recommends that no more of it than $50,000,000 should be permitted to remain outstanding at any time. Silver men, however, insist that $300,000,000 of the bright metal would not be a dollar too much for them. He asks for means to pay more liberally those informers who may report frauds upon the revenue, and he, alone of the Cabinet, refers to Civil Service Reform, by urging, in view of the varied and important duties of revenue officers and the skill required to perform them properly, that they should be removable only for cause, like army and navy officers, and that their pay should be increased for long and faithful services.

The Secretary of the Interior gives a glowing account of the labors of his department in behalf of the Indians, taking all the credit for praiseworthy results and throwing on Congress and the Army the responsibility for starvation, discontent, outrage and pillage among the red-skins. If there is one thing for which Mr. Schurz deserves credit, it is his mastery of the English language, and this deftness with words certainly enables him here to make a fair show. He is strongly opposed to the transfer of the Indian Bureau to the War Department, while Sherman, Sheridan, and all the chief officers who feel most heavily the results of Indian mismanagement and consequent hostility, favor the change, and the incompatibility thus engendered between the two branches of the government, crops out in their reports. Proofs of the allegations made by the military with regard to the misconduct of agents, are demanded, and will doubtless be soon forthcoming.

The Secretary of the Navy, of course, claims a great deal of improvement in his department during the past year, and urges the imprudence of a great commercial nation maintaining a weak navy. The Secretary of war, besides advocating the transfer to his Department of the Indian Bureau, and taking glory for the five or six weeks of tranquillity on the Rio Grande, demands the repeal of the *posse comitatus* law enacted by the last Congress, forbidding the army from interfering in civil matters. If the law shall not be repealed, he asks for authority to employ the army in a greater number of cases; and instances, in support of his request, many outrages which the army could have prevented.

MISCELLANEOUS.

In 1872 the bonds of the United States held abroad, were estimated at $9000,000,000. Inquiries relative to the interest to be paid to foreign holders on the first of January, show the very remarkable fact that only about $6,000,000 will go to such holders and that this sum will be paid on about $100,000,000 of principal. This exhibit, if accurate, indicates a more rapid growth in wealth on the part of our own people than has been calculated in any quarter. A great deal of our money, however, goes abroad as interest on foreign capital invested in railroads and other industrial enterprises in this country. The amount of this, however, it is almost impossible to ascertain.

PERSONAL ITEMS.

Colonel Ingersoll will soon cease the Titanic labor of hurling God from on high, and take to practicing law in Washington.

Rochefort is straitened pecuniarily, owing to the failure of his pamphlet publications, which have all fallen still-born since Napoleon III.'s death.

Rumors that Mr. and Mrs. Sartoris (*nee*, Nellie Grant) are not happily married have been traced to Olive Logan, so, of course, it turns out that they were merely sensational lies.

Bismarck, according to Dr. Busch, is very fond of hard-boiled eggs, and ruefully confesses that while in former days he could manage eleven, he now could not eat more than three,

The Rev. Mr. Pentecost of Boston in a sermon against round dancing, said that a very respectable and intelligent young woman had assured him that the hugging was, to her, the pleasantest part of a ball.

Bill Pearce kept a barroom in Bodie, Nev., and was greatly annoyed by men who drank without paying. He resolved to do only a cash business, and posted an announcement thereof. Sam Halsey read the placard, drank a full tumbler of whiskey, and coolly said: "Put it on the slate." Pearce drew a revolver and killed Halsey on the spot.

Herbert H. Harlow was very honest and exact in his business, in East Bridgewater, Mass. He was a conspicuous Baptist, too. Before leaving the place he paid every one of his debts, and arranged his affairs so that they could be easily comprehended by whomever might take charge of them. The only persons who could complain of his unexpected departure were his wife and Edward French, for he eloped with Mrs. French.

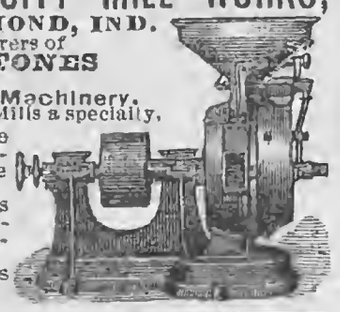
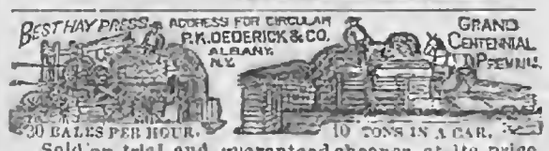
MILL STONES
and
Flouring Mill Machinery.
Corn and Feed Mills a specialty.



The most complete Mill Furnishing establishment in the country.
Special estimates and price-lists furnished on application.
State you saw this in RURAL N.-Y.

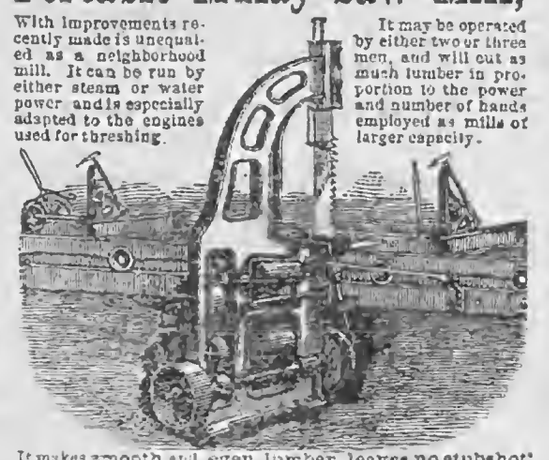


Sold on trial and guaranteed cheaper, at its price, than any other Hay press as a gift or no sale. Don't be swindled by irresponsible manufacturers of infringing machines, as the purchaser is liable. It costs no more for a good press than an inferior or worthless one.
Address, P. K. DEDERICK & CO., Albany, N. Y

Portable Mulay Saw Mill,

With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power and is especially adapted to the engines used for threshing.

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.

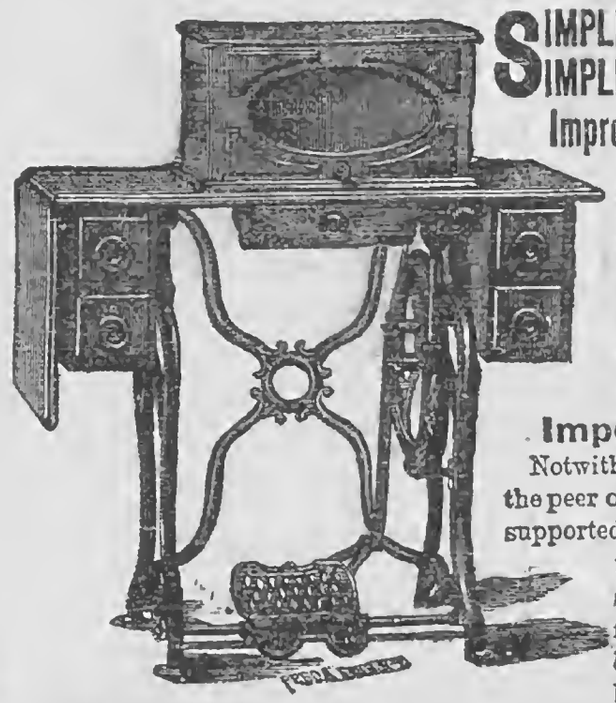


It makes smooth and even lumber, leaves no stubs shot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, prices, etc., to CHANDLER & TAYLOR, Indianapolis, Ind.

The Home Knitter!

The most complete Family Knitting Machine ever invented. Something entirely new in form, construction and method of operation. Retail price $25. Send for Descriptive Circulars. Agents wanted everywhere. HOME KNITTER CO., Canton, O.

Sewing Machines.



SIMPLICITY SIMPLIFIED! SUPERIORITY MAINTAINED!
Improvements September, 1878!

Having regard for the demand of this progressive age, we now offer to the World the

NEW VICTOR

WITH SEVERAL

Important Improvements.

Notwithstanding the VICTOR has long been the peer of any machine in the market—a fact supported by a host of volunteer witnesses—we now confidently claim for it greater simplicity, a wonderful reduction of friction, and altogether a *Rare Combination of Desirable Qualities.* For sale by Merchants and others.

Send for Illustrated Circular and Prices. Liberal Terms to the Trade.

Don't buy until you have seen the lightest running machine in the World,—the Ever Reliable "VICTOR."

VICTOR SEWING MACHINE COMPANY,
MIDDLETOWN, CONN., and Nos. 199 and 201 Wabash Avenue, CHICAGO, ILL.

New Publications.

Important Book for Stock Breeders Just Published.

STOCK BREEDING.

A Practical Treatise on the application of the laws of Development and heredity to the improvement and breeding of Domestic Animals.

By MANLY MILES, M. D.,

(*Late Professor of Agriculture in the Michigan State Agricul. College.*) One 12mo. Vol. Price, $1.50. Agents wanted to sell this book. Address D. APPLETON & CO., Publishers, 549 Broadway, New York.

ARTHUR'S Home Magazine for 1879.

For so many years a guest in the homes and hearts of the people, with whose household cares and duties, and social life, interests and pleasures it has so closely identified itself, the HOME MAGAZINE comes again, as the new year approaches, and asks for the old place among you, and the old cordial welcome.

VIRGINIA F. TOWNSEND so long a favorit will commence a new Serial Story in the Januar number, entitled "**Lenox Dare: the Woma She Was.**" This will be followed by a Story b the author of "*His Dear Little Wife,*" entit "**Tender and True.**"

ROSELLA RICE will contribute a series of a cles on Western Pioneer Life, under the title of "**Fading Footprints; or, the Lowly Lives of Long Ago.**"

PIPSEY POTTS under the title of "**Our Neighborhood,**" is going to give a series of papers in her peculiar vein, which will be spicy and good, of course.

CHATTY BROOKS will talk to our young lady readers, in her easy, sensible and pleasant way, under the title of "**Wrinkles and Dimples; or, Myself and My Girls.**"

BUTTERICK'S PATTERNS for Ladies' and Children's Dresses appear in *every* number.

PREMIUMS We give our Club-Getters something more than an extra copy for their work in making up Clubs. **See below.**

TERMS FOR 1879.

1 Copy, 1 year...$2 25—**3 Copies,** 1 year, **$5.50**
6 Copies, and 1 to Club-Getter, **$11.00**

The Premium to Club-Getter for either of these two Clubs will be $1.00 worth of Butterick's Patterns for Ladies' and Children's Dresses.

LARGER CLUBS For these we offer as Premiums Ladies' Best Quality Kid Gloves and full Dress Patterns of elegant Black Silk or fine French Cashmere.

☞ Full particulars in regard to these large and valuable Premiums will be found in our Special Circular to Club-Getters, which will be mailed on application to all who desire to make up *Clubs for* 1879.

☞ *Specimen Number,* 10 *Cents.*

T. S. ARTHUR & SON, 227 S. Sixth St., Philadelphia.

THE YOUTH'S COMPANION
A WEEKLY PAPER FOR
YOUNG PEOPLE
AND THE
FAMILY

It aims to be a favorite in every family—looke eagerly by the young folks, and read with interes the older. Its purpose is to interest while it amuse to be judicious, practical, sensible, and to have rea permanent worth, while it attracts for the hour.

It is handsomely illustrated, and has for contributors some of the most attractive writers in the country. Among these are:

J. T. Trowbridge, Dinah Mulock Craik,
James T. Fields, J. G. Whittier,
Rebecca H. Davis, Louise C. Moulton,
Charlotte Mary Yonge, C. A. Stephens,
Edward Everett Hale, Harriet P. Spofford,
Rose Terry Cooke, A. D. T. Whitney,
Louisa M. Alcott.

Its reading is adapted to the old and young; is very comprehensive in its character. It gives

Stories of Adventure, Stories of Home and School Life,
Letters of Travel, Tales, Poetry,
Editorials upon Current Topics, Selections for Declamation,
Articles on Health, Anecdotes, Puzzles,
Biograph'l Sketches, Sports and Pastimes.
Religious Articles,

Subscription Price, $1.75. Specimen copies sent free. Please mention in what paper you read this advertisement.

PERRY MASON & CO.,
41 Temple Place, Boston.

HOME & FARM

For 1878 and 1879.

The Home and Farm is published semi-monthly by B. F. Avery & Sons, at Louisville, Ky. It is an eight-page paper, six columns to the page, giving forty-eight columns of matter in each issue, two issues of which are equal to an eighty-page monthly magazine, and not inferior in quality of matter to the best of the magazines published. The subscription price of Home and Farm is

50 Cents a Year.

New Publications.

It Will PAY YOU to READ This.

The LONG WINTER EVENINGS have Come.

AND NOW IS THE TIME TO SUBSCRIBE FOR THE

WEEKLY CRICKET ON THE HEARTH

The **Largest, Handsomest, Best,** and **Cheapest** Literary and Family Publication in the World. It is published **Every Week,** and is a mammoth **16-page, 64-column** paper, (size of *Harper's Weekly*), every number **Elegantly Illustrated,** and filled with the *Choicest Reading Matter* for **Every Member of the Family.** It contains Serial Stories by Mrs. Ann S. Stephens, Wilkie Collins, Mrs. Henry Wood, Emerson Bennett, Margaret Blount, Esther Serle Kenneth, Clara Augusta, and many other writers. Fascinating short Stories, Beautiful Poems, Complete Agricultural and News Departments, Household Receipts, Stories and Puzzles for the Young, Wit and Humor, Useful Knowledge, Fashion Notes, Answers to Correspondents, etc., etc. **A Complete Family Story, Agricultural, and Newspaper,** and the largest, best, and cheapest published anywhere. Terms, **Only $2.00 per year,** or $1.00 for six months. *The Weekly Cricket on the Hearth* is **as Large, and Equal in Every Respect, to any of the $4.00 Weeklies,** and larger and better than any of the $3.00 papers, and is **the Cheapest Paper of the Kind in the World.**

EXTRA GRAND OFFER! To any one who will send us **One Dollar** (and 10 cents extra for postage), we will send *The Weekly Cricket on the Hearth* for **Six Months** (26 issues), and also our charming new premium, "**An Album of Artistic Gems,**" containing six large and magnificent *Gems of Art*, (including American and Foreign Scenery, pleasing Home Subjects, etc.), the whole beautifully bound in a handsome cover, and forming the most attractive ornament for the parlor or centre-table that could be devised. The engravings contained in this Album are perfect **Gems of Beauty,** and were designed and executed by the Aldine Company, publishers of the great Art Journal, *The Aldine.* Either the paper for Six Months, or the Premium, would alone be cheap at the price asked for both, and we guarantee everybody **Double Value of Money Sent.** Send at once and get the papers containing the opening chapters of **Three** great Stories just commenced, by three celebrated authors. Remember, we send 26 issues of *The Weekly Cricket on the Hearth,* and our magnificent Art Album, all for only **$1.10. Write at once.**

ANOTHER GREAT OFFER! Upon receipt of **Only 15 Cents,** we will send the **Four Brilliantly Illustrated and Charming Holiday Issues** of *The Weekly Cricket on the Hearth* **for the month of December.** The small sum of 15 cents invested in this way will secure to you an amount of entertaining, amusing, and valuable reading for the **Long Winter Evenings** which could not be obtained in any other way for four times that amount. It will also enable you to read the three charming stories, just commenced by three celebrated authors. Don't fail to take advantage of one of the above great offers!

SPECIMEN COPIES.—Our paper is too large, and the expense of publishing it too great, to allow us to send specimen copies *free.* We will send a specimen copy of the last splendidly illustrated issue upon receipt of **Five Cents.** The better way, however, is to take advantage of one of our grand special offers above. Address:

F. M. LUPTON & CO., Publishers, 245 Broadway, N. Y.

What 15 Cents will do! What $1.10 will do!

Wit and Humor.

"Do you make any reduction to a minister?" said a young lady in Richmond the other week to a salesman. "Always. Are you a minister's wife?" "Oh no, I am not married," said the lady, blushing. "Daughter, then?" "No." The tradesman looked puzzled. "I am engaged to a theological student," said she. The reduction was made.

A GENTLEMAN in a black coat calls to him his friend, and says: "Come with me while I change my black cravat for a white one for the ball. You will see how it will change me." The change is made. The friend examines his friend with attention: "That's so. Before, one would have sent you on an errand: now one would say, 'Waiter, some coffee!'"

A BOWERY shop-keeper describes himself as "manufacturer of the best imported glover." A photographer's unpunctuated sign reads: "This style 3 pictures finished in fifteen minutes while you wait for twenty-five cents beautifully colored." A cheap restaurant on Fourth Avenue advertises also with an unpunctuated sign: "Oyster pies open all night" and "Coffee and cakes off the griddle."

THE SMALL BOY.—Every day we have evidence that the small boy has no soul. The other day a crowd gathered around a farmer whose wagon-load of butter and eggs was fast in a mud hole, and, while some suggested that he put his horse gee! and others that he put him haw! the ever-present small boy yelled, "It's no use, mister. Yer old hoss ain't stout enough. Take him out, an' hitch in a roll of yer butter."

X. HAD summoned a cab and was well on his way, when the horrible suspicion that he had left his pocket-book at home on the piano became a terrible truth. "Hi, coachee," he exclaimed, as he neared his destination, "hold on—pull up—I've dropped a fifty franc piece in the straw here. Wait till I run over to the shop opposite and get a candle." So saying he sprang out of the vehicle, and was neither surprised nor displeased to see the coachman whip up his horses and disappear round the corner at a 2,13¼ gait.

HURON LIVE STOCK ASSOCIATION

ANNUAL SALE.

The Second Annual Sale, under the auspices of the Huron Live Stock Association, for the disposal of

THORO-BRED AND IMPROVED STOCK,

Such as STALLIONS, BREEDING MARES, BULLS, COWS, SHEEP and SWINE, will be held in the

TOWN OF EXETER,

COUNTY OF HURON, ONT., CANADA, ON

WEDNESDAY, FEBRUARY 12, 1879,

Commencing at 12 o'clock, sharp.

If sufficient stock is offered the sale will be continued the second day.

All entries for the sale must be made with the Secretary, not later than January 1st, 1879. Only such entries as are then made will appear in the sale catalogue.

ENTRANCE FEES.—For each Stallion, $2; for each Mare, Bull or Cow, $1; for each Sheep or Pig, 25 cents. The entrance fee in all cases to accompany the entry.

TERMS OF SALE.—Nine months' credit will be given on furnishing security satisfactory to the owner of the animal sold. A discount at the rate of 8 per cent. per annum will be allowed for cash.

All parties entering animals for sale must consider themselves bound by these terms.

One per cent. will be charged by the Association on all animals sold.

M. Y. McLEAN, Seaforth Ont., Secretary.
W. HODGSON, Exeter, Ont., President.

PATENTS.

In connection with the publication of the *Scientific American*, we continue to act as Solicitors for Patents, Caveats, Trade-Marks, Copyrights, etc., for the United States, Canada, Cuba, England, France, Germany, etc. In this line of business we have had *thirty-three years' experience.*

Patents obtained through us are noticed in the *Scientific American.* This large and splendidly illustrated weekly paper shows the current progress of Science, is very interesting, and has an enormous circulation. Subscriptions $3.20 a year, postpaid; single copies 10 cents. Sold at all Book-stores and News-offices.

Can I Obtain a Patent? The quickest and best way to obtain a satisfactory answer, without expense, is to write to us (Munn & Co.), describing the invention, with a small sketch. All we need is to get the *idea.* We will immediately answer, and give the necessary instructions. For this advice we make *no charge.*

We also send *free* our Hand Book about the Patent Laws, Patents, Caveats, Trade-Marks, their costs, and how procured, with hints for obtaining advances on inventions. Address MUNN & CO., Publishers of the *Scientific American*, 37 Park Row, New York.

DIAMONDS

IN SOLID GOLD MOUNTINGS.

ONE DOLLAR THE WONDERFUL LEFEVRE TRADE MARK PAT'D DIAMONDS **ONE DOLLAR**

Lefevre Ring, $1. Set of Studs, $1. [The Shah] Stud, $1. Lefevre Ear Drops, $1.

THE ONLY PERFECT FAC-SIMILE OF THE REAL DIAMOND IN THE WORLD.

Pronounced by the Academy of France that *M. Lefevre has really obtained artificially the true diamond.* The basis of these gems are pure crystals found in the Sierra Nevadas, from whence they are exported to the Lefevre Laboratory in Paris, France, where they are submitted to a chemical and voltaic process,

BY WHICH THEIR SURFACES ARE COVERED WITH A COATING OF PURE DIAMONDS, imparting to them all the BRILLIANCY, HARDNESS, and refractive qualities of the natural diamond, and making them as desirable for **Wear, Brilliancy,** and **Beauty,** as the veritable gems themselves. The Ring, Studs, and Ear Drops, as displayed in this announcement, are accurate engravings of SOLID GOLD MOUNTINGS, CONTAINING THE WONDERFUL LEFEVRE DIAMOND, warranted by certificate U. S. Mint assay.

ON RECEIPT OF ONE DOLLAR we will send free by REGISTERED MAIL, to any address in America, either article as above represented. Our "Book on Diamonds," with illustrations of artistic Diamond Jewelry in solid (14 k.) gold, mailed free.

I have seen many imitations of diamonds, but never any that could equal the Lefevre Brilliant.—M. LEROY, Stamford, Conn.

I am in receipt of a pair of the Wonderful Lefevre Ear Drops, for one dollar; to say that I am pleased with them hardly fills the bill, they are simply elegant.—ANDREW MORRIS, Hornellsville, N. Y.

The Wonderful Lefevre Diamond Ring, for one dollar, came to hand this morning. It is really elegant, giving entire satisfaction, and eliciting wonder and admiration from all who see it.—W. H. BEEBY, Martinsburg, W. Va.

The Lefevre Diamonds, mounted in solid gold, are truly marvelous.—B. F. AVERY & SONS, Home and Farm, Louisville, Ky.

The eminently successful experiments of M. Lefevre silences all doubt of the artificial reproduction of the true diamond.—M. DU FRENOY, the great French Scientist.

The Lefevre Diamond most effectually disturbs the slumbers of the possessors of costly gems.—Journal of Science.

☞ We guarantee the Wonderful Lefevre Diamonds for **One Dollar** to be mounted in **Solid Gold,** and will cheerfully refund the money if found unsatisfactory. Address all orders to the

AMERICAN JEWELRY COMPANY, 5 Arcade, CINCINNATI, O.

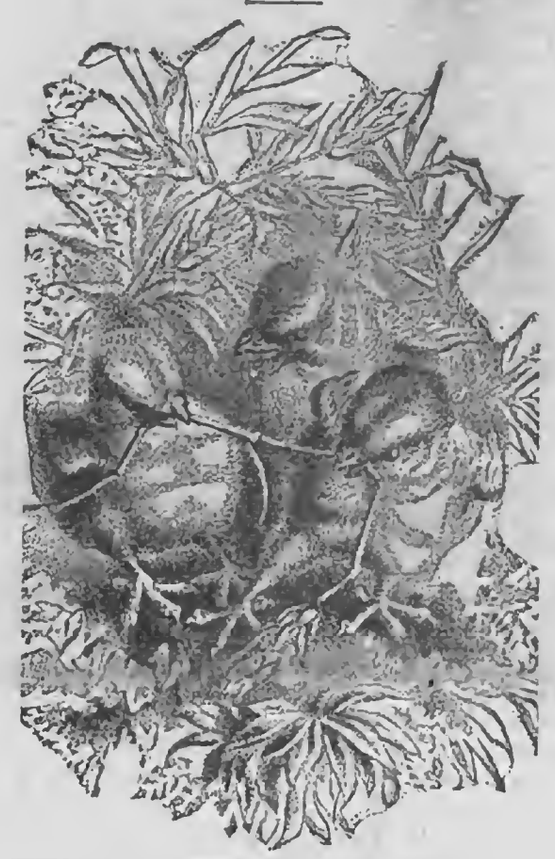
The Poultry Yard.

OUR POULTRY NUMBER.



POULTRY FOR DIFFERENT PURPOSES.

HENRY STEWART.

POULTRY VERSUS PIGS.

Pork and poultry enter into close competition with each other in production, if not in use. To a great extent, pigs and fowls are fed upon the waste matters that could not be utilized in other ways. Their flesh and the eggs of the latter enter very largely into domestic consumption, in the aggregate, perhaps to a greater extent than into commerce for general consumption. But it is a fact that the production of pork receives far greater attention than that of poultry. Yet pork is not by any means so healthful a food, nor is it so profitable a product, at ordinary market prices, as poultry. A flock of hens yields an annual dividend of 100 per cent. upon the investment and leaves the stock intact; while a pig simply returns the outlay and often fails to do even that. For family use, in the household, a flock of hens may be made to furnish the major part of the supply of the animal food of the most healthful and agreeable character, in the shape of eggs and flesh, at a less cost than in any other way. Eggs and chickens, young and old, may be presented on the table nearly every day in such an endless variety of shapes that the appetite is not cloyed, and the dish, whatever it may be, is always acceptable to the most delicate and refined taste. But pork is—pork, in fact and always pork—whether it is fresh, salted, dried, smoked or chopped into sausage. It is always greasy, and while, under some circumstances it is an acceptable and nutritious food, such as, for instance, for those who are exposed to constant outdoor labor of a severe kind, and to much cold, there are thousands who are seriously injured by using it too frequently. Besides, the very name of the swine, *sus scrofa*, has too close a relation to the horrible disease scrofula, to make it acceptable to thousands who like to look closely into the nature of the food they consume. Such persons as these may choose poultry and eggs without any qualms of conscience or stomach. On the whole, then, it may be concluded that it would be well if some of the care and attention lavished upon pigs were devoted to poultry; the more especially now that the markets point so significantly to the same view. Just now a dozen fresh eggs will purchase six pounds of pork and one pound of poultry will pay for two, if not for three, pounds of it.

WHAT KINDS OF FOWLS SHALL BE KEPT?

Much of this backwardness of the poultry interest is due to a want of knowledge of the best breeds and their characteristics, so that the right kind is rarely found in the right place. Thus blame is laid where it does not belong and possible profit is missed. Sometimes fowls are chosen for fancied beauty and a few feathers of a certain color are all that one gets for his money and trouble, in place of eggs and chickens. Then, again, a variety that will not thrive in close confinement is chosen for a small place; and, again, fowls that will fly like partridges are sought to be kept outside of a garden fence; or a breed that will sit and brood for weeks and months continuously, is chosen in the expectation of getting eggs.

FOWLS FOR EGGS.

There are some breeds that are known as "non-sitters" and which rarely evince a desire for brooding. These lay on with rare intermissions, and are the most desirable for keeping in town or village yards, or for farms where there is a large range and where eggs are sought more than flesh. The Black Spanish and the Leghorns, White and Brown, are the principal breeds of this character. When well kept, an average of 200 eggs yearly may be expected from each hen; more than this has been credited to these fowls. One breeder of Brown Leghorns has stated that a hen which died in its eleventh year, had produced more than 2,000 eggs. But let no one who expects to keep a garden in good order choose either of these breeds, unless a yard is provided and surrounded with a picket fence at least ten or twelve feet high; nor should any person who has a desire to live at peace with his neighbors, try to maintain such a condition and a flock of these fowls at the same time. They are active foragers, will wander half a mile from home and are wild and suspicious. In shape, they are comely and symmetrical and the Brown Leghorns are handsomely feathered, and not much unlike some of the Games in appearance. Their chief fault is their large combs which are subject to be badly frozen in winter time.

FOWLS FOR EGGS AND CHICKENS—BRAHMAS.

The first fowl for flesh, eggs and chickens, is undoubtedly the Light Brahma. In some respects, it is also an extremely handsome bird. Its fine carriage, large size, pure white and black plumage, together with its tameness and docility, render it very attractive. From its inability to fly or jump, it may be kept within a picket fence three feet high; and if the house and yard are kept clean, and wholesome food is provided, there is no more hardy and healthy fowl than this. It is a winter layer; pullets hatched in March will begin to lay in November, or earlier. Cockerels of eight months may reach the weight of eight to nine pounds, and, when mature, have turned the scales at twelve to sixteen pounds. For market, this is *the* popular fowl, its yellow legs and flesh pleasing the popular eye. As broilers they sell readily at high prices, and no other young fowl is so juicy or well flavored. They may be made ready for market when three months old. The hens are good mothers, are so docile that they may be lifted off or on the nest, and will readily foster strange chickens. The chicks are remarkably hardy, and will thrive well in the cold weather of early spring when any other varieties would perish. The Dark Brahma is not a popular fowl. It is neither productive nor hardy, and is now rarely seen, except in a few farmers' yards.

PLYMOUTH ROCKS.

The most promising new breed for general use is the Plymouth Rock, a cross-bred fowl, originating from the old but not forgotten Dominique, the Brahma, and some other varieties. By careful breeding it has been brought to a high standard, and generally reproduces itself true to color and feather. It is a heavy-bodied, plump fowl, cockerels of eight months weighing as many pounds. The hens lay large eggs, varying in color from white to reddish brown; and are prolific. Early pullets will lay in November. The plumage of this breed is of a bluish tinge, the feathers being crossed with bars of a darker color. For a farmer's fowl this undoubtedly comes next to the Light Brahma, and for small yards where chickens are desired, will equal it.

THE COCHINS.

The white Cochin is similar in shape, except its single comb, to the Light Brahma, but in color it is pure white. It is a hardy fowl, but not so productive as the Light Brahma, and its chief fault is that it is a most persistent brooder. Otherwise it possesses the same good points as the Light Brahma, and is a desirable fowl for those who can furnish clean roosting places and plenty of room upon a grass run. The most beautiful fowls of this class are the Buff and the Partridge Cochins. The former are of a light cinnamon or yellowish-brown as to the hens, and the cocks are of the same general hue, but have a somewhat gayer coat than their mates. The Partridge Cochin hens are beautifully feathered, of a rich brown color with pencilings of a darker shade; the cocks, with their black breasts, red hackle and orange-red saddle feathers, are handsome when young and in full vigor, but when old, have the shabby appearance of a worn-out and seedy dandy. There is a black variety of Cochins, which, however, is seldom seen except in fanciers' yards, and on the whole, none of the race are desirable for profitable keeping. All the Cochins, except a subvariety—the Pea-comb Partridge Cochins—have single and erect combs and feathered legs.

THE GAMES.

The best flavored flesh and the richest eggs are those of the Game fowl, of which there are many varieties. The Black-breasted Red and the Brown Reds are the best for ordinary use; the others, as the Duck-winged varieties, the Piles, Spangled White, Gray, and others, being more desirable to the fancier. This variety approaches nearer to the original Indian jungle fowl than any other of the domestic breeds, and is a direct descendant from it. The hens are good mothers, lay a moderate number of small but richly-flavored eggs, and the cocks are the most courageous and combative of all fowls. The Games cannot be kept in an inclosure without a high fence, and are active foragers.

FRENCH FOWLS.

Houdans and Crevecœurs are highly considered by some fanciers as profitable fowls. They are somewhat grotesque in appearance, as may be seen from the illustrations elsewhere. These are the most popular fowls in France, and with the care given to them by the French women,

WHITE-CRESTED BLACK POLANDS.

produce immense quantities of eggs which supply, not only the native consumption which is very great, but many millions of dozens for exportation. The Houdans have a mixed or mottled plumage of black and white, and possess a fifth toe; the Crevecœurs are black; both are crested and have horn-shaped, or antler-like combs. The former breed deserves more notice for family and farm use than it has yet received.

THE DORKINGS.

The most popular fowl in England is the Dorking, of which there are the colored, the gray, and the white varieties. These fowls have a fifth toe, but scarcely any other peculiarity for which they are more noteworthy than for this. They are too tender for our climate, lay few eggs, are persistent sitters, but are fine table fowls. If kept in the expectation of profit, except for sale by breeders, they will bring only disappointment.

ORNAMENTAL FOWLS.

There are circumstances in which fowls of unusually handsome or odd appearance will be desirable for these qualities as well as for what eggs they may produce. Of these the Hamburgs, Black, Golden-penciled, Golden-spangled, Silver-penciled, Silver-spangled and White; and the Polish, White-crested Black, White-crested White, Golden, Silver, Bearded Golden, Bearded Silver, and Bearded White, may be chosen. The Hamburgs are good layers, have rose combs square in front, flat on the top and covered with small points with a terminal spike inclining a little upwards. They are neat, "natty" fowls, and a well kept flock of them has a beautiful appearance in the yard or upon a grassy lawn. The Polish are the oldest known variety in Europe and with their conspicuous crests, are attractive to some persons. The White-crested Black, and the Black-crested White, are, perhaps, more curious than useful, as they have been bred for the peculiarities which give them their names more than for profit. A young brood of those fowls, well feathered as they are, with full crests or top knots, are quaint and curious enough to make them the delight of the children. Some of the Polish fowls that have not been spoiled in breeding, are reputed to be good layers.

PETS.

There is nothing more encouraging to the natural kindly affections of children, than the possession and the rearing of pets. And there are no more attractive pets than a pair of Bantams with a brood of wee things no larger than a wren or a tomtit. For useful purposes, these small fowls are not worth consideration, but the idea of confining ourselves wholly to what will pay in a money sense, is somewhat degrading to our better natures. It pays to be happy; to enjoy recreation; to cultivate kindly feelings, and especially to provide pleasures and amusement for our children. In the way of poultry, nothing else will please a child so much as the gift of a few Bantams or other attractive fowls, as the Sultans; and there is abundant choice of varieties of these. The Sebright and Game Bantams are beautiful birds, Liliputian in size and very small copies of larger varieties, in many cases. The most unique of all, perhaps, is the Japanese Bantam, a rare variety in this country, with white and black plumage and all the quaint appearance of the usual Japanese productions. The Sultans are also rare fowls, having been brought hither from Constantinople a few years since.

IN CONCLUSION.

For eggs alone, one should choose White Leghorns, if that color is desired; for black fowls, the Black Spanish, and for handsome plumage and eggs, the Brown Leghorns; for eggs and flesh, the light Brahma first, and the Plymouth Rock next. For brood fowls as foster-mothers for non-sitting breeds, the Cochins or Games, are admirable. For a small yard where beauty is the first consideration and a few but sufficient eggs are desired for family use, the Hamburgs of the different varieties, or the French or Polish fowls and Games will be found suitable, while for ornament alone and for young folks' pets, the silky White-crested Sultans, or one of the many varieties of the Bantams may be procured. As to the common, old-fashioned, mixed-up, mongrel, "barn-door fowl," that ought to be consigned to oblivion as an unprofitable nuisance.

AN INCUBATOR HOUSE AND NURSERY.

A. M. HALSTEAD.

The attention of our poultry raisers as well as of farmers throughout the country, is being largely drawn to the subject of artificial incubation, and of incubators.

Of the latter, there are a number which are claimed to be entirely successful in the hands of the average poultry breeder; and the question next comes up, how or where to place the incubator, to obtain the best results. There are but very few incubators—perhaps not more than one or two—which can be depended upon, unless placed in a room or building specially constructed for that purpose; and even those which do well in the sitting-room, or the cellar, or in a spare chamber, will do better if placed in a room specially designed for them.

My experience, embracing a period of more than twelve years, fully corroborates this. I have tested the incubator in a cellar, in a sitting-room, in a spare bed-chamber, in an out-building, and lastly in a room partitioned off one end of said building. My success had been variable until I tried the last-mentioned room since when, the chicks hatched averaged from eighty to eighty-five per cent. of the eggs set. My cellar gave the next best results, but was very uneven in temperature, owing to the heater flues passing through it. The cellar being a small one, under a new part of my house, heated up very quickly whenever the drafts were turned on in the furnace. But even with this disadvantage, the result was from seventy to seventy-five per cent. of chicks from the eggs set.

FIG. 1.

In giving the accompanying plan to the readers of the RURAL, I do not wish them to think that such a building is necessary or essential to the use of an incubator, but simply that it is beneficial as increasing the success, and a source of gratification and pleasure to those who can afford it, and who like special means for special ends. The farmer and small poultry breeder will find himself able to raise his three to five hundred (if he desires so many) chicks, with a small-sized incubator in his cellar or sitting-room, and two or three "Brooders" or "Artificial mothers," to care for the chicks until a few weeks old. But should it be desired to raise early broilers for market, a building of some kind must be constructed or adapted to the purpose.

The design given here can be enlarged and extended to many times its present size, and may be made much more elaborate in finish; or, on the contrary, it can be made to cost not more than two-thirds, or even half the expense of this structure. The building was originally built and used for a hen-and-chicken house; that is, around three sides of it were pens for hens with their chickens, the hens being all under one roof, and the coops or pens opening outward into several different yards. The size was twelve and a half feet square inside; five feet from floor to eaves, and eight feet to the ventilator in the peak.

I moved the building to its present location, elevated it four and a half feet above the ground, placing locust posts, set four feet into the ground, under the corners. Over the old siding was put a covering of tarred paper—on the north and west sides, double—and over that, worked pine boards. The old floor was also covered with tarred paper, double thickness, and a floor of spruce boards laid over that. The inside was then lathed and plastered. The outer door was made to slide on morticed rollers, the track being placed at a very slight angle from the face of the building, so that when closed, it impinged at top, bottom and sides, making an almost perfectly air-tight door. (See "S," fig. 2.) An inner door "I," hung on shifting-butt hinges, opens inward. In warm weather, this door is unhinged and a door of wire netting or gauze, hung in its place. Opposite the door is the window, six feet broad and two and a half high; sash double, one opening outward and the other inward, the former hinged at the top, the latter at the bottom, so as to avoid a direct draft of air. Under the cupola, in the peak, is the ventilator, which can be closed tightly, or opened to full size of flue, which is fourteen inches square.

The arrangement of the room is shown in figure 2. A board partition "P P.," crosses the room four feet from the outer door, and this space is again divided by the partition "O." This leaves the room "E" as a sort of lobby opening into the inner room "R," through the door "D." The dark closet "T," four feet square, is used as a testing room, to tell the fertility of the eggs; entrance by the door "L." "B, B," in the larger room are benches, eight feet long and two and a half feet wide, on which are placed the incubators; each bench will hold two machines of the capacity of two to three hundred eggs each. Under the window is a small, low table, "A," on which to put the egg drawers while turning the eggs. The end of the room "E" may be fitted with shelves for the eggs which are to be used in the machines. A small window may be placed in the door, if desired. This room, constructed in the manner described, will need no heating arrangement other than the incubators themselves, except perhaps, in very severe latitudes; and then a kerosene-oil stove and heating drum will be found sufficient. The entrance of the hatching house faces a little to the south of east, and the only window, a little north of west, so that the room is not affected by the sun at any time of the day.

The nursery, partly under the hatching room, is boarded down to the ground on the north and west sides, a small window for ventilation being placed in the latter. On the south and east sides, as far as the steps leading up to the door of the hatching room, are placed hot-bed sashes—except at the corner, which is fitted with triangular sashes. The lower edge of these sashes is one foot from the ground; under three of them—two on the south and one on the east sides—are narrow doors, six inches wide, and of any desired length, to give egress and ingress to the chicks. This boarding under the sashes and on all sides is extended down into the earth eighteen or more inches.

The sashes are battened above and below; one sash being battened on top, and the next one underneath, thus making very tight joints. They are not attached to the building, but may be lifted out and stowed away when not in use. The entrance to the nursery is through the door seen in the lower right-hand corner of figure 1.

I use no artificial heat except that of the Brooders, several of which can be put between the entrance and the west wall; or, if preferred, one large Brooder with a capacity of five hundred chicks may be used. The floor of the nursery is dry sand, which is frequently turned over. In a nursery of this size, five hundred chicks may be kept until six weeks old, if proper care is paid to ventilation and cleanliness. By extending the glass around the west side and protecting it by a tight board fence, parallel with the north side of the building, and fifteen or twenty feet beyond, half as many more might be housed for a few weeks.

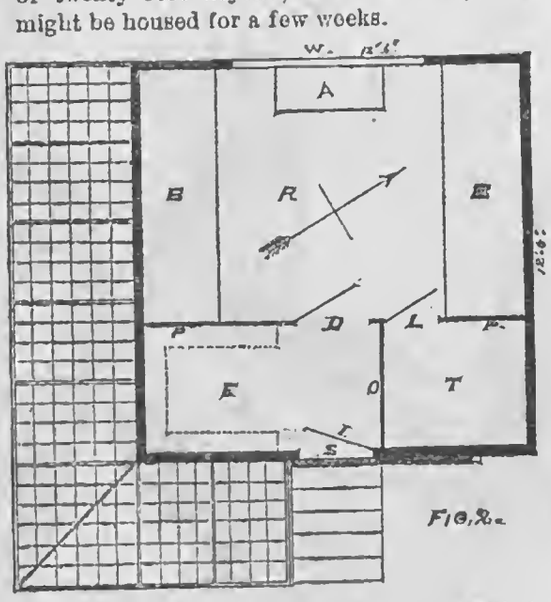


FIG. 2.

The capacity of the hatching room will depend on the number and size of the incubators used. From four machines of two hundred eggs each, fully six hundred chickens should be turned out every three weeks. Another machine might be added by giving up the testing room, and carrying the bench entirely across that side of the room. This, however, is hardly advisable, as this "testing" is a most important matter, when the business is made one of profit and not of pleasure merely.

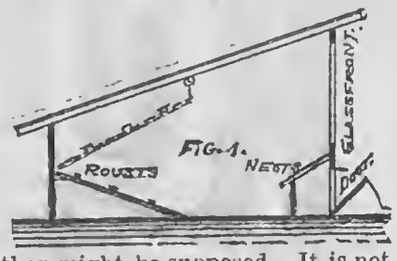
Westchester Co., N. Y.

Crosses, generally, are profitable neither for egg production nor table purposes, and their mongrel appearance is not so pleasing to the eye as that of pure-bred birds.

CONVENIENCES FOR THE POULTRY-HOUSE AND YARD.

NECESSITY OF CLEANLINESS.

Disappointment and disaster will be sure to happen to the poultry-keeper who neglects to maintain perfect cleanliness about his premises and utensils. Cleanliness is a term that includes



more than might be supposed. It is not necessary that the poultry-house should be kept pure and free from the droppings of the fowls, but the air in it must be pure; the water and food should be pure, and the fowls should be kept free from vermin. The house cannot be kept clean unless it is well arranged for that purpose, and to provide pure food and water there must be such troughs and vessels furnished that the fowls cannot foul them, and to avoid vermin, the nests must be of a proper kind.

THE POULTRY-HOUSE.

As to the poultry-house, the plainer and simpler it is made, the better. Gimcracks and fancy "fixings" inside will result disagreeably and harbor lice, which are the greatest pest to the poultry-keeper. Outside, one may please his fancy in any desirable way; but inside, all should be smooth, plain and free from crannies and projections, in and under which vermin may gather. The typical shape of a poultry-house, whether it is for half a dozen hens or a hundred, should be as shown at Fig. 1. When the writer began to keep fowls, as a boyish fancy, nearly thirty years ago, with half a dozen Black Spanish hens, he constructed such a house of very moderate proportions, being about four feet high in front, six feet long and wide, and two feet high in the rear, and with a hot-bed sash, borrowed from the garden, for a light. Since

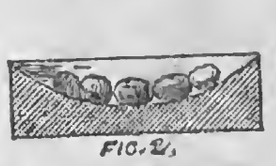


FIG. 2.

FIG. 3.

then, when having several hundred fowls, the houses have all been made on this principle and the largest size ever needed was about fifty feet long, sixteen feet wide, eight feet high in front and four feet at the back. This will accommodate 150 fowls. No more than this should ever be put into one house. If more are kept, other houses should be provided.

THE PERCHES.

High perches are to be avoided. With heavy birds, there is danger of injury from jumping or falling from high roosts. The plan shown in Fig. 1 is the best. It is as follows: A scantling is nailed to the rear wall, or is hung upon strap-

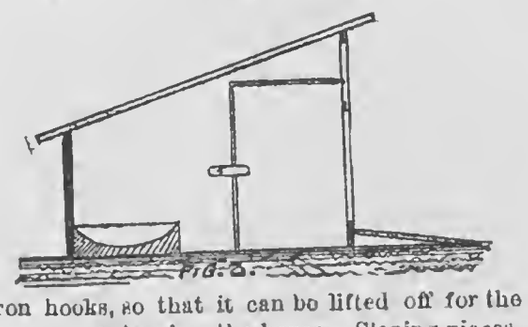

FIG. 4.

iron hooks, so that it can be lifted off for the purpose of cleaning the house. Sloping pieces, two by four, are hinged to this edgewise, about one by six feet apart. Other strips of two by four are nailed on to these about one foot or eighteen inches apart, with the broad side flat and uppermost. The whole forms a frame which rests upon the floor when in use, and which can be raised and hooked to the roof when the house is to be cleaned.

THE NESTS.

Nests should be made so that the hens cannot interfere with each other when laying, and that the interior may be kept clean. For these ends, they should be made small and with narrow entrances and be covered with a steeply sloping top, so that the fowls cannot perch upon them. A conveniently-shaped nest-box is shown in the front of the house and a board may be hinged in the front outside, so that it may be let down when the eggs are to be gathered. This should be done in the evening. The size of the nest-

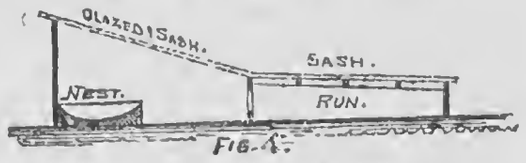

FIG. 5.

box is twelve inches wide by fourteen long, and about ten inches high at the front, with an opening about six inches wide and eight inches high, to admit the hens.

NESTS FOR BROODERS.

Brooding hens should not be kept in the public apartment. They require privacy. The writer's method is to have a small, darkened apartment purposely for them, or to keep the brooders in distant places, in the barn or elsewhere. An excellent plan is to have large coops

made in the shape of the house at Fig. 1, in which the nest-box, with the hen, may be placed, so that when the chicks are hatched, they need not be removed. When thus managed, one hen will care well for twenty chicks. These may be taken from other hens which may be

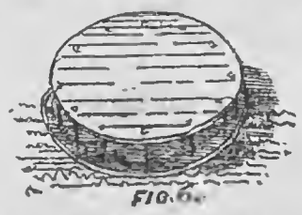

FIG. 6.

turned out to lay again. The nest-box should be low and not too large, so that the hen can step in and out without breaking the eggs, and that the eggs may not be spread too much so as to be uncovered. A well-shaped nest-box is made as shown in Fig. 2. This is ten inches square and three inches deep. These nests can be moved from place to place with the hen, at night, without trouble, and when the chicks are hatched, the first that come can jump in and out at will and are not lost, as with deeper nests. The best material for the nest is soft meadow hay, and if a little kerosene oil is poured on the bottom of the box, before the nest is made, lice will not come near it.

COOPS.

When the young chicks appear, and begin to run around, the hen should be cooped in a place where the young brood can have a clean run. A grass plot is a good place, but the garden is the best. The little things will early learn to hunt insects and will wander off a long distance after them, and stay for hours scratching beneath bushes and in the borders for prey. This

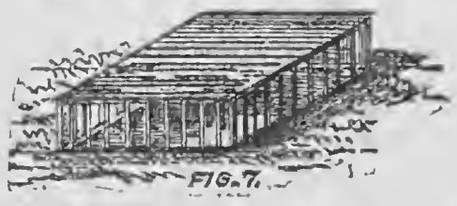

FIG. 7.

does much good and no harm, and should be encouraged. A coop of chicks under a cherry or plum tree, will make a good preventive of curculio. The coops should be roomy and single. When double coops are used, the chicks get mixed and beaten by the strange hens. A convenient coop is shown at Fig. 3. This may be thirty inches square, which will not be too large by any means, and the front should be twenty-four inches high. There is a door at one side, as seen in the engraving; and the nest is shown by the dotted lines. When the chicks are a month old, the nest may be taken away and the floor strewn with sawdust, which is the best litter; sand or dry, sifted ashes are the next best. The front of the coop is lathed up and down, with three-inch spaces. A falling door should be fastened to the front, as shown, and should be closed, unfailingly, at night, when storms are expected or if vermin are feared. Rats are the most to be dreaded.

A WINTER COOP FOR EARLY CHICKENS.

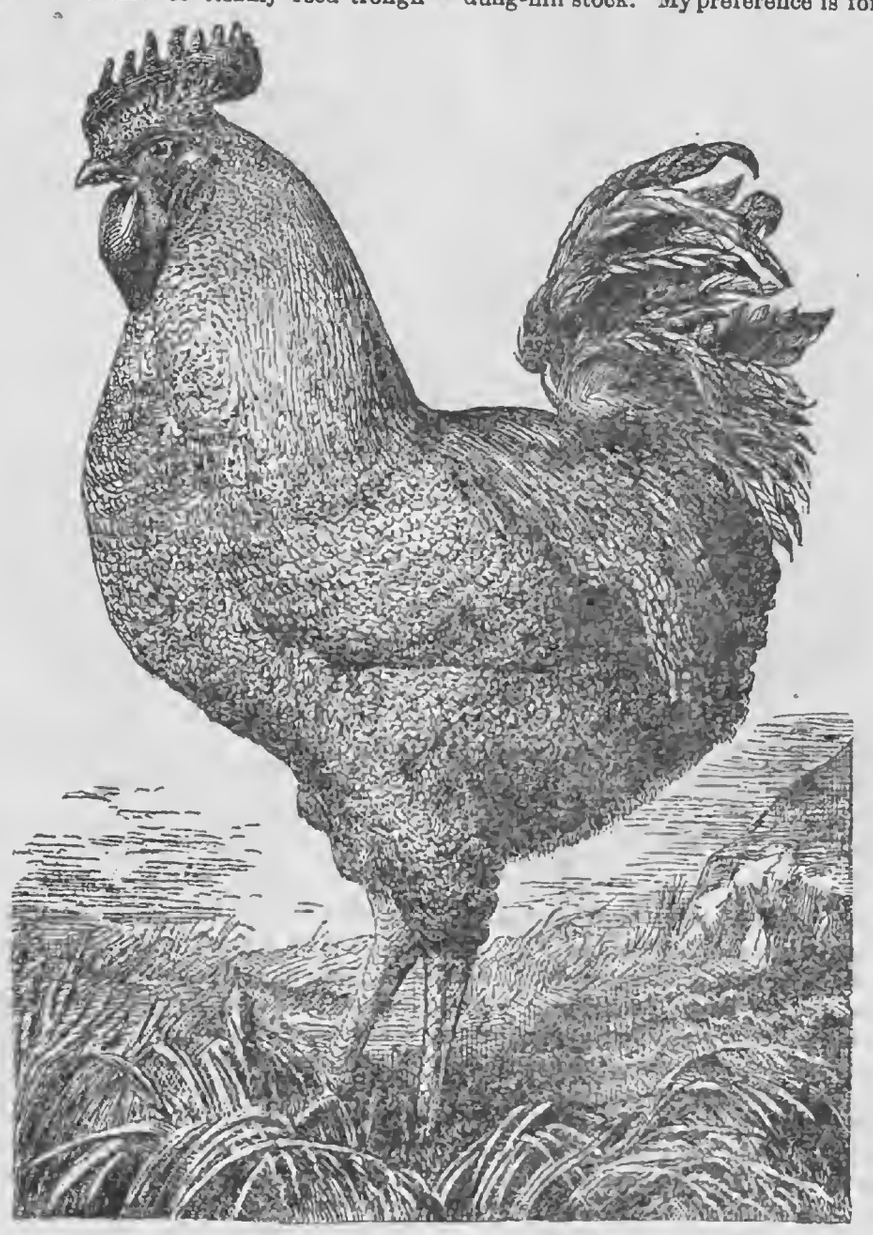
For early chicks a glazed coop and run may be made, as shown at Fig. 4. The hen may be set even at this season in safety, with such a coop. The glazed sash rests upon the sides and ends of the coop, and when ventilation is needed, by reason of too great warmth on bright, sunny days, it may be raised at the upper end by means

FIG. 8.

of small blocks. The run is simply a few short boards nailed together, end to end, to make a sort of box, with light cross-bars an inch square placed across from side to side, upon which a hot-bed or other sash is placed. If this coop or run is used in a house with a glazed front, it will serve effectively for raising chicks through the winter—or for chicks that have been hatched in an "incubator." During last winter, the writer found the temperature in the coop at mid-day nearly always too high, and at night when the sashes were let down, the temperature never fell lower than fifty degrees.

FEED AND WATER TROUGHS.

Young chicks, and old ones, too, are very filthy feeders. They will rather walk upon their food than not, and in this respect are no improvement on pigs. The careful breeder will provide such troughs for food and water, that this may not occur. More than half the diseases prevalent among fowls, and nearly, if not all, the gapes, are caused by filth in the food or water. The best trough is one of cast-iron covered with a wooden frame (Fig. 5), which prevents all waste and fouling of the food and water. After more than a year's experience with this, it has proved effective and has more than paid for itself in the saving of food. For small chicks, a clean water dish may be made of a flower-pot saucer, or a tin, shallow pan, and a wooden cover which is raised from the surface of the water by a few shingle nails, as shown at Fig. 6. Or a common, empty fruit can may be used by removing the top and cutting a few small notches in the edge, filling it with water, covering it with a flower-pot, saucer or a tin dish, and reversing it so as not to spill the water. This makes a so-called fountain which supplies fresh water for several days. When the small chicks are robbed of food by the larger ones, a feeding coop may be made as shown at Fig. 7. The top is made to rise upon hinges or otherwise, and the food is put into the coop, which the large chickens cannot enter. A cleanly feed trough



"BOB."
Plymouth Rock of the Rural Grounds.

for a lot of fowls may be made as shown at Fig. 8. This is in the usual form of a feed trough, but it is protected by cross-bars so placed, that the fowls cannot stand upon them and foul the food. It made be made several feet long, of narrow fence strips, and one may serve fifty fowls.

MANAGEMENT OF POULTRY.

The profits of the poultry yard depend altogether upon the management of it. I assert, without fear of contradiction, that there is no other kind of stock that will pay so large a dividend on the capital invested as will poultry, if rightly managed. The following are a few of the most important points in this line:

The Poultry-House.—First select a dry, healthy location, and on it construct a building that will be warm in cold weather. Arrange it so that it can be thoroughly ventilated at all times, and let it face either the south or east, and let the front be partly glazed.

Choice of Varieties.—Second, procure some variety of pure-blooded fowls; they will be found much more profitable than the common dung-hill stock. My preference is for the Brahmas. During an experience of fifteen years, within which time I have bred nearly every variety, I have found none that would excel the Brahmas. They are splendid layers of large-sized, well-flavored eggs, while for the table, they are the fowls *par excellence*. A Brahma hen, if kept reasonably warm and properly fed, will furnish eggs all winter, when the smaller varieties, as a general thing, will lay but little if any.

Getting Rid of Vermin.—Third, keep the poultry apartments clean, and see that the fowls are not being eaten up with lice. These are among the greatest pests of the poultry-yard, and to keep them in check, a continual warfare must be waged against them. A good dust-bath, arranged something on the plan of a hot-bed and made of fine sand or road dust mixed with slacked lime and flour of sulphur, will be found to aid materially in exterminating these pests. The perches, too, should be saturated once a week with kerosene oil. This will have a tendency to keep lice in a measure under subjection. I believe that half the cases of chicken cholera are caused by the effects of lice.

Proper Food.—Fourth, good, wholesome food should be fed regularly and at stated times. Neither should they be confined to one particular kind of food, such, for instance, as can be obtained by a free run to the corn crib; but they should be fed all they will eat up clean of food of various kinds, the nature of which will be readily indicated by a study of their wants.

Fifth.—They should always be provided with plenty of clean, pure, fresh water, and an occasional dish of milk, either sweet or sour, will be relished by them.

BLACK-BREASTED RED GAME.

WINTERING POULTRY IN THE "COLD NORTH."

T. H. Hoskins, M. D.

The originals of our domestic fowls are natives of a warm climate. Yet the old "common stock" has become so well acclimated that in Southern New England and all the country below it, they endure the winter without much protection, often roosting on trees or under open sheds, all through the cold weather. But in Northern New England and Lower Canada, it is quite a problem how to winter fowls, and especially the fancy kinds, in health, and without loss of toes and combs from freezing. Many fanciers have means for warming their poultry houses in severe weather, but ordinary farmers will not go to the trouble and expense needed to construct such conveniences. I will give my notions derived from observation and experience, of the best cheap way of wintering fowls where the thermometer spends much of its time, at that season, among the minus twenties.

Fowls will endure dry cold much better than damp cold. Dampness, indeed, begets fatal disease among poultry very quickly. Now, the problem is how to have the poultry house as warm as possible, and yet not damp. Finding, several years ago, that in an ordinary boarded and battened house, with the whole south side glazed, my fowls suffered badly from freezing during cold nights, I removed them to the cow stable where it never freezes, only to have them die from the dampness generated by the breath of the cattle. Since then I have devised a poultry house that works much better, though still, for fancy breeds, it is sometimes too cold. The walls are made double by boarding up on the inside of the studding and filling in the interspaces with sawdust. Then, instead of a whole glass side on the south, there is a row of large (12 by 15), single-pane windows around the east, south and west sides, two feet from the floor. As the sun runs low in the cold months, it is necessary to have the windows low, so that the sunshine may strike the *floor* instead of the *wall*, where the hens cannot get into it. In such a house as this, ten by eighteen feet, twenty-five fowls can be wintered in tolerable safety and comfort. They must, of course, be well fed, supplied with gravel and cracked bone, and with dusting boxes, and the houses frequently cleansed, white-washed, and the roosts kerosened. They should be allowed to run out as late in the fall and as early in the spring as possible, and whenever the ground is bare in the winter. If they get scaly legs, rub in a mixture of lard and kerosene. Feed corn freely, but not exclusively. Buckwheat, barley and oats make a good variety, and remember that fowls are essentially carnivorous creatures, and will not do well long without some sort of animal food. In our climate we do not expect many eggs in winter, but when fowls are kept as above described, some eggs are laid all through, and pullets begin to lay early in February.

Orleans Co., Vt.

POULTRY NOTES.

When we recall the many new breeds of fowls—each excelling any before introduced—that have been offered for sale within the last dozen years, we might well conclude that perfection has been nearly reached. It would seem that some of the latest breeds must be perfect in all respects, especially if we credit the statements of those having them for sale. One can easily understand that persons who sell eggs and fowls at high prices, must "get a run" upon something new, or else their occupation would be gone.

This is evidently the principal reason why so many new breeds have been introduced. I have kept nearly all of these new kinds, but have failed to find any material excellence that one possesses over others, when all the points are considered. As layers, the Polands are not a whit behind any of the newer breeds. If meat is wanted, the Brahmas have not been excelled. I have said it before, and will now repeat, that there is more in the feed, care, etc., than there is in the breed. Any one of a dozen kinds, if well kept, will prove very satisfactory. Novices in poultry keeping would do well to see what can be done with those they possess, before investing in the new, high-priced breeds.

I do not propose to give, in full, the rules and regulations for making poultry pay, but shall give a few facts that have come under my observation.

If one wishes to make money by keeping hens, he should have them lay in winter when eggs are scarce and dear. This requires pullets hatched in the April or May previous. They must be kept in warm, dry, clean quarters, with plenty of good feed and water. Wheat should be the principal feed. Buckwheat is valuable feed in winter. Corn should be fed occasionally. Meat, green feed, sand, lime and shells, must be provided. Carrots, onions, sweet apples and cabbage are the best for green feed. My hens refuse to lay well when fed on corn exclusively. Hens will barely live if fed on oats, and will starve on rye. Potatoes should not be given them in freezing weather. Give a warm mess each morning, with cayenne pepper added occasionally, but feed dry grain for the balance of the day. Hens should not be chased or frightened in any way, if eggs are desired.

New-fashioned breeds are of small consequence. If you keep hens to "look at," keep pure bloods; if for profit, breed from laying hens, changing cocks each season, and if these are of a different breed, no harm will result. I am not afraid of crosses, and have now the nicest lot of pullets that I ever owned; but they have been crossed until one can hardly find two that look alike, and yet they are laying finely, which is the great object. My rule is, to keep a large flock of young hens through the winter and sell off most of them in May, reserving only enough old hens for breeding purposes. When one raises chickens, of course about one half of them will be cocks, and if these are hatched early and well fed, they can be sold in July, or August, at good prices. Selling chickens early, and eggs in winter, is the only way I can keep hens profitably. NELSON RITTER.

Onondaga Co, N. Y.

POULTRY NONSENSE.

S. RUFUS MASON.

"KILLING by kindness" is a modern invention, which enables one to take life without becoming amenable to the law. Fancy poultry palaces are just about as appropriate as gold earrings on a barefooted negress. High feed and close confinement are only an imitation of "high life above stairs," by which the aristocracy become enfeebled both in body and mind. Medicine given to healthy poultry to induce fertility is an outrage upon nature. Why do we not attempt to increase the human population by the same means we employ to multiply the feathered bipeds? All the weak, infertile, run-down fancy-stock, now so thoroughly spread broadcast over the land, is merely the natural result of doctoring. Hot-bed plants must be kept in a hot-bed to preserve their beauties; poultry so reared, and sold away from their pampering surroundings, are no exception. All the roup, gapes, pip and cholera, now so common and so destructive, are just what one bargains for when he undertakes to circumvent nature.

Farmers and others who wish healthy stock, must see that they get it when they go to buy—and the only way to keep it so is to let the hens have their own way in choice of food, nests, *time* of producing eggs, etc., etc. I do not believe that there is a farmer in the land who profitably raises eggs or poultry for family consumption from any one pure breed of poultry—[! EDS.] The progeny of a judicious cross are healthier, more fertile, less liable to sudden attacks of disease and, if allowed the farm for a run, cannot but be profitable.

The real needs of poultry are few and simple. They are: warm, dry, vermin-proof roosting and laying quarters, clean water, gravel, lime and a variety of grain to choose from. If any hens are found lousy or sickly under such conditions, cut off their toe nails just behind their ears, and the flock will be better for it. Why should we expect to have good poultry and eggs upon our tables, if we dose the poor creatures all the time upon nonsensical nostrums. Poultry do best when made to work, that is, to scratch for their living. Feed them one full feed of mixed grain every morning at sunrise, and let them have ample range the rest of the day. Change the treatment from nonsense to common sense for a mutual benefit.

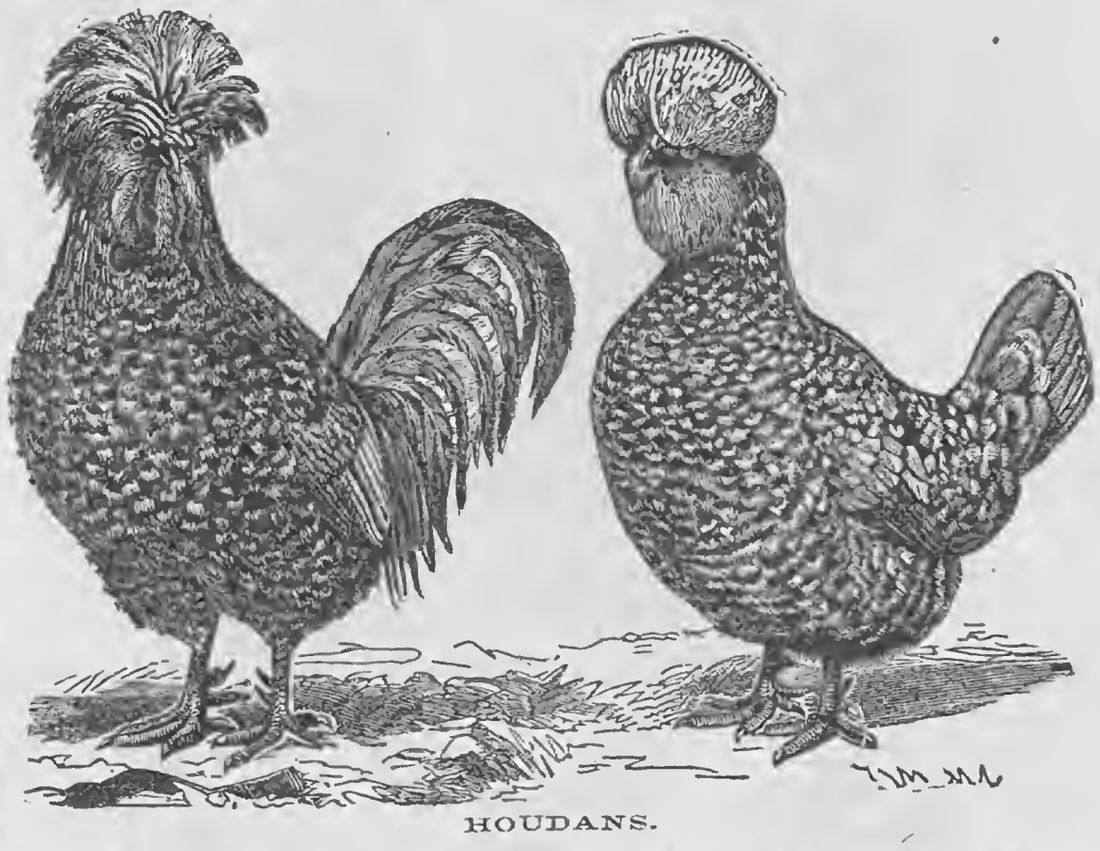
Dodge Co., Neb.

PREPARATIONS AGAINST WINTER FOR POULTRY.

ON account of the higher price obtained for eggs in the winter, it is very desirable that hens should "shell" them out liberally. Now how is this to be done? Certainly not by neglect. Set it down and don't you forget it, that no sloven can succeed with poultry. Farmers and others who keep one or two treefuls of fowls in the winter, must not expect their hens to lay many eggs; but in the balmy month of June, when the voice of the cuckoo is heard through the land, that treeful of fowls may be laying finely. Eggs, however, will then be plentiful in market and low in price.

Now is the time to make provision for the fowl-stock, in anticipation of the colder weather that will shortly be upon us. Their houses should be examined and all cracks and broken places in walls and roof should be made tight. Window sashes, too, should be repaired if broken. The floors, nests and roosts should be thoroughly cleansed, and the perches washed with kerosene. All these things should be attended to *now*. After the house is put in order, the occupants should have a variety of food. By variety I mean both raw and cooked food, meal, vegetables, corn, oats, buckwheat, gravel, pounded bones, etc. The water given fowls to drink should be clean and warm during the winter. In a word, unless good care is taken of the hens during the winter months, and all their wants supplied, when you go out to gather eggs, you may be reminded of the story of the boy who said "that he could not find any eggs, but saw a lot of hens standing around doing nothing." J. H. S.

Knowersville, N. Y.



HOUDANS.

POULTRY FOR PROFIT.

SINCE the "hen fever" has ceased to be epidemic, the breeding of improved kinds of poultry has become a legitimate branch of farming, and every variety has its supporters, who never can agree as to the relative merits of their respective favorites. It is possible, though hardly probable, that we may yet find the best points of all combined in one bird. Having tried several kinds, including Brahmas, Cochins, Black Spanish, Games, Sebright Bantams, Plymouth Rocks, Houdans, etc., etc., I am decidedly of opinion that where poultry and eggs for market are desired, no more profitable investment can be made by the owner of a flock of common barn-yard fowls, than the purchase of a pure-bred cock of any of the above varieties, excepting possibly the Sebrights. The professional breeder, and the amateur whose aim is pleasure not profit, do well in being sticklers for certain distinctive markings in hackle, saddle and wing coverts. There is a worthy class of farmers, however, who take pride in *all* their surroundings, not omitting the poultry yard, but who are constantly changing from one breed to another. Now, if each of these men would select such birds as may strike his fancy in size, plumage, or any other particular, and when such fowls have been secured, if he would endeavor to improve them by reserving the best for breeding, and by care and such attention as he gives his other stock, he would soon have such a flock of poultry that a fancy breeder would be too glad to pay a big price for a selected trio for show.

It is only where poultry are allowed great freedom that any breed can be reared in perfection for several years in succession, unless at great expense of time and food. I have found greater satisfaction in a flock all so nearly alike that I found difficulty in selecting an inferior bird for the table, than when I had some half a dozen sorts in small yards, and moreover, in the former case the profit in dollars and cents was much greater.

In localities where there is a ready market for fresh eggs, I think their production more remunerative than the raising of chickens, and I would, under such circumstances, give preference to some one of the non-sitting breeds. The Houdan is an extra fine fowl for the table, and a good layer of large, white eggs. These eggs, it is true, are not quite so large as those of the Black Spanish, but the flesh of the latter is not fit for the table, and moreover, like the Leghorns, their liability to lose their large combs and wattles in cold weather, unfits them for any but a warm climate. The Hamburgs and Polands are producers of a large number of small eggs; but then the size of the eggs is about proportionate to the amount of food consumed by all the non-sitting breeds.

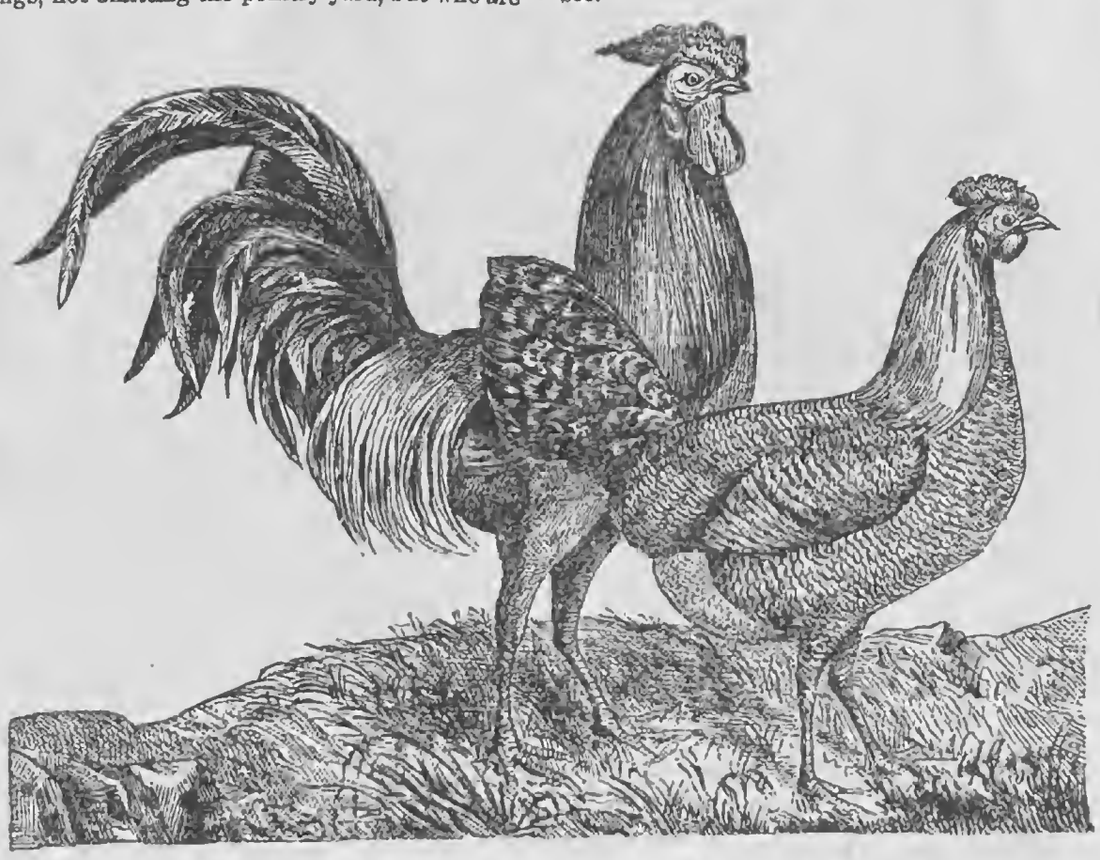
As to the number of birds that can be profitably kept about one set of farm buildings, I have found about one hundred to be the maximum where the climate will permit of foraging nearly the whole year; but where confinement to the houses is imperative during three or four months of winter, a much smaller number will afford more clear profit. CORNPLANTER.

Warren Co., N. C.

WHY SOME POULTRY DOES NOT PAY.

"POULTRY don't pay," exclaimed farmer B., as he threw a recent number of the RURAL upon the table, "my hens don't lay enough eggs to use, to say nothing of any to sell."

Why? Let's visit farmer B.'s poultry, and see.



GOLDEN-PENCILED HAMBURGS.

Behind the barn in an old dilapidated building, the wretched birds are huddled together, exposed to the cold winds of winter, uncared for, having to go without food, or wade through the snow to pick up a scanty livelihood from off the barn floor, and going without water from the time it freezes up in the winter until spring. Thus treated, is it any wonder that this man's hens do not lay? Poor, shivering, starving things! Can you expect a hen to give an egg for such care? Would you expect your cows to give milk without being fed? Feed your poultry with the same care you bestow on your sheep, horses and cows; give them a warm house to shelter them from the storms, and they will reward the care with eggs. M. B. D.

WHAT OTHERS SAY.

EGGS FROM DIFFERENT BREEDS OF POULTRY.—Fanny Field, a lady correspondent of the Ohio Farmer, says that after repeated experiments with the different varieties of fowls, and comparisons with others who have experimented in the same direction, she has concluded that the laying capabilities of the principal varieties are about as follows:

Light Brahmas and Partridge Cochins—eggs, seven to the pound; lay 130 per annum.

Dark Brahmas—eggs, eight to the pound; lay 120 per annum.

Black, White, and Buff Cochins—eggs, eight to the pound; lay 125 per annum.

Plymouth Rocks—eggs, eight to the pound; lay 150 per annum.

Houdans—eggs, eight to the pound; lay 150 per annum.

La Fleche—eggs, seven to the pound; lay 130 per annum.

Black Spanish—eggs, seven to the pound; lay 140 per annum.

Leghorns—eggs, nine to the pound; lay 160 per annum.

Hamburgs—eggs, nine to the pound; lay 150 per annum.

Polish—eggs, nine to the pound; lay 125 per annum.

Bantams—eggs, sixteen to the pound; lay 90 per annum.

She regrets very much that she did not keep account of the cost of food consumed by each variety.

ONE POUND OF MEAT.—Water, 8 oz.; fibrine and albumen, 1 oz. 122 grs.; gelatine, 1 oz. 62 grs.; fat, 4 oz. 340 grs.; mineral, 350 grs. A hen may be calculated to consume one bushel of corn yearly and to lay twelve dozen, or eighteen pounds, of eggs. This is equivalent to saying that 31 pounds of corn will produce, when fed to the hen, one pound of eggs. A pound of pork, on the contrary, requires about five and one-third pounds of corn for its production. When eggs are twenty-four cents a dozen and pork ten cents a pound, we have the bushel of corn fed producing $2.88 worth of eggs and but $1.05 worth of pork. Judging from these facts, eggs must be economical in their production and in their eating, and especially fitted for the laboring man in replacing meat.—[*Scientific Farmer.*

TEN ACRES VS. FORTY.—"My first start," said M. Guillord, of France, "would be, if beginning life anew, to lease or buy about ten acres of land and stock it with pullets. I would build cheap sectional hen-houses which could be moved to any part of the land; would not keep more than ten pullets in each house, and would coax them to eat everything growing on the place. I would bountifully feed them twice a day besides, with cooked and seasoned food, would keep them clean and exercise them well, take advantage of the markets and keep no old stock on hand, and, my word for it, I could make more money than many others with forty acres.

WINTER WORK FOR FOWLS.—In winter, when fowls cannot run out of doors to get their needful exercise, they first mope and then get into mischief, in shape of egg and feather eating. When in winter I see my fowls "killing time" by standing on one leg and sleeping during the day, I set them to work by burying oats or other grain under the sand and straw in the pens. Every fowl will immediately commence business and search the material over and over again, as though their lives depended on getting the last grain. I give them rowen hay, clover, corn husks, &c., &c., of which they are fond. One of the secrets of getting plenty of eggs in winter is *keeping the hens at work.*—Geo. S. Josselyn.

BREEDING PLYMOUTH ROCKS.—The Poultry World says that a medium light cock (not extremely light-colored), with medium dark hens, will average the best combination to give uniformly good-colored chickens. Some of the chicks will be lighter than one might wish; but, generally speaking, this plan is the safest, and the writer says that he has proved the fact to his own satisfaction, that to have a majority of evenly-hued and marked Plymouth Rock chicks, the parents must *not* both be of the darker plumage, however successful such birds may be for matching in the show-pen.

"I AM SURPRISED," says Mr. Joseph Wallace, "when I consider the rapidity of the growth of our country, the general intelligence and inborn skill of our farmers, the hobby, or I might add, the mania of our people to raise fowls, the millions of dollars' worth of poultry and eggs annually consumed, the demand for fancy stock, the cheapness of grain food, and the adaptation of our climate to every known breed, that so few varieties are bred among us, as compared to some smaller countries in Europe.

BANTAMS.—The Bulletin says that one desirable feature in regard to Bantams is that they are eminently useful pets; for they are invariably good layers of large eggs, no matter what the breed, and their small, plump bodies are most delicious eating. The surplus stock, each year, can always be disposed of at a fair price, if one has any hesitancy in serving them up on the table, and thus they prove themselves more than self-sustaining. This is more than can be said of most other pets.

PLYMOUTH ROCKS.—Without wishing to say a word in derogation of any breed, Mr. Dickie predicts in the Poultry Bulletin that in ten years more, or at the end of its second decade, the Plymouth Rock will be one of the leading, if not *the* leading, fowl with the average poultry keeper of our country.

POULTRY HOUSES—A warm, light, clean and dry house in which the birds may roost and lay their eggs and take shelter in cold or windy weather, is indispensable to success in poultry-keeping.—Bacon's Guide.

FATTENING must be completed in ten days, for after that period they begin to lose weight. The best age for table birds is when they are from four to six months old.—Poultry Book for the Many.

ACORNS, baked in an oven and ground into flour, are recommended by a German paper as a valuable food for poultry.

Industrial Societies.

THE INTERNATIONAL DAIRY FAIR.

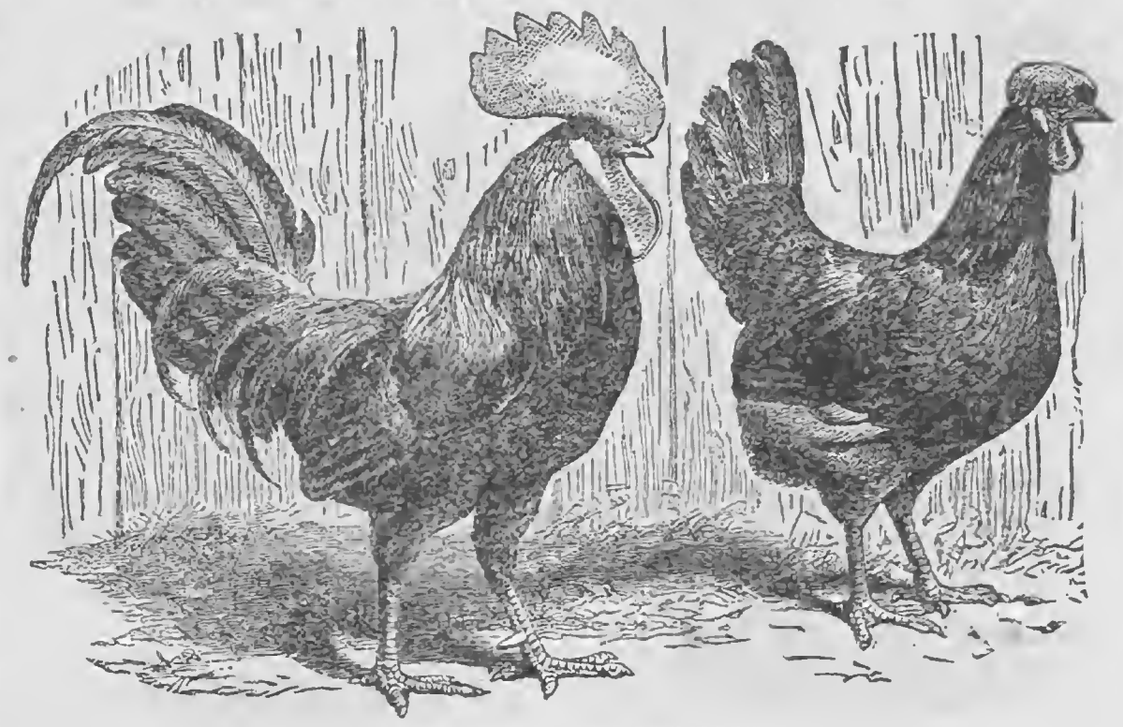
FREE LANCE.

A MOUNTAIN of effort has produced a mouse of effect in the greatly advertised and puffed, so-called International Dairy Fair, held last week in New York. "For what purpose was all this waste of time and money?" After spending some hours in considering the question, in walking up and down amongst the tables loaded with cheese and tubs of butter, and observing the experts mixing tastes and looking remarkably wise over the samples of cheese, the conclusion forced itself upon me, that it was "much ado about nothing." No one who went to see the show came away one whit the wiser for it, nor am I able to see that one useful purpose was effected, beyond the advertising of a few prominent produce-commission men. There was nothing new shown to any dairyman, or anything of interest to one not versed in the business. To see a pile of some hundreds of bags of salt upon one side, and a few ordinary cows with a few *bulls*, (are these dairy animals?) upon the other, and a pyramid of foreign cheese, as the most conspicuous part of the exhibition, was productive of regret that the time taken to see all this was as good as thrown away. And yet there was a lesson to be learned from it.

Every one who knows anything of dairy matters and things in general, knows that the American people are not consumers of cheese; and that the greater bulk of our product is sent abroad. He also knows that the chief reason that we are not a cheese-eating people, is that it is difficult, if not impossible, to procure a piece of cheese at any retailing establishment in city, town or village, that is fit to be eaten; further, that the cheese offered for home consumption is the same thing everywhere, without any more variety than goodness, with one notable exception. This is: that occasionally a rare quality or shape of cheese is discovered by accident in a fancy grocery store, but it is offered as a foreign article. And this brings to my recollection the fact that the most interesting thing to me in the whole display was a sample of cheese which seemed to be of foreign make, and which was the only specimen of anything which was different from the common (indeed too common) bulky cheese of our home dairies. Small, thin cheeses they were, of such a small size as to attract a would-be purchaser for this convenient character, and of such quality as to keep for even years. These were of the kind that are sold in the stores as English dairy cheese, and yet they were the product of a New York, (Otsego County) dairyman. But there was no place for them in the whole exhibition, except as foreign cheese; and among the foreign cheese they were exhibited, as well as classed.

Truly "a prophet is not without honor save in his own country and among his own people;" and so an enterprising and skillful American dairyman who makes a fancy cheese, such as the English Gloucester, or Stilton, or the French Brie cheese, must sell his product as a foreign article, or find no custom for it. Why cannot our dairymen make as good cheese as foreigners? We have learned to compete favorably with the English people in the common quality which suits a gross taste, and can be eaten in large slices by a hungry laborer with his coarse bread, but the delicately flavored cheese is all imported, or if made at home is sold as imported. This is the fault of the dealers who encourage this prejudice in favor of foreign articles and against our home-made products. While this continues, there can be no hope that Americans will become consumers of cheese. We desire variety as well as excellence in our viands, and the prevalent idea that we cannot appreciate goodness for itself alone, is a false one.

It is a matter for regret that those who have usurped the lead and control of the American dairy interest, I mean the produce-commission men, seem to have no idea that the home market is worth caring for, but that their main efforts seem to run in the way of getting all the consignments they can and shipping them abroad for a market. And out of this idea seems to have grown the great International Dairy Fair, which I presume has not been so successful as to tempt a repetition. It is not to the credit of our leading dairymen that they should be led by the nose by a few dealers in dairy salt and commission men; or should permit such persons to run their conventions. These men are well and useful in their way, and may be able to give acceptable advice as to markets, but a good dairyman should know the "ins and outs" of his own business.



BROWN LEGHORNS.

Dairy Husbandry.

WHICH BREED FOR THE DAIRY.—NO. 2.

L. S. HARDIN.

SHORT-HORNS.

THE first in order for discussion is the Short-horn. Her friends, on both sides of the water, are clamorous to have us consider her a dairy cow. If I had my way, I would no more consider the Short-horn a dairy cow than I would the Hereford, Polled Angus or Texas cow. To be sure, every cow that gives milk has a right to go in the dairy, if anyone is foolish enough to put her there. Men who keep cows in the dairy, that give no more milk than a good-sized goat would. This is a free country—for the majority. The sight of the table given in my article in a late issue of the RURAL, has given grave offence to Harris Lewis.

The advocates of the Short-horn for the dairy base their claims, not upon what she is going to do, nor upon what she can do, but, remarkable as it may appear, solely upon what her ancestors have done. This reminds one of that imbecile vanity that we too often see in our own fair Kentucky—men, in drink, acting the beast and claiming to be gentlemen because their honored ancestors were gentlemen. We have no time in this country to rely upon the honors won by our remote ancestors; we must do the deed ourselves if we expect the reward. In this State where Short-horn breeding is at the hight of its glory, the Short-horn cow has been weeded from the dairy. Her tendency, when fed rich food, to fatten and dry up rapidly, coupled with the waste of food in carrying several hundred pounds of useless flesh, has caused her most enthusiastic friends to desert her. The fact that she has been in this country longer than any other breed of thoroughbreds, and has not now what one would call a standing in the dairy, is pretty conclusive evidence that, in some way, the dairyman has arrived at the conclusion that she is not the cow for him.

The authorities of this country differ very much on the subject of this cow's dairy qualities; but the richest piece of breeding philosophy I have seen on this subject, is from the pen of Prof. Arnold. He says: "In crossing with natives the modern Short-horns in which the capacity for milk has run low, the later acquisitions give way and drop out, and the progeny takes back, and the original form of the early Short-horns and their tendency to milk revive." Let us see about that. He acknowledges that the milk has been bred out of the Short-horn. The bull's parents have been bred for beef until the milk is gone. One, and I think I may say the prime point in thoroughbreds, is their power of stamping their likeness upon their offsprings. This beef-bred bull when put to a Short-horn cow, produces a strictly beef animal; but when put to a scrub cow, he does not produce the same beef animal for which he has been bred, but, presto! he changes his whole nature, abandons the beef characteristics of his breeding and goes in another direction! Ah! Prof. Arnold, you are a mighty authority among those who sit with open mouths and swallow your *dicta*, but with those who reason for themselves, the admiration for you is passing away.—(? EDS.)

I do not feel at liberty, nor is it necessary, to restate the arguments against this cow for the dairy, that I have so often made through the press. The fact that Harris Lewis has the only herd of thoroughbreds that I have been able to hear of, that were kept for butter making, shows to what a limited extent the Short-horn cow has made her way with the American dairyman. At the same time it will not do to entirely pass over that ever-recurring argument for the Short-horn in the dairy, to the effect that when her milk gives out she can be turned to a profitable beef animal. Having had some pretty rough experience in handling beef cattle, I am satisfied that no man on earth can make money fattening old dairy cows, if the food he gives them has any reasonable market value. Does not every grazier know that, in order to save himself any margin for profit in fattening beeves, he must use great care in selecting, not old cows, but *young steers?* and they must be good ones at that, with the least possible tendency to offal and the greatest possible tendency to take on flesh kindly. There is no room for foolishness here if one expects to come out even in the fall. In fattening cattle, deliver me from old pot-bellied cows, no matter what their blood.

BLACK SPANISH.

Miscellaneous.

CATALOGUES, &c., RECEIVED.

"JUST TO PLEASE THE BOYS," A new serio-comic song, published by F. W. Helmick, 136 W. Fourth St., Cincinnati, Ohio.

CIRCULAR OF COLLEGE OF AGRICULTURE OF THE UNIVERSITY OF MINN. All information anent studies, etc. will be supplied by C. Y. Lacy, College of Agriculture, Minneapolis, Minn.

VICK'S Illustrated Monthly for December—handsome, bright and full of good things, as usual. The present number contains, as a frontispiece, a very fine colored plate of the new Amaranth, Sunrise. Published by James Vick, Rochester, N. Y.

THE Dairy Interests Abroad, a paper read by Mr. F. B. Thurber at the late International Dairy Fair. It describes recent English and French Fairs together with methods of manufacture pursued abroad and details considerations affecting the foreign market for American Dairy products.

THIRD REPORT of the Montreal Horticultural Society and Fruit Growers' Association of the Province of Quebec for the year 1877-8. This is a well-edited pamphlet of 123 pages containing a very interesting report of the discussions of various members of the Society on horticultural matters. Henry S. Evans is the Secretary.

Mr. Vick sends a bound volume of his magazine for 1878. He says that he thinks it "pretty good and quite handsome" but that, not being an impartial judge of his own work, he would like our opinion.

The volume is, of course, the size of the Monthly. It comprises 376 pages and a carefully arranged index, hundreds of well-executed woodcuts and about twenty colored plates of well-known flowers. Now, to tell in a few words what might be strung out to a column—it is the most interesting popular treatise upon flowers and their culture that we have hitherto seen.

CIRCULAR OF THE UNIVERSITY OF NORTH CAROLINA, containing a list of the Faculty, the course of studies, and other interesting particulars. We are glad to learn that this institution is fast advancing towards its *ante-bellum* prosperity, having, in its first session of 1878-9, reached 175 matriculates, with a promise of an increase to 200 in the second session. Full particulars of everything, the studies, etc., at the University, will be furnished by President R. P. Battle, Chapel Hill, N. C.

The Native Flowers and Ferns of the United States by Thomas Meehan, published by L. Prang & Co., Boston, Mass. Again we have to acknowledge the receipt of parts (14, 15, 16 and 17) of this ever welcome work. Mr. Meehan's heart is evidently in this work, and the text is no less interesting and instructive than the colored plates are true to life and beautiful. We need only repeat our advice to all interested in our native flowers to subscribe for the work. L. Prang & Co will answer all inquiries respecting details which the RURAL placed before its readers when the work was first offered to the public.

The Vineyard.

THE LADY GRAPE IN EUROPE.

A large grape grower near Berlin, Prussia, who has fruited the Lady Grape the present season, writes very enthusiastically in its praise. He says it is very early and perfectly healthy in that country, also one of the very finest flavor (*"Ottervor trefflichsten Gesehmack!"*) He adds that of about 350 sorts of Grapes which he cultivates, he finds the "Lady the best of them all." As this Grape is also one of the most perfect Phylloxera-resisting of the American natives, it will doubtless be largely planted in Europe as well as in this country.

Floricultural.

FLORICULTURE NEAR THE BAY OF SAN FRANCISCO.

CHARES H. SHINN.

Our average climate, within a radius of fifty miles of San Francisco, is delightfully mild and equable, tempered by breezes which are never gales, and moist from the nearness of the ocean. Of course, the soil varies extremely in such an extent of country. For instance, this section in which I write is a sandy loam near the streams which cross the valley, a black loam along the foot hills, adobe, or very tenacious clay, on some slopes, peaty soil around the fresh-water lagoons, and alkaline clay loam near the sloughs of the Bay. The rich loam near our streams is mainly given up to fruit-growing, and the heavier soil of the middle of the valley, to wheat, corn and potatoes.

Owing to its nearness to San Francisco, easy communication and rapid growth, this section is filling up with small homes, and the ornamental grounds and gardens are daily increasing. The counties of Sonoma, Alameda and Santa Clara are making marked advances in this direction. If, as I am inclined to think, fine stock, abundance of small fruits, and flower gardens everywhere are evidences of a civilized community, then these three counties would rank high in any State.

Our gardens are beginning to mingle the old-fashioned beauties, dear to the hearts of our quaint grandmothers, with the rarer, but no more beautiful exotics. Each year a greater variety is attempted, and the business of nurserymen and florists increases. A neighbor of mine had, this year, in one small bed a Clianthus puniceus, trained as a shrub eight feet high; a magnificent clump of Dicentra spectabilis, Pansies, Balsams, Cocks-combs, Asters, Myosotis and a Bouvardia, all flourishing as a horticultural "Happy Family."

All the hardy annuals and most of the half-hardy ones get along without any special care, or sowing of seed. A bed of Portulaca, scarlet Flax, Whitlavia, Mimulus, China Pink, Abronia, or Lobelia, once planted, is a safe thing, the only care needed being to thin out the seedlings which spring up after the first rains. Indeed, after gardening experiences extending over a series of years, I have failed to find any plant which will not occasionally spring up from self-sown seed. Lantanas, Zonale Geraniums, Blue Lobelias and Canterbury Bells have often been, by reason of their abundance, most troublesome weeds, and I have even known Double Fuchsias to self-sow on rare occasions, also Smilax, Maurandias and a Begonia.

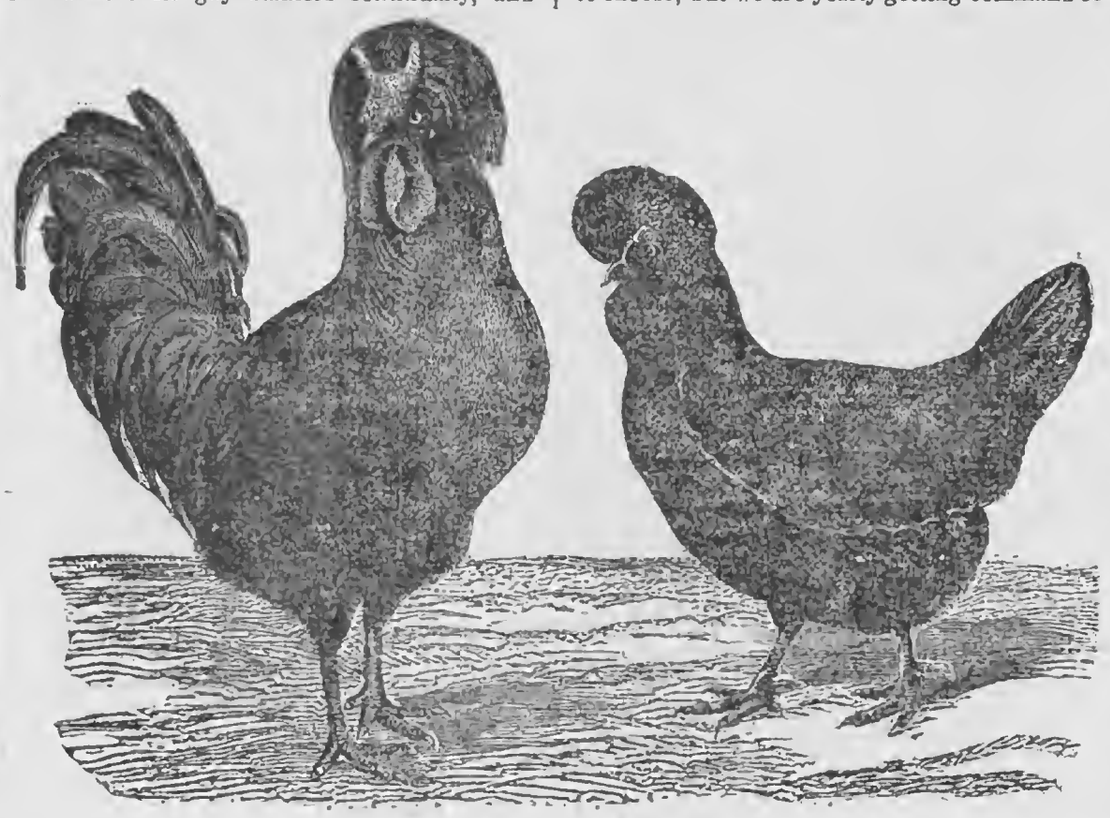
Fuchsias are, with us, the most delightful of beddors. We select a bed having an eastern or northeastern exposure, and put out small plants in January. By June they are noble specimens and bloom for months. I often cut back half of them, so as to keep a succession of winter-bloomers. Roderick Dhu, Sir Colin Campbell, Vaniquer De Puebla, Maximum, Wave of Life, Princess Alice, Arabella and all the improved sorts succeed in this manner.

Our best flowers to line carriage-ways, and to be grouped in shrubberies, are the double Geraniums. Our treatment of them is simply to put in cuttings where they are to stand before the early rains, and by March we have blooming plants. In December these are cut close to the ground, so as to make a new growth and to keep them within bounds. No irrigation is required at any time.

Dahlias, Double Hollyhocks, Pampas Grass, Ricinus, Phormium tenax, and the best striped Japanese Bamboos are also used for groups on the lawn. For single specimens, the Joehroma tubulosa, a new plant with hairy, dark leaves, firm outlines, massive growth and clusters of dark-blue, tubular flowers, and also the Brugmansia Knightii with immense double white fragrant flowers, are deservedly favorites.

The Japan Lilies, especially L. auratum and speciosum roseum, are often seen. Others are being introduced; nor are our native species, L. Humboldtii and Washingtonii neglected, although these are not so fine here as in their native Sierras.

Most of the other bulbs succeed. Crocuses are apt to dwindle after the first year, even with the best of treatment, and new bulbs must be imported. Anemones and Ranunculuses take possession, and grow and bloom for months. We cannot complain of Tulips, Hyacinths, Jonquils or Daffodils. The Crown Imperial is a failure of the complete sort in this section. We have tried dozens, in all contrivable situations, without ever obtaining a flower. Gladioli flaunt their gay banners continually, and



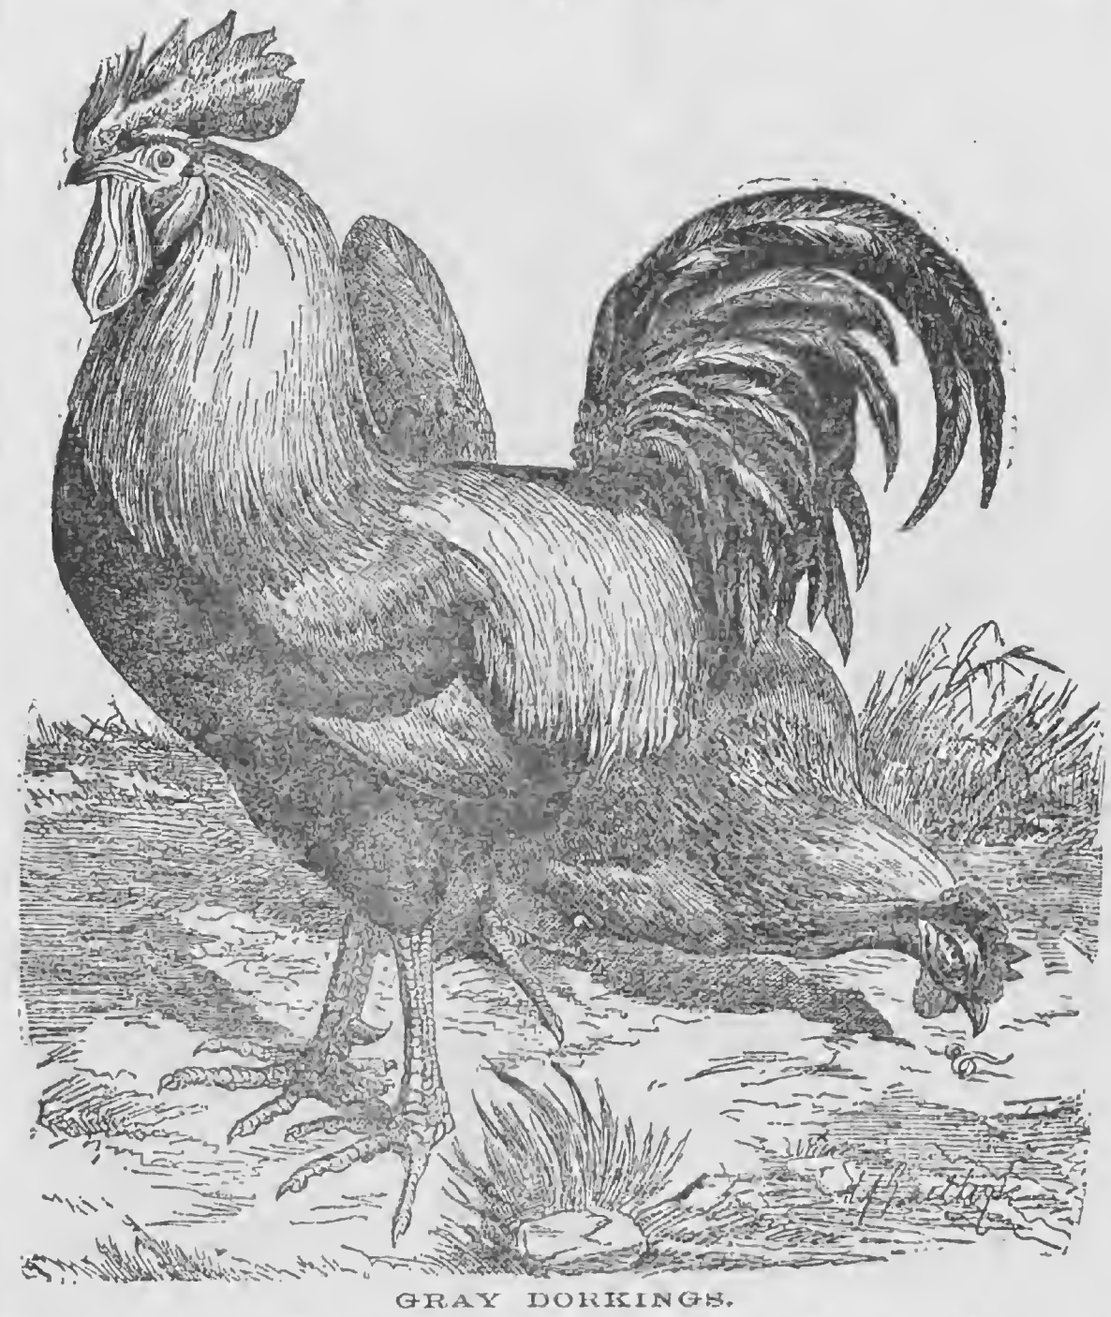
CREVECŒURS.

may be had in bloom every month. We tried an Arum Dracunculus last year, and it grew extravagantly, till it became a neighborhood marvel; but the immense, spotted flower had a vile, unbearable odor, as those who have seen it know.

Roses give us hardly any trouble. We trim them heavily in the fall, to give them a rest. Occasionally, in a foggy summer, a few kinds mildew, and, at rare intervals, the green lice appear, but a little care remedies these evils. Marechal Niel is at the very front for color and growth, Safrano, Bergensitea, Isabella Sprunt, Niphetos and Ben Silene are also widely used. The Lady Banksia Roses are immense growers—indeed the best running Roses we have.

Among vines, the Akebia quinata, from Japan, is very valuable. Mine, now three years old, is up to the second story window, a mass of beautifully interlaced, evergreen foliage. The cup-like clusters of chocolate-colored flowers are fragrant, and long in bloom through the winter and spring months.

Choice shrubs are becoming the rage. Our sun spots Camellias, if planted out-of-doors, and Rhododendrons do well, with care. Azaleas are difficult to manage. Tea plants and Magnelia grandiflora succeed admirably. The Crape Myrtle blooms late here, but stands our winter.



GRAY DORKINGS.

In Stockton and through the Sacramento Valley, it makes almost a tree. Oleanders are popular and handsome. They are a little difficult to start, but soon grow fast. Kennedyas are fine garden shrubs here and make magnificent bloomers. Clianthus and Erythrina are often seen either as shrubs or trained to a wall.

It will, by these brief notes, be observed that we have a wide range of plants from which to choose, and that our gardening ought to be unique. We have had almost too much from which to choose, but we are yearly getting command of our materials, and better things may be hoped for in the near future.

Washington Township, Alameda Co., Cal.

Everywhere.

RURAL SPECIAL REPORTS.

Pike County, Missouri, Dec. 9th.—We have had an unusually fine fall for prosecuting farm work. The standing corn is about all gathered, and cattle are having a good feast in the stalk-fields, the ground at this date being covered lightly with snow and sleet. This is the second snow we have had this winter, the first falling on the first day of the month, a strong point in our favor, as compared with October 28th, for the locality of Attica, N. Y. Owing to the drought in October, the sowing of wheat was considerably delayed. The growing crop, however, where well drilled in, on properly-prepared land, is doing fairly well, and there is at present a reasonable prospect for a remunerative yield. About the usual acreage has been sown. Corn is fully an average crop where planted in time and well cultivated, while very many have to console themselves with small profits on light crops, where cultivation was insufficient. Our apple crop, which is usually one of much importance, both as to quantity, quality, and income, has not this season been up to anything like an average, save in quality; for if there be any noticeable difference from former years, the present crops are of better size, color, and flavor than usual. Peaches and small fruits were abundant. Hogs bring 2¾c. per lb. gross; fat cows for the butcher, about the same price.

H.

Mount Vernon, Ohio, Dec. 10.—Weather very wet here now; prospects of cold soon; have had a remarkably fine fall for all work. A large apple crop hereabouts, of course made prices low, 20c. per bushel for best. A great many thousand bushels have been shipped from this point. We have a very prosperous little city of some 8,000 population. Good farms readily sell for $65 to $100 per acre. City property, however, is very low, not selling for two-thirds of what it is worth. Wheat, 90c. to 95c.; oats, 25c.; corn, 25c. to 30c.; potatoes, 40c. to 50c.; apples, 20c. to 25c.; hay, $6 per ton; butter, 12c. to 14c.; eggs, about the same; chickens, 6c. to 8c.; turkeys, 8c. to 10c., dressed; pork $2.30 alive; $3 to $3 25, dressed. Wages low, but good hands can command 75c. a day and board. A great deal of ice will be put up if the weather is cold enough to form it. We are looking for those good times that have been promised since the *good times* of 1873. M. W.

Burlington, N. J., Dec. 10th, 1878.—The weather for the past three months has been all the farmer could desire, all the storms clearing up warm, which is something unusual. The farmers hereabouts have their corn husked, and, as a general thing, are up with their work. Winter wheat and rye are looking fine. The prices for farm produce are as follows: wheat, 98c. to $1.10 per bushel; corn, 55c.; oats, 35c.; potatoes, 60c. to 75c.; eggs, per dozen, 28c. to 33c.; butter, 20c. to 28c. lb.; pork, 3c. to 4c. Wheat yielded well the past season, ranging from 15 to 45 bushels per acre. Rye was a failure. White potatoes are not very numerous; but sweet potatoes are so abundant that there is no sale for them. Farmers have nearly all done well this season. I. W.

Fayette, Seneca Co., N. Y., Dec. 3, 1878.—This fall, until about the 25th of October, was so warm that farmers in some sections found it quite impossible to plow; consequently, the acreage of winter wheat is not so large as it would have been had we had rain in season. Through November, however, we had an abundance of rain. Wheat is looking well, considering the peculiar season. Clawson wheat did the best with us last season, and is worth now in our market 95c.: barley, 70c.; oats, 27c.; corn, 45c.; potatoes, 70c.; butter, 20c.; eggs, 19c.; apples, 30c. I might here state that this county, as a whole, stands second to none in the State for wheat, corn, oats, barley, and potatoes.

W. B.

Brooks, Waldo Co., Me.—The spring opened early and the fall has held off late. Potatoes were dug in good condition November 30th, and teams were plowing. It has been a fruitful year. Corn has done unusually well. Apples were in the greatest abundance, and grass was very good. Wheat was about an average—other grains the same; but potatoes were only half a crop. Beef, pork and hogs are low. There is hardly any sale for apples, while potatoes bring a good price. It has been an extra fall for work, and much permanent farm improvements have been made. Better farming prevails than five years ago, and improvements are progressing in many agricultural matters. J. W. L.

Le Cygne, Kansas, Dec. 9.—The crops of Kansas, generally, are very fair, with the exception of some localities where the long dry weather damaged our corn crops to some extent. The fruit crops were abundant in everything except apples, which were only about half a crop. This, I think, was principally caused by the overbearing of trees last year, they of course being young. I believe this is one of the best fruit States in the Union, everything considered. All fruit does well here with the exception of pears. These blight to some extent. All small fruits do exceedingly well.

J. A. M.

El Dorado Co., Cal., Dec. 1.—We have had several quite hard frosts during the past week, which cause Nature to take on a wintery look. The apple crop is now all in, and was an exceptionally fine one. Apples are keeping much better than last season, very few withering or showing any signs of decay. Apples are selling at 75c. a box of forty to fifty pounds each. The grape crop is all gathered; grapes sold at $10 per ton here, the producer picking and delivering them at the station, some five miles away. Pansies are in bloom, also Violets. These will be with us all winter. W. O. L. D.

Risdon, St. Clair Co., Ill., Dec. 1, 1878.—The recent mild, pleasant weather has helped wheat greatly, and it now looks first-rate. We hear some complaint of weevel in corn, but the evil is not very bad. Wheat is worth 70c. a bushel; corn, 35c.; potatoes, 50c.; oats, 30c.; cattle, $2 and $2.50 per 100 lbs. gross, and pork about the same. N. J. S.

Bowling Green, Ky., Dec. 9.—Farmers hereabouts have about finished gathering corn, and are now preparing for winter. Wheat is looking well, considering the dry weather we had in September and October, which delayed our sowing. Corn is now worth from 32 to 35c.; wheat, $1; oats, 35c.; hay, 50c. per 100 lbs. J. D. S.

OWENSBORO, Ky., Dec. 1.—Corn is about all gathered in these parts, and is worth 30c. to 35c. per bushel. Hogs are very abundant, bringing only 2¼c. to 2½c. gross for good animals, and many have been sold to grocers to retail at 2½c. to 2¾c. net. Potatoes are selling at 40c. per bushel for the best. J. W. S.

CORNWALLIS, Nova Scotia, Nov. 26th.—The weather here this fall has been delightful. Crops were generally good. Hay and grain heavy. Potatoes only a fair crop; price from 50c. to 60c. per bushel, with several vessels loading for New York. J. E. E.

OXFORD, Oakland Co., Mich.—Wheat, 85c.; corn, 34c.; oats, 20c.; pork, $3 per cwt.; interest on money from 10 to 12 per cent. on first-rate security to those not lucky enough to have a bank account. L. L. T.

BETHEL, Clermont Co., Ohio, Dec. 3.—The largest of my peachblow potatoes was thirty-three ounces, and quite a large number weighed a pound. E. G. G.

The Querist.

ANSWERS TO CORRESPONDENTS.

Hog Cholera.

R. S. Dunnville, Essex Co., Va., says: "We have a disease hereabouts among our hogs. The symptoms appear to be loss of appetite, affections of the bowels and kidneys. Their feet seem to be all drawn together. Sometimes fat hogs die of it in forty-eight hours. Can the RURAL suggest a remedy?"

ANS.—In reply to this question, D. E. Salmon, D. V M., one of the commissioners lately appointed by the government to investigate hog cholera, writes us: "This imperfect enumeration of symptoms indicates the disease to be the contagious fever of swine, known as hog cholera. Unfortunately, up to this time, neither the medical nor veterinary professions have been able to discover a medicine or form of treatment that has any appreciable effect on the course of the contagious fevers; and this is as true of hog cholera as of small-pox or yellow fever. Of course, I would not be understood to say that medical advice is useless in such cases, for this would not be true; there are often, indeed, I may say generally, with those fevers local troubles—inflammations of internal organs, and functional derangements which need watching and special treatment; and of more importance than this is the proper regulation of the surroundings and food. The small value of hogs, and the difficulty of administering medicines, put it out of the question to give them medical treatment. The most that can be done is to keep them in a clean place, where they will not be exposed to draughts of air, and to give them cooling and easily-digested food. The latter is necessary because of the considerable congestion and inflammation of the digestive organs, which are always present in this disease. This food may consist of milk, meat, or well-boiled oatmeal (made from oats ground and the bran removed with a sieve), or other articles of like character.

This disease has now extended over nearly the whole country, and nothing but governmental interference can abate it. If our farmers desire to be relieved from the terrible losses it is now causing, they should see to it that Congress takes proper action on it before another spring. It is the most important subject that will be before the next Congress, and the country cannot afford to have action delayed another year.

Asparagus Culture.

W. B. Y., Norwich Ont., asks how should Asparagus be cultivated; what is the proper time for planting it, and should one sow seed or get roots.

ANS.—Prepare the soil in which to plant Asparagus, as soon as spring opens, by giving it a heavy dressing of well rotted manure, and a deep thorough pulverizing either by the use of the plow or the spade. If grown on a small scale, it is best to trench the land from two to three feet deep. Plant one-year-old plants in rows, one foot apart, and nine inches between the plants in the rows. By omitting every fourth row, a walk is formed between the beds on which to pass while weeding and performing other operations, thus avoiding stepping on the plants.

If grown for marketing on an extensive scale, the plants may be set in rows three feet apart, and nine inches from plant to plant in the rows. Set the plants about three inches deep and be careful to spread the roots well, like the spokes of a wheel. By using vigorous plants, on rich land and giving them careful treatment, a small crop may be gathered the second year after planting. In the above locality it will be well to cover the beds during the winter with a layer of manure containing a good deal of straw. A well kept bed, on rich land, may be productive for twenty years.

Bone-Dust in the Orchard.

A Rural Reader asks whether bone-dust would be beneficial to apple trees, and, if so, how to apply it.

ANS.—Yes.—Apply it to the orchard in such quantities as you can afford, after putting the surface soil into a thorough state of pulverization. Owing to the high price of the article, however, and to its decidedly beneficial effects when applied to many field and other garden crops, the application of bone-dust in the orchard is rarely made. Barn-yard manure which acts as a mulch as well as a fertilizer, is the usual kind employed about fruit trees, and no experience is extant to warrant the substitution of bone-dust instead of it. In a recent discussion, by the Pomological Society of Michigan, on orchard fertilizers, water was placed first, secured near the surface by thorough pulverization; barn-yard manure, second, where it could be secured at ordinary prices, and ashes, third, as a most important sort of manure for that purpose; but not a word was said about bone-dust.

Salt for Wheat.

A subscriber, La Porte, Ind. (?) asks the effects of salt upon wheat, and when and how it should be applied.

ANS.—It is the strong belief of many farmers, at a distance from the seashore especially, that salt is a valuable fertilizer for wheat. It appears to decidely stiffen the straw and increase the yield. The quantity applied is from two to six bushels to the acre. The latter quantity will do no harm, but two or three bushels are enough. Fine salt should be used, and care must be taken to sow it evenly. It must be understood that salt will in no wise take the place of a proper preparation of the land, suitable fertilization, or good seed well put in. But *with* these it is a considerable help. It may be applied to winter wheat early in the spring, and is sown upon spring wheat after it is harrowed in and rolled. Under fair conditions, the average estimated gain in the crop from a dressing of salt, is from four to six bushels per acre.

Reproductive Knarls on Apple Trees.

A. J. C., Newry Station, Perth Co., Ont., during a visit to England, saw a half-grown apple tree of dwarf habit, well laden with fruit, on the branches of which knobs, or swellings, occurred, and if cuttings, made just below the knobs, are set out, they will take root and grow rapidly, and a desire is expressed to learn the name of that variety of apple-tree.

ANS.—As a matter of scientific interest, the propagation by embryo buds or knarls, has occupied the attention of horticulturists, but not as a thing of practical importance. These knarls are formed in the bark of various trees, and in many sorts of apples there is a tendency to produce them in numbers. The variety mentioned is unknown to us. Evidently the peculiar tendency of the variety gives more life to the knarls than we find in the ones upon our own apple trees, for rarely will those, under the most favorable circumstances, throw out a stem. It would be interesting to know more of this variety.

Alfalfa Seed, Again.

M. J. McM., Tallahassee, Fla., says that Alfalfa seed is not sold by seed dealers there, and inquires where it can be purchased, as it is much needed thereabouts as a forage crop.

ANS.—Local seed dealers should be readily able to procure it for a customer. All the large seed dealers in the principal towns in the South generally have it on hand, such as J. B. West & Co. and Folger & Co., of New Orleans.

Cultivating Fruits under Glass.

M. B. P., Warren Co., N. C., says, "Please give us what information you can on the cultivation of fruits under glass."

Remarks.—The question is too general. Different fruits require different treatment, and to give specific treatment for all fruits cultivated under glass, would require too much space for this department.

A Thrice-told Tale.

E. G. G., Bethel, Ohio, asks where he can find out how to caponize poultry.

ANS.—Articles giving full descriptions of different methods of performing this operation can be found in the RURAL for April 20, November 23, and December 21st.

To Farmers' Clubs.

T. C. Loughry, Indiana, Pa., wants the addresses of different farmers' clubs, with a view to correspondence, as a club is about to be organized in his neighborhood. We trust the members of some clubs will write to him at the above address.

THE RURAL NEW-YORKER

from now until Jan. 1st, 1880, for $2.

NOW THE CHEAPEST PAPER IN THE WORLD.

A Four Dollar Weekly Journal for Two Dollars.

30th YEAR. 2nd YEAR OF ITS PRESENT MANAGEMENT.

TO ALL OF OUR SUBSCRIBERS WHO APPLY, A **FREE** SEED DISTRIBUTION EQUAL IN VALUE TO THE YEARLY SUBSCRIPTION PRICE.

ONLY SEEDS OF RARE OR **NEW** VARIETIES FOR THE FARM AND GARDEN OFFERED FROM OUR

Experimental Grounds of 82 Acres.

A New Era in Horticultural and Farm Journalism.

A COUNTRY HOME PAPER FOR EVERY SECTION.

ON PRICE TO ALL.

ORIGINAL ENGRAVINGS---THE BEST WRITERS OF THE LAND.

A JOURNAL THAT IS HONESTLY DEVOTED TO THE WELFARE OF ITS READERS.

No progressive Farmer, Fruit-Grower or Gardener can afford to do without the RURAL for 1879.

THE following are among a few of the recent notices of the press of the United States.

THE RURAL NEW-YORKER has been enlarged and improved, if that be possible. It stands at the head of the strictly agricultural and horticultural periodicals of the country.—*Philadelphia Germantown Telegraph.*

THE RURAL NEW-YORKER, so long and favorably known, seems determined to give its readers the benefit of whatever increased prosperity it secures. It has now, the best list of contributors of any weekly agricultural paper in the country, and is doing a noble work—*Boston Scientific Farmer.*

The editors of the RURAL NEW-YORKER now use a portion of their farm for experimental purposes in raising seeds for their subscribers. Their farm, which by the way is one of the best on the Island, is admirably adapted for such experiments. The RURAL is one of the best of agricultural papers.—*S. S. Observer, Long Island.*

THE RURAL NEW-YORKER.—We are glad to note by an increase of size in the RURAL NEW-YORKER, substantial signs of prosperity. The Agricultural Press of the country has severely suffered by the general depression of the last few years, and it is pleasant to note this first step in prosperity, especially as the Rural New-Yorker deserves all the success it seems to gain.—*Gardener's Monthly.*

THE trouble is that if you take it one year you will like it so well that you will take it every year.—*North Missourian.*

WE regard the Rural New-Yorker as the champion weekly paper of America, for the farm and family circle. While it is especially intended for Rural Homes, there is no fireside that will not be greatly benefited by the Rural New-Yorker's weekly visits. It gives you more for your money than any agricultural publication of which we have knowledge.—*Democrat, Coshocton, Ohio.*

WE are glad to receive assurances from headquarters that this excellent paper was never in such a promising condition as it is now, either financially or editorially, since its removal from Rochester. "It does not owe a dollar, and has half a million at its back." Good enough! but not better than it deserves.—*Buffalo Weekly Express.*

OF our agricultural exchanges none presents such a clear, crisp appearance, typographically, as the RURAL NEW-YORKER. Speaking of its contents, we are led to use the most emphatic language. It is edited with a precision unusual in agricultural journals, and a glance over its interesting "Questions and Answers" columns discloses with what painstaking it responds to requests for practical information. It is more comprehensive than papers of its class, also, embracing a literary department that is again subdivided into minor departments, which furnish excellent short and continued stories, fashions and cut paper patterns for the ladies. Religious intelligence, the news of the week, and a cozy nook for the young people.

Its practical departments embrace articles by the foremost writers on agriculture, horticulture and kindred sciences, accompanied by illustrations that increase the interest of the text. In short, the Rural is just such a paper as our people should subscribe to. It is broad and national in its treatment of topics, and more than any other journal, serves the farming and fruit growing interests of the whole country.—*Dispatch, Live Oak, Florida.*

THE RURAL NEW-YORKER.—This old and well-established weekly is one of our best agricultural and horticultural exchanges.—*Phrenological Journal.*

THE RURAL NEW-YORKER.—One of the oldest, most reliable, and most welcome of farm and household journals published in America has been enlarged and otherwise improved. Its name has become a household word throughout the land, and we have yet to learn where the Rural is not welcomed by the family to whom it is sent.—*Journal, Flint, Mich.*

THE RURAL NEW-YORKER is the best and most prominent agricultural and home journal in the country.—*Democrat, Davenport, Iowa.*

On receiving The Rural New-Yorker, we scarcely recognized it, so greatly has it been changed, for the better.—*Observer, Bowmanville, Ont.*

THE RURAL NEW-YORKER has been enlarged to the size of Harper's Weekly, and otherwise greatly improved. It is one of the oldest and best agricultural weeklies in the country. Terms, $2.00 a year.—*Record, Yorkville, Ills.*

THE RURAL NEW-YORKER, one of the best family and agricultural papers in the land, has recently been enlarged, and its publishers claim that it has also been improved; but we can't see it, for the reason, we suppose, that our vision is clouded with the long and fixed notion that there was no chance for bettering it.—*Home and Farm, Louisville (Ky.)*

THE RURAL NEW-YORKER, once published at Rochester, but latterly at New York, has been the most widely circulated of the agricultural papers.—*Times, Hartford, Ct.*

RURAL NEW-YORKER.—That old reliable agricultural journal, The Rural New-Yorker, renews its youth every year, and steadily improves with age.—*Western Homestead, Kansas.*

THE RURAL NEW-YORKER has no peer as a family and farm paper.—*Commercial, Mitchell, Ind.*

THE RURAL NEW-YORKER has been enlarged and improved, and is now the best agricultural paper issued in the U. S. We cordially recommend it to our farmers.—*Times, Port Hope, Ont.*

THE RURAL NEW-YORKER, so long and favorably known as a guide and representative of the agricultural interests of the country, has been much improved in its typographical "get up." It would be hard to improve it otherwise. The Rural New-Yorker is a mine of information for farmers, wherever located, and amply repays perusal.—*Am. Mail and Express Journal.*

THE RURAL NEW-YORKER, published at 78 Duane street, New York, is now the best agricultural weekly we have any knowledge of.—*Spectator, Ohio.*

THE RURAL NEW-YORKER.—This popular agricultural journal has recently been enlarged and typographically improved, all of which will commend it still more, if such a thing were possible, to its vast army of readers in all the walks of life. The Rural New-Yorker is the most popular agricultural paper published, and we commend it as the best to all wanting a paper devoted to that department.—*Insurance Herald.*

THE RURAL NEW-YORKER has made another enlargement, which makes the Rural the largest agricultural weekly published in this country.—*Western Agriculturist.*

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY DEC. 21, 1878.

We will be pleased to send one or more copies of the RURAL NEW-YORKER *free to any of our subscribers sufficiently interested in its welfare to be willing to hand them to their neighbors for inspection. An intimation by postal card will suffice.*

PARTICULAR NOTICE.

Applicants for seeds will please observe that the postage on ANY POSSIBLE *selection of* TEN *sorts of seeds,* IS NEVER *more than* FIVE *cents.*

A ONE-CENT *stamp suffices for any selection of ten varieties* EXCLUSIVE *of the Beauty of Hebron potato, Pearl Millet and Defiance wheat. If the first of these three is included in the list, then a* TWO *cent* EXTRA *stamp is needed, and if the second and third are included, an extra two-cent stamp is also required.*

OUR readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

OUR readers are particularly requested to read the particulars of our free seed distribution on p. 817, under publisher's notices, before ordering seeds.

MERRY CHRISTMAS.

The early settlers of Virginia were adherents of the Church of England with all its forms and ceremonies, its fasts and its feasts. Those of Maryland were Catholics. In both States Christmas was observed as in England and on the Continent—with religious services, decorations, illuminations, fasting, merry-making and the exchange of gifts. Here as there,

"On Christmas Eve the bells were rung,
On Christmas Eve the mass was sung."

On the other hand, we find the early settlers of New England so averse to following the customs of the Church that, not only were Church festivals ignored, but they strove to make their customs in all ways as dissimilar as possible. As proof of this, instance the fact that prayers at funerals were not made until many years after the first settlement of Plymouth Colony.

But the breaking down of sectarian landmarks and the smoothing of the most angular of Puritanic notions once commenced have never ceased. Year after year, fresh inroads were made, and now there is scarcely a village in New England where some of the inhabitants do not, to a greater or less extent, remember the return of Christmas Day and enjoy its social and religious observances.

It is the liberal-minded people of any community, that break away from old associations and make for themselves homes in new sections. The early settlers of our Great West, were, for the most part, New-Englanders—but of that class who could not be bound by the strict discipline of their fathers. They would not reject that which was good, simply because it was received by others; hence we see the celebration of Christmas almost universal in our Western States.

But why do we commend the observance of Christmas?

First for its religious character, on which account we would make its observance universal. From every house of worship of every sect, we would have sung, "For unto you is born a Saviour who is Christ the Lord." On this day we would not stop to split hairs of theological differences. Christ was born; than him no one has ever lived more worthy to be called Lord or Master, and all are ready to sing Christ as a Saviour. One may believe he saves in one way, and the next in another—one by example, another by precept and a third by vicarious suffering on the cross. Let each be fully satisfied in his own mind as to the method, while agreeing that the final result is the same.

The social character of Christmas-tide observance is also worthy of commendation. Americans have too few holidays, and should not fail to properly improve all they have. Christmas should be a holiday and more, in that it gathers together families who by social intercourse on this annual meeting, keep the feeling of kinship bright and active. Let care be gone and mirth and merriness prevail. Let the old be young again, and the young feel their companionship and pleasure, while all unite in best endeavor to make it truly a Merry Christmas.

When or where the custom of making Christmas Gifts was introduced, it may be difficult to determine. We read that the wise men who journeyed from the East, following the star that finally stood over Bethlehem, brought gifts of gold and frankincense and myrrh. It is a happy conceit that this was the institution of Christmas gifts, although it may not bear strict examination. Wherever it originated, the practice is one worthy of approval, although, like many other good customs, it can be abused. It is not the expensiveness of the gift that gives it its chief value. Unless love goes with it, the richest present is best unbestowed, but love gives to the meanest thing a quality above valuation. Remember this in your choosing and you will not choose unwisely.

Even good wishes are not, we trust, without effect in adding to the amount of happiness in the world, and with this end in view, we most sincerely wish our readers, each and all—A Merry Christmas.

TO OUR READERS.

THE RURAL NEW-YORKER is now generally conceded to have reached, under its present management, a degree of excellence never before attained by any other agricultural or horticultural journal and to have secured for its columns the most powerful combination of writers in the world. Its record for the past year is, perhaps, the best guarantee for the next year. Among our present contributors, we may mention the following names, taking for illustration all that our space will permit:

Charles Downing,	Professor W. J. Beal,
J. B. Lawes (Rothamsted),	Prof. Levi Stockbridge,
Rev. A. W. Mangum,	Pres. T. T. Lyon,
Gen. Wm. H. Noble,	Sec'y C. W. Garfield,
Prof. G. C. Caldwell,	Hon. B. Pickman Mann,
William Falconer,	Thomas Meehan,
Professor I. P. Roberts,	Sam'l B. Parsons,
Ex-Gov. R. W. Furnas,	Samuel Parsons,
Professor E. M. Shelton,	Col. M. C. Weld,
Rev. E. P. Roe,	Dr. T. H. Hoskins,
Henry Stewart,	Professor L. B. Arnold,
Col. F. D. Curtis,	Hon. X. A. Willard,
M. B. Batcham,	Dr. F. M. Hexamer,
Prof. R. C. Carpenter,	Nelson Ritter,
S. Rufus Mason,	"Hector Bertram,"
Lester A. Roberts,	Professor E. W. Stewart,
J. J. Meehi (Tiptree-Hall Farm, England),	B. S. Williams (London, England),
D. E. Salmon, D. V. M.	Professor A. J. Cook,
Professor G. E. Morrow,	George Such,
James Taplin,	A. M. Halstead,
L. S. Hardin,	J. B. Armstrong,
E. R. Billings,	W. I. Chamberlin,
L. J. Templin,	Jonathan Talcott,
Prof. Cyrus Thomas,	S. B. Peck,
Mary Wager-Fisher,	Professor J. P. Sheldon, (Cirencester, England.)
W. C. L. Drew,	J. Stauffer,
Annie L. Jack,	J. B. Olcott,
Lorenzo Rouse,	M. Oakey,
Rev. R. H. Crane,	Professor S. M. Tracy,
Professor Elbridge Gale,	M. B. Prince,
G. Marti,	A. M. Van Auken,
W. H. White,	Jane Gray Swisshelm.

Let us now say to our readers that we have many new projects for another year. We shall try, as hitherto, to please them in every way, and would respectfully ask for their influence in the RURAL'S behalf. Such assistance would enable us the better to please them. Nevertheless—in spite of all words—the RURAL NEW-YORKER MUST SPEAK FOR ITSELF. We ask no aid based upon what it is *going* to be, but what it is to-day. Examine it and examine other periodicals before subscribing for another year, and if the comparison be not favorable to us—how can we consistently ask for your support! We do ask, and that only, that you will take the pains to examine it impartially and then—for the benefit of agriculture and horticulture—for the benefit of the country home—SUBSCRIBE FOR THE BEST.

A QUESTION OR SO.

"Disreputable or untrustworthy advertisements: ought conscientious publishers to admit them to their journals? We say no." Thus we expressed ourselves in this office in a conversation upon this topic with a well-known Eastern publisher, a few days ago. "But," said he, "a majority of our most influential journals, both religious and secular" (and he named some of them), "do admit them. To do so is repugnant to every good man. But we alone cannot afford to reject them!"

That wealthy, influential journalists should accept—yes, even solicit—such advertisements is a disgrace to their journals, to themselves, and to the community that support them. The publishers themselves would resent it as an unpardonable insult were they personally accused of lying, of stealing or of swindling—and yet that is just what they indirectly do when they knowingly lend their columns to the encouragement of such frauds—especially as the friends who support their journals are the very people to be defrauded. "Readers have eyes and experience and judgment," says the publisher. "They can judge for themselves." But the fact that these advertisements *pay* the advertisers and that thousands of well-meaning people are swindled out of their money every year, is proof that many *do* not judge for themselves, and it is as much the mission of the press to guard the public against *such* well-to-do swindlers as against those who have not the means to pay for advertising in "respectable journals." In fact, a publisher by knowingly admitting fraudulent advertisements to his columns, enters into a partnership with the swindler, inasmuch as the money paid him for the advertisement is in reality his share of the plunder out of which the confederates have cheated their dupes.

It has been said that it is impossible to determine in all cases whether or not the advertisement is what it professes to be. This is true. It is not, however, the less a publisher's duty to make a reasonable amount of inquiry, just as he would to determine the responsibility of those who ask for credit. With all due diligence, we are aware that the publisher cannot always acquaint himself with the business or intentions of the advertiser. It is against a class of disreputable advertising, so glaring that he who runs may read, that we are speaking, and the publication of which is proof conclusive that the publisher cares not one whit for the well-being of the readers he professes to serve and to enlighten.

"But see here," remarks a friend; "you advertise that you will distribute twenty-five thousand dollars' worth of rare seeds among your subscribers who apply. *That* is *your* advertisement. Is it honest?" We reply—Yes, it is. We have a right to presume that twenty thousand of our readers will apply for our seeds before the distribution is discontinued. We promise to send from twenty varieties a choice of any ten. That would make more than two hundred thousand packets, for we do not know which of the twenty will be selected. Now we *know* that the seeds we offer, if they could be obtained at all, would cost an average of twenty-five cents per packet at retail. They do not cost *us* that, and there is no pretence made that they do, even if we make an extravagant account of our labor for several years past in raising the plants, as well as of the seeds we are obliged to purchase. But two hundred thousand packets at twenty-five cents each would amount to fifty thousand dollars, which is twice the amount which we announce. This "free seed distribution" is offered to *all* of our subscribers the same as the distribution of the cuttings of Pelargoniums and of the beautiful willow, Salix pentandra, which we have made during the year. Even the postage upon these has been divided with our friends, or not charged at all, so that it could not be said by over-shrewd people that this was made a partial source of compensation. So it is with our present seed distribution. The postage costs us (as those receiving the seeds may see) more than we ask. For instance, we charge *two* cents' postage on the Beauty of Hebron. *Every envelope* will be found to have a *three* cent stamp upon it. We charge but *one* cent for the choice of ten varieties of seeds excluding Pearl Millet and Defiance Wheat, while we are obliged to pay *two* cents' postage. The postage on the Defiance Wheat and Pearl Millet costs us the same as we charge. viz., a two-cent stamp. The entire collection of seeds which we are now preparing for the mail would well fill a room twenty-five feet square, while we have already received from the manufacturers fifty thousand envelopes, and the work is probably not one-quarter done. It is work of this kind—work, too, in which we delight—that verifies the words of the Scientific Farmer that "the RURAL NEW-YORKER is establishing a new era in agriculture, and bringing farming out of the rut of the commonplace." We want our readers to place confidence in the RURAL, and we mean to be worthy of it. Doing more than we promise to do and excluding all advertisements which are calculated to do harm are among the methods which we have adopted, and which, if life be spared, we propose to continue. When our acts and our professions are not in reasonable accord, we hope our best friends will give us up. We have only now to add that this business of admitting fraudulent advertisements to family journals which are supposed to hold a high place in the public esteem, is becoming a dread source of evil. "They all do it," conveys the vilest excuse that ever was uttered by a well-disposed person, and we call upon our rural people at this time, when they are about to subscribe or to resubscribe for their papers, to reject all those whose advertising columns show that they need this demoralizing apology.

An Objection Answered.—"I'd certainly like to take an agricultural paper with such a reputation as the RURAL deservedly has, but really just now times are so hard that I cannot spare the money," is a remark repeated to us by a correspondent, as coming from a neighbor whom he has solicited to become a subscriber. On the other hand, an old friend of the paper writes to us by the same mail, "Times just now are so hard hereabouts that we cannot do without the RURAL; for, besides the pleasure and instruction it affords the whole family and frequent visitors, the hints and detailed information it furnishes every week save us many a dollar during the year, almost without our being aware of it; and, moreover, it enables us in a hundred ways, to make a little more money than we should without it, on account of the improvements it is constantly suggesting in the use of fertilizers and the method of doing every kind of farm and household work. If times were a little easier, we might be able to dispense with it; but as we are very hard pushed, please continue to send it for another year.

BREVITIES.

FOWLS want sunshine.

VARY the food of fowls.

A FEW good hens well cared for will egg on the owner to keep more.

FIFTY fowls kept well are more profitable than one hundred that take care of themselves.

THERE is no advice which poultry writers repeat oftener than "Provide pure water daily."

PREVENTION OF ROUP.—Don't compel fifty birds to roost where there is room for only twenty-five.

THE engravings which we present to our readers in the present number, are taken, for the most part, as will be seen, from life.

DR. KENDRICK, of Washington, D. C., lately sold his two-year-old Jersey bull "Elmwood," No. 2322, to Major Decamp, of Liverpool for $2000.

IN two weeks we hope to present the RURAL in a new dress. We do not need it at present, but the New Year is a good time to turn over new leaves.

FLOUR of sulphur for the nests; whitewash for the houses; kerosene for the perches; variety of food and clean runs for confined poultry, are the secrets of successful management.

THERE is no interest that better or more uniformly holds its own than the poultry interest, and there is none on the farm more slighted. That neglected as it is, it should still pay, is good proof that it deserves more attention.

WE have heard it stated that fifteen well-bred fowls well taken care of, will put more money into the farmer's pocket than a good cow. We cannot support the statement by our own experience, though our birds are well bred and well taken care of.

No doubt if the truth were known, success in poultry keeping is due more to good management than to particular breeds of fowls. Many who give first-rate care to their birds attribute to the breed what is due to their care. There is no breed so valuable that it will "do wonders" under bad treatment.

CONTRIBUTIONS, always welcome to our "EVERYWHERE" department, have so multiplied of late months, that by taking out dividing spaces and rules, we shall be able to give the same amount of matter in a smaller space. We invite our friends to incorporate any valuable items of their experience and to make the department, more than ever before, a medium of exchanging views.

"GOING against Nature," with a big N—is there not just a little more than a trifle of cant about this expression? Isn't culture of the earth and its inhabitants, stock as well as men, really "going against Nature?" There is a lot of cant phrases of this stripe, glibly used to convey a very loose indefinite meaning. Is the doctrine of "total depravity" altogether false, and if there is still some truth in it, isn't it man's duty to "go against Nature?

MANY of our subscribers write us: "If I am entitled to any of the seeds, please send &c." All of our subscribers are entitled to a choice of any ten, and highly welcome to that choice. We hope that these seeds will give great satisfaction. Many of them have never been offered before, and, indeed, it has not been generally known that several of the hardy shrubs mentioned, could be raised from seeds at all by inexperienced culturists, or, perhaps, by others.

IN the last issue of Wallace's Monthly, is an article under the caption, "Why Horses Go Blind," credited to "The Farmer," but which originally appeared in the RURAL NEW-YORKER of September 21. As there are half-a-dozen different "Farmers" with various cognomens, and as the article was extensively copied, it is impossible to determine which of them appropriated it as an original contribution to its columns and thus stole the credit due to this journal. Thefts of the same kind, however, happen so often that we call attention to this one merely to point out that through such dishonesty even so excellent a periodical as the Monthly may unintentionally be led into an injustice.

Literary Miscellany.

MERRY CHRISTMAS!

HEAP on more wood!—the wind is chill;
But let it whistle as it will,
We'll keep our Christmas merry still.
—[*Scott.*

Then Christ was born of Mary free,
In Bethlehem, in that fair citie,
And angels sang with mirth and glee,
In Excelsis Gloria!
—[*Carol in Harleian MSS.*

Bring holly leaves of polished green,
The Christmas feast is bravely set;
And over all the earth, I ween,
The countless Christmas guests are met.

All glory to God,
Who laid by his rod,
To smile on the world through his Son,
And peace be on earth,
For this wonderful birth
Most wonderful conquests has won.
—[*Worcestershire Carol.*

Adeste fideles,
Læti, triumphantes,
Venite, venite, in Bethlehem;
Natum videte
Regem angelorum;
Venite adoremus,
Venite adoremus Dominum.
—[*Old Hymn.*

Carol, carol, Christians,
Carol joyfully;
Carol for the coming
Of Christ's nativity,
And pray a gladsome Christmas
For all good Christian men,
Carol, carol, Christians,
For Christmas come again.
—[*Arthur Cleveland Coxe.*

A CHRISTMAS EPISODE.

T. S. G.

ONE bright morning, a few years ago, great excitement prevailed in the office of the Philadelphia City Bank. Yet the bank had just declared a fat dividend of fifteen per cent. for the half year. Shareholders were contented, and god Mammon seemed to cast a favorable eye on the welfare of the old and thriving corporation. However, a mutinous feeling of discontent was plainly visible upon the faces of the thirty odd employes, who swarmed like bees into the hive every week-day morning for the purpose of manufacturing the golden produce that delighteth the souls of distributing directors and radiant proprietors. The shoe pinched somewhere! Where was it?

The following notice, circulated for the perusal of each clerk, contained the secret of the unwonted gloom:

"Every gentleman will be required to remain at the banking-house two Sundays in the year, to assist in guarding the premises. By order,

"J. SPOFFORTH, Secretary."

Here was a revolution—a *coup d'etat* indeed! Six days we should labor, but the seventh did not belong to the City Bank. The gilding of a little extra pay might have made the pill easier to swallow, but on this point the notice was discreetly reticent. In the end, after a few days of conjecture and excitement, every one quietly resigned himself to his fate, as black and white slaves are bound to do all the world over.

I had been ten years in the Bank, and received a salary which, though not magnificent, was sufficient to support in comfort a young wife; and very happy we were in our snug retreat at Wood Green. Of course we both thought it extremely hard to be separated even for two Sundays in the year, still we soon saw there was nothing for it but submission.

Now, though I, in common with others, rebelled against the forcible seizure of the Sunday's rest, yet it must be owned there was some reason for the extraordinary innovation. The strong-rooms of two neighboring establishments had been attempted within a fortnight, and a boy carrying bonds in Broad Street had been decoyed away and the securities stolen. But, worst of all, some pilfering had been going on for months in our own bank. Stamps had disappeared to an alarming extent. Clerks had missed money from their coats, and now and then the garments themselves were spirited away. Traps had been carefully laid, and a detective spoken with; but as yet the rogue was not discovered, and an uneasy feeling was rife among us all.

The bank boasted of four porters or messengers, one of whom (the chief) lived rent free in premises that nearly adjoined the building. He was a long lean man named Bennett, with a parchment face and a goatee beard. He was quiet, well up to his work, and high in favor with the authorities. Of the remaining three one had been a grocer's boy, and the other was a farmer's son, both honest creatures, but of no importance in this narrative. The fourth was an ex-policeman named Lance, a blunt, pleasant man, much given to relating queer stories of his former life, and not averse to a pot of beer for his trouble.

Eight weeks had passed since the official notification, and as Christmas approached I was notified that I should have to keep guard that day, and a most unpleasant prospect it was. During the week preceding, the mystery had become still more intensified by the unaccountable disappearance of a one hundred-dollar note, and matters began to assume a very grave aspect.

On arriving at the bank, the door was opened by the night watchman, who remained in the building all night, and vanished with the early morning on the arrival of the porters to open the doors. A few minutes afterwards Bennett walked in, accompanied, to my joy, by honest old Lance, whose wonderful stories I fondly hoped would help to relieve the tedium of a long, dull day; then, without more ado, I proceeded to make my first round. Preceded by Bennett with a lighted taper, I marched up-stairs, through every room and office, across perilous planks and up dangerous ladders, till we gained the trap-door which opened on to the roof; then down again to the lowest abysses of coal-cellar and strong-room, looking in vain for some concealed burglar, who however was conspicuous by his absence. Very minutely did I examine and try the drawer, which had already been tampered with, as I knew it contained, besides stamps, a large sum in gold and notes. No—it seemed firm and safe, and would take "a deal of work," as Bennett remarked, holding his taper close to the lock. Lance, too, had a good long look at it, and expressed the same sagacious opinion as his colleague.

Our first visit ended—and I was expected to patrol at least three times in the day—the two portors went down to breakfast, and I adjourned to the manager's room, leaving the door partly open, so as to be able to see all round the bank. I lit a cigar, and, ensconcing myself comfortably in a managerial arm-chair, prepared to stay the two hours which intervened between the cessation of the church bells and luncheon-time. Suddenly old Lance appeared again at the half-opened door, and spoke in this wise:

"'Scuse me, sir, but I've been a pleaceman, and I don't think that lock's all right."

"What lock, Lance?" said I.

"That there drawer with the stamps, sir."

"Well, let us look again."

So saying, we both went to the counter which contained the drawer, and Lance pointed out some small scratches on the lock, and a slight indentation in the woodwork surrounding it.

"That's a chisel if I die for it!" said the ex-policeman.

"Oh, thunder! You don't mean it?"

"Sure of it, sir."

"Well, let's have Bennett up-stairs and hear what he thinks of it."

Angry at being disturbed at his breakfast, the head-porter came grumbling to the place where I stood, and, bending down to the lock, impatiently inquired if it was not a deal more likely the cashier had scratched it in the course of business. After a few minutes' further inspection, he looked up with a knowing smile.

"I believe Lance is right now; it looks so fresh, I shouldn't wonder if the watchman knew something about this."

"Perhaps so," said I; "what do you think, Lance?"

"Well, he looks honest enough—but looks ain't always a guide," said the man quietly.

"Then I'll stop in the bank to-night, and see if I can trap my gentleman," exclaimed Bennett, "if you'll leave me the key."

"I can't do that," I replied, "but I shall report the fact to the manager the first thing in the morning."

"As you like, sir," he assented reluctantly; and they both returned to their long-neglected meal.

Again I retreated into my den, this time with the proud consciousness of having something important to relate when the next morning should see the stream of busy workers once more settling with books and papers and filthy lucre generally. One—nay, two cigars—did I consume down to the last half inch, read Byles on Bills nearly through, in default of more cheerful literature, and I am afraid a tiny doze must have ensued, as I was awakened by Bennett's voice close to me asking what I would take for luncheon. Mechanically I fixed upon the hackneyed chop, and with it a pint of ale, to be fetched from a neighboring eating-house that deigned to open for a couple of hours. While he was gone I took the opportunity of making my second round, and found nothing but peace everywhere, with the slight exception of being startled by the sudden appearance of the bank cat from the cavernous depths of the enormous coal-cellar. Eventually I returned to my room, and found a succulent chop smoking upon the table, flanked by a pewter pot of foaming ale, which, on tasting, I found unusually soft and creamy—indeed I fancied I could detect a peculiar aroma in the grateful beverage which seemed to make it more than ordinarily palatable; anyhow I thoroughly enjoyed the repast, and when an intensely slumberous sensation crept through all my veins, my strongest effort of will proved insufficient to keep me awake. While I was still struggling against the impulse, Lance came in to inform me that he was going out to dine at his home close by, while Bennett was left on guard below. As he closed the door behind him, my eyes shut, and I fell asleep, but only, in a few moments, to be reawakened by his voice again addressing me.

"I don't think I'll go out to dinner, sir," said he, gazing at me with a strange expression.

"Why not!" quoth I drowsily.

"Well, sir, I don't feel very bright to-day, and I'd rather stop indoors; and if you'd be so kind as not to mention to Bennett as I've come back. But you don't look very well yourself, sir, just now?"

"Lance, that ale has made me most confoundedly sleepy!"

"Well, have a bit of a nap, sir. I'll see the place is all right—only I don't want Bennett to know I'm here."

"All right, all right," I replied, rather shortly, for I wanted to be left to myself; yet I was somewhat surprised at his wish for concealment in so trivial a matter.

Again I saw the man pass out and partly close the door, and once more I drifted into a heavy but pleasant slumber. Soon I was a denizen of dreamland, and a sharer in its grotesque and fantastic imaginings. I thought I was clinging to the telegraph-wires that stretch like webs over the town, and performing thereon athletic feats in impossible positions; then I flew through the air towards my home at Wood Green, spinning, as I went, a thread of wire by which to return—a useless precaution, as I was at once transported to the desert of Sahara, where I found myself on a camel's back careering across the burning plain. But in my dreams the face of the camel was the face of the ex-policeman Lance, and ever and anon strange grating noises seemed to be borne past us on the wind. The pace began to slacken and, as I spurred on my steed to fresh exertions, I seemed to feel the prick of the rowel in my own flesh. It became sharper and more painful; and gradually camel, desert, chase, faded from my vision, and the bank once again dawned on my awakening senses. But, though my aerial steed and his surroundings had all disappeared, the spur unaccountably enough remained, as my nether limbs were painfully reminding me.

It was no dream this time—I was wide awake. Quickly glancing round, I discovered Lance crouching down beside my chair, and vigorously applying a pin to the calf of my leg. To this proceeding I was about to enter an indignant protest, when a significant gesture warned me to remain mute. His face was white with unwonted excitement, as he rose noiselessly to his feet, and beckoning me to the small aperture in the wall used for the transmission of books and papers between manager and clerks, bade me look upon a spectacle that made each individual hair upon my head to stand erect. The drawer containing the stamps and gold was being tampered with before my very eyes in broad daylight. Stooping down with his back towards us was a man softly but swiftly forcing the lock with a chisel. But the man—the thief—who was he? I knew at a glance that long lean form. It was Bennett. We both shrank back.

"Take off your boots, sir," he whispered in a low voice. I noticed that his own feet were shoeless. "Creep round outside the counter, and wait till I give the word—then over and help me."

I nodded assent; and then I saw Lance crawl out upon hands and knees into the office, behind the shelter of a long high desk, at the end of which he would be within a few feet of Bennett; I crept away to the other entrance of the manager's room, which led into the large space appropriated to the public, and, gliding noiselessly along, I arrived where I knew I must be opposite the thief at his work. Click, click, went the chisel against the brass lock. It was apparently a work of time and difficulty, though the sound of crushing woodwork betokened the near accomplishment of the deed. How long the time seemed! Had Lance been able to get close to him undiscovered? I judged so, as the chisel still continued its grating work. Sometimes it stopped for a moment, and then I knew that the man was watching the door of the manager's room, to see that I was safe under the influence of the narcotic administered in my pint of ale. Click, click, crunch! and the whole lock appeared to come away, the drawer being at the same time drawn softly open. "Now," thought I, "here goes."

Not yet! I could hear the mellow chink of the small bags of gold as they were hurriedly transferred to the man's pockets; then the stiff rustle of many sheets of stamps told of a like destination. I listened breathlessly. Suddenly there was a yell of mingled fright and rage, and, vaulting at one bound across the counter, I saw Bennett falling backwards, his throat clutched by the practised hands of the ex-policeman, who held on with a will, having sprung on him silently from behind. The half-strangled man struggled like a fiend, dealing me several ugly kicks with his long legs as I attacked him from the front. But the odds were too many, and furthermore he had been taken by surprise; in a few moments he was overpowered, and his hands and feet were securely fastened. Not a word had been uttered since the commencement of the conflict, but now Lance looked up and said in a stern voice:

"Got the scoundrel at last—next thing's a pleaceman. Will you go, sir, or shall I?" Here there was a fierce attempt to free himself by the prostrate thief. "Perhaps I'd better stop with him," continued Lance; "you'll get an officer in a minute at the station in Seventh Street."

Seizing my hat I was off in a twinkling, and returned in double-quick time to the bank, accompanied by a stalwart member of the city police. A few moments saw the policeman, myself and our chapfallen prisoner marching quietly to the station, where I made the charge and left him to the solitude of a cell until the next morning. On my return to the bank the night-watchman had arrived, and I prepared to go home.

"Why, Lance, you must have suspected the beggar before this?" I exclaimed.

"I've thought of it sometimes, sir," he laughed. "Knew I should cop him some day." Then, with a frown—"mean, sneaking skunk! I believe he meant to try to put it on me or the watchman here."

"Well, all's well that ends well, Lance, and it was a clever catch of yours. We have a nice story for Mr. Spofforth to-morrow. Good night."

"Good night, sir."

When I walked into the bank next morning, I found the story was already known. Little knots of men were eagerly discussing the event, and I as well as Lance soon became the center of an animated crowd. At eleven o'clock I was summoned to the board-room, to the Committee of Directors, who complimented me upon the capture, as if I, and not Lance, had been the hero of the day. In the morning newspapers there was a graphic account of the "Great Bank Robbery," concocted by some ubiquitous penny-a-liner, which my wife read and re-read with mingled pleasure and alarm. Bennett was eventually sentenced to eighteen months' imprisonment, which we all considered far too lenient a judgment. The ex-policeman came in for the head-messenger's berth, with a house rent free and a present of two hundred and fifty dollars. In addition to much very unmerited praise, I received a bonus of five hundred dollars, which contributed in no small degree to making the Christmas time at Wood Green a "merry one," after all.

WEAKER THAN A WOMAN.

CHAPTER XVI.

(Continued from page 798.

She tried to think, but she could not; the only thing she could remember was that she might be Lady Chevenix and mistress of all she saw, if she liked. What would people say? They had spoken of Sir Owen almost as though he were an inhabitant of a brighter sphere. She had heard his probable marriage discussed almost as an arrangement of State; no one under the rank of Lady Rolfe's daughter had ever been thought of for him—and now he had asked her. She had heard the future of his wife, when he should have one, discussed many times—how she would go to Court, and be one of the high ones of the earth because of her husband's great wealth; and now this honor had fallen on her. How wonderful it seemed! Of course she must not talk about it; but before she finally refused him she would like certain people to know what a brilliant offer had been made to her—people who had not always treated her as their equal.

The boat was touching the shore, and a dozen hands were stretched out to assist her. It seemed to her only a few moments since they had started, yet they had been all around the lake. She looked up with a bewildered smile at her companion as he spoke a few polite words; he seemed to know by instinct then that this girl had chosen the boat as a kind of refuge. Then Sir Owen came and claimed her—she must have some refreshment—and he remained by her side until the round red sun set and the *fete* was over. She watched it sink behind Larch Hill, and she felt that she would never see its crimson light again in the sky without remembering what had been said there.

There was an hour for rest before the dressing for the ball began.

"If you are wise," said Lavinia Rolfe, "you will try to sleep for an hour, and then have some tea—that will restore you after the fatigue of the day."

Violet followed her advice; she lay down to rest; but how could she sleep? Through her heart swept unceasingly the same refrain—"I could be Lady Chevenix, mistress of all around, if I choose but I hold my lover's life in my hands."

Would it be a great sin, a grievous wrong, to break such a promise? Then she reproached herself for even entertaining the thought. Of course she would keep her promise to Felix; but in the meantime there could be no harm in thinking of what had happened and how wonderful it all was.

She looked exquisitely lovely when she was dressed for the ball. Admiring eyes followed her every movement. It was agreed that the beautiful girl in white and silver, with a crown of silver leaves, was certainly the belle *par excellence*. To Violet the ball always remained more of a dream than a reality. She remembered her wonder at her own loveliness, the homage paid to her, the half-subdued murmur of wonder when Sir Owen opened the ball with her, and then the significant glances that said plainly, "We can all see what this means." She longed to say, "There is nothing in it—I am going to marry Felix Lonsdale. I am only queen of the *fete*, and my reign ends with it." But she could not, so she played her part gracefully; it was all to end so soon, and then it would speedily be forgotten. She might just as well enjoy herself while she was there

She was so brilliant, so gay, so enchanting, that Sir Owen grew every moment more hopelessly in love with her. People could think what they liked about Violet, but there was no mistake as to him—not the least in the world; he was quite lost; he saw and thought of nothing but Violet. Every one agreed that the ball was worthy of the *fete*. To Violet it was a long dream of homage—the most eligible men in the room surrounded her—she was besieged by would-be partners.

Sir Owen took Violet down to supper—the grand supper served by Gunter, which was in itself a wonder; and then they danced until the sun rose in the eastern sky. Sir Owen went to Mr. Haye.

"I will do myself the pleasure of driving you home this afternoon," he said, "if you will not spend another night here. I have something to say to you before you go."

CHAPTER XVII.

"If I had been Mephistopheles himself I could not have managed better," thought Sir Owen, as he watched the three visitors who were of such vital consequence to him. "Seeing I have had just what I wanted all my life, it is not likely I shall begin to go without it now. After all, what is a promise of marriage? What does it mean? People break them every day, and every day they are broken for them—loss of fortune, loss of health, a hundred common-place reasons—loss of fancy—all make a promise of marriage null and void. Such a man as this Lonsdale had no right to ask a girl like Violet Haye to sacrifice herself to him. It is a privilege of a rich man to win for himself such beauty as hers. So far from doing a bad action, I am doing a good one in rescuing this beautiful girl from poverty and obscurity. What is a broken promise? She has said she will marry him—she finds that she has made a mistake, and alters her mind. If any one sees wrong in that, I do not know what wrong is."

These reflections were caused by a simple remark made by Captain Hill. He had said—

"Has any one told you, Sir Owen, that Violet Haye is engaged to marry Felix Lonsdale?" And the Baronet's answer had been a muttered curse.

He had believed himself in such a lofty position that he could do as he liked without comment, but he found it was not so. The girl whom he was so madly pursuing, whom he had sworn to win, come what might, was engaged to another man, and people would make their own comments about the matter. So he reasoned and argued with himself—and to himself his ideas seemed excellent—that honor was simply a dead letter—it did not exist; it was a virtue to be subordinated to convenience—a promise was mere empty words, with no meaning, and he consoled himself by trying to believe that he was doing good rather than harm. That Violet would ultimately refuse him he did not for one moment believe. No woman, he argued, could be proof against such temptations as he offered.

This was the day on which he had promised to take Violet and her parents back to the Limes. He was very unwilling to let them go. "They will have that handsome young lawyer about the place again, and all the good I have done will be undone," he said.

But Mrs. Haye was even more worldly-wise than himself—she declined to spend another evening there. He had ordered a dainty luncheon to be prepared for them in a charming little anteroom known as the Star Room—it bore that name because it was one blaze of light, through the number of its mirrors, girandoles and lusters. When the sun came through the eastern window, and lighted it, the effect was something magnificent. If he had hoped to dazzle them with a fresh exhibition of his wealth, he had most certainly chosen the right way.

The luncheon was laid on the table, elaborately spread with handsome plate, rare wine, costly fruit—every luxury that could gladden the heart of man. When Sir Owen sat down with them, Mr. Haye expressed his regret at leaving so magnificent and hospitable a house. His host looked up with a slight laugh—a keen observer would have seen that he was agitated.

"I am glad you like the place," he said. "I have been asking your daughter to remain here."

A warning touch from his wife told Francis Haye that he was to remain silent. She looked at and addressed Sir Owen.

"I do not understand you; how could Violet remain here without us?"

"As my wife, Mrs. Haye; if she will only consent, Garswood and its master, with all that it contains, shall be hers."

Mrs. Haye rose slowly and drew her shawl round her shoulders.

"You are very kind, Sir Owen," she said dryly, "and I am sure that Violet must be quite flattered by your generous offer; but—she has promised, I believe, to marry Felix Lonsdale."

"That promise should not bind her," he cried eagerly; "it was won from her under false pretenses. It will be a crying shame if you allow her to keep it."

"So I think," said Mrs. Haye, as she drew on her gloves; "but I am quite powerless in the matter." Nor would she hear another word.

She hastened their departure, and Sir Owen left his other guests to drive them home.

In this case as in others Mrs. Haye showed herself to be a woman of more than ordinary intelligence. An average woman would instantly have taken Sir Owen's part—would have done her utmost to induce her daughter to break her promise—would have railed against Felix. Mrs. Haye was far too wise—to take that course would be to confirm Violet in keeping her word. She understood women—she knew that, if she opposed her, Violet would take refuge in making hers it an interesting martyr; whereas, if she and her husband remained passive, and allowed her to see just what she might have and what she might lose, Mrs. Haye had no doubt of the result.

Sir Owen remained at the Limes with them an hour or two, and it was Mrs. Haye who reminded him that his guests were waiting.

"I do not care for my guests," he said—"I care only for you. If you will not go back with me you must let me stop here;" and she had great difficulty in persuading him to go.

Not one word about Sir Owen was said to Violet after his departure.

"Leave it all to me, Francis," said Mrs. Haye to her husband; "if you interfere you will mar all. Leave it to me, and do not utter a single word."

He obeyed, well pleased to have no responsibility in the matter—he did not like the idea of a broken promise.

Violet had expected expostulations, reproaches, persuasion. She could hardly realize the silence; then she came to the conclusion that her parents must have thought that Sir Owen was joking, and her dignity was somewhat wounded at the notion.

Later on in the evening Felix came, and she saw that he looked anxious, worn and haggard. Mrs. Haye had never received him more kindly. Mr. Haye was tired, and had gone to his own room. Mrs. Haye made Felix sit down with them, and began to talk to him about his father, his family, the business, and his prospects.

The simple, noble-hearted young fellow opened his whole heart to her; he told her all his sorrow and distress about his father—how he had been cut, and had met some one who had spoken to him harshly in respect of the will case, and the consequence had been a severe relapse.

"The fact is," said Felix, "that my father is breaking his honest heart, Mrs. Haye."

"It is very sad," she returned—"very sad and very hopeless."

"Yes—it is almost hopeless," agreed Felix; "it seems as though the very spring of his life were gone. I know what would be the only thing to cure him. It would be if all his fellow townsmen—all his old friends—met together and did something to prove that they had confidence in him; something of that kind, proving to him that he is respected and esteemed, would be the only way to cure him."

"And that will never happen, of course," said Mrs. Haye.

"I am afraid not; but it is the only thing to save him. Dear Mrs. Haye, you are very good to listen to me—I ought not to bring my troubles here."

Mrs. Haye looked kindly at him.

"Of course," she said, "if he gets no better, the maintenance of the whole family will fall upon you, Felix?"

"Yes," he replied, "it will fall upon me; I cannot desert them—I must work for my mother and the little ones."

"In that case, my poor boy," she asked, "what will you do with a wife?"

He knelt down by Violet's side, and took her hand in his; he kissed it with a passion that could not be told.

"What shall I do with a wife?" he cried. "Ask me rather what I shall do without one. My wife will be my haven, my rest, my hope, my refuge—will give me courage and hope and fortitude; she will give strength to my mind, my heart, my brain; my wife will be the whole world to me."

"Yes," agreed Mrs. Haye gently; "but, Felix, how are you to keep her? How is she to live? You could not take a wife home to Vale House, to an invalid father, a step-mother, and all those children."

"No; I should make a home of my own," he replied. "Ah, you do not know how I love Violet—how I should work—how I should toil day and night for her! I must keep both homes." Then he looked up into Violet's face. "You would help me, my darling, would you not? You would dispense with luxuries for a time—only for a time? You would be the nerve of my arm, the strength of my soul. You love me enough to help me over a few troublesome years, and then fortune will smile on me. You love me enough for that, sweet heart?"

"Yes, I love you," she whispered.

Mrs. Haye rose from her seat and said she must go to her husband. She left Felix kneeling at her daughter's feet; when she was gone he buried his face in the silken folds of Violet's dress; he kissed her hands, he called her by every endearing name.

"It has seemed to me like an eternity," he said. "Oh, Violet, sweet, you must never go away from me for three days again! Every hour has seemed a year long. Let me look into your eyes, and see if you love me as you did when you went."

"Yes, just as much," she said.

"And all the luxury, the pleasure, the admiration, have not robbed me of one beat of your heart?"

"No, not one," she replied.

"Oh, true heart—oh, dearest love, how Heaven has blessed me in giving you to me! How selfish it seems of me to have brought my troubles here to you, just as you have come from such a bright world!"

"I have a right to bear your troubles," she said; but her eyes dropped half sadly before his. She said to herself, "Dear Heaven, how will it end?"

"You are all the world to me!" he cried, passionately. "I have but you, Violet. It seems to me all a blank where you are not. I work for others, and I love them; but you, my wife that is to be, are my hope and my refuge; you are the sun of my life—without you——

She laid her hand gently on his lips.

"We will not talk of that," she said; and once more, with all the deep passion of his heart, he kissed the silken folds of her dress—the sweet hands—the tresses of golden hair.

"My love is a garment that enfolds you, sweet," he said. "The ground on which you stand is sacred to me; the breeze that kisses your face is sacred too. I would make my love a shield and a buckler for you. Oh, Violet, it is almost a terrible thing for a man to love a woman as I love you! Will you tell me now about the *fete?* Did not every one envy me? And tell me, my darling, did you keep me in your memory?"

Then came to her the memory of Larch Hill and the fiery temptation she had battled with there; but she answered him——

"Yes, I remembered you the whole time;" and he clasped her in his arms.—[To be continued.

THE UPAS TREE.

W. FALCONER.

Most people have read of the deadly Upas tree of the Indian Archipelago, and the story that neither animal nor vegetable can live in its awful presence. But that is a false statement. The Upas tree is indigenous to the forests of the Philippines, Java, and neighboring islands, where it attains a hight of from 70 to 110 feet. It is shaped somewhat like a lanky umbrella—with a tall, naked and rather slender trunk, surmounted by a thick crown of horizontally disposed branches, that are densely furnished with laurel-shaped leaves, which, together with the young shoots, are covered with rusty hairs. Birds and other animals get into its branches with apparent impunity, and its proximity to the dwellings of man has no evil effect whatever. Nevertheless the tree is virulently poisonous. The tree when pierced exudes a milky juice, which, mixed with certain other ingredients, is used by the Malays as arrow-poison, and most fatal it is to any animal it strikes.

The Upas tree belongs to the same group of plants as do the Bread Fruits, which are so highly prized for their fruit and timber, and so extensively cultivated both in the East and West Indies.

The following fabulous story in connection with the Upas tree is told: Some 90 years ago, Dr. Foersch, a Dutch (Holland) surgeon, living in Java, described the tree as growing in a desert with no other plant near it for a dozen miles, because the exhalations it emitted so contaminated the atmosphere that neither plant nor animal could approach nearer to the Upas without suffering the penalty of immediate death. He also speaks of criminals condemned to die, being given the alternative of being executed or of going to the Upas tree to collect some poison, when, if they returned alive, they were pardoned. Though furnished with every precaution, only an average of one in ten returned. On account of civil dissentions some 1,600 people were compelled to reside within fourteen miles of the Upas trees, and in less than two months only 200 remained alive "There are no fish in the waters, nor has any rat, mouse or any other vermin been seen there; and when any birds fly so near this tree that the effluvia reaches them they fall a sacrifice to the effects of the poison." These and many other ridiculous stories, as false as they are novel, have been circulated at the expense of the Upas tree. In the face of all these absurd stories not only is the poison sought after and used, but even the fiber of the bark of the tree is made into cloth by the natives. And it is asserted, that the flesh of animals killed by Upas poison may be eaten with perfect safety.

The foundation for many of these fables, however, consists in the existence in Java of certain low valleys connected with the many volcanoes of the island, whose atmosphere is so charged with carbonic acid gas emitted from crevices in the ground, as to destroy animal and vegetable life. And the Upas tree can no more exist in such places than can other trees.

When I was engaged in the Royal Botanic Gardens at Kew, one of the foremen was relating to us the ridiculous stories of the Upas. Before that time, however, the Upas and I had been old acquaintances; consequently, I told him that such stories were glaring falsehoods, and in proof of my assertion I bared my breast, plucked a leaf off of the Upas tree beside us and kept it for several minutes close to my skin, and I am living still! Had I been sweating copiously at the time I would not have done it, and I was careful not to let the milky juice touch my breast; but I took no precautions against my hands.

There is a Upas tree in most botanic gardens, and they are handled, cleaned, watered, moved about and repotted with seeming indifference. We have one here (Cambridge, Mass.,) and on its account I often wish Americans were as superstitious as Malays—but they are not. No sooner do their eyes catch the name of the Upas tree than they stop to examine, ask a few preliminary questions, and then "Could you not spare me just one leaf?" And not till it is carefully rolled up in paper or handkerchief do they ask: "Do you think it will *poison me?*" I sometimes wish they would ask that question before the leaf is plucked, but they never do.

A TRIUMPH OF ART.

On the Peacock Island in Potsdam we find among the white marble statues an image of Rachel, the celebrated French tragedienne, placed there in memory of her triumph over a monarch who had been by no means friendly disposed towards her. We mean Nicholas, emperor of Russia, whose dislike to her had been caused by her republican sympathies and turbulent sentiments, which he abhored, and on account of which he had prohibited her entrance into Russia; he is even known to have said that he wished never to have set eyes on her. This inclement verdict of the powerful monarch was no small stumbling block in the great tragedienne's way, for Russia is a mine of gold; foreign artists and many a Rachel and Patti of our days might relate wonderful, almost fabulous tales of costly gems raining down upon them on the stage amid the enthusiastic cheers of an enchanted audience.

Therefore, Mlle. Rachel was highly pleased when in the summer of 1852 she received an invitation to act before the court at Potsdam, where the Emperor Nicholas was just then staying as the king of Prussia's guest. The famous actress had been desired to recite several scenes from French plays, but neither in costume nor in company of other actors. She, therefore, arrived attired in black, the most costly lace covering her beautiful arms and shoulders; but the gentleman who, by the king's orders, was at the station to receive her, expressed his doubts whether the royal and imperial party would not object to so melancholy and mournful an apparel; and on reaching the palace the artiste was kindly invited by the late Princess Charles (sister to the Empress Augusta and wife of the emperor's brother) to wear a few gayer-looking things of her own. Such an offer could not be refused, and Mlle. Rachel appeared in the garden adorned with roses. On inquiring for the stage, she was told that there was none erected, and that she was expected to stand on a grass plot in front of the seats of her noble audience. This demand roused her quick temper, so that she was on the point of returning to Berlin, when her official attendant, the above-mentioned gentleman, pacified her by remarking that she would be on the same level with the audience; that her art would prove the greater for the want of any stage apparatus and (last, but not least) he reminded her of how much was at stake—an enormous honorarium and perhaps the repeal of that fatal interdiction. After a moment's hesitation and a struggle with herself, Mlle. Rachel took her cicerone's arm and suffered him to lead her to the spot destined for her performance.

The evening was lovely; the moon, half hidden behind a group of poplars, threw her silvery light on the pond and the gently murmuring fountain. A few torches and lights illuminated the face of the artiste, while the court sat in the shadow. Deep silence ensued upon her appearance—one could hear the crickets chirp—and then she began her orations. The listeners seemed spellbound, that was not human speech, it was music dropping from her lips. She was determined to be irresistible; and she succeeded so well that even the hitherto unfriendly emperor himself, won by her art, rose from his seat when she had ended, and meeting her half way, kissed her hand in presence of the assembled court, assuring her that henceforth she would be welcome in Russia.

What were the praises, flatteries and congratulations of the others who were crowding round the happy artiste, compared to the homage rendered to her by the mighty ruler of Europe's vastest country—the monarch from whom a sign ordered thousands of his subjects to be or not to be?

Thus was one of the greatest autocrats in Europe won over by the acting and elocution of—a woman.—[*Chamber's Journal.*

PAUPERISM AND EXTRAVAGANCE.—The case, *prima facie*, is always against a pauper. The accidents of life sometimes cast a man or a woman high and dry upon the sands of a helpless poverty; but usually pauperism comes through a lack of the prudential virtues. It is not always that a pauper wastes his revenues in drink, or other immoralities; but somewhere in his career, forty-nine times in fifty, it will be found that he has been extravagant; that he has not exercised self-denial under temptation; that he has lived up to or beyond his means, or has ventured upon risks that the lowest grade of business prudence would condemn. Now who is to bear the penalty of these sins and mistakes? How are they to be prevented in future, if those who commit them, regardless of consequences, are to be coddled and taken care of by those who have denied themselves and laid up a little wealth?—*Scribner's.*

MAGAZINES.

SCRIBNER FOR JANUARY.—The paper on Old Maryland Manners, by F. B. Mayer of Annapolis, is an interesting reproduction of the quaint and stately times of the Maryland Gazette, and of the Tuesday Club, to the whims and oddities of which considerable space is devoted. The Tile Club at Work, by W. F. Laffan, describes the methods of an association of artists and others, whose work speaks for itself in the illustrations, which include drawings by E. A. Abbey (a tiled mantelpiece), W. M. Chase, Hopkinson Smith, Winslow Homer, Alden Weir, Reinhart, Quartley, Wimbridge, Laffan and Paris, and a tile in relief by O'Donovan, the sculptor. A companion paper, The Tile Club at Play, is to appear in the Midwinter number, with a large variety of illustrations.

The serious side of the holiday season is touched upon by the longest contribution in the number, a paper on Leonardo da Vinci, by Clarence Cook, who considers his subject as both painter and mechanical inventor. Among the cuts are two important blocks by Cole: the well-known Last Supper, and the Head of Christ, supposed to be a study for its central figure. The Mona Lisa, by Henry Marsh, is considered to be one of the finest blocks. There is also a Christmas ballad, Biorn the Bold, by Constantina E. Brooks, with a large drawing by Mrs. Mary Hallock Foote, which opens the number. Other illustrated papers are The Mountain Lakes of California, by John Muir, author of The Wild Storm, Douglas Squirrel, etc., with drawings by Thomas Moran; and At the Old Bull's Head, by C. C. Buel, a picturesque description of the famous cattle and horse market of New York, with sketches by Kelly and Muhrman. Haworth's contains a humorous scene from the Brierley family and the plot is rapidly carried on.

Of the unillustrated matter there are two stories: Century Plants, by Miss Isabella T. Hopkins, light and fanciful; and Nion, by Miss Annie Porter, a pathetic story of New Orleans. The sixth installment of Boyesen's Falconberg; papers on College Hazing, by C. F. Thwing: and The Amendment to the Patent Law, by the Secretary of the Western R. R. Association; and Mr. Bayard Taylor's Epicedium, on the death of Bryant,—are also given. Other poetry is by R. R. Bowker, Amanda T. Jones, the late Richard Realf, and R. W. Gilder.

In his department, Dr. Holland discusses Religion in these Days, Art as a Steady Diet, and Popular Despotisms, Mrs. Oakey's Hints to Young Housekeepers are continued in Home and Society, the special topics being the engagement, treatment and duties of servants. Culture and Progress contains, besides the reviews, a paper on the Second Loan Exhibition, with suggestions of interest to those who may wish to organize similar projects in smaller cities. The World's Work department is especially interesting, and among the appliances described are a wonderful Machine for Measuring Plane Surfaces, a New Electric Lamp (others to be described hereafter), Hydraulic Fire-Escapes, New Insulated Telegraph Wire, etc., etc. Bric-a-Brac is fanciful, humorous and satirical.

DEMOREST'S MAGAZINE for January 1879 appears in a new dress, and wonderfully pretty and appropriate it is too. A full-page illustration in oil, entitled Something for Ou ornaments the first page; this is followed by a fac simile of an etching by P. P. Rubens. First steps (a full-page cut) and illustrations of fashions in costumes, jewelry and fancy caps, complete the pictorial part of the number. There are two serial stories and seven short ones. Then there are some interesting sketches about Higher Education and New Year in Japan. The Editorium has a word to say about Church Fairs, Etching, Making Home Pleasant, Country Kettledrums, A Few Words About Toys, Decorative Novelties, Afternoon Teas, New Year's Receptions, Winter Readings What Women are Doing. Then there are the Kitchen, under which head now and palatable recipes are given—and Domestic Science, where one may learn how to treat the various ailments which fall to the lot of mortals. All this is exclusive of the fashion intelligence which takes up over nine pages. The Women's Club and the Correspondents' Class afford the subscribers ample opportunity to exchange views and information.

SONG OF THE CAKES.

With features heated and red,
With head that throbs and aches,
A woman stands in passionate dread,
Turning buckwheat cakes.
Bake! bake! bake!
In autumn, winter and spring,
And still with a voice of tremulous quake,
She but of the cake doth sing.

Beat! beat! beat!
While the batter is foaming high,
And bake, bake, bake,
Till it seems our men must die!
It's oh! to eat the most
Along with the glutton and knave,
That woman may fizzle and toast,
And never a cake to save!

Bake, bake, bake,
Till the brain doth seem on fire:
Bake, bake, bake,
Till arm and nerve both tire!
Spread and turn and lift,
Lift and turn and spread,
Till over the whole as I work so deft
I seem to be dreaming or dead!

Oh, men with sisters dear!
Oh, men with mothers and wives!
It is not the cakes that disappear
As honey—minus hives!
Bake, bake, bake,
In kitchen furnace, and glow,
And still, in a voice of trembling quake,
We sing while spreading the dough.

[*Norristown Herald.*

GLEANINGS.

Scientific Reliance on Soap.—Dr. Richardson lectured recently in this city on the germ theory of disease. He acknowledged his obligation to Tyndall for his microscopic investigation on air, dust, spores, and other comforting and salutary topics. It is worth while for common people to learn that 50,000 typhus germs will thrive in the circumference of a pin head or a visible globule. It is worth while for them to note that these germs may be dessicated and be borne like thistle seeds, everywhere, and, like demoniacal possessions, may jump noiselessly down any throat. But there are certain things spores cannot stand, according to the latest ascertained results of science. A water temperature of 120° boils them to death, and soap chemically poisons them. Here sanitary and microscopic science come together. Spores thrive in low ground and under low conditions of life. For redemption, fly to hot water and soap, ye who live in danger of malarial poisoning. Hot water is sanitary. Soap is more sanitary. Fight typhus, small-pox, yellow fever with soap. Soap is a board of health.—*The Philadelphia Press.*

New York's Costly Buildings.—New York can boast of some buildings, bridges and other things that cost very handsome sums. The following are the most noted examples: The new Postoffice, designed by Mullett and built of Dix Island granite, cost about $7,000,000. The Brooklyn Bridge has cost a little over $9,000,000 up to date. When completed the total bill will be about $14,000,000, according to present estimates. The City Hall, with its marble front and brown-stone back, cost $500,000 at the beginning of the century, when labor was cheap and jobbery rare. Vanderbilt's Grand Central depot cost $2,250,000, but the approach to the depot, through the Fourth avenue viaduct and tunnels, cost six or seven millions, half paid by the Vanderbilts and half by the city. The Tribune tall tower is nine stories high, has a gin shop and a clock, cost about $600,000 and is mortgaged for $300,000, which is just about its present value. The Croton Water Works have cost between $25,000,000 and $30,000,000. The house that Mrs. A. T. Stewart lives in cost $2,000,000. The Custom House cost $1,800,000. The New York Life Insurance Company's building cost a round million. The Western Union Telegraph's building cost $2,300,000. The County Court House was originally estimated at $800,000, but owing to unforeseen circumstances, the expense was between twelve and fourteen millions, nearly six millions of which went for furniture, and three millions for plastering and painting.—*Boston Post.*

George Henry Lewes, the English author whose death is now noted, was without doubt chiefly known in this country as the husband of "George Eliot," but he had won a considerable reputation in literature before he had met that great woman. He was known as an essayist and biographer, and especially as a subtle philosopher of the positivist school; he had, besides, tried his hand at a tragedy, "The Noble Heart," and had twice published a novel, the results being "Ranthorpe" and "Rose, Blanche and Violet," the latter of which was before the public 30 years ago. His name as a student, and in some measure as a teacher, of philosophy is more than a respectable one; his "History of Philosphy from Thales to Comte," and his life of Goethe are sure of readers for years to come. He had also recently made some remarkable studies in physiology, and had published the first two volumes of "Problems of Life and Mind," designed to be a system of philosophy. He was founder of the Fortnightly Review, besides having been contributor to nearly every English review and several of the magazines. The relations of Mr. Lewes with Miss Marian Evans long attracted much attention and criticism. The facts are that his first wife proved unfaithful to him, and yet on her profession of penitence he had condoned her fault, when she again dishonored and deserted him. The condonation debarred him from procuring a divorce, but when his acquaintance with Miss Evans grew into mutual attachment, neither of them recognized any moral wrong in assuming the relations of husband and wife, and they accordingly did so. We believe they were married upon the death of the unworthy Mrs. Lewes. The companionship of the two has been helpful, but we believe they have suffered the severity of British social ostracism on account of it—*Springfield Republican.*

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

CHRISTMAS.

Glory to God in the highest, and on earth, peace, good will toward men.

Wake! Wake! Wake! Do you hear them—
Bells pealing out on the wintry air?
Bells catching echoes from bells, and flinging
New echoes forth till the world is ringing,—
Ringing and echoing everywhere.

"Joy, joy, joy!" they are calling,
Lives shall respond to the vibrant chord,
Hearts catching echoes from hearts, repeating
Still through the world the angel greeting,
Welcome and welcome, new "year of our Lord."

—[*Anon.*

But while joy's echo falls
In gay and plenteous halls,
Let the poor and lowly share
The warmth, the sports, the fare:
For the one of humble lot
Must not shiver in his cot,
But claim a bounteous meed from wealth and pride.
Shed kindly blessings 'round
Till no aching heart be found,
Then all hail to merry Christmas tide!

—[*Eliza Cook.*

TALKS ON TIMELY TOPICS.—No. 9.

FEATHER TRIMMINGS AND MOLE-SKIN DECORATIONS.

ROSE GERANIUM.

If you covet feather trimmings and cannot have them upon any other terms, up and make them for yourselves!

A certain little matron I know has more than once been accused of extravagance. The truth, as she has confided it to me, goes far in evidence of her superior economy. Of course her little Dotty always is daintily dressed, but if mamma works it all out of her own brain and fingers, without affecting the tax-bills, need Mrs. Grundy be too severe?

Dotty's pretty, black straw walking hat fell under the last-named personage's observation a short time since.

"Just behold!" she exclaimed. "Mattie Dorris is the wife of a man struggling with a heavy mortgage upon his farm, and yonder goes Dotty with a dollar and a half's worth of feather-band around her hat. It looks in elegant taste, to be sure, but Dorris can't afford it!"

Mrs. Grundy was not at all in the secret; but the Black-Spanish, crowing patriarchs of the Dorris' fowl-yard know all about it, having been party several to deftly performed "clippings." A strip of foundation muslin, two inches wide, and a needle and thread, flying to the time of Mattie's happy humming, did the rest.

More than this,—a few yards of the same trimming, made possible by a judiciously-timed slaughter of market-birds, found grace in the eyes of the town milliner. The result was several dollars set down to the credit of the little home manufacturer.

An excellent pretense at marabout bordering, to hedge about your hoods and cloaks, may be devised from the soft black feathers of your turkeys.

"Black?"

Certainly! First bleach them white!

To accomplish this, wash them thoroughly in very strong, hot soap-suds, to remove all the oil they may contain. Next, place them in a bath of bi-chromate of potash and water, to which has been added a few drops of nitric acid. They will rapidly bleach and should be removed as soon as the process is finished and rinsed in clear water.

They are now ready to be dyed any delicate shade. Ten cents' worth of rose or slate dyes will color sufficient feathers to array your entire household.

Cut away the stiff portion of the quill and sew into bands with an inch-wide tape for foundation.

Appropriate feathers from your chickens may be shaped into perfect imitations of those jaunty little bird's wings which are so popular. If you manufacture them from these innocent resources you not only practice economy, but preserve for yourself "a conscience void of offense" against our much persecuted and harmless minstrels of the air!

Moles for Decorative Purposes.

I believe we are all agreed that it is but right and proper to kill moles. They are meddlesome; they are stealthy and dishonorable in the prosecution of their business, and they employ their capital in direct violation of that sentiment of the common law which directs that "no man"—nor mole—"shall use his property in such manner as to injure his neighbors."

Therefore, be it resolved, that moles shall be exterminated! As they will have no possible need of their skins afterward, you may as well use them. Likely as not they have been grown upon your hyacinth bulbs and apple tree roots. So don't spoil them! Get some dexterous mole-skinner to remove them for you. Stretch and tan them. I would here interlard a formula, but you will certainly find a score in the Rural New-Yorker, if you will but glance over the index.

When prepared, cut cross-wise, in bands adapted to your taste, purpose and the depot of supplies. Fasten the lengths together with delicate, overcast stitches. In applying to an article, sew the upper edge with heavy thread and a plain seam. Then turn over, stroke down and catch the lower edge with a few stitches underneath.

Around the collar and cuffs of your velvet jacket or your good, substantial winter suit these bands will look very lovely and soft. And, in addition, you will feel yourself to have done something practical in favor of agriculture! How very nice!

FOR WHOM THE BOOT FITS.

If you are one of the men who are always in the habit, about Christmas time, of making slurring remarks concerning women "taking their husbands' money to buy their Christmas presents," lest you may plead it don't fit you, and so not put it on, I will state explicitly, in the beginning, that it does; 'twas made for you specially, though, perhaps, not "to order." I tell you thus expressly, because I wish to "let no guilty man escape," and more men are guilty than would care to be found so "by a jury of their peers"—though it does not trouble them a particle that their wives know it, and suffer for it.

I happen to know all about the money that buys your Christmas present, sir, (which allow me to tell you, you don't deserve). I happen to know all about the little petty economies your estimable wife has practiced for the past year, with a view to purchasing it. I happen to know how she saved a penny here, and squeezed out two pence there, where you would never have dreamed of doing it. I happen to know the days when she even did her own washing (more fool she! say I), that she might have that dollar, or half dollar toward it. I happen to know how she walked, many a time, to save toward it the half dime, you probably wouldn't begrudge the railway company. I happen to know how she turned, and twisted, and contrived to make old do as well as new, that she might put that with the increasing amount of sacrifices. I happen to know how she laid awake nights, thinking, and planning where she could save the last needed dollar for the purchase. And, then, when the sum of all these self-denials, money that she should have spent for herself is lovingly expended in a Christmas present for you and proudly and trustingly brought for your acceptance, that you, who boast yourself a man, should ungratefully, meanly, taunt her of buying your presents with your money! I tell you, sir, that money is no more yours than if you never laid eyes or finger on it. It is just as much hers as if she had earned it by hard work—which she did—harder work than you ever think of doing. I'd like to see you pinch and scrimp to get your wife a Christmas present, or any other present the way she does to get your presents. I'd like to see you even give up your cigars, your occasional glass of—whatever you are in the habit of calling for—your games of billiards, and your lodges, to get your wife a present.

She has not one of these indulgences, and denies herself even necessaries for you sake, and then you sneer and accuse her of getting your present with "your money," and, worst of all, never dream but that you are a full-fledged man.

But, what if your wife did or should get you a present with money that you give her, out and out? though what would ever bring you to that astonishing state of generosity I don't believe she will ever know, from experience. So long as she gets you something you need, what if you do give her the money, I say? If you are so magnanimous would it hurt your mighty lordship, in your most vital part, your pocket, to allow her to delude herself and others with the belief that it really was her gift to you? It would be a pleasant delusion—one that she at least, would enjoy; but you can't let her cherish it. You must needs remind her, smilingly, that "you might just as well have got it yourself; she got it with your money!"

And, now, I want to ask you, sir, even granting for a moment that it is "your money," I want to ask you, sir, "Whose money should it be?"

Do you want your wife to buy your present with some other man's money? or, do you expect her, or want her to go to work and earn money from outsiders for it?

I tell you, my dear sir, there are more wives, to-day, who wish they could do that than you dream of in your shameful indifference. There are more women, to-day, wives of well-to-do men who envy the women who earn, independently, their livelihood, than would like to be found out. There are more women, to-day, who would gladly imitate the lawyer's wife—was it not?—who desperate for money that should have been freely given hung out the sign, "Washing and Ironing done here," with satisfactory results from her husband than would be brave enough to do it. There are more wives, to-day, who long, with intensest longing, for a single dollar they can call their own—a dollar in which their husbands, sir, want not "part or parcel," than there should be for the credit of husbands! Wives who work for their husbands and the children they have borne them, as only devoted wives can; and, many of them, women who knew what it was before marriage, to have money to spend as they pleased, to whom it comes all the harder to be told, "You bought it with my money."

The man who will say "my money" to his wife and mother of his children, who does for him and them as most wives and mothers do, is too contemptible to live; but if he must live, he'd never get a Christmas present, nor any other present, if he was my husband.

Gale Forest.

There! I happened to hear that as I was shutting the door, and just step back to inform you, that you needn't, "thank heaven you're not"—for I can beat you at that every time!—*Cincinnati Times.*

THE KINDLING WOOD.

J. E. M'C.

Almost every newspaper we take up has some sad story of a poor girl who lost her life trying to light a fire by the help of coal-oil. And most people who read the account exclaim against such stupidity in the face of so many warnings. But alas! the warnings come to you and me, and not to the poor girls who try the experiment. They know nothing of the news of the day, and probably could not read it if it was placed before them. It is a good plan for housekeepers to read such accounts in their kitchens, for the warning may be badly needed there, little as the housewife may suspect it. It is not the lamp-light alone that is responsible for the rapid lowering of the oil in our cans.

But these "accidents" call up quite a different line of thought in my mind. What straits the poor girls were doubtless reduced to for kindlings before they adopted this expedient! The fire must be had by fair means or foul. There are no paper or shavings provided, and coarse kindlings will not light with a match. But breakfast must be on the table in time or there will be trouble enough in the kitchen. What can a girl do but expedite the business by any method she can devise? The blame may lie farther back than is commonly supposed.

A few years ago, the papers contained the harrowing story of a domestic who took a handful of leaves from one book after another in her employer's library to light her kitchen fire from time to time. She supposed she was doing little harm, as "she seldom went twice to the same book." Everybody was suitably indignant and sympathized with the master; but does anyone suppose a girl would have taken that trouble if she had been provided with anything suitable for fire-building?

It is not city folks alone who are careless about these things. In the country where wood is cheap and abundant, the women-folks are often put to great trouble for nice, dry kindlings, cut sufficiently fine for this purpose. The wood is split coarse under the impression that it will last longer, with no shadow of regard to a housewife's convenience. If to hurry up the belated dinner a few kindlings are added, there is a great outcry from the boy who splits them. There ought to be a reform in some places on these matters. There should be at least equal parts of fine and coarse wood always in the wood-box, and never a stick of green split up to aggravate a good housekeeper's feelings, and put her work back for hours every day. A little forethought would save a great deal of wear and tear of mind, as well as of body.

MARRIED WOMEN'S RIGHTS IN THE MIDDLE STATES.

In New York a married woman has absolute control of her separate estate, and is entitled to demand a conveyance of any property held in trust for her, provided she has a fee simple estate in the same. She has a right to deposit money in a bank in her own name and draw out the same by check.

A will requires but two attesting witnesses.

In New Jersey, the separate property of the wife is not liable for the debts of her husband.

Wills must be signed in presence of two subscribing witnesses.

In Pennsylvania the separate property of any married woman, owned by her before marriage or which she has become the owner of after marriage, is free from any liability, except for her own debts, and then not until the creditor fails to obtain the amount of debt from the husband's estate. If, however, judgment is obtained against the husband for the wrongful act of the wife the creditor must first exhaust the wife's separate property before he can levy on the husband's.

Wills must be in writing and signed by the testator, or by some one at her request, and must be proved by two competent witnesses.

In Delaware the wife's property is liable for the debts of the husband, unless certain legal proceedings are taken to prevent such liability.

Wills must be in writing, signed either by the testator or by some one at her request, and must be proven by two subscribing witnesses.

Shall I not be forgiven for repeating good Fuller's words, even though they may jar a little upon some wedded ears? "Deceive not thyself by ever expecting happiness in the married state. Look not therein for contentment greater than God will give, or creature in this world can receive—viz., to be free from all inconveniences. Marriage is not like the hill Olympus, wholly clear, without clouds. Remember the nightingales, which sing only some months in the spring, but commonly are silent when they have hatched their eggs, as if their mirth were turned into a care for their young ones."

ENGLISH LAVENDER WATER.

Alcohol,	40 ounces

Oil of Bergamot,	2 drachms
" Clove,	10 drops
" Rose,	20 "
" Lavender,	1 ounce

The widow of millionaire Ralston, the Californian who suicided a bankrupt, evidently has been turning money into time pretty fast since the death of her husband. A. J. Ralston, her brother-in-law, made application for the guardianship of the widow on the fifth of last August, and the 6th inst. had been fixed upon by the Court as the day upon which the case should be heard. Mrs. Ralston has received $176,000 since the millionaire's death, in August, 1875, and this sum has been cast out of her reach shekel by shekel. She has traveled in the most luxurious manner, and now resides at the Palace Hotel in San Francisco

A Cheap and Good Prepared Glue.—Dissolve common glue in cider vinegar as thick as may be wanted; as it becomes thick from time to time add vinegar.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN THOUGHTS FROM EVERY-DAY HOUSE.

BY ANNIE L. JACK.

DAY AND EVENING WORK IN THE FALL.

THE head gardener is tired. He says there is no end to the work in the fall, if the ground keeps open. So he has been busy plowing the pear orchard, cutting down dead trees, which are handed over to the wood choppers to be prepared for firewood, as they usually contain a great number of borers. He has also been busy the past few days, with grape-vines, making countless cuttings which are tied in bunches, labeled and then buried a few inches below the ground. After frost comes, a little coarse straw and a board are considered safer protection than too much earth. Then there is the bed of spring-flowering bulbs. I hope none of my readers who love flowers—and who does not?—allows the spring to return without having, in autumn, made preparation for the first flowers that bloom. The richly perfumed Hyacinth succeeds the pale Snowdrops and the Yellow Crocus, while the jaunty Tulip flames upon the world in sudden beauty when we seem most in need of flowers. So we plant the beauties in in the autumn with faith in the future, and if they are given a slight protection, to prevent their being frost-thrown during a thaw, they will amply repay the trouble. In a garden there is always work to be done, and one is kept busy in spring preparation. So in life, were it not for hope in the future, the world would be dreary indeed.

In the household the work goes on as usual. Breakfast, however, is later as the mornings grow darker, and the evening chores are done and the lamps lighted before five o'clock, so that the greater part of our leisure is in the long evening. And in this, how much can be done for improvement! I do not believe in spending all the pleasant hours in a steady round of sewing and fancy-work to ruin bright eyes permanently, though part of the time may be employed in this way, but I would advise the young people of every household to take up some study and pursue it thoroughly. If there are several members with different tastes, let each take up his special pursuit in turn. If art is first, read Gilbert Hammerton's books, and enjoy them, if geology, let the student of that science read The Old Red Sand-stone of Hugh Miller or some of the recent publications, among which stand first in my mind those of our eminent Canadian geologist, Dr. Dawson. His works, "Nature and the Bible," "The Story of the Earth and Man," and "The Dawn of Life," all read like a continuous geological poem, though strictly practical in their honest convictions. Of works on botany, Professor Gray's stand first, and after one has mastered "How Plants Grow;"—there is a pretty little book called "How Plants Behave"—that is very charming. If while sitting by the evening lamp, our young people wish to learn a little of the history of many nations, let them read Collier's "Great Events of History," each reading a turn while the rest take notes, or ask questions at the close. In this and many other ways, the winter evenings will pass pleasantly and be eagerly looked forward to through the short stormy days. For "is not the life more than meat and the body than raiment?" and even in the domestic department of every-day life one loves to read, discuss and remember the sayings of the good and the great who have spent their lives in efforts to enlighten and improve mankind.

DOMESTIC RECIPES.

Broiled Chicken.

Split down the back, put into a steamer and steam one-half hour; wipe off the moisture, rub well with butter, dip into broad crumbs and broil over a clean fire until of a delicate brown on both sides. Season with pepper and salt.

MARY B.

Chicken Pudding.

Cut up a pair of young chickens, put them into a stewing-pan with enough water to cover, adding two tablespoonfuls of butter; pepper and salt to suit the taste; let stew gently until about half-cooked; then take out the chickens and let cool, pouring the gravy into a separate dish. Prepare a batter of a quart of milk, six well beaten eggs, a tablespoonful of baking powder, a little salt and sifted flour to mix to the proper thickness. Put a layer of chicken at the bottom of the pudding dish and pour over some of the batter, then another layer of chicken and more batter, and so on, having batter on top. Bake for one-half hour, or even longer, in a hot oven. Beat an egg into the gravy reserved, let it boil up and send to the table to be served with the pudding.

Chicken Cutlets.

Take the meat of cold roast chickens chopped very fine, a cup of gravy, four beaten eggs, two-thirds of a cup of bread-crumbs, pepper and salt to the taste. Put the gravy into a pan to heat and when hot add the meat and bread crumbs, then the eggs and seasoning; let thicken for two or three minutes, stirring constantly, pour out into a flat dish to cool. When stiff cut into little cakes and fry in lard to a delicate brown.

E. M. L.

Grilled Fowls.

Cut the remains of cold fowls into nice pieces; season with pepper and salt; squeeze over them the juice of a small lemon; let stand half an hour; dip the pieces into melted butter, and then into bread-crumbs. Put them on a gridiron and broil over a clear fire.

To Use up Cold Fowl.

Take the remains of a cold fowl chopped fine; cover the bottom of a pudding-dish with fine bread-crumbs; put in the chicken, seasoned with pepper and salt, pour over a half-teacupful of gravy, cover quite thickly with bread-crumbs, and then strew over bits of butter; cover and place in the oven for ten or fifteen minutes; take off the lid and break in enough eggs to cover the top; sprinkle pepper and salt over and bake until the eggs are well cooked.

AUNT KATY.

Omelet.

Allow two tablespoonfuls of milk to each egg; beat the yelks and whites separately; add a little salt; pour into a hot skillet, in which a piece of butter, the size of a walnut, has been melted. The skillet should be as hot as it can be without scorching the butter. As the omelet bubbles and rises, run a thin broad-bladed knife under every now and then that it may not burn; cook two or three minutes, or until the eggs set; fold over, shake the skillet, turn on to a hot plattor, and serve at once.

Custard.

Beat six yelks and four whites until very light; add a quart and a scant pint of rich milk; flavor and sweeten to taste; bake for one hour. Beat the reserved whites to a froth; add two tablespoonfuls of sugar, flavor, spread over the top of the custard and return to the oven to brown.

Pickled Eggs.

Boil the eggs until very hard; take off the shells; have prepared some nice spiced vinegar and pour hot over the eggs. The spice should be tied in a little muslin bag.

MRS. M. H.

Cayuga Co.

POULTRY NOTES.

STEAMING is preferable to boiling for tough fowls.

Remove the *threads* before sending roast fowls to the table.

In winter kill poultry three days to a week before cooking.

Poultry and game are less nutritious, but more digestible than other meats.

Singe with alcohol instead of paper—a teaspoonful is sufficient for either a turkey or chicken.

Remember, much of the skill of roasting poultry in the best manner depends upon basting faithfully.

To give roast birds a frothy appearance, dredge, just before they are done, with flour and baste liberally with melted butter.

When onions are added to stuffing, chop them so fine that in eating the mixture one does not detect their presence by biting into a piece.

Ladies doing their own marketing will do well to remember that young poultry may be told by the tip of the breast-bone being soft, and easily bent between the fingers, and when fresh by its bright full eye, pliant feet and soft moist skin.

To boil eggs properly, place them in a dish having a close cover; pour over *boiling* water; cover and set away from the fire for ten to fifteen minutes. Eggs cooked in this way are more delicate and digestible than when allowed to boil in the old way. The heat of the water cooks them slowly to a jelly-like consistency leaving the yelk harder than the white.

Poultry requires skillful carving. The requisites are grace of manner, ease in the performance, a sharp knife of medium size, a perfect knowledge of the position of joints and the most complete mode of dissecting. Etiquette teaches us that the carver retains his seat while carving, managing his hands and elbows artistically etc, etc. Common sense teaches that the carver has far better control over the platter while standing, is more at ease, the knife is less liable to slip, and with the majority of carvers the table-cloth is likely to escape with fewer soiled spots.

To bone a turkey or fowl: Cut through the skin down the center of the back; raise the flesh carefully on either side until the sockets of the wings and thighs are reached; next disjoint and bone, after which the whole of the body may be easily separated from the flesh and taken out entire, only the neck bones and merry-thought remaining. The fowl may be restored to its original form with a dressing of bread or forcemeat, or the legs and wings may be drawn inside of the body and the fowl, first flattened on a table, covered with forcemeat, rolled tight and bound with a tape. If necessary steam before roasting. To be served cold.

News of the Week.

Monday, Dec. 16th, 1878.

POLITICAL.

In Congress the event of the week has been Blaine's speech in support of an investigation into alleged Southern outrages against negro suffrage. It was well advertised in advance as designed to strike the key note of the Republican presidential champaign for 1880, and as a bold bid on the part of the orator for the position of their standard-bearer then. It was temperate, forcible and short. It referred to negro wrongs only indirectly, but dwelt mainly on the injustice done to the white voter of the North by the white voter of the South by depriving the colored man of his vote and thus doubling the value of his own. While 31 additional members of Congress had been assigned to the 11 ex-Confederate States on account of their 4,500,000 colored population enfranchised by the 14th and 15th amendments, he insisted that owing to frauds, these four and a half millions had as little to do with determining the elections as their remote kindred on the Gold Coast. Accordingly he advocated that so long as the South deprived some of its citizens of suffrage, the number of representatives from that quarter should be proportionately reduced; for otherwise in determining every national question the vote of the ex-Confederate soldier South, who fought to destroy the Union, would be twice as influential as the vote of the Union soldier North who fought to protect it. He entered largely into statistics, arranging the figures so as to convey forcibly the points he wished to make, and said well in 20 minutes what a less dexterous speaker would have said ill in six hours. Senator Thurman offered an amendment extending the inquiry to ballidozing in the North also, as well as the use of money in elections. This was agreed to and, after remarks by several other senators, the debate closed to be continued at intervals throughout the session.

Among the host of measures hitherto introduced into Congress, the most important or intesting are: resolutions passed by both Houses looking to the appointment of a joint Congressional Committee to consider the best means for preventing the spread of yellow fever. A bill to correct that probably fraudulent omission from an Appropriation Bill, just at the close of last session, of a clause providing for the Hot Springs reservation. Several measures to make silver dollars bankable, and redeemable at the Treasury in greenbacks, and also to redeem and suppress the trade dollar. The bill for the latter purpose secured a majority of 154 to 91; but as a majority of two-thirds would be required to pass it, it failed. A bill threatening to withdraw its circulation from any bank that should refuse to receive the legal-tender silver dollar on a par with gold and paper, received a majority of 150 against 80; but this also fell through owing to a lack of the requisite two-third majority. A bill was introduced by Mr. Page, of California, to reduce the Congressional representatives of South Carolina to two members, on account of "a large number of male citizens belonging to one party" having been by fraud and terrorism deprived of the rights secured to them under the Constitution. Of course, it was not expected that this would pass, but it gives an opportunity for ventilating the subject in the House, as Blaine's resolution does in the Senate. A much needed bill has also been introduced forbidding railroads from making unjust and arbitrary discriminations against "way" and in favor of "through" freight.

When Kellogg was admitted to the Senate, Eaton, of Connecticut, gave notice that on the 4th of March, 1879, he would move to declare Kellogg's seat vacant. "A prominent democratic senator" is now quoted as saying that "Kellogg will not remain a minute longer, after March 4, than it will take to turn him out." Senator Conkling, it is said, will insist upon an adverse report from his committee on the New York nominations and ask the Senate to reject them on precisely the same grounds as he urged last session. These friends also represent the senator as confident that he will be able to secure prompt action in accordance with his wishes.

MISCELLANEOUS.

Storms of extreme severity during the week have done an incalculable amount of damage in the Eastern and Middle States, and unfortunately farmers have been the greatest sufferers. Wade Hampton of S. C., who was injured by a fall from his mule some weeks since has been in a very precarious condition during the last few days. His leg was amputated, last week, about the time he was elected U. S. Senator almost unanimously, and since then his life has been in danger. This morning's telegram, however, says that though still exteremely feeble, all indications are of a favorable nature.

During the past week there has been no little excitement among the grain operators of Chicago due to the arrival among them or Jim Keene, the redoubtable stock manipulator of California and New York. His avowed object is to put wheat up from 85c. to $1 a bushel and he has started to do so by buying in one or two million dollars' worth for cash, and he has at least three million more dollars to invest in the same way. He says that wheat is worth fully a dollar a bushel in the Western metropolis, that he has a lot of spare change, is backed up heavily by New York friends and that he is resolved to put all his disposable cash into wheat, being fully confident that the price must go up in spring. Some say he intends to attempt a corner in wheat, others say he is acting in the interest of the Erie railroad, over which he will ship all his purchases at a low rate, after navigation opens in spring. There seems to be too much grain in the market for one man to handle; but inasmuch as his speculations tend to raise the price of wheat, farmers will not be sorry.

FOREIGN.

In England business of all kind is extremely dull. Wheat and flour are both low and sinking in price; and although this is a disadvantage to the farmer there and here, still it gives cheap bread to the working classes generally, who, with a hard winter, scanty employment and poor pay, find their lot at best a hard one. In the agricultural districts, the farmers are attempting to cut down the wages of the laborers to about the same starvation prices paid a few years ago, before the agitation begun by Arch and others led to an advance. Strikes are therefore threatened in many counties, and it is believed that not a few of the men will seek a better chance in other lands. The number of agricultural laborers is now hardly enough, and is fast diminishing by emigration mainly to Australia and New Zealand, but also to Canada, this country and South Africa—the Cape of Good Hope, Natal, etc. The general distress has been increased by another great bank failure—that of the West of England and South Wales Bank, together with its forty-two branches. The debts of the institution are over $17,500,000; its assets are reported to be amply able to cover its liabilities, but as they could not be promply collected, the bank had to suspend. Great hardship and consternation have thus been caused throughout South Wales, and not a little distrust and dread everywhere. The shareholders number 2,000 and their personal liability to pay the debts of the institution is unlimited.

Meanwhile party bitterness is constantly being aggravated. Gladstone and his followers are inveighing so violently against the Administration that many of the Liberals decline to indorse them. Most of the accounts of public sentiment sent to this country by correspondents are naturally tinged by republican proclivities, and therefore unduly favorable to the Liberals, but the temporary unpopularity of most of these in the country is shown by the fact that the Times and many more of their own organs have "gone back" on them, while the motion of censure against the Ministry they introduced into Parliament last week, has been defeated by a vote of 328 against 227. So strong does Beaconsfield feel himself in public favor that it is considered probable he will dissolve the present House of Commons so as to cause a fresh election of members, in the expectation of thus securing a still larger number of adherents. The course of events of late seems to be decidedly in favor of his policy. Some months ago it was thought highly probable that the treaty of Berlin would be a failure, and that war would be resumed in the spring. Now, however, all indications point to its observance by all parties. A new Ministry favorable to a strict compliance with its terms, has just been inaugurated at Constantinople. A definite treaty, supplementary to those of San Stefano and Berlin, is said to be in a fair way of satisfactory completion between the Czar and the Sultan. Austria has occupied and quieted Bosnia and Herzegovina, and the movement has just been indorsed by the formerly discontented Hungarian Parliament which has just voted 20,000 roubles towards paying the cost of the expedition. The other disturbances which lately threatened a renewal of the conflict in the war-harrassed country, are gradually abating, either on the approach of winter to be renewed in spring, or because they were merely the result of the turmoil that always remains for some time after a storm. A peace here would be greatly to the credit of Beatonsfield's policy. Out in Afghanistan, too, success after success has hitherto attended the British arms.

The three divisions of the army have each been hitherto successful in advancing through the gorges in the mountain range dividing India from Afghanistan, and on the approach of spring, if not sooner, will take possession of the country. The Ameer is already reported to have fled to Turkistan, many of his turbulent tribes have already joined the British, others are reported to be in rebellion, and a protracted war is deemed impossible. England's real difficulties there, so say the wiseacres, will begin when she attempts to dispose of the country when the war is over. There is a probably groundless report that she will divide it with Russia. Emperor William of Germany has returned to Berlin and resumed the reins of government, temporarily confided to the Crown Prince. Much popular rejoicing and probably some royal apprehension. Severe measures against socialists and all that class, are being vigorously enforced throughout Germany. Great numbers of known adherents of such political creeds are banished, and not a few imprisoned. A mysterious conspiracy of European extent is said to have been discovered, the members of which are styled King-killers—a name indicative of the object they have in view as the first step towards the millenium. Alexander of Russia, either as a first step towards inaugurating a constitutional government in his vast dominions, or to lessen his own responsibilities, is said to be about to appoint a Ministry whose members shall be collectively responsible for the administration of the government. Italy is agitated by the necessity for another change of Cabinet, a very frequent necessity in that unstable country. The Princess Alice, third child of Queen Victoria, and grand duchess of Hessedramsdt, died of diptheria at 7 o'clock on Saturday morning at Dramsdt in Germany.

The first shipment of American horses for the use of the French army arrived at Havre upwards of a week ago, and gave great satisfaction to the military inspectors. Very heavy importations of American wheat are also being made into France this year—an unusual circumstance, as France generally is an exporter of that cereal. Corn, too, is finding a good market there, and the exports of it to other European countries, also, are much larger this season than heretofore.

HERMAN.

PUBLISHER'S NOTICES.

OUR readers are requested to read the following before making up their orders for seeds:

Any ten of the following require a one-cent postage stamp:—that is ONE *cent* for the ten, not for each.

The Voorhis Water-melon.
Acme Tomato.
New Bronze Ricinus.
Hibiscus moschentos.
Callicarpa Americana.
Hibiscus Syriacus (mostly from double-flowering seedlings), "Rose of Sharon."
Welgela.
Chater's Lemon Hollyhock.
Deutzia crenata fl. pl.
Hibiscus militaris.
Eryngium Leavenworthii.
Geranium sanguineum.
Yucca filamentosa.
Vitis heterophylla.
Rural hybrid Aquilegia.
Grindelia squarrosa.

When the Beauty of Hebron Potato is included, a two-cent extra stamp.

When both Pearl Millet and Defiance Wheat are included, a two-cent extra stamp.

We request that our subscribers will write their addresses IN FULL and PLAINLY, and not *stick the stamps to their letters*. By so doing they will save us a deal of trouble and expense. For particulars, send stamp for RURAL of Nov. 9.

WE are constantly hearing of some new and wonderful invention or discovery, such as the Telephone, Phonograph, Electric Light, &c., which tends to revolutionize all the old-fashioned ideas of what is what. The principal drawback to the use of these new appliances has been the considerable outlay necessary for their introduction; but this difficulty as regards the Telephone has been satisfactorily overcome. A Boston firm has succeeded in producing an instrument that works one mile, which they are able to sell for $3 complete. A description of the invention will be found in our advertising columns.

Coughs and Colds are often overlooked. A continuance for any length of time causes irritation of the Lungs or some chronic Throat Disease. "*Brown's Bronchial Troches*" are an effctual COUGH REMEDY.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 14, 1878.

BEANS AND PEAS.—Medium and marrow beans are weak in the absence of steady business. The few sales are restricted to choice qualities of those two grades, and prices are 2½@c. off. Pea beans have no decided outlet; many former eastern buyers are receiving stock direct from growing districts. White kidney not in heavy supply, prices steady. Red kidney hold all of their recent firmness and extra even, deep-colored new quoted $2.20. Black beans in fair demand. Green peas steady at $1.25@1.30; Canadian field, in bulk and bond, 70@75c.; medium to choice: Southern B. E. peas held higher after recent fair sales; $2.75@2.80 per 2-bushel bag. Medium beans, prime, $1.60; fair to good, $1.45@1.50; Marrow, free to ship, $1.65@1.70; fair to good, $1.50@1.55; pea, $1.50@1.75; white kidney, $1.80@2.00; Red do., $1.90@2.20; Black, $1.90@2.25.

Receipts of beans for week, 15,632 bushels; exports, 1,459 bbls.

BUTTER.—This as well as a good many items has had a poor show for business during the past week. A severe rain-storm Monday and Tuesday kept buyers away, and very little sharp trade can be noted. Western creamery begins to show its superior winter body compared with State, and is quoted highest. English shippers are opening some trade, but want easy rates, and they should have full play in the stored surplus that will never do any better than now. We note a continental inquiry for wholesale parcels of fine butter. State dairies quoted as before; 20c. asked and 19c. accepted. Choice half tubs, Welsh tubs and perfect Western dairy are not overplenty—in fact, there is a noticeable disparity in the yield of fine fall compared with former seasons—and prices are firm. Rolls have still a low range: the trade neglects them when quality is unattractive. Special care should be taken to avoid mixing old with fresh. Cloth-wrapped half-bbls. meet most favor latterly.

State, full dairies, special, 20c.; other, 16@19c.; firkin dairies, fair to prime, 13@18c.; Welsh dairies, fine full, 18@19c.; choice dairy, pails and half tubs, 22@23c.; fair to prime do., 19@21c.; choice Welsh, 21@22c. fair to prime, 13@17c. Choice creamery 23@26c.; other, 22@24c.; sweet cream, 24@26c. Best Western creamery, 26@27c.; other, 20@24c.; early packed creamery, 17@20c.; poor State 10@12c.; Western dairy, fine fresh, 18@18c.; fair to good, 10@14c.; factory, choice, 13@14c.; other, 6@12c.; rolls, 10@15c.

Receipts for week, 24,892 pkgs. Exports, 4,089 do.

CHEESE.—Exporters are drawing steadily upon the stock of strictly fancy, which is getting rather scarce, and is easily made; the newer grade is about 8½c., and fine stock can be had at 8@8¼c Outside of the call for special lots there is a meagre showing of business and prices tending easier.

Quotations are: 8¼@8c. for fancy; 8@8¼c. for fine lots; 7@8c. for good and prime; 6@7c. for fair to good; 4@5c. for skimmed. Slate, farm dairy at 8¼@8½c. for good to choice; 7@8c. for good to prime. Wisconsin factory, fine to fancy, 8¼@8½c.; do. good to prime, 7@8¼c.; do. fair to good, 6@7c. Western factory, fine and fancy, 7¾@8¼c.; good and prime, 6@7c.

Gold closes at 100¾.

Liverpool cable 458.; lower.

DRIED FRUITS.—There has been a moderate export movement in Ohio quarters, but other quartered lots are neglected, the better grades of sliced have a fair inquiry. Peeled peaches of choice quality are in demand, and hold well up in price. Blackberries are easy; other small fruits favor sellers.

Southern plums at 13¼@14c.; State plums, 15@15½c.; Blackberries are quoted at 5½c. Peaches—Peeled Georgia, at 6@7c. for poor; 8@c. for fair to good; 10@10½c. for prime; choice North Carolina, 11½@12½c.; good do., 8@10c.; unpeeled halves, 3@3½c.; quarters, 3@3½c. Pitted cherries, 22@23c. Apples—Old State quarters, 2¼@3c. New apples, 2¼@3c. for southern quarters in bbls.; 4@5c. for prime sliced, State at 4@5c. for new sliced; and 3@3¼c. for quarters; western at 2¾@3½c. for new quarters. Raspberries, 30c.

Exports, past week, 1,327 bbls. dried apples.

EGGS.—Supplies are not pressing, and quatations are firm for all fresh and good lined. Near points 27@28c.; State and Penn., 25@25½c.; Western, 25c.; Southern, 24@25c.; Canadian, 22@23c.; off quality, fresh, 20c. Limed, choice, 16@17c.; good, 14@15c.; other, 12@13c.

Receipts for the week, 4,487 bbls.; do. last week, 5,789 do.

FRESH FRUITS.—Apples are off 12@25c. per bbl. for the high grades, but dealers are benefited by a more active local trade. Stocks abroad are up, usually large, but shippers are still adding to them, feeling it to be a safe way of relieving the home market. Choice red, $2, prime retailing $1.50; common to good winter including Greenings, $1.12@1.37; Newtown pippins $3@3.50; Lady apples, half bbl., $2@4. Florida oranges active at late prices, the market is full of foreign. Standard boxes, 12x12x27 inches, $2.50@4; bbls., $6@7. Cranberries hold the late advance with a good general call. Fancy bbls. (Capes), $8; good to choice, $7@8.50; other, $5@6; N. J. crates, extra, $2.50; other, $1.75@2. Catawba grapes not in quotable supply. Chestnuts slow; quality now poor; prime, $4@3.50. Hickory nuts, shellbarks, $2.50; B. Walnuts and Butternuts, 50c. bush. Peanuts sell freely at old ruling prices. Hand-picked Va., $1.15@1.20; other, 85c.@1.05; shelled, 4¾@5¾c.; Pecans, 12@16c.

Exports, past week, 8,926 bbls.

FLOUR.—Most of the week buyers have had the advantage on a declining wheat market and full supplies, but towards the close more activity prevails and there is more confidence as to prices.

Latest prices are: $3.15@3.65 for inferior to fancy superfine State; $3.70@4.00 for very poor to very good extra do., odd lots and lines; $4.00@4.25 for good to very choice do., and fancy lots above this; $3.15@3.65 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $3.60@4.00 for very poor to very good shipping extra do. and $4.00@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.20@5.10; choice to strictly fancy do. at $5.10@5.85; red and amber winter wheat, very inferior to very choice trade and family $4.10@5.75; round hoop Ohio at $3.90@4.25, and trade and family brands of do. at $4.35@5.75, the latter rate for very choice; St. Louis, $4.15@4.85 for very poor to good extra, and $4.85@5.75 for good to choice; Minnesota clear, very inferior to very choice at $3.85@5.15; few brands going above $4.75; Minnesota "straight," inferior to very choice at $4.65@5.75; and patent fair to strictly fancy at $5.25@8.25, few brands going above $7.50; unsound stock at from $3.00@4.75; city mill extra at $4.90@5.10 for West Indies (the latter rate in new packages); do. for England, $3.75@3.90; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@6.60 for fair to very choice; No. 2 at $2.30@3.00 for very inferior to very choice.

CORN MEAL.—Sales are at $2.15@2.65 for yellow Western and $2.85 for Brandywine.

HAY AND STRAW.—There are lighter receipts, and the demand having improved prices are steadier.

Sales at 35@40c. for shipping, and 65@70c. for retail qualities. Straw quoted at 35@45c. for long rye, and 25@30c. for short rye, and oat at 35@40c.

Exports past week, 1,419 bales.

GRIAN.—Wheat has been lower on account of declining English markets and a sluggish export demand, but towards the close there is a slight reaction and an improved outward movement. Corn is in freer export demand and prices closed a trifle better. Rye is easier and in freer demand.

Latest sales of wheat are of No. 2 amber at $1.05@1.05½; No. 1 amber at $1.08; ungraded red at 97½c.@1.07½; No. 3 red at $1.02½@1.03; No. 2 red at $1.07½@1.08; No. 1 red at $1.08@1.08½; ungraded spring at 83½@92c.; white Canada, in bond, at $1.04@1.08½; ungraded white at $1.06@1.10½; No. 2 white, steamer grade, at $1.03½; No. 1 white at $1.08@1.09½; white State at $1.00@1.10½; extra white at $1.10½@1.11; New York No. 2 spring, January option, at 97c.; No. 2 amber, December option, at $1.05½@1.05½; do. January option, $1.06½@1.06½; No. 2 red, December option, at $1.07½@1.08; do. January option, at $1.09; do. February option, at $1.11; extra white, delivery January 20 to 27, at $1.12. Rye at 58@59c. for No. 2 Western and 60c. for State. Corn at 45@45½c. for steamer mixed; New York No. 2 at 47½@47c.; New York No. 3 at 42½@43½c.; ungraded mixed at 45@47½c.; yellow Western at 47c. for new; yellow Southern at 45c. for track lots or new; yellow white at 47c.; yellow Jersey new at 45@45½c.; New York No. 2 white at 47c.; steamer white at 45c., and round yellow at 46@47c. for new; No. 2, December option, at 47½c.; do. January option, at 47¾c.; steamer mixed, December option, at 45½c.; do. January option, at 45¾c.; do. February option, at 45½c. Oats at 31c. for New York No. 1; New York No. 2 at 30@30½c.; New York No. 2 white at 33½c.; New York No. 3 at 29½c.; New York No. 3 white at 32c.; white Western at 31@35c.; mixed do. at 30@31c.; white State at 32½@36½c.; mixed do. at 31c.; No. 2 Chicago quoted at 31c.; New York extra white quoted 39c.; New York No. 1 white at 34@34½c. Barley. State, 6-rowed, 90@$1; 2-rowed, 75@80c.; Canadian, 65c.@$1.25; malt, $1@1.25.

POULTRY AND GAME.—Live has only a chance sale at easy prices. An order for 5,000 head for Cuba is being filled. Turkeys, fowls and chickens rate 8@9c.; roosters, 4@5c.; ducks, choice, 65@80c.; other, 45@55c.; N. J. Geese, $125@1.50; Western, $1.12@1.25.

Dressed poultry has almost lost a week, the weather has been bad and purchases very light. There is, however, no material surplus, and the weather at the close allows fresh receipts to turn out in good condition. Prices are low and cannot improve much while open weather prevails. If indeed they work above the quotations that have been made this season. Supplies at the moment are somewhat mixed in quality, hence the very low figures.

Dry picked turkeys, 12@13c.; prime scalded, 11@12c.; fair, 9@10c.; common, 7@8c. Chickens and fowls, dry picked, 13c.; common to good scalded, 8@10c. Ducks, choice, 12@13c.; other, 9@12c. Geese range, 7@10½c.

Game is in good demand at reasonable prices for the bulk of items. Extra canvas-backs are high. An odd lot of Missouri flight pigeons sold at 40c. doz., not wanted.

Quail, doz., $1.12@1.37; Grouse, trapped, pair 75@80c.; drawn, 50c.; Partridges, State, 80@85c.; other, 50@70c.; canvas-back Ducks, Havre de Grace, $2.25@2.50 pair; Western, $1.50@2; red head, 75c.@$1.25; Mallard, 60c.; Teal, 40@45c.; common, 25@35c.; Hares, 30@40c.; Rabbits, 25@30c.; Venison, short saddles, 11@13c.; long do., 10@11c.; whole deer, 7@8c.

PROVISIONS.—Hog products generally have been at easy prices and taken to a fair extent by exporters.

Mess pork quoted at $7.25@7.75 for job lots, as to quality; $7.25 for December; $8.70 for new for January; $8.70 for February and $8.75@8.80 for March. Bacon at 4½c. for long clear and 4¾c. for short clear. Stearine at 6¾. for Western. Tallow at $6¾@6 11-16 for prime. Lard—Western steam at $5 90@5.97½ for spot lots; $5.92½@5.95 for December; 5.95@5.97½ for January; $6.05 bid for February, and $6.12½ bid for March. Beef Hams at $14.50@15. Beef—Extra Inoia mess, $20.50@21.50 for city brands; do. Philadelphia, $19@19.50; packet at $11@11.50; plain mess at $9.50@10; extra mess at $10.50@11.50.

SEED.—Clover is in moderate demand; quoted at 6¼@6¾c. for prime to 6¾@7c. for choice. Timothy at $1.25 for prime. Flax seed at $1.40.

TOBACCO.—There is a fair local trade demand, but export movement moderate; prices are steadily held.

VEGETABLES.—Potatoes drag and there is a general disposition to shade prices for all stock. Onions easier. Pumpkins scarce and higher; other truck as before.

Nova Scotia E. Rose, bulk, $2.62@2.75 ₱ bbl.; Prolific and Chili red, $2.25@2.50; P. E. I. Jackson whites, $2; Mercers, $1.75@2; Eastern E. Rose, with bbl., $2.25@2.37; State, $2.50; fair to good, $2@2.37; do. Peach Blow, choice, $2.50@2.75; common, $2@2.25; Peerless, choice, $2.37@2.50; poor to good, $2@2.25. Sweet potatoes, Del., $2@2.50; Va., $1.50@1.75, which is higher. Onions steady. White, $1.50@2; red and yellow, $1.75; Chester, $1.25@1.62. Hubbard and marrow squash, $1.75@2. Cabbage, $4@6 per 100. Cauliflower, bbl., $1.50@3. R. Turnips, 75@87c. Beets, 75c. Carrots, 75c.@$1. Pumpkins, 100, $6@10 Celery, 75@90c. doz.

Exports, potatoes, past week, 4,710 bbls.; onions, 320.

WOOL.—Trade has been more moderate this week on account of the approach to the close of the year, when there is always a disinclination among manufacturers to carry material supplies. Prices have not varied, and they are generally steadily held.

Quotations are for Domestic Fleeces: Ohio, Pennsylvania and West Virginia—XXX and picklock, 37@38c.; XX, —@35; X, 34@35c.; No. 1, 33@37c.; No. 2, 32@35c; coarse, 28@31c; combing, 36@40c.

New York, Michigan, and Wisconsin, XX, 31@33c.; X, 30@33c.; No. 1, 32@35c.; No. 2, 30@33c.; coarse, 27@30c.; combing, 3?@40c.

Indiana, Kentucky and Tennessee—XX, 30@34c.; X, 30@33c.; No. 1, 33@35c.; No. 2, 31@33c.; course, 27@30c.; combing, 38@42c.; unwashed combing, 28@33c.

Illinois, Iowa and Minnesota—XX, 30@33c.; X, 32@34c.; No. 1, 32@34c.; No. 2, 28@30c.; coarse, 25@27c.

Georgia, Alabama, Mississippi and Louisiana—Fine unwashed, 23@28c.; medium unwashed, 26@29c.; coarse unwashed, 18@21c.; burry, 11@16c.

LIVE STOCK MARKETS

Saturday, Dec 14, 1878.

BEEVES.—Receipts for the week, 9,477 head; do. last week, 8,900 do. No essential change can be noted at J. C. since Wednesday. Supply not excessive. At 60th street quotations were ½c. lower in the bulk of transactions compared with Wednesday last. Poor cattle 7@7½c. dress 54 lbs.; fair to prime, 7½@9½c.; tips, 9¾@10c., bulk of sales 8@9c. dress 56 lbs.

COWS AND CALVES.—The market is running in its ordinary tame winter limits. Slow sales at $40@60 per head. Selections $75. Receipts large.

VEAL CALVES.—Live milch have ruled steady and firm, 7c. for both State and N. J. choice, Fair to good, 5½@6c., including heavy weight; fed calves, 4@5c.; grassers, 2¾@3¾c. Hay dressed, 8@10c.

SHEEP AND LAMBS.—Receipts for the week, 23,709 head; do. last week, 20,336 do. The demand is good, quality of sheep improved. Canada is sending some extra heavy aboard in bond. Two car loads of extra wethers held at 6c., average 200 lbs. Market sheep quoted 4¾@5¾c. Lambs 4¾@5¾c.

SWINE.—Receipts for the week, 50,138 head; do., last week, 44,446 do. Market dull. Weather has been bad for handling dressed: closing rates $2.90@3.15 per 100 lbs., mid. to good corn, Country pork, light, 4¾@4¾c.; medium 4@4¼c.; heavy 3¾@3¾c, city dressed 3¾@4c.

HORSFORD'S Bread Preparation

UNSURPASSED FOR MAKING

LIGHT BREAD,

Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof. E. N. Horsford, by the Rumford Chemical Works, Providence, R. I.

THE CHEMISTRY OF METALS.—Continued.

W. H. WALENN.

As we approach to the purely chemical experiments, it is necessary to sound a short prelude, especially as in the proposed method of treating the subject it is not intended to sacrifice important and interesting experiments to a fancied difficulty or danger in trying them. The way to surmount difficulties is not to avoid them, and this is quite as true in experimental chemistry as in any other department of learning. The true way to surmount a difficulty is to encounter it, and by a careful study of its peculiarities as they arise, to strip it of its ugly and intractable appearance, thence, by perseverance, to overcome it and to produce a perfect success. It is weakness to be satisfied with a partial success—the true inventor is always the most difficult to please; the test of devotion to a cause is the perfection of the result obtained. Be careful also to fully understand the subject before engaging practically in it. In trying each experiment, the whole of the account of the experiment herein detailed (and of its and peculiarities, whether set forth before or after the experiment itself), should be thoroughly read and understood, and the apparatus and materials collected before beginning to work; strict adherence should be given to the instructions. No chemical experiment, however simple, should be tried in the drawing-room (if the integrity of the carpet is to be preserved), except by a practiced hand; and he sometimes meets with a mishap. If it is required to produce some "show experiments" to friends, they should be well rehearsed in private with the same apparatus and assistance that are to be ultimately used. In any case it is well to have assistance, and a senior friend is to be preferred. An uncarpeted floor and a clean wooden table, together with cloths, plenty of water, and clean apparatus are very helpful accessories. When a spirit-lamp is used, it must be filled, at a distance from any light or fire, with spirits or wine or with wood naptha. Poisons should be marked with the word Poison in large letters; and every bottle or other receptacle, should be properly labeled. Stoppered bottles should be used for highly acid or alkaline substances, and for volatile bodies. The complete adoption of attention to direction, cleanliness of materials, and apparatus, and of activity of handling, will insure success.

The two following experiments show the tarnishing, or "oxidation," of copper—that is to say, its union with oxygen when exposed to circumstances favorable for that result to take place:—

EXPERIMENT 1. — Copper does not rust, as iron does, when exposed to the action of the weather. It slowly tarnishes. If, however, a penny (of earlier date than 1859), or other piece of pure copper be held in a flame by a pair of pincers, the films that successively form upon its surface appear of various and beautiful colors, which change with the thickness of the film, and the heat of the coin. The best flame for this purpose is the flame of a spirit lamp, as it burns without depositing soot or carbon upon anything held in it.

The air is chiefly composed of two gases, one—oxygen—that will unite with metals. All chemical union is promoted by heat; when the coin is held in the flame, the oxygen of air unites itself in various but definite proportions with the copper, and forms "oxides" of copper of various tints; this it could not do at the ordinary temperature.

EPPERIMENT 2.—If the polished coin (cleansed from grease by boiling in a solution of common washing soda) be boiled in a little water (about a wineglassful), to which four or five drops of nitric acid have been added, its surface will be covered with a brown "oxide" upon its being taken out of the water and allowed to dry in the air. This process is sometimes employed to give the metal a bronze-like appearance.

In this case the oxygen comes from the liquid. The following experiments show how the metal can be dissolved, or obtained in solution:—

EXPERIMENT 3.—At the bottom of a test tube, or a tall, narrow glass, like a champagne glass, place some clean turnings of copper, and pour a small quantity of strong nitric acid upon them. Powerful action will immediately take place, and the tube will soon be filled with a red gas, evolved from the nitric acid during the solution of the copper. In a few minutes the action will cease, the copper will have disappeared, and the liquid will be of a fine green tint. "Nitrate of copper," or "cupric nitrate" is in solution; if the tube be allowed to remain quiet in a cold place for a few days, blue crystals of cupric nitrate will be deposited.

The red gas is very poisonous, and care should be taken not to breathe it. The gas will cause a lighted taper to burn brilliantly, if it is immersed therein. Nitric acid is the most powerful acid known, therefore great care must be taken, when pouring it, not to let any of it drop upon the skin or clothes. It corrodes the skin, turning it of a yellow color, and dyes the clothes (especially if black) a bright red. It is well to wash the stoppered mouth of the bottle thoroughly with water after having poured out any acid. In adding nitric acid to the copper turnings, the face should be kept away from the red fumes, so as to avoid breathing them; a small cup inverted over the tall, narrow glass, as soon as the acid is added to the copper, confines the gas, so that its color may most distinctly be observed, and affords the means and opportunity of safely taking the apparatus to the chimney or the window-sill, so as not to fill the apartment with the gaseous fumes.

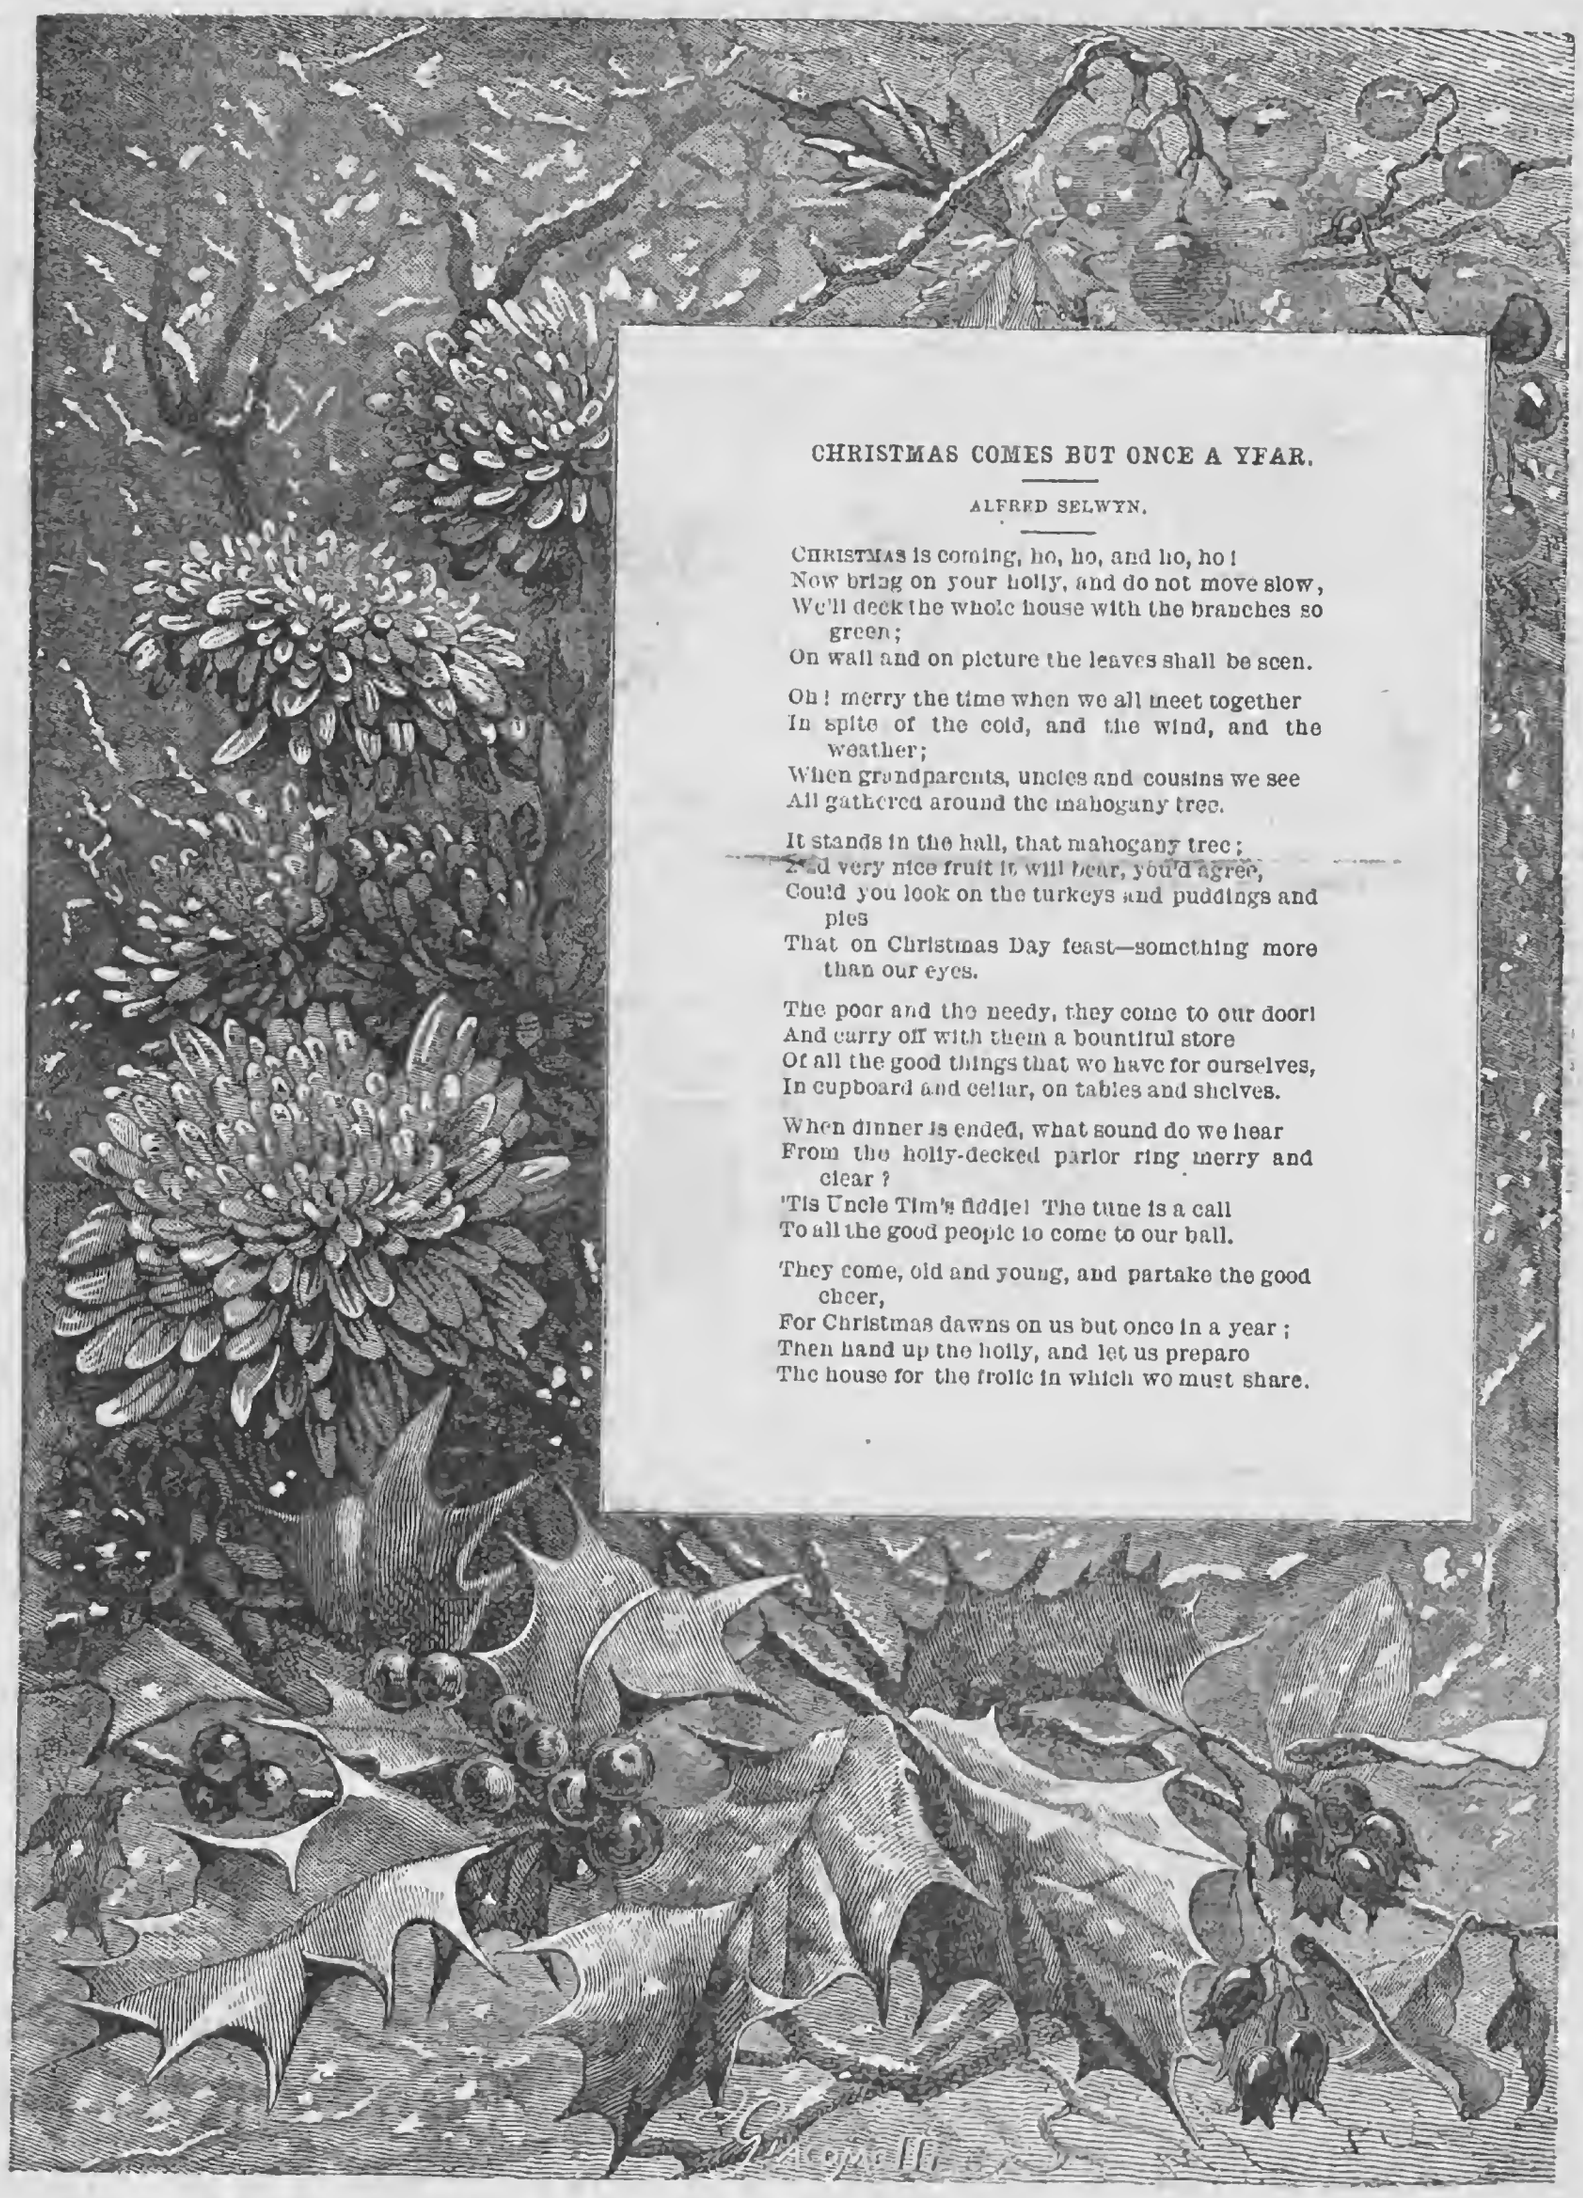
EXPERIMENT 4.—Place in a small saucer, or evaporating dish that will bear heat, some copper filings or turnings, and pour thereon a mixture of three parts (by measure) of water, with one part of oil of vitriol, so that a comparatively large surface of the liquid is necessarily exposed to the air; then heat the contents of the dish (by means of a spirit lamp) to nearly the boiling point, adding water from time to time as the liquid evaporates. The metal will gradually dissolve. If the dish be loosely covered over, and stood in a quiet place for some days, beautiful blue crystals of "sulphate of copper," will form,

"FARMING UNDER THE SEA."

THE fact is not generally known, that within three hours' ride of Boston a large and profitable business has been carried on ever since 1848, along the sea-shore, and which is nothing more or less then "farming under the sea." Everywhere upon the coast of New England may be found, about ten feet below the water-mark, the lichen known as carrageen,—the "Irish Moss" of commerce. It may be torn from the sunken rocks anywhere, and yet the little port of Scituate is almost the only place in the country where it is gathered and cured. This village is the great center of the moss business in the country, and the entire Union draws its supplies from those beaches. Long rakes are used in tilling this marine farm, and it does not take long to fill the many dories that await the lichen, torn from its salty, rocky bed. The husbands and fathers gather the moss from the sea, and the wives and daughters prepare it for market. Soak it in water and it will melt away to a jelly. Boil it with milk and a delicious white and creamy blanc-mange is the result. The annual product is from ten to fifteen thousand barrels, and it brings $50,000 into the town, which sum is shared by some one hundred and fifty families. Its consumption in the manufacture of lager beer is very large, and the entire beer interest in the country draws its supplies from the Scituate beaches, as the importation from Ireland has almost ceased. It is generally known that the moss, as an article of food, is called "Sea Moss Farine."

THE pretty Christmas poem "Christmas Comes But Once A Year" pictures a scene of mirth and good-cheer that we hope will find a counterpart in many a RURAL household. It originally appeared in The Nursery.

THE juvenile literature of the period is getting a pretty vigorous handling by our college professors, our monthly magazines and the public press. Parents should scrutinize every line of every issue of the flash literature which, under so many alluring disguises, is poisoning the minds and corrupting the morals of the rising generation.



CHRISTMAS COMES BUT ONCE A YFAR.

ALFRED SELWYN.

CHRISTMAS is coming, ho, ho, and ho, ho!
Now bring on your holly, and do not move slow,
We'll deck the whole house with the branches so green;
On wall and on picture the leaves shall be seen.

Oh! merry the time when we all meet together
In spite of the cold, and the wind, and the weather;
When grandparents, uncles and cousins we see
All gathered around the mahogany tree.

It stands in the hall, that mahogany tree;
And very nice fruit it will bear, you'd agree,
Could you look on the turkeys and puddings and pies
That on Christmas Day feast—something more than our eyes.

The poor and the needy, they come to our door!
And carry off with them a bountiful store
Of all the good things that we have for ourselves,
In cupboard and cellar, on tables and shelves.

When dinner is ended, what sound do we hear
From the holly-decked parlor ring merry and clear?
'Tis Uncle Tim's fiddle! The tune is a call
To all the good people to come to our ball.

They come, old and young, and partake the good cheer,
For Christmas dawns on us but once in a year;
Then hand up the holly, and let us prepare
The house for the frolic in which we must share.

Sabbath Reading.

THE HOLY NIGHT.

SILENT night, holiest night!
All asleep—lonely light!
Where adoring watch the pair,
Watch, as is his Father's care,
Sleeps the infant Christ—
Sleeps the infant Christ.

Silent night, holiest night!
Shepherds saw angels bright,
Heard from heaven the white-robed throng,
Bearing down to earth the song:
Christ the Saviour's come!
Christ the Saviour's come!

Silent night, holiest night!
Son of God! oh, how bright
Beams the ray of heavenly grace
In the infant Saviour's face—
Saviour born for us!
Saviour born for us! *[Tyrolese Carol.*

BUNYAN'S IDEA OF THE DOCTRINE OF PERSEVERANCE.

THE doctrine of perseverance is also a cross to the flesh; which is not only to begin, but to hold out, not only to bid fair, and to say, "Would I had heaven, but so to know Christ, put on Christ, and walk with Christ so as to come to heaven." Indeed it is no great matter to begin to look for heaven, to begin to seek the Lord, to begin to shun sin; O but it is a very great matter to continue with God's approbation: "My servant Caleb," saith God, "is a man of another spirit, he hath followed me (followed me always, he hath continually followed me) fully, he shall possess the land." Almost all the many thousands of the children of Israel in their generation, fell short of perseverance when they walked from Egypt towards the land of Canaan. Indeed they went to work at first pretty willingly, but they were very short-winded, they were quickly out of breath, and in their hearts they turned back again into Egypt.

It is an easy matter for a man to run hard for a spurt, for a furlong, for a mile or two: O, but to hold out for a hundred, for a thousand, for ten thousand miles, that man that doth this, he must look to meet with cross, pain, and wearisomeness to the flesh, especially if as he goeth he meeteth with briars and quagmires, and other encumbrances, that make his journey so much the more painful.

Nay, do you not see with your eyes daily, that perseverence is a very great part of the cross? why else do men so soon grow weary? I could point out many, who, after they have followed the ways of God about a twelvemonth, others it may be two three, or four (some more, and some less) years, have been beaten out of wind, have taken up their lodging and rest before they have got half-way to heaven, some in this, some in that sin; and have secretly, nay, sometimes openly said, that the way is too strait, the race too long, the religion too holy, and I cannot hold out, I can go no farther.

THE LITTLE GARDENER.

"THE weeds grow faster than the flowers," said a boy, as with a sigh he pointed to the patch of ground his father had given him for a garden.

"But the flowers and shrubs are worth cultivation," answered his father; "and it only requires care and attention to destroy the weeds one by one when they appear above the soil. Nothing useful is done without trouble. Will you, my son, give your garden the care it needs?"

"Yes, father," said the boy, "I will try."

"And if you try, you will succeed."

He tried, and after a time he was successful; but not at once. Many an idle habit had to be overcome, and much self-denial exercised; and what troubled him more than all was that the garden seemed as if it produced weeds of itself in the night whilst he was sleeping, and the insects came and ate the leaves and buds of the flowering plants when there was no one near to destroy them. But when the summer and autumn came, he was well repaid for his labor. His garden was filled with blossoms, amid which the bees hovered with a drowsy murmur, and around which the sunshine seemed to rest with a softened splendor.

PERSONAL ITEMS.

Thomas Carlyle celebrated his 83rd birthday last Wednesday.

Senator Gordon left college before he graduated, in order to get married. He preferred a wife to a diploma.

General Fremont is making himself popular in Arizona. He is a non-partisan Governor, and attends to business.

Mrs. General Sherman continues to reside in Baltimore, while her husband and daughters reside in Washington.

Senator Anthony, as is his pleasing custom, sent each of the New-England Senators a Rhode Island turkey for Thanksgiving.

Dickens's real name was Charles John Hoffam Dickens, but the novelist had the good sense to tone it down to simple Charles Dickens.

Senator Chaffee, of Colorado, is the fortunate owner of half of a newly developed silver mine which is yielding $9,000 worth of silver daily.

William Sackville Gordon, employed as a letter carrier in Australia, died there recently. He was a son of the late Lord Henry Gordon, and a cousin of the Marquis of Huntley.

General Robert Patterson of Philadelphia, now more than eighty years of age, is said to have entertained at his table every President of the United States since Madison's time.

Orson Hyde, one of the Mormon "Twelve Apostles," and for many years among the ablest and most active in behalf of the Latter-Day Saints, died in Utah on Thanksgiving Day.

Congressman-elect Murch, the Greenbacker who defeated Eugene Hale in Maine, proposes to spend this winter in Washington and try to consolidate all the opposition to the Republican party.

Horace W. Tabor is a lucky man. In 1864 he was a stone-cutter in Augusta, Me. In 1859 he went to Colorado and engaged in mining. He is now worth two millions, and has been elected Lieutenant-Governor of the State.

Lord Beaconsfield is described as having a face waxen and habitually ashen pale, on which suffering or pleasure, or, indeed, emotion of any kind, is never allowed to appear. As to his walk, it is "a curious, panther-like stride."

Mr. Smith of New Orleans was agreeably surprised to find a plump turkey served up for his dinner, and inquired of his servant how it was obtained. "Why, sir," replied Sambo, "dat turkey has been roosting on our fence three nights. So dis morning I seize him for de rent of de fence."

Wit and Humor.

"Masterly inactivity" was first alluded to by Isaiah, when he said (xxx., 7), "Their strength is to sit still."

Why is it men will scorn a maid
Of thirty-two or so,
But if in cap and crape arrayed
Pronounce her *comme il faut*?

Extract from a late French romance: "With one hand he held her beautiful golden head above the chilling waves, and with the other called loudly for assistance."

"My dear," said Mrs. Snodgrass, shuddering, "how do these awful men succeed in entering dead people's vaults?" "With skeleton keys, I presume," unfeelingly replied Mr. S.

He was a countryman, and he walked along our busy thoroughfare and read a sign over the door of a manufacturing establishment, "Cast-Iron Sinks." It made him mad. He said that any fool ought to know that.—*Camden Post.*

Cart Loads of Medicinal Rubbish

Are swallowed by invalids, and their physical troubles thus kept alive for years, when that peerless tonic stimulant and corrective, Hostetter's Stomach Bitters, would speedily set the disordered and worn out mechanism of the system in active and healthful operation again. It has been demonstrated over and over again that the requirements of the sick are answered far better by the Bitters than by a majority of the miscalled remedies of the pharmacopœia. The stomach is strengthened, the liver regulated, the bowels put in proper order, the blood enriched and purified, and the nervous system rendered tranquil and vigorous by this inestimable family medicine and safeguard against disease, which is, moreover, a most agreeable and effective appetizer, and a cordial peculiarly adapted to the wants of the aged and infirm, delicate females and convalescing patients. It is, besides, immensely popular as an antidote to malaria.

WHAT AILS THE HENS?

Fashionable lady.—Nelly, the eggs grow smaller and smaller—why don't you have the hens sit longer!

GREGORY'S SEED CATALOGUE

My Annual Catalogue of Vegetable and Flower Seed for **1879**, rich in engravings, from original photographs, will be sent FREE, to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. *Printed directions for cultivation on each package.* All seed *warranted to be both fresh and true to name*; so far, that should it prove otherwise, *I will refill the order gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables, I invite the patronage of *all who are anxious o have their seed direct from the grower: fresh, true, and of the very best strain.*

Biographical.

J. B. LAWES.

For nearly forty years the name of J. B. Lawes has been synonymous with progress in agricultural science and practico, the civilized world over, generally conpled with that of his able assistant Dr. J. H. Gilbert. During this time many laborious students have given to the agricultural world much scientific information with regard to its own apocial avocations; but the correctness of this information has been best tested and its value most accnrately determined by the renowned exporiments at Rothamsted. During this timo, too, many practical agriculturists have contributed to the general fund of knowledge belonging to their class a multitude of lossons from their own experience, but most of these lessons, also, have been either bonoficially corrected or elncidated by the samo serios of experiments. It is doubtful whether within the last quartor of a century, a single standard work relating to agriculture has been published anywhere, in which referonces are not specifically made to these experiments; and it is certain that in that time not only has no valuable work of the kind been published, but that no valuable numbor of an agricultural periodical has been issued which did not derivo a fair share of its information either directly or indirectly from tnat source. While local peculiarities of soil and climato must always greatly influence the methods and results of intelligont agriculture, there are certain general principlos the judicious practice of which will at all timos go far towards deciding the measure of success that rewards the farmer's labors. What these important principles are, and how they can best be reduced to practice, no one, in any ago, has done more towards discovering with the certainty of a demonstration than the gifted owner of Rothamsted.

This now famous placo is a fine entailed estate of over a thousand acres of very excellent land situated twenty-five miles from London, on the Midland Railway, near Harpenden Station in Hertfordshire. The house is approached through an extensive park ornamented with single specimens, clumps, and vistas of noble oaks, chestnuts and beeches. It is an old English battlemented mansion built of brick, in the Tudor style of architecture. The oldest part of it dates away back more than fonr hundred years to the troublous times of Edward IV. and Warwick, the King-maker; but extensive additions in the same style were made in the peaceful reign of James I, and still more have been built in modern days. Beautiful lawns, fine conservatories, ancestral paintings; in a word, all its surroundings and accessories, internal and oxternal, bespeak the excellent taste and ample fortune of its owner.

Mr. Lawes inherited it in 1834, and although then only a trifle beyond his majority, ho commenced at once to experiment with different fertilizing materials, at first, however, merely in a small way with plants in pots. But it was not long before his interest in his investigations and his far-sighted perception of the beneficial results that might be obtained from them if systematically conducted, led him to enlarge his operations and to transfer them from the greenhonse to the field. The first conception of the system which has since proved so productive of good results, must have been original with him; for not only had nothing of the kind been previously practiced, but it could not have been suggested by the toachings of others, for it was begun before Liobig had promulgated the results of his studies in agricultural chemistry, and when, aside from the early labors of Davy, there were scarcely any researches in that line, except those of De Saussure. Neither were the operations undertaken with even a distant eye to profit, for the experimenter was already rich in material goods and youthful enthusiasm. It was pure love of research and of mankind that prompted him thus early to devote his keen intellect and abundant means to the beneficent project in the execution of which the same motive has elicited in the intervening years such marvelous foresight, judgment and persistence, despite the occasional discouragement inseparable from all somi-philanthropic undertakings.

The problem he presented to himself at the outset, and to the solution of which he has devoted a useful lifetime and an ample fortune, was to determine the actual relations of various crops with the soil in which thoy are grown and with the fertilizers used to promote that growth, and to do this on so extensive a scale, both as regards area and time, as to settle upon a definite basis the fundamental principlos of agricultural practice. To elaborate the plan that would conduce best to this end was not the work of a day or a year; it required the labor and experience of nearly a decade before it assumed the systematic shape which it has since snbstantially retained. The nature of this, and the care with which all conceivable sources of error are eliminated from it, as far as human ingenuity can do so, have been already set forth in the Rurals of October 13, 1877 and July 27, 1878, and more briefly referred to in several other issues. It can hardly be said to date further back than 1843, when Dr. Gilbert, a well-known member of the leading scientific societies of the United Kingdom, was fortunately engaged by Mr. Lawes to take the direction of the laboratory department of his experimental station, and so closely have the two been since associated that the name of one has almost become a complement to that of the other. Down to 1855 laboratory work was done in a large barn fitted up for the purpose; but during the winter of '54–'5 a fine new laboratory was built by public subscriptions among the farming community, and presented to Mr. Lawes as a grateful recognition of the great benefit his researches had conferred upon agriculture. Nor have the labors at Rothamsted been confined exclusively to the soil and its immediate products; for they also embrace a long series of experiments on stock management, condncted with the precision and completeness that distinguish all the tests made there.

Althongh but a small part of the results of these innumerable experiments has hitherto been pnblished, yet that small part wonld make a good-sized library of entertaining and instructive reading, for both Messrs. Lawes and Gilbert, recognizing the fact that the world will be benefited by their labors jnst in proportion to the publicity given to the method of those labors and their results, in addition to giving to the public several standard works on the snbject, have been generous in their contributions to agricultural periodicals, eloquent in numerous addresses at public meetings, and always courteous to the many visitors seeking information by inspecting the grounds to which their labors have given a world-wide celebrity. Moroover, after all these years of devotion to his cherished object, Mr. Lawes, feeling that he has only commenced a work which it will require many lives to complete, has lately set aside $500,000 and a certain area of land, to insure the continnance of these investigations when an honored memory of him alone and the lasting results of his labors shall remain among the living.

The use of superphosphate of lime found favor at Rothamsted early after Liebig's suggestion with regard to its manufacture and advantages, and a little later, when tho discovery of vast deposits of mineral phosphates opened to the agriculturist a prospect of undreamt of sources of wealth, Mr. Lawes was among the first to utilize the discovery. In order to insure the purity on his own land of what are now known as commercial fertilizers, and to demonstrate their utility, he began their manufacture many years ago and snccessfnlly prosecuted the industry on a very large scale nntil the present year, when he sold out the business to a company with a capital of about $3,000,000. At all times he has been a zealous, out-spoken advocate for the amelioration of the condition of tenant farmers and of agricultural laborers, and has set an example to other landlords by his considerate treatment of his own tenants and by his effectnal efforts to improve the lot and dispel the ignorance of his hired hands.

J. B. LAWES. (From a photograph.)

It may well canse surprise that in a country in which titles are nominally bestowed as rewards for signal merit, this man, whose long labors have done so much for the individnal and national prosperity, not only of his own countrymen bnt also of the dwellers in all civilized lands, shonld still remain untitled; but satisfaction will snceeed surprise on reflecting that in bygone days British titles crowned vice as often as they honored virtue or meritorious services, and that even to-day they are reserved almost exclnsively to requite the soldier's murderous skill or chance good fortune, the lawyer's crafty pleadings, the politician's plansible trickery or the civil functionary's accidental prominence.

The accompanying likeness of Mr. Lawes is taken from a photograph which at our solicitation he lately sent to ns. Without consulting his wishes in the matter, wo have ventured to thus use his gift in order to please our readers with the portrait of one whom, having done so mnch for agriculturo, all agriculturits should delight to honor. So far as our remembrance and inquiries go, it is the first likeness of him ever placed before the American public, and will be specially interesting to our readers who have already made his acquaintance through his valnable contribntions to these columns.

Farm-Topics.

IMPROVED FARMING.

Hon. Thomas P. Janes, Commissioner of Agriculture for the State of Georgia, speaks in his Fifth Annnal Report, as follows: "Successful agriculture secures a liberal annual profit upon the capital invested in land, appliances and labor, and at the same time increases the fertility, or producing capacity, of the soil." Admitting the correctness of this proposition, and jndging from the condition of many farms in the past, the presnmption would be that our forefathers were not all snccessful agricultnrists, for the reason that in many instances there is an evidence of deterioration of the soil, which, in some cases, has amounted almost to barrenness. This Mr. Janes describes as follows: "Wasteful agriculture, such as was practiced in the early history of every country, may secure annual profits, but is often accompanied by a diminution in the fertility of the soil, and hence a reduction in the value of the capital invested." Here is where many farmers commit an error; because they are, for the time being, reaping a profit from the cultivation of the soil, they do not consider that the course which they are pursuing is working a secret injury to the soil, which more than balances the temporary profits obtained.

It therefore becomes necessary to resort to a system described as "Recuperative Agriculture, which, under the influence of science and skill, builds up the waste of the previous system, and results in successful agriculture."

Wasteful agriculture may result from different causes; cropping a soil without returning to it fertilizing materials to replace those taken from it, causes waste; so, too, cropping a greater surface than the amount of fertilizing substances applied will snpply with what has been taken by the crop, will produce a like result, only less in extent. It is a damaging system of agriculture that draws from the soil a greater amount of fertility than is supplied to it, and it is all the more dangerous because its evil results are so gradual in their appearance that they are hardly noticeable as the years go by until the land is impoverished; and yet this is just what has been going on all over the country, and in a multitude of cases is still being done. But fortunately for the future prosperity of agriculture, farmers are becoming better educated, and the practice of many of them is so changed as to make it worthy of being classed as "recuperative agriculture." This is being effected in two ways: first, the acreage brought under cultivation is so reduced as to make it

absolutely certain that the manures, or other fertilizers employed, are amply sufficient to supply the demand of the growing crop; second, some of the rougher portions of the farms are being abandoned to nature and her recuperative action.

Still another auxiliary condition is the abandonment of close fall feeding of meadow or mowing lands that are not from their location self-supporting. The farmer who supposes that he can feed his mowing lands closely, thus leaving them unprotected during the winter, is deceiving himself in a manner that will sooner or later work injury to his interests. This has been illustrated in the case of a farm which, under good management, easily filled a large barn with hay. It changed ownership, and the newcomer had no fears of browsing too closely; but in a very few years the whole amount of hay cut would not fill the mows up to the main beam.

It is a sure evidence of improved farming to see an increase of crops, and at the same time this is certain evidence that the permanent value of the land is not being impaired. Heavy manuring, thorough tillage, and the exercise of good, sound judgment in all other operations of the farm, are sure to bring their reward, and that these are being more generally practiced than in the past is an encouraging feature of American agriculture. WM. H. YEOMANS.

Tolland Co., Conn.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

In answer to the inquiry of Mr. Hendrick, which appeared some weeks ago in the RURAL, we will state that the potatoes raised on sod under straw, turned out the best of any crop in the neighborhood. The yield was three times as great as it was in the field with ordinary hill culture on the same amount of ground. The potatoes were smooth and clean, and grew in bunches or little piles, which make it easy to gather them. All we had to do was to rake off the straw which was matted down and pretty well rotted, and then pick up the potatoes. No digging was necessary. The grass was all dead and the sod rotted, leaving the ground clean. Next year we intend to devote this piece of ground to Hubbard squashes and plant the quince orchard with potatoes under straw. We will do this to subdue the grass and weeds which are very rank, and at the same time to mulch the young quince trees, and give them a good start. We will cover the nut grove with straw also, for the benefit of the trees and the squashes, if we have the straw left over.

We begin to think we cannot keep house without Hubbard or Butman squashes. They are the best substitute for potatoes, and when baked and served up with plenty of butter, one can make a good meal out of them. They come the nearest to sweet potatoes of any vegetable, and combine in themselves the most palatable nutriment of any single vegetable, excepting the sweet Carolinas. By covering the surface with straw, any stubborn patch of ground may be devoted to squashes, and a good crop raised with little labor. The essential point is to make a rich hill for a seed bed.

We have a near neighbor who has one redeeming quality; every morning, the year round, he feeds his chickens. He sells eggs.

Farmers are a queer sort of folks. As soon as they hear that pork is going down in market, into town they rush and try to engage theirs before it gets down any lower, and so they help to make the market duller by over-stocking it, whereas if they would stay home, it would not be long before butchers would be coming to them and bidding up the price. In Schenectady, our market-town, the farmers have "heared" the pork market to such an extent that the price has gone down, within two weeks, from five dollars per hundred to less than four dollars. This suits the butchers who help to growl and run the price down, while they expect to double their money invested. There is no reason why pork should be so low in price, except the panicy pressure made by the farmers themselves.

The bumble-footed rooster is well, but is minus two toes. We feel quite elated over this surgical operation and the result, as this is the only fowl with these ulcers, which ever lived.

We have dropped the old practice of saving seed corn with the husks on and then braiding it up. The main thing is to select bright and perfect ears, and then put them where they will get dry and can be kept so. Corn selected out of a crib will often grow better than when united and hung up. We spread our seed corn either by the fire or in the sunshine for a few days, and then put it in a barrel where the mice and rats cannot get at it. Old seed corn is just as good as new, and hence it is a good idea to save plenty when the crop is good and have it on hand. Sometimes there may be an unfavorable season and and the extra supply will be valuable. Two years we have known farmers to be put to a great deal of trouble on this account. This year is a grand time to lay by a big stock of seed corn, as corn is unusually bright; we have not seen a soft ear. Japanese corn, a striped, ornamental variety, had a hard time to ripen, but finally by the middle of October it become glazed.

Seventy-eight hills of Chufas produced a half bushel of nuts. Boiling is no improvement, but injures the flavor. They taste as nearly like chestnuts as anything. They are quite like artichokes but of better flavor and more tender. In a warm climate no doubt they will pay as a crop to leave in the ground for the pigs to root out and eat, but in our frozen latitude where they must be dug up and housed, they are not desirable, unless a few are raised for the children, to take the place of chestnuts, for which they are a tolerable substitute. They have to be washed—which is not a hard matter—before they can be eaten. After drying a little, they are sweeter.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

TREATMENT OF ORCHARDS.

We have an orchard of some fifty trees that are old and rough-barked, bearing small fruit, in small quantities. The trees were set years ago on the side-hill, and are of large size, making it next to impossible to plow among them. We shall draw manure and spread it thickly, say a half a load to the tree, about the roots, immediately. In the spring the stems shall be subjected to a thorough scraping and the old, rough, dead bark removed entirely. They shall then be washed with weak lye. This, together with severe pruning, will, I think, insure a great change for the better in their appearance and bearing.

We do not like the practice of white-washing trees. Even if not injurious to the trees, it makes them unpleasant to the eye. [Add sufficient quantities of lamp-black and red mineral paint to the lime. In this way the color of the bark may be closely imitated.—Eds.] On the other hand, a washing with lye every spring, I consider very beneficial for old or young trees. The effects are soon apparent: bark lice and other insects are exterminated; the bark changes from brown, to a dark healthy green, and becomes perfectly smooth; the growth of new wood is much greater than in trees which had not been so treated. There is no wash for trees the good effects of which are more marked. I have an idea that the lime in white-wash, would cause the bark to crack, although in this I may be mistaken.

I shall turn the sheep into the orchard next spring. They will not injure the trees as long as there is plenty of grass. Besides, they will consume all the wind-falls, the diseased and wormy fruit, and the benefits of this will be apparent in succeeding crops. When these apples are left lying under the trees, fine, smooth fruit, free from insects cannot be expected. Noxious insects will be propagated in readiness to work mischief in the next season's crop, whereas, if the eggs are destroyed, the danger from insect depredations will be greatly lessened. We do not, as a general thing, draw sufficient manure on land set with trees. When one considers the immense drain made upon the soil by an orchard of thrifty trees, one is apt to realize his error. The land must be fed, and well fed, if one would obtain large yields. Fall I think the best time to apply manure to trees. The rains and snows assist in carrying its fertilizing properties down within nourishing distance of the tiny rootlets. Coarse stable manure is probably the best; for if applied thickly, it forms an excellent mulch, destroying the grass and loosening the soil.

SHINGLES.

A dozen years ago, the buildings at Maplewood Farm were roofed with chestnut shingles, and although shingles of this kind were highly recommended by many, they have proved a poor investment. The buildings will require new roofing in the spring, if not sooner. The advantage claimed for them, was their durability. So far was this claim from being well founded, that hemlock shingles remained undecayed longer. Chestnut shingles make an excellent barometer. During dry weather, they warp and curl up badly, causing the roof to present an unsightly appearance; but on the approach of rain, they become flat again. This peculiarity loosens the nails and injures the roof. That, on this account, they will not retain moisture as long as others, is true; but they are not durable, do not make a nice roof, and I shall use no more of them. Good white-pine shingles are, in my opinion, the cheapest, everything considered. A neighbor was telling me that he had tried the experiment of dipping shingles in white-wash, before laying them, with the best of results. Their lasting qualities were very much improved, nearly doubled. It is a simple process, yet of much benefit, if the result stated can be obtained. I have, however, seen buildings roofed with shaved pine shingles, which remained good for thirty years. A good coat of paint applied every two or three years, would prove a profitable investment, yet many people think they cannot afford it.

MAKING GATES IN WINTER.

We are getting ready a supply of four and six-inch fence boards, against the stormy days of winter. I shall use them in making gates for all fields not so supplied. Much time is wasted during the year by opening and shutting bars, "stake and ridered" fences, and the like. To the farmer, more than others, time is money; and plenty of light, durable gates, well hung, will save a good deal of time and add not a little to his cash account.

Entomological.

THE WOOLY, APPLE-TREE LOUSE.
(Eriosoma lanigera)

Edward Parker, King's Co., Nova Scotia, asks the name of an insect pest that infests his fruit trees and whether there is any preventive or remedy for it. The insects have the appearance of a bunch of cotton and when rubbed with the hand look like a mass of blood. He has applied pickle, soap and various other washes against them to no effect. They are especially destructive to his young trees in the nursery. He says that he has been told that they are called "Downy Lice"

ANSWER BY B. PICKMAN MANN.

FIRST APPEARANCE OF THE PESTS.

Mr Parker is rightly informed that the insects which trouble his orchard are called "Downy Lice." They go also under other names, the fullest of which is placed at the head of this article. His description of their appearance leaves nothing to be desired on the score of their recognition. Harris, in his treatise on Insects Injurious to Vegetation, says that the young lice appear in the spring of the year, like little specks of mold on the trees. As the season advances, the downy coat of the insect becomes more distinct, and the presence of the pest, to quote the words of Asa Fitch, is revealed by small patches of white down, or cotton-like wool, covering a cluster of minute pale lice. These patches are usually situated near the root, particularly around the base of twigs and suckers growing from the trunk, and where any wound in the bark is healing. In autumn these patches are common also in the axils or crotches of the leaf-stalks, towards the ends of the twigs Under each small patch of down are commonly one large louse and many of her young.

THEIR HISTORY.

The lice are generally believed to have been imported from Europe into North America, but authorities differ in regard to the native home of the species. The present scientific name was first given to them in the year 1801, by Hausmann, who described them in the first volume of Illiger's Magazine fur Insektenkunde, p. 440, in Germany. They seem to have been noticed first in France, long previous to the year 1787, when they first attracted attention in England, but subsequently to 1787, they received in England the name of "American blight," on the supposition that they had been imported from North America. Riley, in his fourth and in his sixth report on the insects of Missouri, states that such is the case. Walsh, however, had previously gone so far as to doubt whether the American species is the same as the European, and to imagine that the European species was naturally a trunk-inhabiting species, while the American lived especially upon the roots. In European countries the insects multiply, occasionally, to such an extent as to cover the whole under sides of the limbs, and also the trunk, the tree appearing as though it were whitewashed.

THEIR HARDINESS IN COLD WEATHER.

Verrill says that these insects have a remarkable power of enduring the cold of winter and severe storms of rain and snow with comparative impunity. As late as Dec. 11, he found a small tree, in New Haven, Conn., covered along the under sides of all the branches with healthy and active lice of all sizes, busily engaged in sucking its sap, although two snow storms and many cold rains and freezing nights had occurred previously. Doubtless many of these insects thus survive the winter, especially when they are lodged in crevices where they delight to establish themselves. The downy or cottony substance that usually covers them abundantly may serve to protect them, in some degree from cold as well as from the summer heat.

THE YOUNG AND THEIR COVERING.

The eggs from which the first brood are hatched in the spring, are so small that they cannot be distinguished without a microscope. The young, when first hatched, are covered with a very short and fine down, but at a later period they become entirely imbedded in this secretion, as described above. This down is in fact a kind of wax, and dissolves completely in alcohol, as well as in some other liquids. It adheres to the fingers when it is touched, and is very easily removed from the insects, out of all the pores of the skin of the hinder part of the body of which it seems to issue. The adult insects emit, from time to time, drops of a sticky fluid from the hinder extremity of the body.

MODE OF GENERATION.

In common with the other members of the plant-louse, or Aphis family of insects, this louse has an unusual method of generation. The individuals which hatch out of eggs in the spring of the year are not of different sexes, or wholly of either sex, not being capable of producing or laying eggs, but go under the name of "neuters" or of "nurses," or under other names. They are without wings and, when fully grown, are 2.5 mm. in length, according to Harris, 1.5 mm long according to Fitch, egg-shaped, with honey-yellow or dull, reddish-brown body, and with blackish or dusky head and appendages. The body does not bear any honey-tubes, such as characterize so well many of the plant-lice. These individuals bear living young in great abundance, and their progeny become like them in appearance and nature, for several generations throughout the summer.

Late in the fall, however, as cold weather approaches and food becomes scanty, other individuals are produced in this same manner from this same stock, which do acquire wings, and are of the two sexes, capable of producing fertile eggs.

These sexual individuals have nearly black and rather plump bodies, but their distinguishing characteristic is their large wings. The fore wings are broad and have three delicate stiffening ribs traversing their central field, the third rib forked near the middle, and scarcely visible near its base before forking. On the front edge of the fore-wings is the usual colored spot, called the stigma, which is about three times as long as it is broad, and is acute at each end. The hind wings are about half as long as the fore wings and are quite narrow. They have two simple delicate ribs traversing them. Prof. A. E. Verrill, of Yale College, New Haven, Conn., discovered these winged individuals, which had not previously been known to exist, about the middle of October, in New Haven.

MANNER OF DEPOSITING THE EGGS.

The females fly from tree to tree, later in the year, depositing their eggs in the crotches of the branches and in the chinks of the bark, at or near the surface of the ground, especially if there are suckers springing up from the same place. As these females fly through the air, bearing with them the masses of down which they have secreted, they look like snow-flakes. They are not known to infest any other kind of trees than apple trees, and Fitch says that they prefer the trees whose fruit is sweetest. The young derive their nourishment from the sap of the bark and of the young wood immediately under the bark, inserting their beaks into the bark for the purpose. Harris says that the numerous punctures of these lice produce on the tender shoots a cellular appearance, and that whenever a colony of them is established, warts, or excrescences arise on the bark; the limbs thus attacked become sickly, the leaves turn yellow and drop off; and as the infection spreads from limb to limb, the whole tree becomes diseased, and eventually perishes.

REMEDIES.

As with other plant-lice, a persistent attack upon these results in a victory. The presence of insects is marked so conspicuously that there can be no difficulty in finding them. Wherever found, they should be destroyed, and as they can spread so easily in the fall of the year or in the winter, from tree to tree, they must be looked for upon apple trees which are not deemed worthy of care, but are allowed to stand as nurseries for all manner of pests, as well as upon the choice trees. Any oily substances or liquor that is destructive to insects, applied directly to them, will serve the purpose. A mixture of equal weight of fish-oil and melted resin, applied with a brush while warm, spirits of tar, spirits of turpentine, oil, urine, soft soap; a kilogram of potash in seven litres of water, have all been recommended.

The rough bark of the trees should be removed, so that the insects may find less opportunity to conceal themselves. Harris says also that the sods and earth around the bottom of the trunk of infested trees should be carried away, and their place supplied with fresh loam; at the same time any insects which are found underground should be killed, and all cracks and wounds should be filled with grafting cement or clay or mortar. Small limbs and extremities of branches, if infested, and beyond the reach of the applications, should be cut off and burned. He recommends the scrubbing of the bark, in the spring of the year, after it has been scraped smooth, with a stiff brush wet with the potash solution described above. Even scalding-hot water, applied with a mop-rag to the infested spots, will destroy the lice. Perhaps the most practicable remedy, and a sufficient one, would be the application of kerosene, benzine, or turpentine directly upon the insects.

A NEW INSECT DESTROYER.

A FRIEND of ours, an experienced gardener, tells us of a new and effectual way of exterminating insect pests both in and out-of-doors. Take a barrel and half fill it with coal tar. Then fill the barrel with water. After standing awhile the water may be sprinkled upon the leaves and stems by means of a whisk-broom or flowering

pot. According to the positive statement of our friend, it will at once kill all the insects with which it comes in contact, without in the least harming the plant. We cannot test it for ourselves at present, as we are not troubled with insects of any kind; but it may be worthy of a trial on the part of our readers, since it can do no harm in any event.

It has also been frequently noticed that worms which happened to be under newly-laid gas-tar walks, would, soon after the walks had been made, appear lifeless along the edges.

Dairy Husbandry.

PERFECT CHEESE.

T. H. HOSKINS, M. D.

TIME INJURES BUTTER, BUT IMPROVES WELL MADE CHEESE.

BUTTER is never better than when the manufacture of it is finished. Every day that it is kept, though the fact may not be apparent to the senses at first, deterioration is at work, and the money value declines. But this is far from being the case with cheese. When taken from the press, indeed, bandaged and annointed, the first process only is complete. The chemical changes which, in butter, work to lessen value, will in cheese, when properly conducted by art, develop value. But this can occur only when the cheese has been properly manufactured from pure, fresh and uncontaminated milk. Nor can it occur in the best made cheese from the best materials, unless the necessary conditions are understood and the proper facilities are at hand to secure such conditions in their perfection. The curing, no less than the manufacture of cheese, is a high art, and must have for its basis a thorough science.

NECESSITY OF MORE STUDY AND PRECAUTIONS.

These facts are only gradually becoming known. The studies in practical operations, as in organic chemistry, which have brought forth knowledge upon this matter, have only lately reached up to positive conclusions, and even yet, upon many minor details, the genius of our Edisons of the dairy has work to do. With the best of care in the dairy and factory, cheese is not always the same when it comes from the press. To recognize these differences, and give to each its right treatment, whereby the highest value is developed, require skill and knowledge of a high order. And besides these unavoidable variations, it is well known that by different methods of making up and curing, very different ulterior products are obtained, each of which has its peculiarities of taste, smell and appearance, and each commending itself to a particular market, and bearing a special value as a commercial product.

The recent triumphant success of our exhibits of cheese in England may be regarded as the first fruits of the improved methods recently introduced among us, especially in curing; and, although the English papers excuse their defeat on the ground that their own cheese as exhibited was not up to the highest mark of their manufacture, yet they concede that the American cheese was very fine, and well deserving of the premiums accorded it.

NEED OF BETTER CURING ROOMS AND PURER MILK.

These results are most encouraging, and should lead to the rapid investment of a large amount of capital in curing vaults, where the temperature, moisture, and other accessories can be kept under that perfect control which alone insures a perfect product. It is said that quite satisfactory results in this direction have been attained by the use of Wilkinson's subearth ducts for modifying and controlling the temperature of the air admitted into butter dairies. It would not be strange if this ingenious method should find its most profitable application in connection with the curing of cheese. It is certainly worthy of thorough trial. But it cannot be too earnestly impressed upon the minds of cheese makers that such an investment of capital as I refer to, can never be justified by a profitable success unless the makers of cheese, by requiring of the dairies the utmost care in feeding, in milking and in handling the milk on its way from the udder to the vat, secure for themselves a raw material of the first quality. A man once, in the market-house of a western city, asked of an egg-dealer if his were good eggs. The reply was, "Well, middling good." "This is the first time," exclaimed the would-be purchaser, "I ever heard of a middling good egg." And just as there is no such thing as a middling good egg, so it is more true that there is no such thing as middling good milk, when either butter or cheese making is in question. The rigid exclusion from a cheese factory of every dairy in which every possible care is not given to the making of good milk and its delivery unimpaired to the cheese maker, is essential to the manufacture of a good cheese, and especially of a cheese capable of being profitably cured for exportation. This point needs to be impressed upon the minds of our cow-keepers by line upon line and precept upon precept, until no cavil or doubt remains possible.

The Poultry Yard.

CAPONIZING.

HAVING seen in the RURAL an article on making capons, I here give my method of performing the operation. I learnt it, when a child, from my mother as I held the birds while she operated on them. Sitting on a chair or stool, with his hands resting on his knees, the person in charge of the bird holds it upside-down, pressing its feet against his thighs with his thumbs, while his hands are placed over the wings and around the body. Then the operator, supplied with a sharp penknife and a long, slender needle threaded with common cotton sewing thread, plucks out feathers enough to lay the skin bare midway between the end of the breast bone and the anus. Then with the left hand he pinches up the bare skin, and with the penknife makes a gash large enough to admit easily the fore-finger of the right hand. Then, holding the needle in his left hand, he catches the membrane covering the bowels and cuts it, and straightway slides the fore-finger of the right hand between the bowels and the walls that inclose them down to the spine and then forward until the testicles are distinctly visible. Then bend the right fore-finger until the tip of it rises in front of the testicle, which can be readily removed by drawing the finger backwards and bringing out the testicle in the hook formed by the bent finger. Afterwards operate on the other organ in the same way, in both cases holding the back of the bird against the palm of the left hand to facilitate the manipulations. Then grease the wound with a little fresh lard or butter, together with just enough carbolic acid to make its odor perceptible, and sew it up.

If the person who may wish to operate, will first examine some chickens that are being dressed for the table, he will readily understand this description of the operation, and a few trials will make him proficient enough to do the thing in less time than it would take to tell how it was done, and with no more danger to the bird than usually attends the castration of other animals.

THE USES OF THE CLEMATIS.

W. O. L. DREW.

OF all the beautiful climbing and trailing plants in cultivation, none are more worthy or deservedly popular than the many varied and beautiful varieties of Clematis. I speak of these plants as climbers, but let not the enterprising amateur be confined to the old-fashioned notion that these beautiful vines are only to be trained over the veranda, or summer arbor—though for this purpose the Clematis stands unequaled—,inasmuch as the uses to which this plant may be applied, and to which it is in every way adapted, are almost innumerable. It is to some of these uses I would now call the reader's attention. As

CLIMBERS

few plants will give more satisfaction for covering trellis-work arbors, etc., than the various sorts of Clematis, but for this purpose it is well to combine with them some pretty and contrasting vine. I have found the Passion vine, [Not hardy here.—EDS.] or Chinese Honeysuckle, to give good satisfaction when so blended. But of the uses of the Clematis as a climber I will speak no further, as nearly all amateurs know their value. For

PILLAR PLANTS.

I have yet seen nothing so well adapted as the beautiful, large-flowered varieties of the Clematis; yet I have seldom seen them used in this way whether from a lack of knowledge as to their desirability for the purpose, or from not knowing how to grow them as pillar plants, I cannot say. The pillar arrangement is extremely simple, and easily managed by any enterprising amateur. Plant a neat pole with five or six short arms attached, where you desire the plant to grow—it will be well to tar the end of the pole in the ground, to prevent decay—then plant strong, healthy Clematis, of some large, showy-flowered variety, of the Jackmanni type if to hand; if not, any variety will do. Train the plant to the pole and if it shows any tendency to become lanky or bare of new shoots at the base, it should be pruned down to about three feet, which will force new growth below. The usual hight to which it is desirable to train the vines in this way, is about five feet.

Another purpose to which they are admirably adapted, strange as it may seem to some, is as

BEDDING PLANTS.

To grow them successfully in this way is a little more difficult. The bed in which they are to grow should be made convex; that is, raised in the center; for only in this way can the blossoms be displayed to the best advantage. Having made the soil rich with a liberal dressing of decayed manure, set the plants, but not too thickly. As they begin to grow and send out shoots, they should receive attention. They must be looked after weekly, and trained and pegged down as recommended for Verbenas and Nasturtiums taking pains to train them where most required to cover the surface. As the plants do not throw up blossoms from the lower portion of the stems, that is, within a foot or so of the roots, the points of one series of plants should be trained so that they will over-lap and cover those portions of the other series which would otherwise remain bare and detract, therefore, from the beauty of the bed. Pegging should be attended to early and often, as they cling so closely together by their clasping leaf stalks, that the young shoots might be injured if they became untied and an attempt were made to separate them in order to train them aright.

If these directions be properly attended to, the bed will soon become brilliant with blooms, and will be a constant source of pleasure until frost. As soon as frost stops their blooming, they should be closely cut back. Here, in California, they require no covering, but in the East no doubt a slight protection will be required. If the season be warm and dry, like our summers, the bed should be well soaked several times during the season. Another way in which they show to great advantage, but which is only adapted to large grounds, is to let them grow in their own sweet way, scrambling and climbing over rock-work, etc; then the regal beauty of the Clematis is given full sway, and the gorgeous blooms show remarkably well.

El Dorado, Cal.

Horticultural.

THE BEARING YEAR OF APPLE TREES.

There is a good deal said and written about changing the bearing year of apple trees. After a number of years of observation, I believe that it is best to take the fruit when we can get it. There may be some philosophic reasons for trying to change the bearing year of young orchards, and good results may follow the attempt, but when an orchard gets of considerable size, the labor and the uncertainty of the results of such an undertaking place the matter in an unfavorable light. We have an old orchard of about fifty trees, all of which used to bear the same year, until there came a frost or cold wind that killed all the blossoms except those on a few trees that were sheltered by the building. Ever since, some trees in the orchard have borne on the odd years and the remainder on the even years. This year, however, the fruit crop was a general failure.

I also notice that trees of certain varieties among those whose bearing year has been altered, from some unaccountable cause have a tendency to get back to the year on which they originally bore fruit. Baldwins have been noted as bearers on even years for a long time; the Smith's Cider has had the same tendency to bear on the odd year, and taking into consideration the great range of country where this apple comes to perfection, I think that the question of bearing years will soon be settled by the orchardists selecting varieties whose natural habit is to bear on the even or odd year, as may be desired. Bucks Co., Pennsylvania, the home of the Cider Apple, was well supplied with apples last year; whereas, this year there are very few. I think that seventy five per cent. of all the trees set in Pennsylvania and New Jersey are of this variety, and for years it has been scarce in the nurseries. Out of 1,500 trees in our orchard, 800 are of this sort. I know orchards in which 90 out of every 100 trees are of this single variety. I believe that the Cider Apple could not be treated so as to bear permanently on even years; nor, in my opinion, can the bearing year of any other variety be permanently changed from the year on which it was originally accustomed to bear. Last year hundreds of barrels of apples were shipped from this section to England; this year Trenton is supplied from New York and Philadelphia.

I. J BLACKWELL.

Mercer Co., N. J.

PROFESSOR BEAL'S REPORT.

THE Michigan State Agricultural College unquestionably has earned the reputation of being one of the best institutions of its kind in the country. We have before us Prof. Beal's Report of the Horticultural Department for the present year, and notice particularly the good work the institution is doing in the line of experiments. For the elucidation of a few of these we quote from the Report: "We are trying by selection and cultivation to improve one variety of Indian corn, two of onions, one of beans, one of tomatoes, and one of wheat." ——We have planted about seventy-five varieties of corn, over twenty of onions, and about 250 named varieties of potatoes, besides about as many more unnamed seedlings which have originated at the College.——We have pruned some limbs from two apple trees on the twenty-fifth day of each month in the year, to see which will thrive the best.——For experiment we have planted pits of peaches diseased with the yellows.——We have small samples of hedges of Honey Locust, Osage Orange, Pepperidge, wild Crab-apple, wild Plum, Hawthorn, Prickly Ash; also of Arbor-Vitæ; Siberian Arbor-Vitæ; Austrian Pine, Norway Spruce, Lilac, Spiræa, etc. ——We are testing ten or more of the best varieties of tomatoes, and have crossed the Conqueror (best of all last year), with a smooth, early sort.——We have crossed the flowers of Clawson Wheat with Diehl, and have root-pruned these also.——We have crossed flowers of two varieties of Gooseberries; also Black-Cap Raspberries with red Raspberries.——We have saved seeds of some old plants of red clover to try to establish a perennial variety.——We have crossed Duke and Morello Cherries.——We are testing forty varieties of new and promising named varieties of Strawberries; we also have a fine lot of seedling Strawberries, some of which have borne this year; also some seedling Gooseberries, a few of which have borne this year for the first time.——Many other experiments too numerous to mention are given in the Report. People who are unacquainted with the character of, and the difficulties attending experiments, are apt to be in too great a hurry for the results. *Reliable* conclusions can be drawn only after a protracted series of experiments under varied circumstances. Under the careful management of Prof. Beal, conclusions will no doubt be reached that will be of lasting benefit to all cultivators of the soil. We hope the institution will continue its good work.

Miscellaneous.

IMPROVING BACKWARDS.

THERE are many grand improvements now before the public intended to enable lazy, shiftless people to farm better than their more sensible and industrious neighbors. Patent cow-milkers are an abomination; they unnaturally distend the natural orifice of the teat, finally permanently ruining the cow by rendering her unable to hold her milk at all. Patent egg-food is another, forcing hens to lay out of season, and finally preventing them from laying in season. Any tool, instrument or treatment which violates nature must rapidly lessen the real value of the animal upon which it is used, far beyond any temporary advantage from its employment.

Good health among stock is the best security that the animals will yield well; and sensible people who own good animals cannot be wheedled into the use of any quack nostrum or quack machine. On the other hand, those folks who own poor stock, and expect to suddenly make it valuable by the use of these foolish devices, show how little they know of their business.

S. R. M.

DEFIANCE WHEAT.—A correspondent from Providence, R. I., had the same experience with this variety of wheat during the past season, that we, ourselves, had, as detailed some time back. With aching back he deposited 14,000 kernels separately four by twelve inches apart, used 100 pounds of Darling's animal fertilizer, and kept the ground absolutely free from weeds. The straw was five feet long, and the heads from 4½ to 6 inches. The leaves, however, were destroyed by rust and the yield was only 69 pounds of light wheat. He is not disposed to consider this test decisive as to its merits, however, but intends to plant another pound or so next April.

WHAT OTHERS SAY.

AMSDEN.—Mr. John Powell (Dayton, O.,) says that this peach ripened the 4th of July; that it does not rot; and that it is large and handsome.

THERE would not have been any milk in the cocoanut if some of our dairymen had had the construction of it, says the Cincinnati Saturday Night.

TOO BAD.—The Germantown Telegraph says that in the next law against vile weeds, for which fine and imprisonment are the penalties, the Jerusalem Artichoke should be inserted by all means. It knows of a grass-field, the past summer, in which the vile thing has nearly half the ground through some former owner, perhaps fifty years ago, having been seduced to give it a place.

TEMPERATURE OF SLEEPING ROOMS.—The rule should be everywhere, during the part of the year when fires are kept burning, to avoid hoisting outside windows. It is safer and better to leave the chamber door open, as also the fireplace; then there is a draft up the chimney, while the room is not so likely to become cold. If there is some fire in the room all night, the window may be opened an inch. Hall's Journal says that it is safer to sleep in a bad air all night with a temperature over fifty, than in a pure air with a temperature under forty. The bad air may sicken you but cannot kill you; the cold air can and does kill very often.

A COMPARISON OF BREEDS OF SHEEP, with regard to weight of fleece and carcass, percentage

of lambs and average hardiness, has been pithily compiled in the form of the following table, by the National Live Stock Journal, from answers to inquiries on the subject sent out to a number of prominent breeders in various parts of the country. The table possesses interest as setting forth the average opinions of gentlemen representing all parts of the country, and engaged in breeding the stock of which they speak:

BREED,	Av. weight when fully grown.	Av. weight of fleece.	Av. No. of lambs at birth in decimals.	Av. hardiness, 100 the maximum.
Cotswold	200	13	1.6	90
Leicester	195	10	1.6	80
Shropshire Down	175	9	1.5	80
South Down	155	7	1.4	100
American Merino	103	12	1.1	100

THE ANGORA GOAT, according to Mr. Hayes, Secretary of the National Association of Wool Manufacturers, is the most valuable wool-bearing animal, not even excepting the cashmere goat, which produces only two or three ounces of the *pushm* used for making Indian shawls. Mohair, the fleece of the Angora, is worth, on an average, 75 cents a pound—more than double the price of the best Lincoln wool. It is used for making Utrect velvets, or "furniture plush," the piles of imitation seal-skin, the best carriage and lap-robes, braids for binding, black dress goods, laces, and for many other purposes, the number of which is only limited by the limited supply—the entire production of the world being only about 4,750,000 pounds. The English have obtained the highest success in spinning mohair, and owing to the stiffness of the fiber it is rarely woven alone, either the warp or woof being usually of cotton, silk or wool. A pure mohair fabric is considered nearly indestructible.

THE BEST BREED OF COWS under all conditions, has no existence, as so much depends upon the adaptation of the peculiar qualities of each breed to surrounding circumstances. The National Live Stock Journal says, however, that if the production of milk for towns is the leading object, then selected Ayrshires, Holsteins or Short-horns will give satisfaction. If they are intended for butter making, then the Jersey, Short-horn and Ayrshire would be the best, taken in this order; if for cheese making, then the Holstein, Ayrshire and Short-horn. It does not, however, approve of pure breeds for dairy purposes, but advises a cross of a Jersey bull on a deep-milking Ayrshire cow, as the delicate Jersey will be much improved by crossing on the hardy Ayrshire, while the grade will yield more milk than the former and of a richer quality than that of the latter. A square cross of a Jersey bull upon selected common cows also generally produces an excellent dairy grade.

A CHEAP ICE-HOUSE.—A correspondent while approving of Mr. Brooks's plan of an ice-house, in RURAL for December 14, thinks some may object to it on the score of expense; and tells how he makes a cheap, yet sufficiently effective one, in the form of a rail pen. He lays down some rails for the bottom, on which he places a fifteen-inch layer of sawdust. He then packs his ice, leaving around the outside a space of fifteen inches, to be packed with sawdust. Straw or boards can be used to prevent the sawdust from escaping through the cracks between the rails. Two or three feet of sawdust should be placed on the top of the ice; and, finally, four posts or forks should be set up, one at each corner, to support some planks for a covering. It would be well to place the whole under a good shade tree, and with such a device one may have ice throughout summer.

BOOKS RECEIVED.

ADDRESS of F. D. Moulton at the late International Dairy Fair, containing 15 pages.

PREMIUM List of the Fourth Annual Florida State Fair to be held at Gainsville in that State, Feb. 20 to 25, 1879. C. Covington Pres; D. S. Place Sec.

PRIZE List and Rules of the Second Annual Exhibition and Fair of the Parker City Poultry Association, to be held at the Opera House, Parker City, Pa., from Dec. 20 to 25. J. M. Laming, Parker City, Pa., Sec.

REGULATIONS and Premium list for the Second Annual Exhibition of the N. J. Poultry Association, to be held at Institute Hall, Newark. Jan. 14–17, 1879. Specimens must be delivered at the hall before noon on the 14th. Howard Valentine, Woodbridge, Cor. Sec.

PRIZE Essays on Cooked and Cooking Food for Domestic Animals on the farm with useful information for stock feeders, farmers and others. Published by Dr. R. Prindle, East Bethany, New York, and by Barrows, Savery & Co., Philadelphia, Pa. Price 20c. This pamphlet of 64 pages is mainly taken up with three prize essays on the subject of cooking food for stock. The authors of the Essays are E. W. Stewart, W. H. White, and John Wilkinson, all three of whom are thoroughly practical men, well skilled in every phase of the subject they here handle, as well as on many other subjects of interest to the farming community, as our readers already know, since all three of them are contribnters to the columns of this paper. As winter in its full severity will soon be upon us, the subject here treated of is a timely one, and we can strongly recommend this publication to all whom it may concern.

THE Sugar Industry of the United States and the Tariff. Feeling that the existing duties on imported sugars and the methods by which the same are assessed and collected by the general government are faulty, unsatisfactory, and that while they give rise to injurious suspicions against honest importers, they afford to unscrupulous men, an opportunity for cheating the revenue, some of the chief importers and dealers in sugar, on July 8, commissioned D. A. Wells, the well known statistician to institute a careful examination and inquiry into the entire subject of the assessment and collection of duties on imported sugars and to report at an early day the result of his investigations. In the present pamphlet of 179 pages he treats the entire subject exhaustively, and presents many powerful reasons for the speedy alteration of our present laws regarding the importation of sugar.

TRANSACTIONS OF THE INDIANA HORTICULTURAL SOCIETY for the years 1876 and 1877. The first of these well edited, handsome, cloth-bound volumes contains 114, and the second 145 pages. Besides much other interesting information, each gives a full account of the proceedings of the Society at the annual sessions held in December each year, together with reports from local societies, and essays, addresses and discussions on various subjects connected with practical and scientific horticulture. The great benefits derivable from Societies of this kind are yearly becoming more apparent, and among the most influential means of spreading these benefits abroad are such works as those here referred to, containing, as they do, in a pithy, attractive form, the opinions and experiences of the best horticultural talent in the State. Indeed, the reputation of some of the members of this Society are not confined to State limits, but are broadly national, and their well considered teachings, as here set forth, are excellent aids to improvement in the refinement of agriculture, as horticulture has been justly termed.

The Querist.

ANSWERS TO CORRESPONDENTS.

Black-leg in Cattle.

A. M. K., McGaheysville, Va., having lost several calves by what he supposes to have been black-leg, asks for the symptoms of that malady and some remedy for it.

ANS.—Black-leg is a common form of Anthrax, other phases of which are known by the names of *quarter-ail, black quarter, black-tongue, puck, etc.*, according to the nature of the symptoms manifested or part of the animal's body most severely attacked. In all cases, however, the disease is essentially the same and the symptoms substantially alike. To the veterinarian the principal of these is the condition of the blood, which has a black, tarry, viscious aspect, coagulates not at all or only imperfectly, leaves a dark stain on tissues it comes in contact with, or, passing through the walls of the vessels, causes large, black patches of flesh. Moreover, it contains small microscopic bodies known as bacteria, which some consider the result and others the cause of the disease. To the farmer, however, among the most obvious symptoms are: a sudden depression of the whole animal frame; swellings on the legs, shoulders, under the belly, or on some part of the back. These swellings are caused by an accumulation of gases in the tissues, which produces a crackling sound when handled. A still worse symptom is the sudden appearance of hard, dry, scruffy patches of what seems to be dead skin. The mouth is almost invariably ulcerated and the tongue blistered. Costiveness is always present, frequently attended with bloody stools; the urine is deficient and highly colored; the eyes protruding and the mouth hot. The second stage is marked by lameness, chiefly in the hind-quarters; the head and neck are protruded; the eyes blood-shot; the appetite lost; thirst severe; the animal stands gloomy and dazed, away from the rest of the herd. All the symptoms aggravate rapidly and continuously; the animal soon lies or drops down; gets up almost immediately; but is soon down again, where it lies on one side with outstretched neck; stomach painfully distended with gas; tongue protruded; eyeballs retracted and covered with the haw. The ears, horns and extremeties grow cold, and insensibility and death speedily follow from twelve to forty-eight hours from the commencement of the attack.

The *post-mortem* appearances are: accumulations of air in all available spaces throughout the body; black exudations of blood, forming extensive patches, often confined to one limb or quarter; the blood dark and fluid; the lungs congested, especially the lower one; frothy mucus almost chokes up the bronchial tubes; the heart is soft, flabby, and filled with black, semi-fluid blood. The spleen, liver, and lymphatic glands are greatly enlarged, and the mucous membranes are often of a dark-red color. The body is only slightly rigid, most so immediately after death, and rapid decomposition sets in at once, often commencing indeed before the animal has breathed its last.

The disease is most common among young stock and in the fall and spring of the year. It is very liable to develop on certain farms, while the neighboring ones are free from it. Low wet lands, without drainage, are most conducive to it. As cures of afflicted animals are rare, prevention should be mainly looked to. To this end wet lands should be drained and healthy animals should be promptly removed from pastures where the malady has made its appearance, and always kept at a distance from diseased ones. Animals dying from the ailment should be at once buried deeply together with their litter and manure; the place where they have been should be thoroughly disinfected; care should be taken that dogs and pigs do not get to the bodies, otherwise they will spread the disease. As it is contagious to man as well as to animals, all raw sores, however small, on the hands and faces of those who attend infected animals, should be promptly cauterized with lunar caustic, and both before and after handling such animals one should wash well with soap and water in which a small quantity of carbolic acid has been dissolved.

Generally the disease acts so rapidly that there is little time for the use of remedies. In slower cases, the bowels should be acted upon with Glauber salts and afterwards mineral acids, antiseptics, tonics and stimulants should be used. A remedy strongly recommended is the following: For cattle, give morning and night a drench composed of sixty drops nitro-muriatric acid, three grains bichromate of potassa and two drachms chlorate of potassa dissolved in two quarts of water; and at noon give a drench composed of thirty grains of sulphate of quinine, one drachm of iodide of potassium and two drachms of bisulphate of soda in a pint of water. If one of these cannot be obtained, give the others, as directed. In case the animal shows signs of weakness and sinks rapidly, give every hour a solution of camphor in sweet spirits of niter, made by dissolving an ounce of gum camphor in eight ounces of niter and dividing into four doses. Each dose should be mixed with about a pint of water before it is given.

Poultry Queries.

M. W. Mt., Vernon Ohio, asks, 1. Where can he get a stock of pure eggs for setting the coming spring. 2. The name of a good, practical work on poultry-keeping, 3. A number of other questions on poultry matters.

ANS.—1. From any of the wide-awake poultry-keepers who advertise in the RURAL; see last week's issue. 2. Lewis's practical poultry book $1.50. Wright's practical poultry-keeper $2.—to be had through this office. 3. All these questions were substantially answered in our pontry number, last week.

Cisterns for Vinegar.

S. E. W. Milton, Ind, asks whether cisterns made with hydraulic cement are suitable receptacles for vinegar.

ANS.—We see no reason why they would not; except that the acetic acid in the vinegar might combine with some of the ingredients of the cement and form acetate of lime. But as we have had no personal experience in the matter, we shall be happy to publish information from any one who may have used such a device.

The Potato-digger of the Future.

A subscriber, Milton, Ky., asks whether there is a potato digger that takes up an entire row, sifts, separates and empties the potatoes into sacks, throwing the dirt and refuse matter to the ground.

ANS.—There is no such machine as yet in existence. A potato digger is made by a Canada manufacturer which digs, sifts and deposits the potatoes free from earth in a row. This is as far as we have got; the bagging of them is not yet accomplished.

Miscellaneous.

L. R. Briggs, Toledo, Benton Co., Oregon, asks where can he get half a pound of Persimmon seed.

ANS.—Write to Chas. H. Shinn, Niles, Alameda Co., Cal.

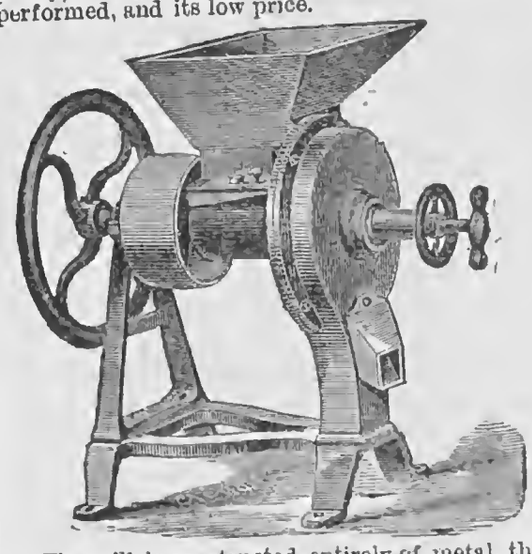
Industrial Implements.

THE VICTORY MILL.

HEREWITH is given an illustration of the Victory Feed-Mill, made by Thomas Roberts, of Springfield, Ohio. Its leading features are simplicity, strength, quality and quantity of work performed, and its low price.



The mill is constructed entirely of metal, the grinding-plates being chilled to an extraordinary hardness. The cob and corn are crushed before going to the buhr by means of a heavy screw, revolving in a cast-iron chamber. By the operation of this screw the mass is fed continuously to the buhrs where it is ground coarse or fine by simply turning the feed-screw shown in front of the mill. Shelled corn may be ground fine enough for family use. By reversing the motion of the mill the plates become self-sharpening, and will thus remain serviceable until worn out. An extra crusher sent with the mill effects this change when it is used. If the corn is dry the capacity runs up to twenty bushels per hour, at a speed of from 500 to 700 revolutions. An extra perforated plate for grinding apples for cider is sent with the mill at a small additional expense, if desired.

Power of any kind capable of employing a belt may be used to operate the mill. A four-horse power will answer unless it is desired to grind up to the full capacity, when an eight-horse is sufficient. The firm makes a horse-power that is light, strong and durable at a very low price. Saw mill owners have found it profitable to employ their surplus power in grinding feed, and the Victory Mill has won golden opinions from some of these gentlemen.

Circulars will be sent to any of our readers interested in the subject.

THE ALEXIS REVOLVER.—Tramps are mainly responsible for an active movement in the fire arms market, and we venture to say that the Peace Commission would feel quite aggrieved if it could be made aware of the numbers of right-thinking people whose thoughts are not on murder intent, but whose homes have become magazines of death-dealing weapons. While it is by no means certain that this large home-guard army could, in cases of emergency, use their garnered destruction effectively, still, the possession of a revolver is a great moral support, and we think any country home is unprotected in the present state of affairs without one. It is easy to learn how to use fire arms with safety, and a little knowledge of this kind imparted to the ladies of the household would enable them to hold the fort in the face of an army of tramps. Intimidation, to be effective, must be exercised in a way that foreshadows experience. Few are willing or can afford to pay ten or twelve dollars for protection of this kind. We have recently seen a revolver that is well-made, effective and finished in an ornamental manner, that sells at from $2 50 to $4 50, according to the ornamentation. A number were made on a large foreign contract, which was cancelled, and Messrs. G. W. Turner & Ross have bought the entire lot at a price much below cost, and are selling them as represented. The offer is a bargain, as may be seen by a reference to the announcement in another column.

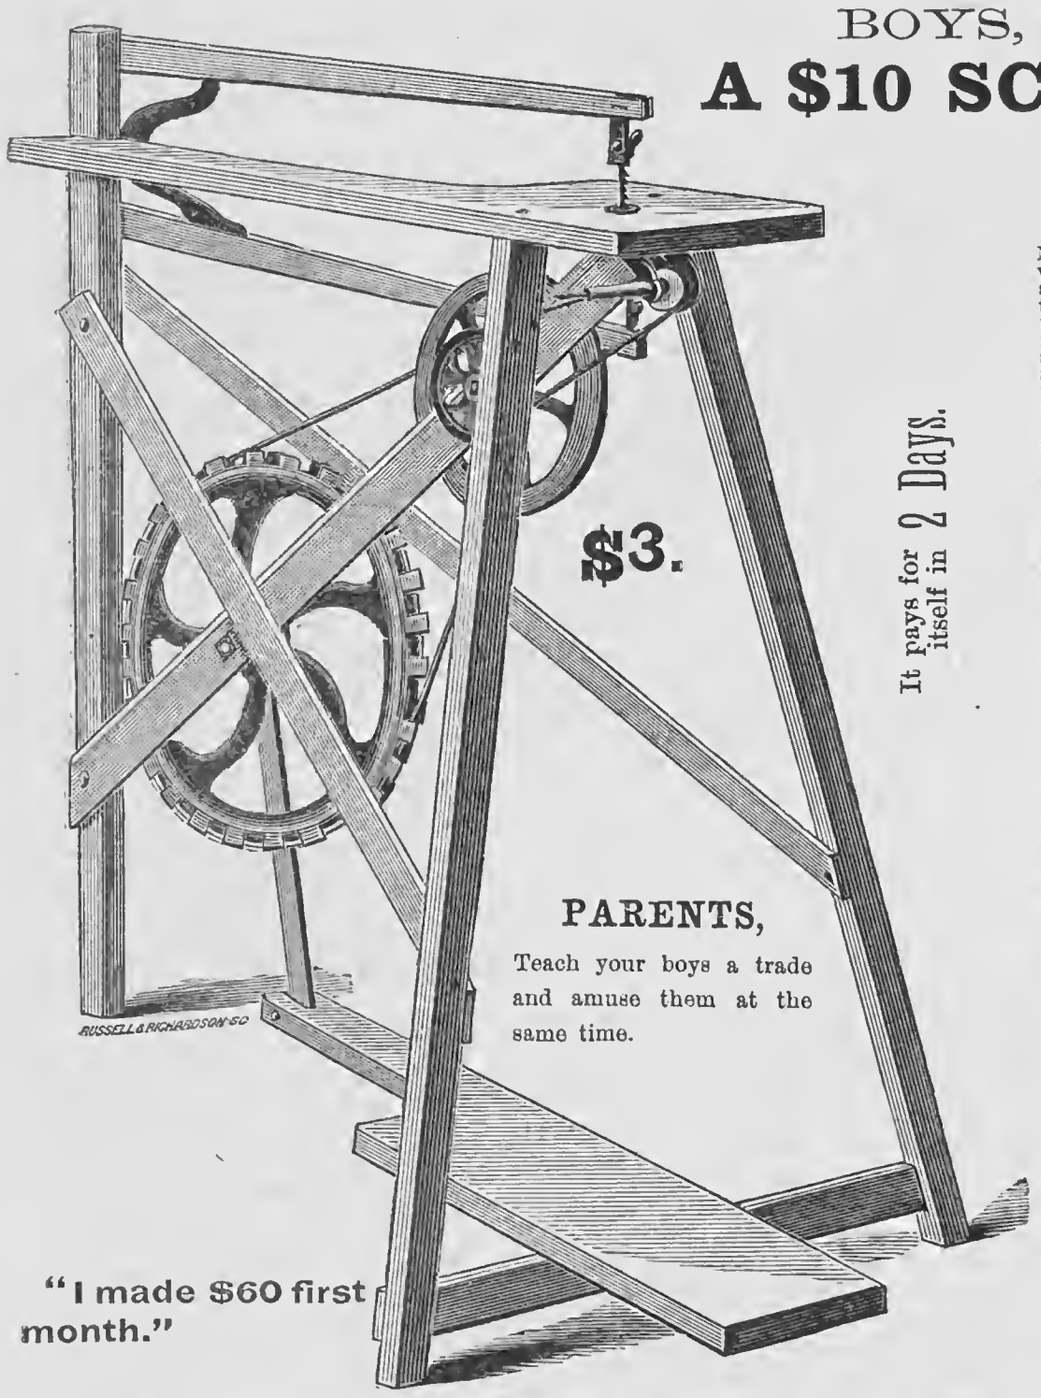
THE MENDELSSHON PIANO, is a neat adaptation of the xylophone to the piano by which it can be played upon through the medium of the keys. The notes are sounded on steel bars that are correctly pitched to produce the notes in sequence just as in a piano. The instrument is a piano in appearance and would make a seasonable present. For purpose of practicing or learning how to play. The Mendelsshon is just the thing. Its tones are clear and musical, and powerful enough to fill an ordinary room, and it does not require tuning. Messrs. Chas. H. Spaulding & Co., sell the piano for $5. which makes it the cheapest piano in the world. The announcement on another page sets forth its merits clearly.

SCROLL AND JIG SAWS have become very popular, and perhaps nothing so useful and profitable in machinery has ever been sold at such low prices, but we have just had our attention called to "My Companion" saw made by the Turner Mfg., Co., of Boston, and sold for only $3. One made to order, could not cost less than ten or fifteen dollars. Its mechanism is simple, it runs with perfect steadiness and rigidity, with great speed, and will cut inch board if necessary. These machines have been very popular, and no more fitting present could be made at this season. The saw is fully illustrated and described in another part of the issue. It is offered with a very powerful lathe for $5, and is the only saw and lathe in the market sold at that price.

THE SWAMP FOX is the peculiar name given a new breech-loading single-barrel shot gun made by G. W. Turner & Ross, the large Boston fire-arms dealers. It is made of good material throughout, especial attention being given to the barrel to secure long range, extreme penetration and even shooting. It has two triggers, the forward one being used to produce the tip-up breach action. Any center-fine brass, or paper-shell cartridges may be used. It is well balanced and altogether an exceedingly serviceable gun sold at an extremely small price.

BOYS, HERE'S A FORTUNE FOR YOU.

A $10 SCROLL AND JIG SAW FOR $3.



It pays for itself in 2 Days.

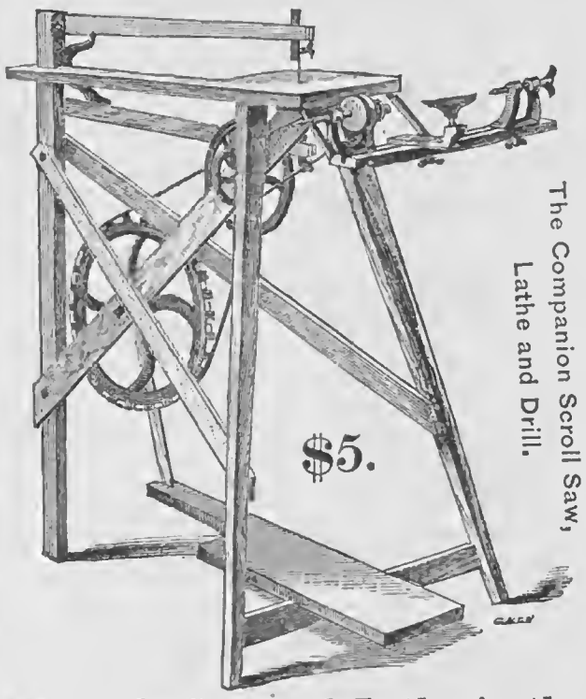
PARENTS,

Teach your boys a trade and amuse them at the same time.

"I made $60 first month."

REDUCED PRICES.

It is less than a year since we offered our New Improved My Companion Jig Saw for sale. The overwhelming success we have met with has induced us to improve in manufacture and reduce in price. The My Companion Saw, as it stands to-day, is the finest piece of mechanism in the world for less than $20, and it has that most important desideratum often missing in high-priced machines and never before found in a low-priced one, *perfect steadiness and rigidity when in motion.* It is a fact that our Saw will do as fine and perfect work as a $100 steam-power jig-saw, and will saw with lightning speed through heavy inch thick board, thus doing what few $20 machines will do, enabling the finest fret-sawing and heavy fancy carpenter work to be done with the same machine. Over 1,000 of our Saws are in use by carpenter and cabinet-makers in New England alone. **TO THE BOYS** of the United States we offer a prize never equaled. You can make $5 a week working evenings alone, and learn a trade which, if necessary, will always give one good wages. **Remember** this is not a toy, it is a **practical machine.** It runs as easily and lightly as a sewing-machine, and girls as well as boys can put the long winter evenings to good use, making useful articles and beautiful presents. A competent carpenter says: "*I cannot make this saw for $10; I should not get paid for my time alone.*" We make them by the 10,000: make each part with special and expensive machinery, which cuts out and finishes with great rapidity, each part fitting exactly where it belongs, and there is no waste of material or time. A SINGLE MACHINE COULD NOT BE MADE FOR $15. The frames are of best oak and ash, with iron wheels, blocks, braces and connections, and steel bearings. Each one **warranted for ten years;** every one adjusted and tried before sold. Directions sent for putting together which can be done in ten minutes. (They are shipped packed in a neat crate only 36 inches by 13 inches by 4 inches, weighing about 25 pounds.) Every boy is delighted with bracket-sawing; it pays them good wages, and their work commands a ready sale. Our saw completely fills the long-felt want for a foot-power saw that will do the **best work,** AND BE WITHIN THE REACH OF THE POOREST BOY. We make but very little on a single saw, but we mean that every boy in America shall have one. Both the press and mechanics flatteringly indorse our saw. IT IS AN UNPRECEDENTED BARGAIN. **DESCRIPTION:** *Length of Arms, 21 inches; Length of Arm for work, 18 inches; Hight of Table, 31 inches; Diameter of Balance Wheel; 6¼; Diameter of Drive Wheel, 12 inches; Length of Stroke, 1¼; Number of Strokes of Saw per minute, from 800 to 1,000; Speed of Lathe, 5,000 revolutions per minute; Length of wood that can be put in Lathe, 13 inches; Diameter of wood that can be turned in Lathe, 3¼ inches.* **PRICES.**—No. 1 Saw and powerful Drilling Attachment, with full set of Drills for boring in wood or iron, **$3.** (No. 1 is represented by large cut above, and our price has always been $3.50.) No. 2 Saw and Drill complete (represented in small cut above), with powerful Circular or Buzz Saw, with bed and gauge, and a fine Turning Lathe, with full set of turning tools, **$5.** This is a complete workshop, with full sets of tools which could not be bought elsewhere *equally as good* for **$25.** With each saw we **give** over fifty original Designs and Patterns, four Saw Blades, and four Illustrated Lessons for Beginners. When the cash accompanies the order we give **free** extra saws and our 50-cent Prize Sheet of Designs. If it is not all we claim in every particular, **we will refund your money.**



The Companion Scroll Saw, Lathe and Drill.

The only Saw and Lathe in the world for $5, or anywhere near it.

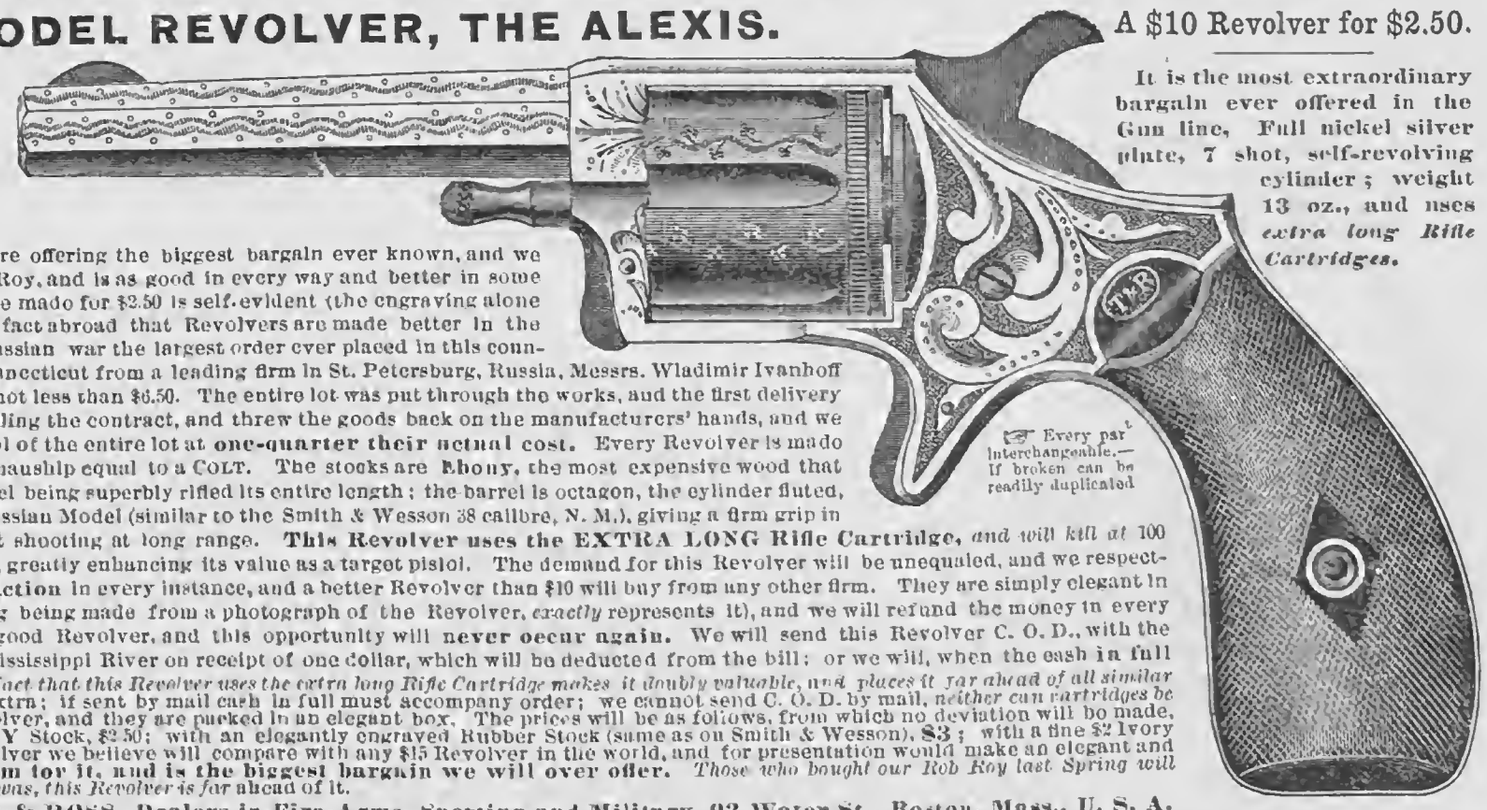
THE GREATEST BARGAIN EVER OFFERED IN THIS COUNTRY IN REVOLVERS.

THE NEW RUSSIAN MODEL REVOLVER, THE ALEXIS.

A $10 Revolver for $2.50.

☞ The most elegantly proportioned and beautiful Pistol in the world. *This engraving is made from a* **photograph,** *and exactly represents this most superb Revolver in every particular,*—**size, shape and finish.**



It is the most extraordinary bargain ever offered in the Gun line. Full nickel silver plate, 7 shot, self-revolving cylinder; weight 13 oz., and uses *extra long Rifle Cartridges.*

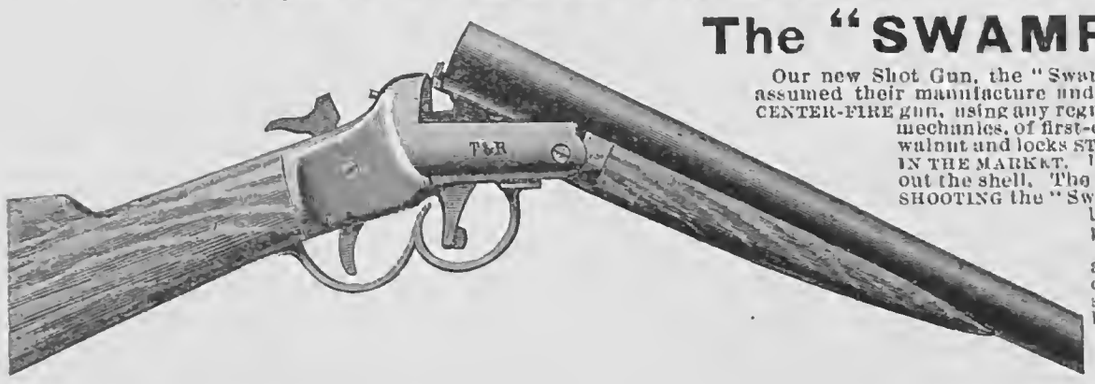
☞ Every part interchangeable.—If broken can be readily duplicated

When we offered our new Rob Roy at $2.50 we considered that we were offering the biggest bargain ever known, and we were; but the Alexis is a *better* weapon in *every particular* than the Rob Roy, and is as good in every way and better in some than a Smith & Wesson or Colt. The fact that this Revolver could not be made for $2.50 is self-evident (the engraving alone cost $2); we will explain our ability to furnish them. It is a well-known fact abroad that Revolvers are made better in the United States than elsewhere, and cheaper; just before the late Turco-Russian war the largest order ever placed in this country for Revolvers was received by one of the largest manufacturers in Connecticut from a leading firm in St. Petersburg, Russia, Messrs. Wladimir Ivanhoff & Co., for 30,000 of the above Revolvers, the *actual cost* of which was to be not less than $6.50. The entire lot was put through the works, and the first delivery and payment thereon made; the war prevented the above firm from fulfilling the contract, and threw the goods back on the manufacturers' hands, and we have just completed negotiations which gives us sole and exclusive control of the entire lot at **one-quarter their actual cost.** Every Revolver is made *on honor,* the engraving is the finest ever seen in this country, the workmanship equal to a COLT. The stocks are **Ebony,** the most expensive wood that could be used for this purpose. The metal is finest English steel, the barrel being superbly rifled its entire length; the barrel is octagon, the cylinder fluted, as shown in cut. The shape of this Revolver is what is called the New Russian Model (similar to the Smith & Wesson 38 calibre, N. M.), giving a firm grip in the hand, preventing the Revolver's throwing up, and producing elegant shooting at long range. **This Revolver uses the EXTRA LONG Rifle Cartridge,** *and will kill at 100 yards.* It weighs **13 ounces,** having an extra heavy and very long barrel, greatly enhancing its value as a target pistol. The demand for this Revolver will be unequaled, and we respectfully suggest an immediate order. **We guarantee more than satisfaction** in every instance, and a better Revolver than $10 will buy from any other firm. They are simply elegant in design and finish, as the above beautiful engraving shows (the engraving being made from a photograph of the Revolver, *exactly* represents it), and we will refund the money in every instance where our representation is at fault. Every one should own a good Revolver, and this opportunity will **never occur again.** We will send this Revolver C. O. D., with the privilege of examination at the express office, to any point east of the Mississippi River on receipt of one dollar, which will be deducted from the bill; or we will, when the cash in full comes with order, **give free** a box of extra long target Cartridges. (*The fact that this Revolver uses the extra long Rifle Cartridge makes it doubly valuable, and places it far ahead of all similar ones in the market.*) We will send it by mail to any address for 20 cents extra; if sent by mail cash in full must accompany order; we cannot send C. O. D. by mail, *neither can cartridges be sent by mail.* A full and complete set of cleaning tools go with each Revolver, and they are packed in an elegant box. The prices will be as follows, from which no deviation will be made, except in dozen lots:—Alexis Revolver, as described above, with **EBONY** Stock, $2.50; with an elegantly engraved Rubber Stock (same as on Smith & Wesson), **$3;** with a fine $2 Ivory Stock, **$3.75;** or with an elegant $3 Pearl Stock **$4.50.** The last Revolver we believe will compare with any $15 Revolver in the world, and for presentation would make an elegant and beautiful gift. **We know that this Revolver is all that we claim for it, and is the biggest bargain we will ever offer.** *Those who bought our Rob Roy last Spring will have no hesitation in purchasing the Alexis, for big a bargain as the Rob Roy was, this Revolver is far* ahead of it.

Address **G. W. TURNER & ROSS, Dealers in Fire-Arms, Sporting and Military, 93 Water St., Boston, Mass., U. S. A.**

A $16 BREECH-LOADING CENTER-FIRE SHOT GUN FOR $10.

The "SWAMP FOX." THE BEST SINGLE BARREL BREECH-LOADING SHOT GUN IN THE WORLD!



Our new Shot Gun, the "Swamp Fox," is exactly what we state it to be above—**A $16 GUN**—that having been the regular price until we assumed their manufacture and sale; and it is the finest single barrel breech-loader in the market. The "Swamp Fox" is a breech-loading CENTER-FIRE gun, using any regular paper or brass shell center-fire shell. It is elegantly proportioned, and thoroughly well-made by the best mechanics, of first-class—A No. 1—material. It is well balanced and comes to the shoulder splendidly. The stock is selected black walnut and locks STEEL. THE FRAMES ARE HEAVILY NICKEL-PLATED, and the barrels finely blued, making it the HANDSOMEST GUN IN THE MARKET. It has an improved and very strong tip-up action, simply pressing the forward trigger tips up the barrel and throws out the shell. The Barrels are bored on the most approved principles, and for LONG RANGE, EXTREME PENETRATION AND EVEN SHOOTING the "Swamp Fox" *can't be beat.* A common double A B C muzzle-loader cannot be bought for less than $14, and a single barrel BREECH-LOADER is in *every way* better than a double muzzle loader. We are selling this gun at a smaller profit than is made on any gun in the market, and at the regular price of this gun ($16) it was cheap and a bargain. REMEMBER, they are warranted in every way; our name and brand being stamped on every barrel. Prices, 16 and 14 bores, **$10**; 12 bore, **$10.50.** Sent to any address on receipt of price. Parties living at a distance and desiring the gun taken apart and boxed will send 50 cents extra for boxing. Every gun WARRANTED, and perfect satisfaction guaranteed. Any boy can now own a *good breech-loading shot gun,* and the "Swamp Fox" is indorsed by Sportsmen wherever shown. Address the manufacturers,

G. W. TURNER & ROSS, 93 Water St., Boston, Mass., U. S. A.

THE CULMINATING TRIUMPH OF MECHANICAL SKILL.

THE MENDELSSOHN PIANO, PRICE $5.00.

The latest addition to the many testimonials of the mechanical ability of the age.

☞ **THE ONLY PERFECT MINIATURE PIANO IN THE WORLD** ☜

The Mendelssohn Piano is the invention of an eminent and well-known Swiss musical instrument maker, and embodies new and valuable improvements not to be found elsewhere. It has black and white keys (sharps and flats), same size and proportion as in a regular Piano. The action is exactly the same as in a regular Piano, and any one who can play the Piano can play on the Mendelssohn; for beginners it is exactly as good as a $150 Piano. In short, the keys and strikers are on the same principle as a regular Piano. The notes or music pruncers are **insulated steel bars,** which give the same tones as a tuning-fork, the most correct notes known; and being of metal **never get out of order, and never require tuning;** and the music produced is very melodious and pleasing. Every one is surprised at the remarkable sweetness and purity of tone and the beautiful action which the Mendelssohn possesses. It is powerful enough to be heard throughout any room, and is an admirable substitute for a Grand Piano. The above engraving represents this beautiful Piano, and it will give satisfaction in every instance. The high price of Pianos has precluded their general use; but there is now no reason why every one, and especially the children who are musically inclined, should not own a real Piano, and the "Mendelssohn" will answer every purpose. It is elegantly proportioned, finely finished, and in perfect tune. It is made and operated the same as the ordinary Pianos; it cannot get out of order, and it is an ornament to any room. Any little girl owning one will be the envy of the whole town. It will give her a thorough knowledge of the Piano, which she may possess in after years; afford her months of pleasure, and lay the basis of a perfect musical education; for **remember** the Mendelssohn is played *just like a Grand Piano;* and the most beautiful music is produced in clear, melodious, crystal like tones. The top of the Piano lifts up, and a beautiful musical scroll supports the music. The Mendelssohn has received the warmest praise from fathers, mothers, and children, and also from the leading musicians in Boston. **The sales during the first 30 days of its introduction amounted to over 7,000,** and we, as its introducers, feel just pride in its success.

Every instrument is carefully tested by an expert at the factory before shipping, and every note is surely perfect, and **once right it is always right.** They will be sent to any address, by either freight or express, on receipt of $5. Make your child a sensible present; one which will delight both her and and the whole household. N. B.—When the buyer lives at a *great* distance from us, or is reached partly by stage or similar conveyance, it might be well to have the Piano packed in an extra strong manner; the charge for extra boxing will be 75 cents, which is the cost of the material used alone.

CHAS. H. SPAULDING & CO., Sole Agents,
95 WATER STREET, BOSTON, MASS.

Finely finished imitation Rosewood Case, handsomely designed Legs.

Elegantly proportioned, thoroughly made, and in perfect tune.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY DEC. 28, 1878.

We will be pleased to send one or more copies of the RURAL NEW-YORKER *free to any of our subscribers sufficiently interested in its welfare to be willing to hand them to their neighbors for inspection. An intimation by postal card will suffice.*

PARTICULAR NOTICE.

Applicants for seeds will please observe that the postage on ANY POSSIBLE *selection of* TEN *sorts of seeds,* IS NEVER *more than* FIVE *cents.*

A ONE-CENT *stamp suffices for any selection of ten varieties* EXCLUSIVE *of the Beauty of Hebron potato, Pearl Millet and Defiance wheat. If the first of these three is included in the list, then a* TWO *cent* EXTRA *stamp is needed, and if the second and third are included, an extra two cent stamp is also required.*

OUR readers who apply will have the Beauty of Hebron potato sent to them separately, because to send this with seeds makes an awkward package, and also, because the seeds may be forwarded at any time regardless of the weather, while the potatoes may be injured by frost. We mention this for the reason that our friends receiving the potato only, may think the rest of their selection has been overlooked.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

OUR readers are particularly requested to read the particulars of our free seed distribution on p 829, under publisher's notices, before ordering seeds.

WE offered, some time ago, to sell the cuts used in this Journal for ten cents the square inch. Many have requested us to send proofs of our cuts. As we have upwards of ten thousand, we could not undertake to do so. Persons wishing to purchase, must select from files of the RURAL NEW-YORKER.

THE NEW YEAR.

WHEN the sun appeared to have reached the southern limit of his journey, and gave promise of retracing his course, the ancients held high festival, and said a New Year was born. Among the old Romans, the day on which he apparently began his return northward, was considered the commencement of a New Year and consecrated to the god Janus, who, having a double face, it was supposed could look back at the old as well as forward to the New Year.

Beside the fact that the division of time into months and years, gives a basis for chronological calculations, it is useful for purposes of reflection and consideration. The careful navigator never fails to make, when possible, daily observations whereby to ascertain his true position, and is in consequence often enabled to avoid rocks and shoals that are dangers in his way. So, we should, in life's journey, have set times on which to look about us and see our position, and what time more fitting than the beginning of a new year! Let us, then, for a few moments, take a retrospective view, and see what has been done during the year that is just closing.

As it has been every year, there have been wars and rumors of wars, useless and expensive. They have cost many lives and much money, and what has been gained? Has a new truth been established, or an old one set firmer on its foundation? Has a sound principle been sustained, or has the whole expense been incurred merely to gratify national pride or personal ambition? Would that we could look forward and see the time when nations should make war no more!

In our own country the year has been one of national prosperity. True, the cry of hard times has come to us from many quarters, but the "hardness" has, in most instances, been more imaginary than real. Many individuals have suffered pecuniarily; many mills and manufactures have been idle to the loss of the owners, but the people at large have not suffered therefrom. The earth has produced bountifully; economy has prevailed and our country is richer than a year ago. Prices for land and some commodities may be less; but of real intrinsic value, when measured by life-sustaining capacity, there is more.

Politicians have quarreled, but more for control of office than over any particular difference in political principles. The credit of the Government is steadily gaining, and its promise to pay is now as good as, or better than, the pay itself. Gold is at par, as it has not been before within the memory of many who will read this. There have been difficulties with the Indians in the West, as there always will be until there is more honesty among the traders and Government agents. There have been difficulties with the Chinese in California, and with the colored population of the Southern States, and there always will be until the problem is solved how two races differing in mental caliber, can live together harmoniously in a condition of equality—a problem that has defied all nations in all times—or until some plan can be devised by which the one shall be master and the other servant, that shall work no injustice to either, and be a benefit to all!

In discoveries in the arts and sciences, the past year has been fertile. Not to speak of minor improvements, witness the telephone, by use of which those miles apart can converse as readily as if in the same room; the phonograph that records and stores away conversations, speeches or songs, to be reproduced years afterward in the same tone and manner in which they were originally delivered; the electric light which bids fair to displace gas for lighting streets and public buildings, to be, perhaps, displaced in its turn by gas made from water at still less expense, and many others which have been from time to time noticed in the columns of the RURAL.

But, passing from the public to the individual, will it not be well for each one of us, on this day, to calmly and seriously turn over the pages of our lives, that during the past year have been printed in the book of memory, and, reading there where we have been astray, determine that the next year shall be one in which we will do better and be better for ourselves and for those about us. Is there one of us who would not, if possible, change many things we have done in the past year? We cannot live perfect lives if we would, but there is none of us who does as well as he knows how; who lives up to his own standard of excellence; who does not allow his appetites and his passions to exert more influence over his actions than his reason commends. With these facts patent before us, how can we excuse ourselves if we commence another year without a determination to do better. Such a determination, once made, can be kept, if we will. If it is not, the blame as well as the penalty will fall on our own heads.

DEPARTMENT OF AGRICULTURE.

WHEN we take into consideration that Agriculture furnishes more than three-fourths of our exports, and that those exports have turned the balance of trade $200,000,000 in our favor, it might be thought strange that this greatest interest should have no direct voice in the Government; that its chief Commissioner should be accorded a mere clerk's salary; that in the appointment of Commissioner, heretofore, no discriminating attention has been given to the real wants of Agriculture, and that his capacity for the duties of the important trust has often been scarcely that of a first-class clerk, yet we suppose, that the capacity even of such a Commissioner might correspond with his salary. In fact, so far as a clear understanding of Agriculture and the proper duties of the office, the Statistician has been, under most administrations, superior to his chief. But this want of proper consideration on the part of the Government is perhaps excusable on the ground that the great mass of farmers are quite indifferent to any organization of their interest.

This Department ought to be the inspiring head of all the State Agricultural Colleges, organized under the Act of 1862—judicious and wise in recommending a a proper course of experiments to be carried out on the experimental farms attached to these Colleges. Its head should be thoroughly acquainted with the agricultural needs of all the States, so that he may assist in devising methods of improving and increasing their productions. He should be a man of sufficient capacity to take in the whole field—to make a careful study of the agricultural situation in all parts of the country, assist in turning attention to the production of crops needed for local consumption, where the soil is propitious—teaching the great lesson of self-support by diversity of crops, and of independence through home production. And as the relation of demand and supply is the key to all commerce, the statistics of production and consumption should be so accurate that any intelligent farmer or trader may be able to come to a safe conclusion as the basis of market values. He should be able to command our agents abroad, and gain accurate information as to imports and consumption in the respective countries, of those articles produced here in excess of home demand.

If this Department were thoroughly equipped by Congress for carrying out this programme, it would swell our exports to the utmost limit of our surplus production. The best interests of the whole country require that it should be treated with a wise liberality and furnished with a defined policy. If it has not been all we might wish in the past, let us hope for great future improvement under the fostering care of a Congress that appreciates the reasons for its establishment. France, Germany and Austria have Ministers of Agriculture, and yet agriculture in none of these countries reaches such colossal proportions as in ours.

We believe this Department, properly conducted, would promote the welfare of the whole people in an eminent degree. And entertaining these views we were a little surprised that one of our cotemporaries, lately, in reviewing the Report of the Department, should argue that an appropriation to agriculture was an anomoly under our system, saying: "If we mistake not, agriculture is the only business that receives a special appropriation." What, then, is an appropriation for a break-water, for dredging a river—the large gift to the Pacific Railroad Company, etc.? Is not navigation a business? and the carrying trade of a railroad a business? "But these benefit the public," our cotemporary may say. "Certainly; but do not the objects promoted by a well-conducted Agricultural Department benefit a still wider public? Our cotemporary admits that, "If the influence and labors of the Department tend to improve the agriculture of the country at large, all are benefited, both consumers and producers." Well, if it does not "tend to benefit the agriculture of the country at large," then it is the fault of the conduct of the Department. Had we not better strive to reform and enlarge the conduct of the Department rather than pour cold water on it, and discourage efforts to build it up?

INDEX TO THE RURAL NEW-YORKER FOR 1878.

THE most valuable and highly appreciated improvement in scientific and practical works published of late, is acknowledged on all hands to be the excellent indexes that accompany the best of them. The systematic compilation of these, so as to enable the inquirer to refer readily to any desired subject treated of in the volume, requires a clear, methodical, analytic mind and no small amount of pains-taking labor. The successful result, however, amply repays the skill and toil expended on its achievement. Without it, any particular item of information contained in the work, can be referred to only after a search so lengthy and vexatious that few have the time or patience to go through with it, and if the same subject is treated of in various aspects in different parts of the volume, the chances are multiplied that some of its bearings will be overlooked or slighted, and it may well happen that these may be precisely the points that demand careful attention. By means of a good index, on the other hand, every topic discussed in the work is placed before the inquirer's eyes so plainly and systematically that he can promptly turn to every page of the volume, on which the matter is handled in any of its bearings. It is with justice, therefore, that a good index, especially to works of a practical nature, is considered by all a highly important addition to the value of the text, and the worth of it is vastly enhanced in connection with periodicals devoted to practical subjects; for in these the same questions are repeatedly discussed from different points of view at long intervals apart, while the aggregate bulk of the various numbers would generally render unaided search for all that may have been here and there said on any particular topic, a tedious, if not a hopeless, task.

These considerations have led us to bestow special attention this year upon the arrangement of the index to the volume of the RURAL for the whole of the year 1878. The improvement upon former years in this respect certainly keeps pace with the advance made in other parts of the paper. Practical topics alone find place in the new index; for however interesting or instructive the contents of the literary departments, they cannot, of course, have for the farmer the permanent value possessed by the teachings of agricultural science and experience recorded every week in the practical departments. The subject discussed in each article, and not its title in the paper, has been our guide in classifying it in the index, and whenever ease of reference is thereby promoted or ambiguity avoided, the same topic has been indexed under more than one heading.

Within the compass of the fifty-two numbers of the RURAL issued every year, there will be few questions relating to any branch of agricultural economy, on which valuable information cannot be found, while all important topics in that connection will during each year be fully discussed. In whatever part of the accumulated yearly volume any item of practical information may occur, the present and future arrangement of the index will enable the reader to refer to it even more accurately than the short index on the editorial page of each issue now guides him to the contents of a single number; for, in the latter case, merely the title of the article is given; whereas, in the former, each article will be analyzed and its subject-matter recorded. In view of the valuable fund of useful information in this way placed at all times within easy reach of our readers, would it not be well for many more of them than now do so, to save the weekly RURALS, bind them into yearly volumes, and thus in course of time accumulate a handsome library rich in information on the pursuit the best instruction on which is essential to their own prosperity and that of many of their children?

BREVITIES.

UPON our first page next week, we shall present an original engraving which we think will provoke study and merit commendation.

REV. E. P. ROE brings several apples of his Seedling Highland Beauty. Further than to say that they are of excellent flavor and possess fine keeping qualities we will not at present speak, since we shall give an engraving of a specimen later with all that can be said of this apple.

PEARL MILLET has been raised this year by a correspondent of ours living in Orleans Co., Nebraska; and he says that for cattle it is the best forage plant he ever saw. His horses, however, did not seem to like it. It matures seeds well in that section, and stands droughts excellently.

WE are glad to receive new subscriptions and renewals as fast as possible—but our friends need not hurry on account of our seed distribution. Due notice will be given of any additions, subtractions or changes. The Beauty of Hebron potato is sent whenever the weather warrants. The seed distribution will not be begun in less than a month. Of its commencement notice will be given also.

IN conversation with the proprietor of one of our largest agricultural newspaper agencies, we learn that two subscriptions are being received this season where one was received last year. This is highly encouraging and we trust as a straw will show which way the wind blows. We say Happy New Year to the Agricultural and Horticultural Press. May it have great success for 1879, and may it well deserve it.

THIS number ends a very prosperous year with the RURAL NEW-YORKER. We feel like thanking every one of our friends for their support and appreciative words. The RURAL has never been more praised and, we would fain hope, has never been more worthy of praise than during the year about to close. We wish our readers knew how stirring is our *determination* to make benevolence the one ever active sentiment in our labors for the future. Let us see how well our acts and our professions may be found to harmonize.

THERE is a fierce agitation against Green's Driven-well Exactions out in Minnesota and Wisconsin. On the 29th ult., a large meeting of harrassed well owners took place at St. Paul, Minn., and a State organization was formed to resist Green's exorbitant claims and test the validity of the patent. Numerous affidavits have been secured going to prove the antiquity of the device. In the issue of the RURAL for Nov. 30, 1876, the completest history that has yet appeared was given of this invention and of the litigation to that date concerning it.

SOWING GRASS IN THE FALL.—A correspondent from Rowan county, N. C., who, last year, gave our readers his experience on this subject, writes us again this year, still more strongly favoring the fall sowing of grass for meadow or permanent pasture. He sowed a mixture of two bushels of Orchard-grass, one quart of Timothy, two quarts of Red Clover, one pound of Herd's-grass and two pounds of Blue-grass to the acre for the purpose of making a permanent pasture, and where it was sown in the fall, the stand is splendid, while the Red Clover alone is good, where it was sown in spring.

THE insertion in this issue of our Complete Index for the yearly volume of the RURAL necessitates a curtailment of the space usually given to practical and literary subjects. Even a brief examination of the index will show the vast number of topics interesting to farmers which have been discussed in our columns during the past year, and it should be remembered that the list refers exclusively to the practical departments, omitting altogether the various branches of the literary departments, as well as news, market reports, etc., etc. We would urge upon our readers to retain this index, and still more strongly press upon them the desirability of saving all the numbers of the RURAL for the year 1879, which we intend to be even more instructive and interesting than its predecessor.

THE LONG AGO.

BAYARD TAYLOR.

Oh! a wonderful stream is the river of time,
As it runs through the realm of tears,
With a faultless rythm, and a musical rhyme,
And a broader sweep, and a surge sublime,
And blends with the ocean of years.

How the winters are drifting like flakes of snow,
And the summers like buds between,
And the years in the sheaf as they come and they go,
On the river's breast, with its ebb and its flow,
As it glides in the shadow and sheen.

There's a magical isle in the river of time,
Where the softest of airs are playing,
There's a cloudless sky, and a tropical clime,
And a song as sweet as a vesper chime,
And the Junes with the roses are staying.

And the name of the isle is Long Ago,
And we bury our treasures there—
There are brows of beauty, and bosoms of snow,
There are heaps of dust—but we loved them so!
There are trinkets and tresses of hair.

There are fragments of song that nobody sings,
And a part of an infant's prayer:
There's a lute unswept, and a harp without stringe,
There are broken vows and pieces of rings,
And the garments she used to wear.

There are hands that are waved when the fairy shore
By the mirage is lifted in air,
And we sometimes hear thro' the turbulent roar,
Sweet voices heard in the days gone before,
When the wind down the river is fair.

Oh! remembered for aye be that blessed isle,
All the day of life till night:
When the evening comes with its beautiful smile,
And our eyes are closing in slumber awhile,
May that greenwood of soul be in sight.

WEAKER THAN A WOMAN.

CHAPTER XVIII.

(Continued from page 814.)

"A dreary future," said Mrs. Haye, "a dreary future! I cannot tell you how sorry I am for Felix, Violet."

For Mrs. Haye was true to her tactics. She never named Sir Owen at all—she left him quite out of the question; but she talked incessantly of Felix, and always in the most kind and pitying manner. She deplored his fate; she declared it was the saddest she had ever known. To think that a man so young and so gifted should be burdened with the maintenance of so large a family! She feared he would not have the strength to manage it.

They were arranging a wardrobe one day, and the beautiful dresses so mysteriously sent for the *fete* lay within it.

"Violet," said Mrs. Haye solemnly, "if I were you I would put those dresses away out of sight; you will never want them again; you will never have an opportunity of wearing them."

"Mamma, do you think I am going to live in a cloister?" she asked.

"No, my dear, certainly not; but I know where and how you are going to live. It will be in a small house on very limited means."

"I shall go out at times," said Violet.

"Yes, but you will not be invited to such places as Garswood—it is out of the question: poo Felix could neither visit nor receive such people. And now that we are speaking of it, Violet, I think it would be just as well if you would try to learn a little of domestic work. You have been foolishly brought up, I am afraid."

"Why should I learn to work, mamma?" she asked, looking at her hands, so white, so delicate. "I am sure Felix will never like to see me working."

"He will not be able to help it, poor fellow!" Mrs. Haye said pityingly. "But you must look your future in the face, Violet; you cannot spend all your life in waiting for him—waiting until your hair grows gray, and your youth only a dream; and, if you marry him, it must be to help him."

"So I will help him, mamma," she replied.

"That is quite right," said Mrs. Haye serenely. "I am glad to hear you say so. I should like you to understand what helping in this case means. Felix will have to keep up Vale House and maintain all his step-mother's family. He will not, of course, have much to spare for himself; hence he will want all the care and economy possible in his household. You should learn to cook, to sew, to iron, to manage a house; for you will not be able to keep more than one servant, if you manage to do that."

"Mamma!" cried Violet in dismay, and she raised her pretty white hands with the pink tapering fingers deprecatingly.

"I am sure of it, Violet. I know what money is, and how far it goes. With every man's hand against him Felix will have a hard struggle; and the only way in which you can help him will be by spending as little money as you can."

Then wise Mrs. Haye left the words to work their effect.

In the meantime Sir Owen devoted himself unceasingly to Violet. Every day brought some lavish gift or other to the Limes—great hampers of game and fruit, of rare foreign wines, of flowers—and Violet said nothing of them before Felix, because she saw he was hurt that he could not do the same—and during that period the girl's mind was tortured and harassed by doubts and fears.

It was such a chance to miss. She might be Lady Chevenix of Garswood; she might be the wealthiest woman in all the county; and yet she had elected to be nothing all her life but a mere domestic drudge. When Sir Owen came over and insisted upon driving her out, she would say to herself that luxury was a necessity for her, that she could not live without it, that she must have it. Then Eve Lester would spend a day with her, and would talk to her with such noble simplicity, such simple grandeur, of the life before her, that she felt she loved Felix more than ever. At Vale House however, the cloud deepened, and honest Darcy Lonsdale wore his great heart away in sorrowful repining.

One evening—how well Violet remembered it!—it was the beginning of July, and the western sky was crimson with the setting of the sun, Sir Owen rode up to the door. He came into the dining-room, where the family had just partaken of tea, and it struck all of them that he was ill at ease. He spoke chiefly to Mrs. Haye, and looked but seldom at Violet.

"I went to London yesterday," he said, "and something tempted me into a jeweller's shop. I bought some very fine diamonds, and I have brought them here for you to see."

He took some heavy morocco cases from his pocket, and Violet looked up with a new light in her eyes and a low cry of delight. Few women, thought Sir Owen, can resist the temptation of diamonds.

He opened the cases and laid them before her. There was a beautiful diamond star, a superb necklace, brooch, earrings, bracelet and rings, all with stones of the first water, full of fire, clear, brilliant and beautiful. The crimson light of the setting sun shone in them and made them so dazzlingly bright that it was almost impossible to look at them.

"What do you think of them?" he asked Violet.

"I cannot tell you. I did not know there was anything in the world so beautiful!" she cried.

"How much are they worth?" asked Mrs. Haye.

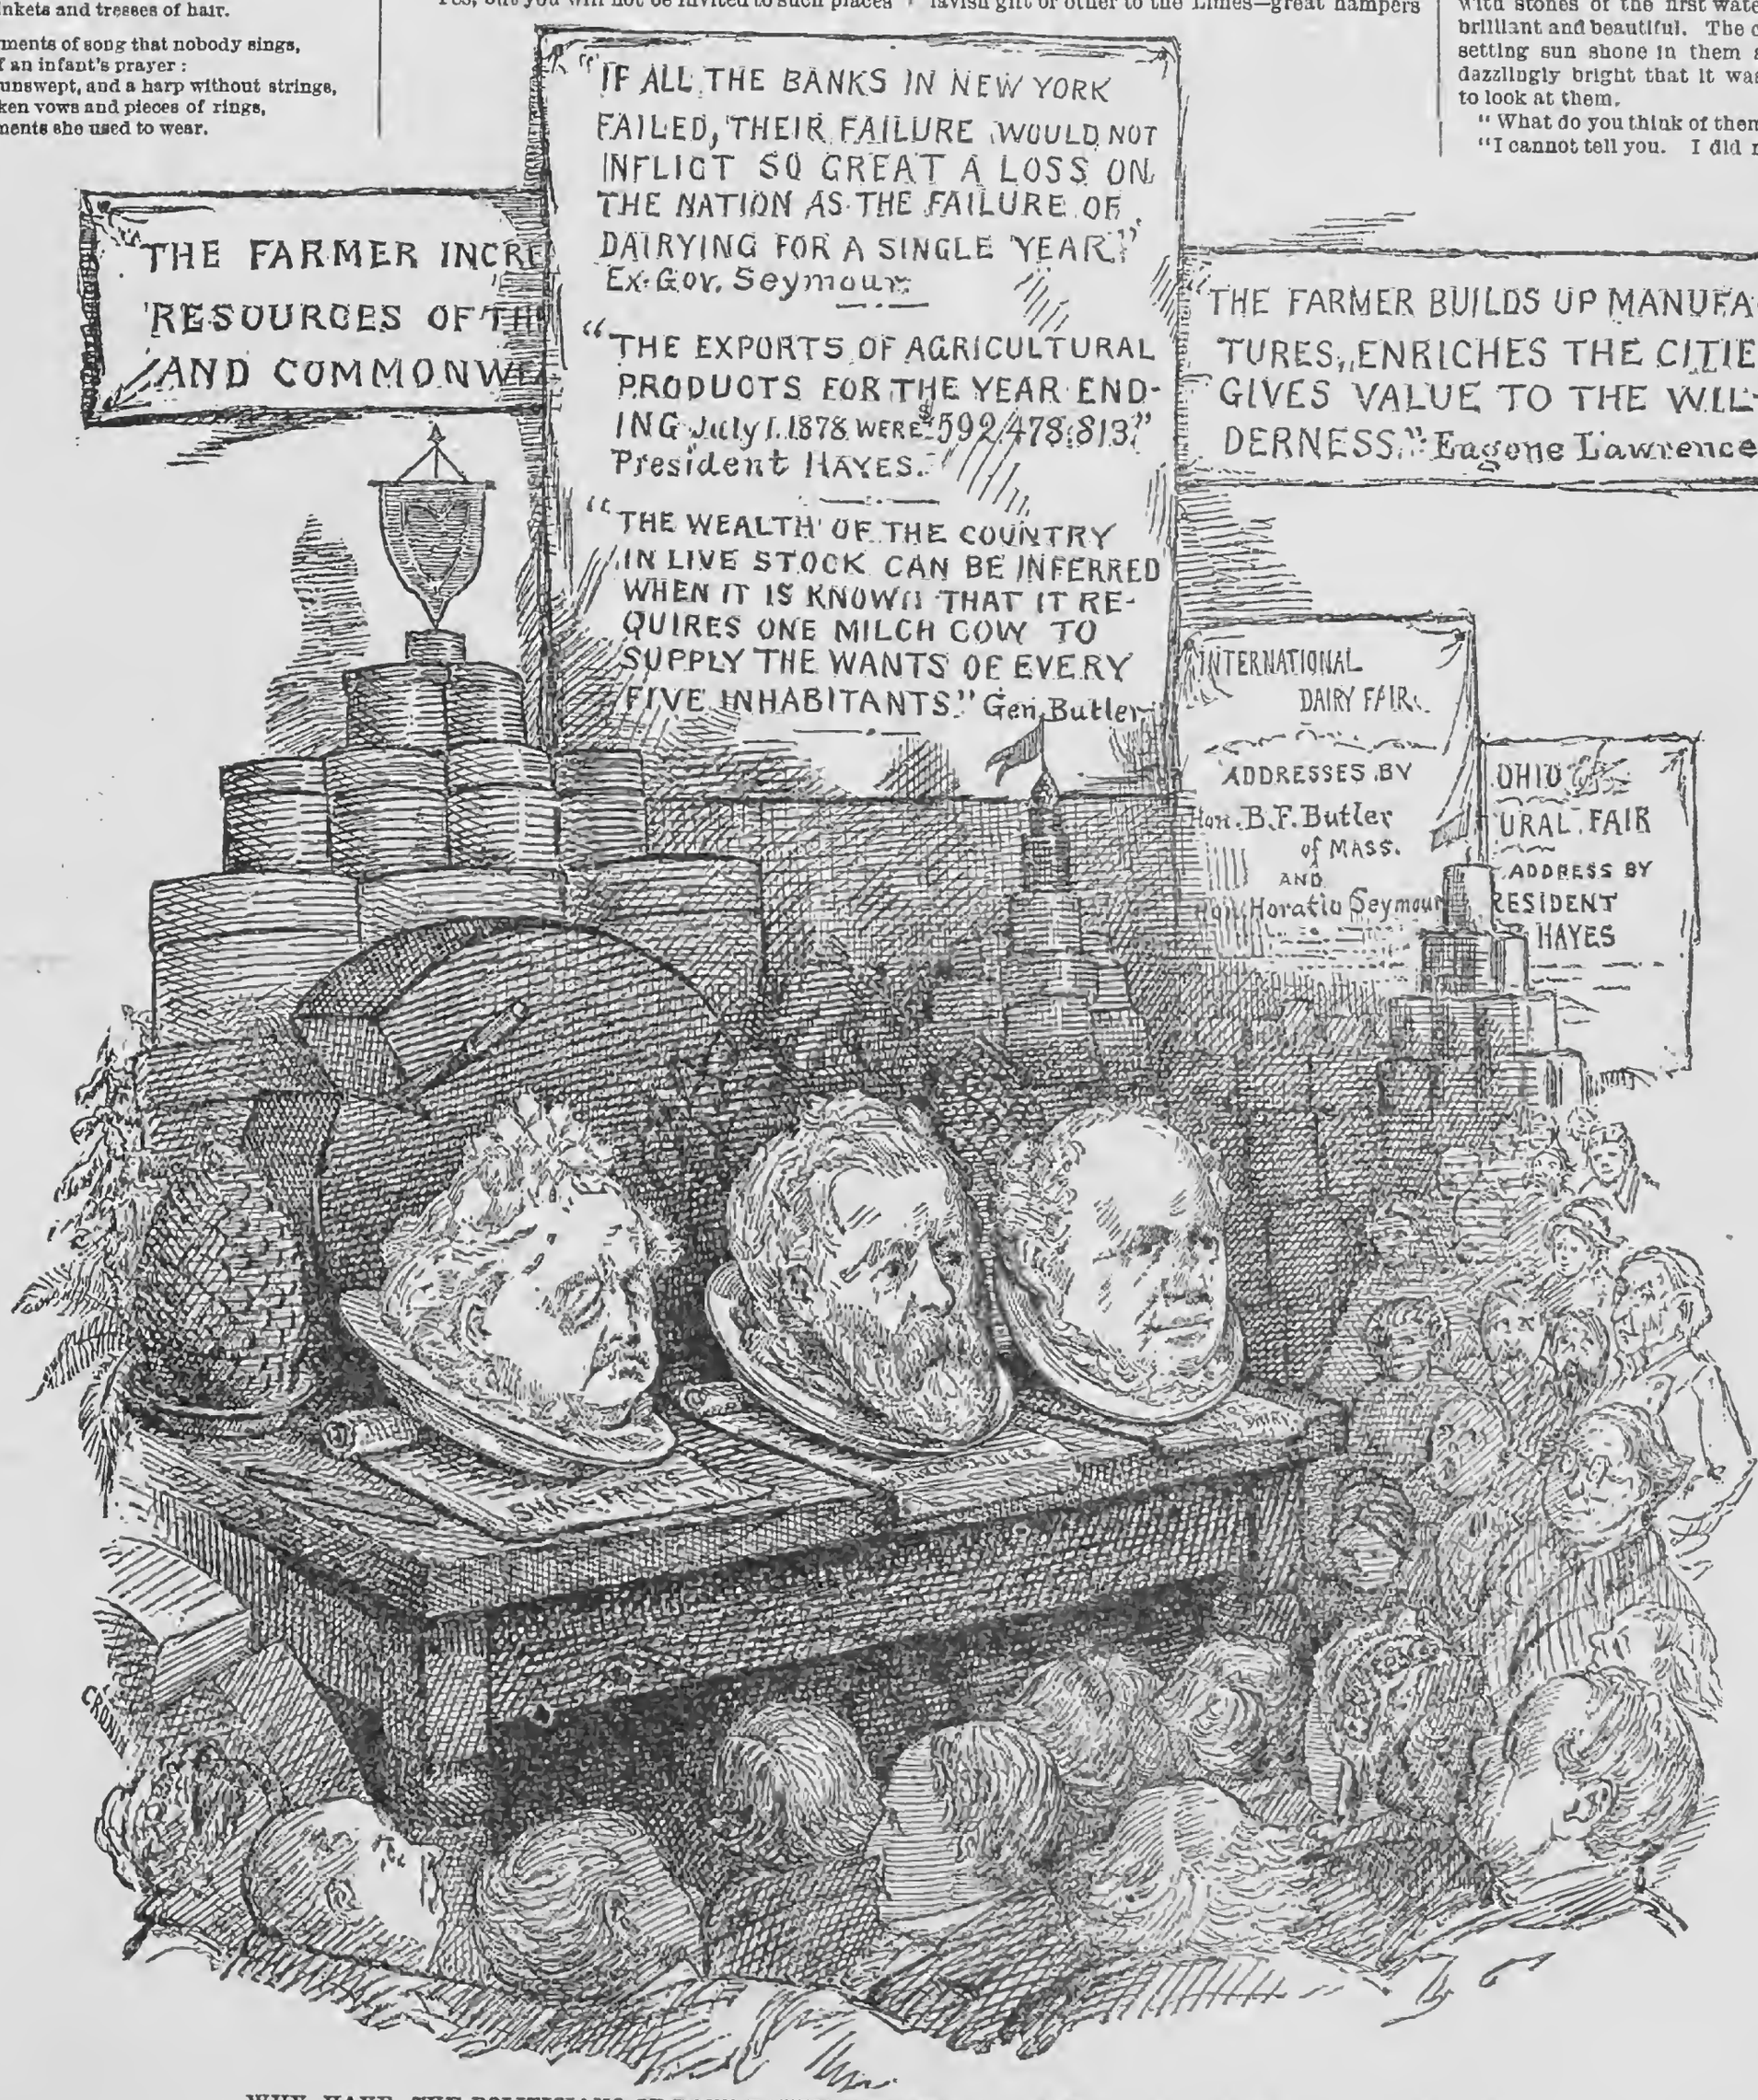
"I have paid more thousands for them than I should like to tell you," Sir Owen replied, laughing; "and I would pay as many more to please the same person for whom they are intended. Miss Haye, will you try them on? I should like to see the effect."

But Violet's hands trembled as she tried to raise the glittering gems from their velvet beds.

"Let me help you," he said.

The next moment he was standing by her side. He placed the brilliant star in her golden hair, and she felt that he lingered far longer than he need have done over it.

"What wonderful hair you have!" he said. "How beautiful it is! The diamonds are not good enough for it."



WHY HAVE THE POLITICIANS OF LATE TAKEN TO PRAISING FARMERS AND FARMING SO FRANTICALLY?

Then he clasped the necklace round the white graceful neck; Violet fastened the brooch herself, and he clasped the bracelet on her lovely arm. She would rather that he had not done so—Felix would not have liked it, she was sure; but then the temptation to see herself so decked just for once was irresistible. She had never worn a diamond—and these were so gorgeous.

Very soon he placed her before the great gilt mirror, and the crimson sunlight fell full upon her, on the sheen of her golden hair, on the brilliant gems, on the face more beautiful than any gem. Such a marvelous picture as she made in those glittering diamonds Sir Owen told himself had never been seen. Mr. Haye cried out in admiration.

"She is like the Queen of Sheba," he said.

"She is fairer than any queen," laughed Sir Owen. "You ought to wear diamonds, Miss Haye. You were born to wear them. Knowing that, and feeling sure how well they would become you, I have ventured to buy these for you; will you honor me by accepting them?"

But Violet drew back from the mirror with a pale, scared face, and a movement so sudden that the light in the diamonds was like gleams of fire scattered over her.

"You bought them for me?" she said.

"Yes; and I hope you will honor me by accepting them," he replied with a low bow.

"I cannot," she said quietly; "they are too valuable. I should never wear them."

"You shall wear them at Court," he told her—"and no royal Duchess has finer."

"Felix Lonsdale would not be willing," she said calmly; "I cannot take them."

An angry flush burned his face, a lurid light leaped into his eyes; but a sign from Mrs. Haye controlled him.

"My daughter is quite right, Sir Owen. She cannot take these diamonds from you while she is the promised wife of Felix Lonsdale. I will help you, Violet,"

The diamonds were taken off and restored to their cases. Mrs. Haye had never acted more wisely. Violet would have resented it had they been pressed upon her; woman-like, when they were so quietly taken back, she longed for them. There was no word spoken as Sir Owen replaced the case in his pocket and rose to take his leave.

"I trust I have not offended you, Miss Haye," he said, "by offering you the best tribute I could think of to prove my admiration!"

"Why should I be offended, Sir Owen? You were kind to think of me, but I—you see, I cannot take them."

"I will not offend again," he replied.

He shook hands with Francis Haye and his wife; he parted from Violet with a bow.

When the door had closed behind him, Francis Haye looked at his daughter.

"You have refused quite twenty thousand pounds," he said.

Mrs Haye held up her hand with a warning gesture.

"She has done quite right, Francis. It would be absurd for the wife of a poor struggling lawyer to wear twenty thousand pounds' worth of jewels—more than absurd. Who would make puddings and mend socks clad in such diamonds as these? Let Violet be consistent. She prefers linsey-woolsey to satin, poverty to riches. It is her own choice—we must not interfere."

Violet kissed her mother; but Mrs. Haye felt with keen delight that there was little rapture in the kiss; and all the rest of the evening the fair face was clouded.

Another thing happened which annoyed Violet. She was walking one day through Ordfield Lane, when she met Lady Rolfe and her daughter Lavinia. With great cordiality her ladyship stopped to talk to her.

"Will you mind walking on with me, Miss Haye?" she said. "I have often thought that I should like to chat with you."

"I shall be very pleased," answered Violet, little dreaming of the mortification in store for her.

"I wished to speak to you when we were at Garswood," said Lady Rolfe, "but I found no opportunity. I think it only my duty, Miss Haye, to utter a few words of warning to you about Sir Owen."

Violet looked up proudly.

"I do not think that there is the least need for such words, Lady Rolfe," she replied.

"I am very glad to hear you say so. Sir Owen Chevenix is a wealthy man. I do not wish to say one unjust word against him, but I am quite correct in stating that he does not bear one of the best reputations; he drinks and—well, he has other faults which I must not name to you."

"I do not see how this concerns me," said Violet.

"But I do, Miss Haye. Pray listen to me. You have a pretty face, and Sir Owen is always attracted by such. Yours is not the first by any means he has admired."

"I never supposed that it was," said the girl proudly.

"That is right. If you understand the character of the man, all is well; but, having a friendly interest in you, I was afraid that his flattery might mislead you."

"If she only knew the truth!" thought Violet. "If she could only guess that I have refused to be Lady Chevenix!"

"I am not alone in my ideas," continued Lady Rolfe. "I heard many ladies at Garswood say what a pity it was that no one warned you. This is what I want to say to you, Miss Haye—and, believe me, real kindness dictates the words. You are engaged to marry a very honorable gentleman. Even though he be unfortunate, do not lose the substance for the shadow; do not give him up under the mistaken impression that Sir Owen will marry you. The difference in your rank and position is too great. He is simply amusing himself with the prettiest face near him. Be warned in time—he will flirt with you, but he will never dream of marrying you."

"That is your ladyship's opinion," said Violet.

"And the opinion of every one else who knows Sir Owen and who knows you," added Lady Rolfe. "I assure you that many ladies have spoken to me about it, and have expressed a great hope that you would not be misled by Sir Owen's flattery and love of flirtation."

"If she knew all," thought Violet—"if she did but know!" And her beautiful face wore such a witching smile as she bade Lady Rolfe good morning that the keen, worldly woman felt alarmed.

"She would never look like that, Lavinia," she cried, "unless in some way or other she had the best of the matter. Surely it can never be that he has asked her to marry him."

"My dear mother, Sir Owen may marry just whom he pleases. The only fact which interests me is that he has not asked me to marry him. As for Miss Haye, I am not interested in her, and do not care to talk about her."

Miss Rolfe dismissed the matter very quickly from her mind, but Lady Rolfe pondered it deeply. Surely she must be mistaken—the best match in the county, the most eligible man for many miles round, could never be so absurd as to throw himself away on a mere nobody like Violet Haye, even though she had the face of an angel and the grace of a queen.

CHAPTER XIX.

So the decision as to her own future was left entirely in Violet's hands. Neither father nor mother spoke one word which could influence her, and Felix was so engrossed in his business that he was but seldom able to see her. Sir Owen, on the contrary, always kept himself present to her mind. Every day brought hampers, parcels of books, everything that could be thought of, from the Hall. Every day brought a little note begging that she would accept flowers, fruit, or whatever accompanied it. He rode over very often himself; he seemed to bring an atmosphere of the fashionable world with him; he was always full of spirits, with wonderful news to tell.

Violet had been very much annoyed by Lady Rolfe's warning—it had turned the balance the wrong way.

"I understand," she said to herself—"they think I am so far beneath Sir Owen that he will never deign to marry me. How mistaken they are, and how little they know of the real truth! How I could surprise them if I wished to do so! What a triumph and a victory I could win over them all! How they would wonder to see me Lady Chevenix! If ever I do become Lady Chevenix, that woman Lady Rolfe shall come no more to Garswood."

That was the first time she had ever admitted to herself that there was an "if" in the matter—the first time she had thought of the possibility that she might eventually be Lady Chevenix. The temptation was great and subtle; it was some time in forcing an entrance into her heart—but, once admitted, it would not leave her. There were many excuses for her—there was much that pleaded for her—her youth, her love of luxury, her dread of poverty, her longing for the bright side of life. The constant dropping of water wears away a stone. Such was Violet's case. The constant talk of poverty with which her mother plied her morning, noon and night—the constant praise of Sir Owen, the blank, cool toleration of Felix—the wonder at the riches of the one, the pity for the poverty of the other, all influenced her, until at length a day came when her heart opened to the worship of Mammon, when love dwindled into insignificance by the side of wealth. The day came when, wearied of everything, she went out into the cool green depths of the summer woods and her life, as it were, in her hands.

She tried to think of her case as though it were that of a stranger—as though she herself had no vital concern in it. On the one side she had to suppose that she would prove true to her promise, true to her word—that she would marry the man whom she really loved—Felix Lonsdale. "Let me look at that picture quite calmly first," she said to herself. She would have to wait at least two or three years longer, and by then the brightness of her beauty would have waned—the spring of her youth would have left her. They would be years of sorry discomfort too. Her mother and father would lose all patience; they would be years of constant unpleasantness; Felix too would doubtless be always in trouble—and she, like most of the young, gay, and beautiful, dreaded trouble. Taking the marriage at its best, it was a poor one. When she was first engaged to Felix Lonsdale, things were quite different. No cloud of disgrace hung over his family; he did fair to become a rich man; he had every hope of making a beautiful home for her. Even then it was not such a marriage as she with her queenly dower of beauty and grace had a right to expect. Were she to marry him with his present prospects, what a fate would lie before her! Such limited means—such genteel poverty! She shuddered as she saw the years stretch themselves out before her. She foresaw hard work—the work she disliked most of all, domestic drudgery; hard fare; no balls, no parties, but little dress, nothing but the care of a house—a bare, plain existence from which she shrank—no visiting. How people would laugh at her! It would be like going out of the world at once. But then—and her heart grew warm at the thought—she would have Felix—Felix who loved her so dearly—Felix to whom the ground she trod on was sacred! She would be with him, and she would have the happy consciousness of having done what was right; she would have done her duty, and she might be happy after all.

Then came the other side of the picture—and the girl's brain whirled as she tried to understand it, tried to realize it. If she married Sir Owen, she would be mistress of all his grandeur, of the superb grounds, the gorgeous pictures, the wonders of silver and gold; they would be hers to use when she liked and how she liked. She would be Lady Chevenix, patroness of balls, queen of the county; she would be able to patronize Lady Rolfe in her turn, to punish those who had dared to think she required warning; she could have dresses such as she had not dreamed of; she would be great, wealthy and powerful. But there would be no Felix with all this; she would have to give him up, and she would live the remainder of her life with a sense of having acted unfairly—of having betrayed such love and faith as were given to few women.

These were the two paths that lay so clearly and so distinctly mapped out before her. In her heart she loved Felix—and she knew it; but that same heart longed for wealth and luxuries such as Felix could never give her—that same heart recoiled from the poverty, the struggles, the hard work, the economy, the daily cares that must attend her as the wife of Felix Lonsdale. She disliked all such; she remembered how even when things looked brightest, she had stood in the house that had belonged to the Hendersons, wondering what her life would be like there, and recalled the curious sensation that had come over her of there not being enough there to fill her life. Then she laughed a little bitter laugh as she flung away the wild-flowers that she was holding.

"I have a desire to be rich," she said, "but none to be noble. I am not noble. I see the right and honorable path, but I have not the strength to follow it. I hate myself for being what I am, but I cannot change."

She made no false excuses to herself; she gave no high-flown name to the sin she was about to commit. Mammon tempted her, and she fell; the spirit of the world, the pride of life, the love of riches had all entered her soul, and taken possession of it. She did not disguise from herself what she was doing when she deliberately resolved to break her plighted word—to give up her lover and marry Sir Owen.

Her temptations had been many and great—they had been continual, they had been hard to resist; but that was no excuse. She knew that she was committing a double sin; she was proving false to the one man whom she really loved to marry one whom she did not love at all.

"It is a double sin," she said to herself, "but I cannot help it—I could not go through a life of drudgery and poverty. Felix will hate me, but in after years he will know that my decision was wise."

So she thought and mused, dreaming in the sweet shade of the summer woods of the gorgeous future that would be hers if she married Sir Owen. Presently her mood changed and her eyes filled with passionate tears as she thought of Felix.

"I love Felix," she cried. "Why can he not have Garswood? Why must he be poor and obscure while Owen Chevenix revels in wealth? It is not fair."

She had love and wealth both before her, yet she had deliberately given up love and had chosen wealth. She made no effort to justify herself in her own eyes.

"Those diamonds were too much for me," she said. "I cannot help it if I am not noble by nature."

Yet, when she had left the woods, and walked home through the meadows, something was gone from the sunlight, something from the song of the birds, which was never to be there again for her. She walked as one over whom a shadow lies. She had joined hands with sin—and sin is never a cheerful companion. The flowers and the trees, the color of the grass, had lost their charms for her—there was a dark shade over everything.

"Will it always be like this?" she thought. "If it is, I shall not find my future very bright."

Then the girl's heart misgave her. As she looked round, everything reminded her of Felix. She had walked with him down those groves, she had lingered with him by that stile and under those trees; he had been so much part of her life that she could not picture life without him.

"How shall I live without him?" she said. "How shall I spend the days, the years without him?" Then she tried to harden her heart. "People cannot live on love and poetry," she told herself; "if they could, all would be well."

That same evening she said to Mrs. Haye—

"Mamma, I have been thinking it will be better for Felix and myself to part. I am afraid he has enough on his shoulders."

"I have thought so for some time, my dear," was the quiet reply. "Your engagement is folly, your marriage would be madness."

Then Violet went up to her mother, and put one arm round her neck.

"Mamma," she said, "you will save me all trouble?"

"Yes;" replied Mrs. Haye, "you may safely leave it all to me."

And so wealth won a soul not noble enough to live for love.—To be continued.

A MORE abundant supply of Sea Island cotton has long been a great desideratum with the spinners of counts of yarn running from 250's to 300's. It is well known that the long silky fiber which grows on the slopes of Georgia and Florida, and which is so highly valued by English manufacturers, has, in fact, for years fallen short of the required quantity. It appears, however, that some time ago a parcel of the Sea Island seed was sent to Fiji, and, after having been sown in a chosen district, the experiment has proved so successful that a material almost equal to the famed Georgian is produced, which commands a ready sale in England. A London journal states, in this connection, that not long ago a Belfast manufacturer, largely engaged in the make of very fine muslins, purchased in Manchester several lots of high-class yarns that had been spun from the Fiji cotton, and had a portion of the lot woven through an 1800 reed. The result was that the web thus produced appeared, in beauty and texture, very little inferior to those gossamer-like fabrics which are woven in such perfection in Hindostan.

CHRISTIAN MODERATE DRINKERS.—If Christians would be honest to the dictates of their own consciences, we should not have so much controversy upon the prevailing evils of our own times, and Christians would be more willing to give up that which is the cause of so much evil—viz., drink—for the sake of others, realizing that "With such sacrifices God is well pleased.—*L. Herbert.*

News of the Week.

POLITICAL.

Monday, Dec. 23d, 1878.

BLAINE'S Committee for investigating alleged southern election outrages, turns out to be hardly Blaine's after all. The custom is to call the Committee by the name of the man who asks for its appointment, who is by usage placed at its head as Chairman. Blaine, however, declined that position on the Committee he had demanded, Conkling would have nothing to do with it, and indeed, it was no easy matter to get a prominent republican on it. Blaine, the newest of senators, of his own motion, without consulting the republican fathers of the Senate or waiting for a caucus, had dared to sound what was heralded as the key note of the next campaign, and the older senators didn't care to carry him and his bantling on their shoulders. It is generally conceded that the democratic members of the Committee are a trifle too much for their republican colleagues. They will sit with open doors, and are now bothering Blaine and Hayes for a statement of the causes which led the former to ask for the Committee and the latter to denounce the supposed outrages, in his message.

MISCELLANEOUS.

The most notable incident of the week has been the return of business to a specie basis, the first time in sixteen years. On Tuesday last it was found in the gold room here that greenbacks were at par with gold and they have remained so since. This vast appreciation of legal tenders, from the neighborhood of 3 to 1 to an equality with gold, has been hard on the debtor class, who contracted the debts when the purchasing power of greenbacks was much less than that of gold, and besides having paid heavy interest meanwhile, will now substantially have to pay in gold what they borrowed in depreciated greenbacks. But a single general benefit always implies a thousand individual hardships, and the return to specie payment amongst us is no exception to this rule. It will be very hard on the farmers, who as a class are more widely in debt than any other; but the country at large will immediately be the gainer, owing to the greater steadiness in business, and those of the farmers who are not broken by the pressure will also be ultimately benefited, because owing to their position and the nature of their products, there is no class so liable as they to be injured by the fluctuations in prices and speculative uncertainty promoted by the existence of two standards of value—greenbacks and gold.

IT will be within the memory of our readers that a number of months ago, there was a quarrel between Judge Hilton, the representative of A. T. Stewart's estate and the Jews throughout the country. The former objected to admit some Jews into his hotel at Saratoga and the latter felt justly indignant at the insult thus offered to their co-religionists. Since then the Hebrews throughout the States have refused to do any business with Hilton, and the old firm of A. T. Stewart & Co., has lost heavily on this account. Lately Mrs. Stewart made donations to several charitable institutions in this city and among others to three Jewish charities, and these were advised that they could get the money by calling on Judge Hilton. They have all refused to touch a dollar of it on account of that proviso, and are supported by Jews everywhere. Hilton seems to have exhausted his supply of tact in toadying to Stewart and his wife until a cool million was left him by the former, for which the latter transferred to him nearly $20,000,000 worth of property. Since then he has gained a wider unpopularity than any man ever won in the United States within so short a time.

FOREIGN.

From across the Atlantic comes word that the Afghan war is virtually ended. Russia has withdrawn her Embassy from Cabul—the presence of which there, was the chief cause of the war. The Ameer with his family and treasures is flying with the retiring Embassy to Balk; complete anarchy prevails in the country, and no serious opposition to the movements of the British is at present expected. The Princess Alice of Hesse-Darmstadt has been buried, and her cousin, the Duke of Cumberland, son of the late King of Hanover, was married on Saturday morning to the Princess Thyra of Denmark, sister of the Princess of Wales. Bayard Taylor, our Minister at Berlin, died suddenly in that city last Wednesday and the body was yesterday placed in the receiving vault of Jerusalem Church, preparatory to its transfer to the dead author's home at Cedarcroft near Philadelphia. Despite the large sums he made by literature, his generosity is said to have been so great that his family are left unprovided for—his wife getting only the $10,000 for which his life was insured.

At no time within the memory of the present generation has the distress among the lower orders in England and Scotland been so grievous or so widespread as at present. Cotton and woolen

mills are either altogether idle or runing on reduced time; iron works of all kinds are in somewhat the same condition; farming is an improfitable business at present rentals, and prices; public works are unusually few and unimportant; financial distrust is general owing to late bank rascalities and the fears that others will soon be disclosed; tens of thousands of men women and children, necessarily idle, are on the brink of starvation; capital, as usual, is greedily taking advantage of the public agony and reducing wages to starvation rates; because thousands of famine-pinched wretches are expected to be forced by hunger to work for even a pittance; a strike of 100,000 colliers is imminent on account of a threatened reduction of their present small wages. Public and private charities of all kinds are taxed to the utmost, and were times a little better on this side of the Atlantic, there would be a rush of immigration to this country unexampled since that during the Irish famine of '48.

The political prosecutions in Germany are fast becoming persecutions, and there is great danger according to some, great hope, according to others, that there will be avery large influx of Teutonic revolutionists to this country. Already the tide of immigration from the Fatherland has set in at this port and so soon as the weather grows milder, many expect it to come with a rush like that of the ocean up the Bay of Fundy.

Georgia women make good political helpmates; Senator Gordon's wife advises her husband what to do in many important matters of state; Governor Colquitt's wife conducts much of his business for him; Congressman Felton's lady ought really to be the Congressman and Senator Ben Hill looks to his better-half for clear-headed logic.

Charles Francis Adams appears to be slippiag from the grip of Massachusetts. He bought $40,000 worth of Kansas City lots lately, and will build a cotton mill, with cottages for the operatives.

Wilkie Collins is small, short, stout, timid and gouty.

PUBLISHER'S NOTICES.

OUR readers are requested to read the following before making up their orders for seeds:

Any ten of the following require a one-cent postage stamp:—that is ONE *cent* for the ten, not for each.

The Voorhis Water-melon.	Chater's Lemon Hollyhock.
Acme Tomato.	Deutzia crenata fl. pl.
New Bronze Ricinus.	Hibiscus militaris.
Hibiscus moscheutos.	Eryngium Leavenworthii.
Callicarpa Americana.	Geranium sanguineum.
Hibiscus Syriacus (mostly from double-flowering seedlings), "Rose of Sharon."	Yucca filamentosa.
	Vitis heterophylla.
	Rural hybrid Aquilegia.
Weigela.	Grindelia squarrosa.

When the Beauty of Hebron Potato is included, a two-cent extra stamp.

When both Pearl Millet and Defiance Wheat are included, a two-cent extra stamp.

We request that our subscribers will write their addresses IN FULL and PLAINLY, and not *stick the stamps to their letters*. By so doing they will save us a deal of trouble and expense. For particulars, send stamp for RURAL of Nov. 9.

A Favorite Cough Remedy.—For Colds, Sore Throat, Asthma, Catarrh, and other diseases of the bronchial tubes, no more useful article can be found than the well-known "*Brown's Bronchial Troches.*" **25c. a box.**

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 21, 1878.

BEANS AND PEAS.—The market is weak, under a free offering of mediums and light prospective business in marrows. Exporters do not state when their orders will resume, but a further decline may stimulate business. Pea beans dull, quality against sales. White kidneys hold old rates, as supplies are moderate. Red kidneys firm and again higher. Black beans steady, without large business. Green peas, $1.30@1.35: Southern B. E. peas, $2.05@2.70 per 2-bushel bag.; a loss from recent rates. Canadian peas, in bulk and bond, 72@74c.; Medium beans, prime, $1.55@1.57½; fair to good, $1.35@1.45; Marrow, free on ship, $1.65; fair to good, $1.45@1.50; pea, $1.50@1.75; white kidney, $1.80@2.00; Red do., $1.90@2.25; Black, $1.90@2.25.

Receipts of beans for week, 13,500 bushels; exports, 415 bbls.

BEESWAX.—A little call from exporters at steady prices. Sales at 26@27c. for Western and Southern.

BUCKWHEAT FLOUR.—Sales at $1.65@2; the latter for choice.

BUTTER.—Merely an ordinary grocery demand has attended the market, and sellers will have to be favored with a brisk late winter business if the uneven and average dull fall and December demand is to be atoned for. One feature is encouraging: the quality of late State receipts is high and of good keeping grade. Of common stored lots there is little to say further than they will depend on a chance market. As usual, in dull times, when western has quality merit, and late supplies run well in this way market buyers and fair styles of grocers avail themselves of the favorable difference in price between western dairy tubs and useful table grades of State. Line dairies, firkins and hf. tubs are not active, holders quote them as before; but a wholesale call would obtain a concession. Welsh lower.

State, full dairies, special, 2?c.; other, 16@19c.; firkin dairies, fair to prime, 13@18c.; Welsh dairies, fine full, 16½@17½c.; choice dairy, pails and half tubs, 22@23c.; fair to prime do., 15@21c.; choice Welsh, 19@20c. Imitation prime, 13@17c. Choice creamery 25@26c.; other, 22@24c.; sweet cream, 24@26c. Best Western creamery, 27@29c.; other, 20@25c.; early packed creamery, 17@20c.; poor State 10@12c.; Western dairy, fine fresh, 16@18c.; fair to good, 10@14c.; factory, choice, 13@14c.; other, 6@12c.; rolls, 10@14c.

Receipts for week, 30,240 pkgs. Exports, 4,188 do.

BROOM CORN.—There are fair supplies of most grades. Jobbing rates are 4½@5½c. for medium green to choice hurl, with inferior at 4c. Car lots do not exceed 4½c. for very best and off grades sold below 4c.

CHEESE.—There have been exported this week 24,500 boxes; most of this business has been in strictly fancy factories, and as these are getting scarce, for special lots extreme prices have been made, 9 to 9½c. being quoted and for a named factory of 3,500 boxes as high as 10½c was paid. The under grades are slow, in ample stock and weak. Quotations are: 8½@9c. for fancy, special lots to 9½c.; 8@8¼c. for fine lots; 7@7¼c. for good; 4@5c. for skimmed. State, farm dairy at 8@8¼c. for fine; 7@7½c. for good to prime. Wisconsin factory, fine to fancy, 8¼@8½c.; do. good to prime, 7@8c. Western factory, fine and fancy, 7½@8½c.; good and prime, 6@7c.; do. full skimmed, 2@5c.

Receipts for week, 53,790 boxes.

Liverpool cable 45s.

Gold, par.

COTTON has shown sharp fluctuation and has been active, closing strong at, for December, 9.15@9.17c.; January, 9.27@9.28c.; February, 9.46@9.47c.; March, 9.61@9.62c.; April, 9.74@9.75c.; May, 9.88c.; June, 9.99@10c.; July, 10.08@10.10c.; August, 10.15@10.18c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade bove or below the grade quoted:

	Uplands.	*N. Orleans.*	*Texas.*
Ordinary	7¾	7¼	7¼
Strict ordinary	7 9-16	7 11-16	7 11-16
Good ordinary	8 1-16	8 3-16	8 3-16
Strict good do	8⅜	8⅜	8⅜
Low middling	8⅝	8⅝	8⅝
Strict low middling	13-16	8 15-16	8 15-16
Middling	9	9¼	9¼
Good middling	9⅜	9⅜	9⅜

Middling fair	10 7-16	10 9-16	10 9-16
Fair	11¼	11⅜	11⅜

Stained.

Good ordinary.....7¼; Strict good ordinary. 7¾
Low middling.....8¼; Middling 8⅜

DRIED FRUITS.—Trade is slack, as usual at this period approaching the holidays, but prices generally steady.

Southern plums at 13½@14c.; State plums, 15@15½c.; Blackberries are quoted at 5@5½c. Peaches—Peeled Georgia, at 6½?c. for poor; 8@9c. for fair to good; 10@10½c. for prime; choice North Carolina, 11½@12½c.; good do., 8@10c.; unpeeled halves, 3@3¼c.; quarters, 3@3¼c. Pitted cherries, 22c. Apples—Old State quarters, 2½@3c. New apples, 2¾@3c. for southern quarters in bbls.; 4@4½c. for prime sliced; do., fair, at 3@3½c. State at 4@4½c. for new sliced; and 3@3¼c. for quarters; western at 2¾@3½c. for new quarters. Raspberries, 30c.

Exports, past week, 751 bbls. dried apples.

EGGS.—There has been a fairly active market; holiday purposes increasing the call. Main demand for prime fresh, but limed and good held are selling fairly for mixing use. Near points, 27@28c.; State and Penn., 25½@26½c.; Western, 25¼@26c.; Southern, 25@25½c.; Canadian, 23½@24c.; off quality, fresh, 21@22c. Limed, choice, 16@17c.; good, 14@15c.; other, 12@13c.

Receipts for the week, 6,800 bbls.; do. last week, 4,487 do.

ESSENTIAL OILS.—First hand prices in N. Y. as follows: Peppermint in tin, $1.60; in glass, $2.30; sassafras, 44c.; wintergreen, $2.15; tansey, $3; wormwood, $3; pennyroyal, $1.20.

FEATHERS.—New white geese primo. 40@45c.

FLOUR.—Large receipts and insufficient export and home trade demand have weakened prices. A decline quite general of 10 to 20c. per bbl.

Latest prices are: $3.15@3.60 for inferior to fancy superfine State; $3.60@3.90 for very poor to very good extra do., odd lots and lines; $3.90@4.25 for good to very choice do., and fancy lots above this; $3.15@3.65 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $3.50@3.90 for very poor to very good shipping extra do. and $3.90@4.25 for good to very choice extra do.; common to about choice white wheat extras, $4.30@5.00; choice to strictly fancy do. at $5.00@5.75; red and amber winter wheat, very inferior to very choice trade and family $3.30@5.00 round hoop Ohio at $3.80@4.25, and trade and family brands of do. at $4.25@5.60, the latter rate for very choice; St. Louis, $4.00@4.75 for very poor to good extra, and $4.75@5.60 for good to choice; Minnesota clear, very inferior to very choice at $3.50@5.00; few brands going above $4.50; Minnesota "straight," inferior to very choice at $4.40@5.65; and patent fair to strictly fancy at $5.25@8.25, few brands going above $7.50; unsound stock at from $2.00@4.75; city mill extra at $4.65@5.00 for West Indies (the latter rate for fancy in new packages); do. for England, $3.65@3.85; do. trade and family extras, $5.10@6.00; do. for South America, $5.00@5.60 for fair to very choice; No. 2 at $2.25@3.00 for very inferior to strictly fancy.

CORN MEAL.—Sales at $2.15@2.50 for yellow Western and $2.85 for Brandywine.

FRESH FRUITS.—There is a fair demand for apples but prices are no better. At this season domestic fruits and nuts have divided a good deal of trade with foreign items. Spitzenburg apples, bbl., $1.75@2 choice; fair, $1.25@1.50; Baldwins, $1.25@1.50; fancy, $1.75; Greenings and other good winter fruit, $1.25@1.50; very common, 75c.@$1; Lady apples, selected, $5@7; poor, 2@4; Cranberries firm with good sale. Fancy Cape Cod, bbl., $9; fair to prime, $7@8.50; poor, $5@6.50; N. J., crates, fancy, $2.50@2.75; other, $1.75@2.25. Catawba grapes, nominally, 6@8½c. Florida oranges do not advance even with the special call. Half-barrel boxes, $3@4 best; other, $2@2.62; barrel, 6@8. Pecans, Texas, scarce, 12@14c. lb. Chestnuts out of date. Hickory nuts, shellbarks, $2.50@2.75; Va. hand-picked peanuts $1.10; other grades, 3@3½c.; shelled, 4@5c.; demand good.

Export of apples for week, 5,424 bbls.

GRAIN.—Wheat has shown diminished export demand and easier prices, closing weak.

Latest sales are of No. 3 spring at 88@91c.; amber ungraded at $1@1.03; No. 2 amber at $1.01½@1.05; ungraded red at 97c.@1.03½; No. 3 red at $1@1.02½; extra white at $1.10½; white State at $1.09½; No. 1 white at $1.03@1.03½; No. 2 white at $1.05½@1.06; ungraded white at $1.05@1.08½; No. 1 red at $1.03½; No. 2 red at $1.07½@1.08½; New York No. 2 spring, January option, at 97c.; No. 2 amber, December option, at $1.01½; do. January option, at $1.03; No. 2 red, December option, at $1.03½; do. January option, at $1.03½@1.03; do. February option, at $1.03½@1.10. Rye at 58@59c. for No. 2 Western and 59@60c. for State. Corn is easier and more active; sales of steamer mixed at 46@46½c.; New York No. 2 at 47½@48c., afloat; New York No. 3 at 41½@46c.; ungraded mixed at 45½@47c.; yellow Southern at 46c. on dock; No. 2, December option, at 47½c.; do. January option, at 47½c.; new No. 2, January option, at 46½c.; steamer mixed, December option, at 46¼c.; do. January option, at 45½c.; do. February option, at 45½c. Oats are active and about steady in price; New York No. 1 quoted at 30½@31c.; New York No. 3 at 30@30½c.; New York No. 2 white at 33½c.; New York No. 3 at 29½c.; New York No. 3 white at 32@32½c.; white Western at 32½@34½c.; mixed do. at 29@31c.; white State at 32@35c.; mixed do. at 30½@31c.; No. 2 Chicago at 30½c.; New York extra white quoted at 38@39½c.; New York No. 1 white at 34@34½c.; No. 2 Milwaukee at 31c. Barley unchanged; State, 6-rowed, 90@$1; 2-rowed, 75@80c.; Canadian, 95c.@$1.25; malt, $1@1.35.

HAY AND STRAW.—Demands have been good and prices held steady.

Sales at 35@40c. for shipping, and 65@75c. for retail qualities. Straw quoted at 35@45c. for long rye, and 25@30c. for short rye, and oat at 40@45c.

Exports past week, 312 bales.

HONEY.—The supply begins to be oppressive; clover unusually low; single comb, 13@14c., two do., 11@12c.; buckwheat, 8@10c.; strained, 6@11c.

POULTRY AND GAME.—Live poultry has had a bad week; prices unprofitably low at the close. Chickens, 6@8c., lb.; fowls, 7@9c.; roosters, 4@5c.; turkeys, 8@9c.; ducks, choice, pair, $65@$1; other, 50@60c.; N. J. geese, $1.75@$2; other, $1@$1.50; pigeons, 30@35c.

Good weather has kept dressed moving, but prices are quoted full even at the moderate rates. Western has had a better share of trade this week; chief demand is for turkeys. Western shippers should use the telegraph while the market is so tender.

Dry picked turkeys, 13@14c.; prime scalded, 12½@13c.; fair, 9@10c. Chickens and fowls, dry picked, 12@13c.; common to good scalded, 8@10c. Very poor ducks, 6c.; choice, 12@13.; other, 9@12c. Geese range, 7@11c.

very poor, 6c.

Supplies of game are large and sellers have to adopt easy figures. Grouse, for an exception are scarce; many going to England this season. The export trade in fine American game promises to be a feature. Christmas brings a good deal of local trade, especially for wild ducks.

Quail, doz., $1@1.12; Grouse, trapped, pair, 75@80c.; drawn, 60@70c.; Partridges, State, 85@90c.; other, 55@75c.; canvas-back Ducks, Havre de Grace, $2.50@2.75 pair; Western, $2@2.25; red head, 75c.@$1.25; Mallard, 50c.; Teal, 35@40c.; common, 25@35c.; Hares, 30@40c.; Rabbits, 25@30c.; Venison, short saddles, 12@13c.; long do., 10@11c.; whole deer, 8@9c.

FURS AND SKINS.—There has been a more liberal business and some kinds show an improvement. Receipts show a greater willingness on the part of trappers and collectors to accept the prices offered.

Southern furs usually sell 15 to 20 per cent. below western.

HOPS.—Export movement has been fair in choice stock, and some parcels held above quotations. Good and under grades are plenty and freely offered.

Quotations are for New Yorks, new crop, choice, 12@15; New Yorks, new crop, good and prime, 8@10; New Yorks, new crop, low to fair, 5@7; Eastern, 8@12; Western, 8@12; Yearlings, 4@6; Olds, all growths, 1@3; Pacific coast, 12@15.

OIL-CAKE.—Western is offered at $23 ₩ ton.

PROVISIONS—Have tended easier, and have been fairly active.

Old mess pork on spot quoted at $7.20@7.25; new do. at $8.60@9, $7.05 bid and $7.15 asked for old for December; $7.05 for January; $8.55 bid and $8.70 asked for new for January; $6.15 bid and $7.25 asked for old for February; $8.56 bid and $8.65 asked for new for February; $7.25 bid and $7.35 asked for old for March, and $8.65 bid and $8.70 asked for new for March. Bacon at 4¾c. for long clear and 4¾c. for short clear. Lard at $5 87½ for spot lots of Western steam for December and January; $5.95 for February; $6.02 for March. Stearine at 6¾c. for prime. Tallow at $6¾@6 11-16 for prime. Beef Hams $14.50@15. Beef—Extra India mess, $20.50@21.50 for city brands; do. Philadelphia, $19@19.50; packet at $11@11.50; plain mess at $9.50@10; extra mess at $10.50@11.50.

SEEDS.—Grass are steady; clover at 6¼@6¾c. for prime to 7c. for choice; timothy at $1.25. Flax seed quoted $1.42½.

TOBACCO.—Export demand has been slack this week and general trade moderate, but prices steady and essentially as quoted last week.

SEEDLEAF—CROP OF 1877.

HORSFORD'S Bread Preparation

UNSURPASSED FOR MAKING

LIGHT BREAD,

Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof. E. N. Horsford, by the Rumford Chemical Works, Providence, R. I.

A GREAT OFFER FOR

HOLIDAYS!!!

We will during the HOLIDAYS *dispose of* 100 PIANOS & ORGANS, at EXTRAORDINARY LOW prices for cash. SPLENDID ORGANS 2 3-5 sets of reeds $65, 3 sets with Sub Bass and Coupler $80, 2 sets $50, 1 set $40, 1 set $35. 7 Octave *all* ROSEWOOD PIANOS $130, 7 1-3 do $140, warranted for SIX years. AGENTS WANTED. Illustrated Catalogues Mailed. Music at half price, HORACE WATERS & SONS, Manfrs. *and* Dealers, 40 E. 14th., St., N.Y.

USE THE PERFECT BUTTER COLOR!

WELLS, RICHARDSON & CO.'S PERFECTED BUTTER COLOR is recommended by the agricultural press, and used by thousands of the very best Dairymen. It gives a perfect June color, and is harmless as salt. A 25-cent bottle colors 300 pounds, and adds 5 cents per pound to its value. Ask your Druggist or Merchant for it, or send for descriptive circulars. WELLS, RICHARDSON & CO., Prop's, Burlington, Vt.

My Annual Catalogue of Vegetable and Flower Seed for 1879, rich in engravings, from original photographs, will be sent FREE, to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. *Printed directions for cultivation on each package.* All seed *warranted to be both fresh and true to name;* so far, that should it prove otherwise, *I will refill the order gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables, I invite the patronage of *all who are anxious to have their seed direct from the grower: fresh, true, and of the very best strain.*

NEW VEGETABLES A SPECIALTY.

MOP-HANDLE PAPERS.—No. 10.

MAY MAPLE.

A Chat in the Kitchen.

It is not often one spends a happier week in the golden autumn than I did at the snug little farm house of Cousin Jennie Gordon. This same fair cousin is a really practical house-wife, never seeming to be in the least hurried or troubled about anything. Her work moves along like clock-work. It is said that there are born poets; then why may there not be born housewives as well? I believe there is one now and then, and that this fair relative of mine is such a one. If their comforting mantles could only spread far and wide over the sisterhood of farmers' wives, there would be less complaiuing and fewer drudges.

One morning I followed her into the kitchen, for we could not afford to "stop our chatter" while she performed her usual morning duties; for she only kept a hired girl during the summer months. Her own daughters, aged twelve and ten, usually assisted her in the labors of love about the household; but they were visiting in a distant town.

"Now, Cousin May," said Jennie, at the close of an animated discussion of a favorite author, "if you'll excuse, I'll go on with a piece of work that I put down in the programme for one of the odd jobs to be done to-day. You see I have certain parts of my work for certain days. Monday morning, before I leave the breakfast table, I write out in a little book kept for the purpose, my plans for each day of the week. And although my rule is not as unalterable as the laws of the Medes and Persians, yet it helps me wonderfully towards the accomplishment of various tasks that might be otherwise neglected for a time, and then cause my work to be done in haste. To-day the tin-ware is to be cleaned. I'll be very quiet about it and we can go on with our reviews and criticisms of fictions, poems and authors just as well as though we were sitting in the parlor making cats and dogs on Java canvas."

I found that by cleaning the tin she did not mean *scouring* it, but giving it a thorough washing with plenty of soap and water, using a brush instead of a cloth. She said that during the hurrying season the girls were not always as particular as they ought to be about washing the seams and hems of the pans, bread and pie tins, dish-pans and tea-kettle. In putting the pans about the stove to dry, they frequently became so heated as to melt the resin, and this caused the seams to be dark and gummy, an appearance not at all pleasant to the eye of a tidy housekeeper. She used a brush for this work, because a brush would do it more thoroughly than a cloth; and in very obstinate cases a small, sharp stick would do good service in removing impurities.

After the dishes were all nicely cleaned and put away in poetical order, that is, in long lines and short ones, in clusters and groups, Jennie took a large basket and went to the cellar, soon returning with the basket heaped full of Irish potatoes.

"Now don't think I am going to cook all these for dinner;" said she. "I am only going to wash their faces and have them ready to use when I want them, for several days to come. You shall see how quickly I wash them; the basket holds half a bushel."

She put them all into a tub that stood near the pump. Then after pouring plenty of water upon them, she took an old broom and scrubbed them till they were as bright and shining as apples. When rinsed, they were put into a basket to drain, and the labor had occupied scarcely five minutes. "There!" said Jennie, as she wiped her hands as fair as in her girlhood, "if it be necessary to get a meal quickly, the potatoes can be boiled with their jackets on; otherwise, I can take a few in a dish, and sit with you in the parlor to pare them, if I choose, and there will be no danger of soiling hands or clothes. I'll tell you, May, if you ever go to housekeeping, hang a brush in every corner of your kitchen and pantry, and you will find it a labor-saving machine in a hundred ways."

[NOTE.—Owing to the fact that it was found necessary to present our Poultry Number somewhat earlier than was at first intended, the following article by Mrs. Jack and several others, were received too late for that issue.—EDS.]

OUR DUCKS.

ANNIE L. JACK.

"WHO would have thought it!" said the family epicure, as the delicious, dark meat of one of our much prized ducks fell in rich slices beneath the carver's knife. "There is as much meat on one of those immense fellows as on a turkey," said another critic, and so, of course, for the benefit of visitors we had to state the cause of these remarks.

The much prized ducks are called "Muskoka," and are certainly very large and fine in shape. When dressed, their weight is about an average of nine pounds, and the flavor and color are those of the wild black duck, while they are very heavily feathered and handsome in the rich color of their plumage. Much given to hiding their nests, they make them deep and soft with the fine down which they pluck from their breasts for a lining, and which might be taken for eider-down. They roost like the chickens, flying up to a perch at nightfall, and have to be kept with one wing clipped while young to prevent their flying away. Many a chase the children have had along the timber after the old drake or some of the ducks, when their wings had grown again. But one of their peculiarities is that they do not seem to *need* the usual puddle, the necessity for which makes the common duck such a very disagreeable character. While fond of a bath, and of plunging into clean water after a shower, they will not seek the river in a dry time, but are content to share with the chickens a small pan of water. The young are very subject to the attack of the "fly," which is only to be guarded against by not allowing them to return to their nest after hatching out, but placing them in clean quarters, when they grow with wonderful rapidity. In the matter of cooking, they can be used in all the ways in which tame ducks are prepared, but if preferred, they make up very well as a

Salmi of Wild Duck.

First—Partly roast the duck; cut it into joints and slices; put refuse bits of fat or skin into a saucepan with a cup of gravy; two onions fried in butter; pepper and salt to taste, a pinch of cloves and nutmeg, parsley, marjoram and sage chopped fine. Boil one hour, skim when cool, and return to the saucepan with a piece of butter the size of a walnut; thicken with browned flour; let it boil a few minutes; put in the pieces of duck, after which it must not boil, but the saucepan should be placed in a dish of boiling water. Fry bread in some of the gravy; cut it into squares; lay them on a hot dish; place the pieces of duck neatly in the center and pour the gravy over all.

MINCE PIE.

One pound of finely-chopped, boiled beef—that from the neck is best; one-half pound of grated sour apple, a pound of raisins, stoned and cut fine, a pound of currants, one-fourth of a pound of suet, and the same of citron, both chopped. One teacup each of jelly, sugar and molasses, the juice and grated rind of a lemon, one grated nutmeg, a teaspoonful each of salt, ground cinnamon, mace and cloves; two quarts of cider boiled or not. Mix thoroughly, put in a porcelain kettle and set in the back of the stove. Let the mixture simmer for one hour, stirring it often. Pack in a stone jar and keep in a cold place.

Most cooks weaken their mince pies with too many apples. Pies made according to this receipt will be found very rich and fine, and the the fewer eaten, the better. M. G. R.

Iowa.

QUESTIONS ANSWERED.

Pop-Corn Balls.

Geo. G. Doctor wishes directions for making pop-corn balls.

ANS.—Pop the corn, rejecting that which did not open nicely, and put into a large pan or on a clean table—there should be a scant half bushel. Add a little water to a pound of granulated sugar and boil until the mixture, when tried in cold water, is waxy; stir in five tablespoonfuls of gum-arabic solution, of about the thickness of molasses—made by dissolving the gum in boiling water—and pour over the corn. With a spoon or stick stir until all of the kernels are coated with the mixture. When cool, flour the hands and press into balls. Flavor the sugar mixture with whatever you choose.

Dried Citron.

M. H. H., New Lebanon, N. Y., asks how to to dry citron and have it look like that in market.

ANS.—Boil the citron in water until clear and tender; make a sirup in the proportion of one-half pint of water to a pound of sugar; put in the pieces and boil until the sirup has penetrated them; take out, spread on plates and dry slowly, turning often and sprinkling with powdered sugar each time. Pack in jars with sugar between the layers.

Skins from Peaches.

Mrs. J. W. L., asks for some speedy way of removing skins from peaches. She has heard of lye being used for that purpose, but does not know of the process and asks for enlightenment.

ANS.—Yes, lye is used, but we do not know as to its strength. If peaches are placed in a wire basket and plunged first into boiling water for a moment and then into cold, it will enable you to rub off the skins with ease. Any of our friends who has had experience with the lye solution, we will be pleased to hear from.

Alonzo Wolf, Pa., says, please give directions for a good vinegar and also for a secret ink.

ANS.—1. Our correspondent does not state whether he wishes directions for cider vinegar or for a "made" vinegar. If for the former, the process will be hastened by adding mother of vinegar, as it is called, to the cider. Sometimes the cider is too strong, remaining in a state too sour for cider and not sour enough for vinegar. In such a case add of warm water one-fourth as much as there is cider, and of molasses, two quarts to the barrel. A cheap vinegar is made by filling up the vinegar barrel, before it is quite empty, with a gallon of molasses to every eleven gallons of soft water. A quicker vinegar can be made by allowing a quart of molasses and a pint of yeast to every three gallons of warm rain-water. In making any vinegar, bear in mind that the process is accelerated by keeping it where there is a moderate degree of heat and in filling the cask or barrel only half full, thereby allowing a free access of external air.

2. Lemon juice, onion juice or a weak solution of oil of vitriol, common salt or saltpeter will turn brown or yellow when exposed to the fire. A dilute solution of chloride of copper becomes yellow at a moderate heat and disappears on cooling, while a weak solution of chloride of cobalt and chloride of nickel is turned a bright-green. Use these liquids the same as ink, only the pen must be clean.

W. S. T. wishes to know how to keep cider sweet for a long time with but little expense.

ANS.—It is desirable to make the cider late in the season. The barrel must be perfectly sweet and clean. To a barrel allow seven pounds of white sugar. Let it ferment until it is safe to drive in the bung. Draw off in February or March into a clean cask; dissolve one-third pound of gelatine in a quart or more of warm cider; when dissolved and cold, add to the other cider, mixing thoroughly; bung tightly, and bottle in April or May. Or, when it comes from the press, rack once a week for four weeks, put in bottles, cork tightly and place the bottles on their sides in sawdust. Another method recommended is, to add *sulphite*, not sulphate, of lime. When the cider is in lively fermentation, add one-fourth pound of white sugar to each gallon; let the fermentation proceed until it has the taste to suit; then add one-fourth ounce of sulphite of lime to each gallon. Dissolve the sulphite in a little cider before pouring into the barrel. Agitate briskly for a few minutes and after a day or two when the cider has become clear, draw off and bottle or remove the sediment and return to the same cask. If kept in the barrel it will retain its taste as a still cider, and if bottled carefully it will become sparkling.

Cream Crackers.

E. S. G. wishes a recipe for cream crackers.

ANS.—One pint of sweet cream; six eggs; a little salt and flour enough to make a stiff dough; beat the eggs separately, and pound the dough for fifteen or twenty minutes. Roll thin; cut into any shape you please and bake in a moderate oven.

Reading for the Young.

FOLLOW THOU ME.

HAVE ye looked for My sheep in the desert,
For those who have missed their way?
Have ye been in the wild, waste places
Where the lost and the wandering stray?
Have ye trodden the lonely highway,
The foul and darksome street?
It may be ye'd see in the gloaming,
The print of Christ's wounded feet.

Have you folded close to your bosom
The trembling, neglected lamb,
And taught to the little lost one
The sound of the Shepherd's name?
Have ye searched for the poor and needy
With no clothing, no home, no bread?
The Son of man was among them,
He had nowhere to lay his head?

Have ye carried the living water
To the parched and thirsty soul?
Have ye said to the sick and wounded,
"Christ Jesus makes thee whole?"
Have ye told my fainting children
Of the strength of the father's hand?
Have ye guided the tottering footsteps
To the shores of the "golden land?"

Have ye stood by the sad and weary,
To smooth the pillow of death,
To comfort the sorrow-stricken,
And strengthen the feeble faith?
And have ye felt, when the glory
Has streamed through the open door,
And flitted across the shadows,
That I had been there before?

Have ye wept with the broken-hearted,
In their agony of woe?
Ye might hear me whispering beside you,
'Tis a path I often go.
My disciples, my brethren, my friends,
Can ye dare to follow me?
Then wherever the master dwelleth,
There shall the servant be.

JACK AND JILL.

An Authentic Account of the Adventures of These Nursery Favorites.

JACK and Jill went up a hill
To get a pail of water;
Jack fell down and cracked his crown
And Jill came tumbling after.

NOW Jack was the son of a nobleman who lived in a strong castle far across the sea. He once had a little sister, but she went to live with the angels when she was only three years old. Jack, as you ma uppose, was very lonely after that, for he was the only child in this great house, and his heart was so sad that he would creep away by himself and cry aloud to his sister Effie to come back and play with him once more. Then his papa bought for him a beautiful white pony, and calling his gray-haired steward, told him to teach Jack how to ride, and always to keep his own hand upon the bridle until he could keep his seat properly. Now Jack was not a very obedient boy, for since his sister's death no one had ever crossed his wishes, and his will had grown to be altogether too big for such a small body. He thought it looked very silly for him to be on the pony's back with the steward holding the bridle, walking round and round the yard; yet while his father stood near, he dared not disobey his order. By and by papa mounted his own horse and rode down the steep mountain side, and was soon out of sight. Then Jack told the steward to let go his hold upon the bridle, and because he would not obey him, he raised his whip to strike the old man a blow, but missed his aim, hitting the pony instead, who gave a great spring, thus clearing himself from the steward, then dashing through the open gates, ran down the mountain at full speed. Little Jack was nearly thrown, but by grasping hold of the pony's thick mane he managed somehow to keep his seat. The pony kept going faster and faster, till it seemed to the poor boy as if he was flying. He began to scream for his papa and mamma, and at last faint through fear and so much weeping, became dizzy—his eyes closed, his numb little fingers let go their hold upon the pony's mane, and with a hard thump he fell to the ground, while the pony, with no longer a burden upon his back, sped on like the wind.

In a few moments a poor old woman chanced to come that way, and seeing a little boy lying by the roadside, drew near, thinking it might be a fairy prince—for fairies were quite common on this mountain. But she soon saw it was no fairy boy lying there so still and pale. She went to a spring near by and got some water in Jack's cap and sprinkled it in his face. In a few moments he opened his eyes, but his head was so much hurt that he did not know what had happened to him or how he chanced to be there. After a while the old woman asked him if he thought he could walk, and he said he would try; so he stood up, and, with a good deal of help and many times sitting down to rest, they at last came to a low, brown hut, where the old woman lived with her little grand-daughter Jill. Jill's blue eyes were full of wonder when she saw Jack, though she made him very welcome, giving to him her own little stool by the one window in the hut.

Jack grew well fast, but he could not remember his name or the place where he came from. He thought that Jill was his own dear little sister Effie, and so crazy was his poor head that he really believed this mean, low hut was the home of the angels. He would sit and look in Jill's blue eyes and call her Effie, and tell her how much he had missed her, and how glad he was to be with her again. Both the old woman and Jill grew to be very fond of him as the days and weeks went on, until the mountain was white with snow and the cold winter winds made dismal music round the low, brown hut. They were very comfortable inside; the fire was always bright upon the hearth and there was plenty of oatmeal from which to make gruel, with a goat to give them fresh milk. To be sure, it was not like the dainty fare Jack used to have in his father's castle, but he had forgotten all that and was very happy and contented with what he had.

One cold morning, when the rain the night before had turned the snow into ice, little Jill took her pail to go to the spring for water to make the gruel for breakfast, and Jack insisted upon going also.

They had to climb quite a steep hill to reach the spring, and when they were nearly there Jack fell down, and his head struck the ice so hard that his crown was cracked—indeed there is one old lady who insists to this day that it was broken—but she is mistaken. Then he slid down to the bottom of the hill, and having hold of Jill's hand, of course she kept on with him also. When they stopped Jack's eyes were round as saucers.

"Who are you," he cried to Jill, "and how came I here?"

(You see, that just as a thump had driven away Jack's wits, a harder crack had brought them back again.)

Then Jill told him how that many months before her grandmother had found him by the road-side, and that he could never tell them his name, or where he used to live.

"But I can now," he cried. "My home is a big grand castle; my papa the splendidest man, and my mamma!—oh, so lovely—but how can I get word to them where I am?"

"I don't know," said Jill, "let's go and ask grandma."

Then they went both to the hut, and Jack told the old women who his father was.

"Indeed, I knew him well once," she cried, "for I was many years a servant in his father's house, and I will soon let him know where you are."

You may be sure Jack was very glad to think he should soon see his dear parents, and waited with great impatience for them to come for him. And it was not long before he was clasped in their arms, with kisses and tears of joy. Nor did they forget those who had given their little son love and tender care when he so much needed both—for they took the old woman and her granddaughter back with them to always live at the castle, and after one year they loved blue-eyed Jill so much they concluded to adopt her as their own little daughter, which made Jack very happy. He promised never again to disobey—yet I cannot say whether or not he did. Let us hope, however, that he kept his promise, and also that he begged the old steward's pardon for trying to strike him. Be that as it may, I am sure that neither he nor Jill ever forgot the time when:

Jack fell down and cracked his crown.
And Jill came tumbling after.

PUZZLER ANSWERS.—Dec. 14.

HIDDEN KINDS OF RHYME.—1, Dirge; 2, Lay; 3, Ballad; 4, Song; 5, Pæan; 6, Epigram; 7, Requiem; 8, Poem; 9, Epopee; 10, Ode; 11, Epic; 12, Cantata; 13, Parody; 14, Elegy; 15, Hymn; 16, Canticle; 17, Madrigal; 18, Blank verse; 19, Pallnode; 20, Doggerel; 21, Roundelay.

CENTRAL PUZZLE.—New Hampshire.

FRACTIONAL PUZZLE.—Cornelian.

DOUBLE ACROSTIC.—Initials, "The Widow's Son;" finals, "The Gold Brick."

PERSONAL ITEMS.

Charles Lamb wondered why people made such a fuss about children, "they were so common."

The Baltimore Gazette says Mr. Stephen now weighs 92 pounds, a Democratic gain of two pounds.

Senator Jones, of Nevada, sold 5,800 shares of Sierra Nevada stock, during the recent rise, at $208 a share, or a total of $1,106,400.

If George P. Marsh holds out until next March, he will have served the country as Minister to Italy seventeen years, and will have drawn for his services $204,000.

Victor Hugo is in Paris with his two grandchildren, George and Jane. His location at the Avenue d'Eylau is the rendezvous of literati and men of the future.

Ex-Senator Ramsey, of Minnesota, has given his private library to the Historical Society of that State. It contains many valuable historical and documentary works.

Dr. Halley says that the total evaporation caused by the rays of the sun on the surface of the Mediterranean sea amounts to 52,800,000 tons of water in one summer day.

Marcus R. Robinson, ex-president of the American Anti-Slavery Society of the West, who passed an unusually adventurous career just before and during the war, died at Salem, Ohio, on Tuesday.

Mrs. Myra Clark Gaines, the famous litigant, had a claim to eighty-five thousand acres of land under an old Spanish grant. This claim has been considered by the House committee on private lands and refused.

Lord Falmouth, during the English racing season of 1878, won $193,500. He was unlucky at the beginning of his turf career, but his luck changed in 1869, when Kingcraft won several two-year old victories. Since then Lord Falmouth's horses have won him about $300,000.

A lady left several thousand pounds as a personal bequest to Charles Spurgeon. He inquired into the circumstances of the relatives of the donor, and, finding that they were needy, and that nothing had been bequeathed to them, divided the legacy among them.

Gladstone, according to all accounts, is just in the prime of his oratorical powers. He must be ranked among the few men who know how to make a statement so clear that none can mistake his meaning, however abstruse the subject. It is said that he can state a case better than any man in England.

Lord Chelmsford, who lately died, left less money than any Chancellor in the past century. It is sad, for the credit of the sex, to have to state that it was the remarkable extravagance of Lady Chelmsford which kept His Lordship poor. So his real estate was but small, and his personal was sworn under $240,000.

Widow Marie Jeanette Bell is still living at Kankakee, Illinois. She is one hundred and nine years of age. She was born in 1769, the year of Napoleon's birth. She saw Napoleon, as the "Little Corporal," knew Robespierre, was surged in the crowd that witnessed the execution of the Sixteenth Louis, and remembered when Marie Antoinette's blood was split. Old Mother Bell measures five inches less in hight than she did twenty years ago.

The death of Captain Whyte Melville, the novelist, is announced in a London dispatch dated the 5th inst. He was born near St. Andrews, Scotland, in 1821, received a liberal education and entered the army in 1839. He became Captain in the Coldstream Guards in 1846 and retired in 1849. At the breaking out of the Crimean war, however, he entered the Turkish cavalry and served throughout the war, rendering distinguished service. He has contributed quite largely to the fictitious literature of the day, his works having met with very large acceptance in Great Britain and the United States.

Senator McDonald, of Indiana, has recently donned a new cloak, which gives him the appearance of a Roman Senator. It is a toga, and he wears it as a Roman must have worn his. In the back it reaches below the knees, and as he wraps it about him, throwing a corner over his left shoulder, it adds greatly to his always fine appearance. A lady who has seen him with it remarked the other day, that "it is so very becoming, other gentlemen of his splendid physique ought to go and do likewise." The senator has always been a temperate man in everything, hence his good health.

Good, rugged, grand old Thomas Carlyle! It is refreshing to read amid the mawkish sentimentality of this latter day, such a healthy utterance as this from his sturdy pen: "Let wastefulness, idleness and improvidence take the fate which God has appointed them, that their opposites may also have a chance for their fate." As it is, our philanthropists try to make us believe that the special business of a thrifty man is not in any way to enjoy the fruit of his prudence and enterprise, but to shield the shiftless people around him from the results of their own imprudence and improvidence.—*J. G. Holland, in Scribner.*

Implements and Machinery.

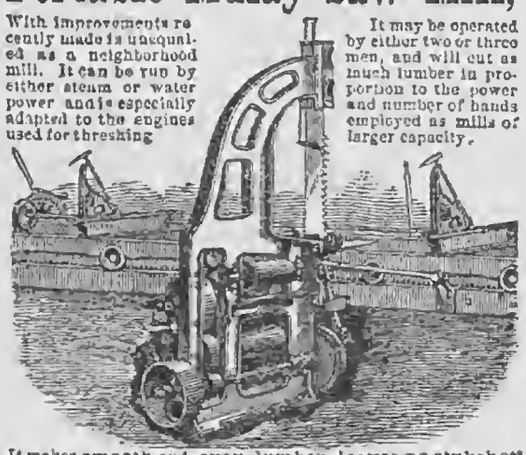
"THE AQUAPULT," a new and greatly improved Fire-Extinguisher, Garden Engine, Window and Carriage Washer, Tree, Vine, and Shrub Protector from Insects, etc., for starting Aqueducts, and various uses which readily suggest themselves. No Dwelling, Factory, Railroad Station or Wooden Railroad Bridge or Viaduct should be without one of these valuable articles. Weight, with hose, 5 lbs.; throws water 60 feet. Price, $3.00 each, sent by express, C.O.D. Manufactured by W. & B. DOUGLAS, Middletown, Ct., the oldest and most extensive manufacturers of Pumps in the world. Branch Warehouses, 85 and 87 John St., New York; 197 Lake St., Chicago, Ill.

Implements and Machinery.

Portable Mulay Saw Mill,

With improvements recently made is unequaled as a neighborhood mill. It can be run by either steam or water power and is especially adapted to the engines used for threshing

It may be operated by either two or three men, and will cut as much lumber in proportion to the power and number of hands employed as mills of larger capacity.



It makes smooth and even lumber, leaves no stub shot and will cut any sized log up to four feet in diameter. It may be transported from one locality to another and re-erected ready for sawing in from two to three days, and can be made profitable in localities where there is not sufficient timber to justify the erection of a large mill. Send for descriptive circular, price, etc., to CHANDLER & TAYLOR, Indianapolis, Ind.

IXL FEED MILL.

This mill is the cheapest, most durable and perfect feed mill ever offered. It is simple, easily managed, and can be run by Wind, Steam, Water or horse power. The chilled iron plates have grinding surfaces on both sides and can be reversed, thus making one set equal two on the old plan. An extra set is sent with every machine, and the two sets will grind Four Thousand bushels of good feed. New plates can be had for $1.25 per set. These mills are built wholly of iron, (except the Hopper,) are strong, efficient and durable. Thousands are in use on Stock Farms—every one giving excellent satisfaction. Every farmer should have one and grind his own feed.

Wit and Humor.

THE CARPENTER'S WOOING.

"Oh, beam of my life, my awl to me!"
He cried, his flame addressing—
"If I'adze such a love as yours,
I'd ask no other blessing!"
"I am rejoist to hear you speak,"
The maiden said with laughter—
"For tho' I hammer guileless girl,
It's plane what you are rafter;
Now, if file love you just a bit,
What further will you ax me?
Can—will you be content with that,
Or will you further tacks me?"
He looked handsaw her words were square—
"No rival can displace me—
Yes, one more favor I implore,
And that is, dear Em, brace me!"

THE SEQUEL.

She came full chisel to his arms;
It really made him stair
To have her make a bolt for him
Before he could prepare.
He tried to screw his courage up,
And did his level best
To nail the matter then and there.
While clasped unto her breast,
Says he: "It augers well for me,
All seems to hinge on this;
And what is mortise plane to see,
The porch child wants a kiss."
He kissed her lip, he kissed her cheek,
And called her his adoored—
He dons his claw-hammer next week.
And she will share his board.

ALBERT Smith once wrote hisinitials in a hotel register. A wag wrote just underneath, "Two-thirds of the truth."

COCKROACHES dipped in marine iuk, and set at iberty on tinted paper make very reliable Afghanistan war maps.

AMERICANS are not much given to titles, but there is a universal demand for an "honest count" on election day.

COLONEL Ingersoll thinks women should be exclusively employed on the Mississippi river flatboats. He don't believe in a he-rafter.

We have known many a man to sit around waiting for something to turn up, until that something was his toes.—*Whitehall Times.*

WHAT IS LOVE?—At a friendly gathering at Holland House the conversation turned on love. Tom Moore compared it to a potato, because "it shoots from the eyes." "Or rather," exclaimed Byron, "because it becomes less by paring."

A WIDOW, whose husband's artistic perceptions had caused his house to be elegantly furnished, married his brother. When her visitors, after the second marriage, complimented her upon the beauty of her house-furnishing, she answered, "Oh, yes, my dear brother-in-law had such exquisite taste."

A LITTLE boy in a Sunday-school put a poser to his teacher. The lady was telling her class how God punished the Egyptians by causing the first-born of each household to be slain. The little boy listened attentively. At the proper interval he mildly inquired: "What would God have done if there had been twins?"—*Independent.*

"That young lady tried her best to catch your husband before you married him," remarked one lady to another, as a mass of curls and braids, flounces and overskirt passed the window at which they were sitting. "I wish to Heaven she'd got him!" was the quick reply, and then a dead silence fell upon the two, and wonders in crochet-work were accomplished in the next half hour.

HER ANSWER.—"What," the young man asked the young woman who was waiting for him to ask for his hat, "what do I put you in mind of?" "A French clock," she said softly. And pretty soon he arose and went his way. The next morning he called upon an eminent horologist and asked him what was the distinguishing trait of a French clock. The horologist said, "Why, it never goes." And the young man was sorely cast down, and he grieved and told no man of his hurt.

ONE night last week, at a party in Toronto, a young man was frightening some of the young ladies by his daring exhibition of a revolver, when the weapon was accidentally discharged, the bullet entering the young man's side, inflicting a serious wound. We have said a great many harsh things about these young men whose revolvers contain more than their heads, but we retract everything now. At last a revolver has been found that knows which man to shoot.—*Burlington Hawkeye.*

CHILDREN are very apt to think a great deal more of an illustration than of the truth it was intended to illustrate. A teacher once endeavored to illustrate faith thus; "Children, if I should tell you that one day I saw a monkey climbing a liberty pole, would you believe me?" "Yes, sir," unanimously. "Well, that is faith; you believe me because I say it, and you feel that I would not tell an untruth." The next day the question was asked of the same children. "What is faith?" "A monkey climbing a liberty pole," answered a quick little boy.

UNCLE SAM, (satorically). "Farmers to the rescue!" (?)

Something for the New Year.

The would-renowned success of Hostetter's Bitters, and their continued popularity for a quarter of a century as a stomachic, is scarcely more wonderful than the welcome that greets the annual appearance of Hostetter's Almanac. This valuable medical treatise is published by Hostetter & Smith, Pittsburgh, Pa., under their own immediate supervision, employing 80 hands in that department. Ten cylinder printing presses, eight folding machines, five job presses, &c., are running about eleven months in the year on this work, and the issue of same for 1879 will not be less than ten millions, printed in the English, German, French, Welsh, Norwegian, Swedish, Holland, Bohemian and Spanish languages. Refer to a copy of it for valuable and interesting reading concerning health, and numerous testimonials as to the efficacy of Hostetter's Bitters, amusement, varied information, astronomical calculations and chronological items, &c., which can be depended on for correctness. The Almanac for 1879 can be obtained free of cost, from druggists and general country dealers in all parts of the country.

Agricultural Chemicals

and all Fertilizing Materials adapted to Home-made Manures, Composts and Formulas.

It is easy, durable and cheap. Sent by mail. Circulars free.
Eggleston Truss Co., Chicago, Ill.,

It is a mistake to suppose that any department of a paper may be slighted. The most important information is to be found, at times, under the guise of an advertisement; and it is agreeable to the advertiser and a courtesy to the publisher to mention the source of your information—in other words, to mention the paper.

CATARRH

"IT IS REALLY A LUXURY TO USE IT."
95 CHAMBERS ST., N. Y., AUG. 15, 1878.

MR. N. B. PHELPS.—Dear Sir: Last winter, while suffering severely from Catarrh, which almost unfitted me for business, I happened to notice a circular of your NORWEGIAN BALM. I thought I would try it, although I had used every Catarrh remedy I had heard of without receiving much, if any, benefit; and I am pleased to say that I received immediate relief from the use of your BALM. All obstructions were soon removed, which immediately relieved me of the headache; the soreness gradually passed away, and the discharges grew less, until now I am seemingly perfectly well. I still continue to use the BALM, it is so soothing and cleansing.

It is really a luxury to use it, especially when the head feels dry and feverish.

Respectfully, R. W. BYRON,
Book-keeper for E. S. Dodge Printing Co.

"LEAVES THE HEAD AS CLEAR AS A BELL."
198 COLUMBIA HEIGHTS, BROOKLYN, N. Y., MARCH 23, 1878.

N. B. PHELPS, ESQ.—Dear Sir: It gives me great pleasure to add my experience to your list of testimonials, of the soothing and healing effects of your NORWEGIAN BALM as a Catarrh remedy. It is such a great relief to me to use it, especially through the Fountain, that I desire all those who are afflicted with that unpleasant and annoying disease to know of the great relief it brings. It cleanses the nasal passages of all mucous matter, and *leaves the head as clear as a bell*, without the usual irritating exertions.

I am sure that if those suffering with the Catarrh will give your BALM a trial, they will not be without it. The liability of spilling the BALM and soiling the clothing is entirely obviated by using your Check-Spring on the tube to the Fountain. The slightest pressure regulates the flow of the BALM. Nothing could be more simple or effectual.

Respectfully, DANIEL R. PRATT.

NORWEGIAN BALM
is guaranteed to give
IMMEDIATE RELIEF.

Quart Bottle, sufficient for Two Months' use,
Price, $1.00.
Sample Bottle, 25 cents.

P. O. Box 4235. 31 and 33 Vesey St., N. Y.

HELP!

FOR THE WEAK, NERVOUS AND DEBILITATED!

The afflicted can now be restored to perfect health and bodily energy, at home, without the use of medicine of any kind.

PULVERMACHER'S
ELECTRIC BELTS
AND BANDS,

For self-application to any part of the body, meet every requirement.

The most learned physicians and scientific men of Europe and this country indorse them.

These noted Curative appliances have now stood the test for upward of thirty years, and are protected by Letters-Patent in all the principal countries of the world. They were decreed the only Award of Merit for Electric Appliances at the great World's Exhibitions—Paris, Philadelphia, and elsewhere—and have been found the most valuable, safe, simple, and efficient known treatment for the cure of disease.

READER, ARE YOU AFFLICTED?

and wish to recover the same degree of health, strength, and energy as experienced in former years? Do any of the following symptoms or class of symptoms meet your diseased condition? Are you suffering from ill-health in any of its many and multifarious forms, consequent upon a lingering, nervous, chronic or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, or blood, in a disordered condition? Do you suffer from rheumatism, neuralgia or aches and pains? Have you been indiscreet in early years and find yourself harassed with a multitude of gloomy symptoms? Are you timid, nervous, and forgetful, and your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to any of the following symptoms: Restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? Thousands of young men, the middle-aged, and even the old, suffer from nervous and physical debility. Thousands of females, too, are broken down in health and spirits from disorders peculiar to their sex, and who, from false modesty or neglect prolong their sufferings. Why, then, further neglect a subject so productive of health and happiness when there is at hand a means of restoration?

PULVERMACHER'S ELECTRIC BELTS AND BANDS

cure these various diseased conditions, after all other means fail, and we offer the most convincing testimony direct from the afflicted themselves, who have been restored to

HEALTH, STRENGTH, AND ENERGY,

after dragging in vain for months and years.

Send now for DESCRIPTIVE PAMPHLET and THE ELECTRIC QUARTERLY, a large Illustrated Journal, containing full particulars and INFORMATION WORTH THOUSANDS. Copies mailed free. Address,

PULVERMACHER GALVANIC CO.,
Cor. Eighth and Vine Sts., CINCINNATI, O.

Avoid bogus appliances claiming electric qualities. Our Pamphlet explains how to distinguish the genuine from the spurious.
